**BACKGROUND**

Ubiquitin-Proteasome Pathway (UPP) is a critical pathway that regulates proteins and  
degrades misfolded or abnormal proteins. UPP is central to multiple cellular processes, and if  
10 defective or imbalanced, leads to pathogenesis of a variety of diseases. The covalent  
attachment of ubiquitin to specific protein substrates is achieved through the action of E3  
ubiquitin ligases. These ligases comprise over 500 different proteins and are categorized into  
multiple classes defined by the structural element of their E3 functional activity. For  
example, cereblon (CRBN) interacts with damaged DNA binding protein 1 and forms an E3  
15 ubiquitin ligase complex with Cullin 4 in which the proteins recognized by CRBN are  
ubiquitinated and degraded by proteasomes. Various immunomodulatory drugs (IMiDs),  
*e.g.*, thalidomide and lenalidomide, binds to CRBN and modulates CRBN's role in the  
ubiquitination and degradation of protein factors involved in maintaining regular cellular  
function.

20 Bifunctional compounds composed of a target protein-binding moiety and an E3  
ubiquitin ligase-binding moiety have been shown to induce proteasome-mediated degradation  
of selected proteins. These drug-like molecules offer the possibility of temporal control over  
protein expression, and could be useful as biochemical reagents for the treatment of diseases.

Tripartite motif-containing 24 (TRIM24) is a protein kinase transcription regulator of  
25 nuclear receptors belonging to the tripartite motif superfamily of proteins. TRIM24 has been  
shown to interact with numerous proteins involved in chromatin structure and has been  
implicated as a potential dependency in multiple cancers (including lung and colorectal  
cancer). TRIM24 has also been shown to induce transformation in breast cancer cell lines.  
Previously developed ligands for the TRIM24 bromodomain have shown underwhelming  
30 biological activity.

Alternative strategies to inhibit transcriptional intermediary factors, such as TRIM24, are needed. At present, suitable compounds with alternative mechanisms of action targeting TRIM24 are not available. The present application addresses the need.

Some of the foregoing compounds can comprise one or more asymmetric centers, and thus can exist in various isomeric forms, *e.g.*, stereoisomers and/or diastereomers.

Accordingly, compounds of the application may be in the form of an individual enantiomer, diastereomer or geometric isomer, or may be in the form of a mixture of stereoisomers. In one embodiment, the compounds of the application are enantiopure compounds. In another embodiment, mixtures of stereoisomers or diastereomers are provided.

Furthermore, certain compounds, as described herein, may have one or more double bonds that can exist as either the *Z* or *E* isomer, unless otherwise indicated. The application additionally encompasses the compounds as individual *Z/E* isomers substantially free of other *E/Z* isomers and alternatively, as mixtures of various isomers.

In one embodiment, the present application relates to compounds that target proteins, such as TRIM24 for degradation, which have numerous advantages over inhibitors of protein function (*e.g.*, target protein or protein kinase activity) and can a) overcome resistance in certain cases; b) prolong the kinetics of drug effect by destroying the protein, thus requiring  
5 resynthesis of the protein even after the compound has been metabolized; c) target all functions of a protein at once rather than a specific catalytic activity or binding event; d) expand the number of drug targets by including all proteins that a ligand can be developed for, rather than proteins whose activity (*e.g.*, target protein or protein kinase activity) can be affected by a small molecule inhibitor, antagonist or agonist; and e) have increased potency  
10 compared to inhibitors due to the possibility of the small molecule acting catalytically.

Some embodiments of the present application relate to degradation or loss of 30% to 100% of the target protein. Some embodiments relate to the loss of 50-100% of the target protein. Other embodiments relate to the loss of 75-95% of the targeted protein.

A bifunctional compound of the present application (*e.g.*, a bifunctional compound of  
15 any of the formulae described herein, or selected from any bifunctional compounds described herein) is capable of modulating (*e.g.*, decreasing) the amount of a targeted protein (*e.g.*, TRIM24). A bifunctional compound of the present application (*e.g.*, a bifunctional compound of any of the formulae described herein, or selected from any bifunctional  
20 compounds described herein) is also capable of degrading a targeted protein (*e.g.*, TRIM24) through the UPP pathway. Further, modulation of TRIM24 through UPP-mediated degradation by a bifunctional compound of the application, such as those described herein, also provides a new paradigm for treating, preventing, or ameliorating diseases or disorders in which TRIM24 is deregulated.

In one embodiment, a bifunctional compound of the present application (*e.g.*, a bifunctional compound of any of the formulae described herein, or selected from any bifunctional compounds described herein) is more efficacious in treating a disease or condition (*e.g.*, cancer) than, or is capable of treating a disease or condition resistant to, the Targeting Ligand, when the Targeting Ligand is administered alone (*i.e.*, not bonded to a Linker and a Degron). The term "therapeutically effective amount" of a bifunctional compound or pharmaceutical composition of the application, as used herein, means a sufficient amount of the bifunctional compound or pharmaceutical composition so as to decrease the symptoms of a disorder in a subject. As is well understood in the medical arts a therapeutically effective amount of a bifunctional compound or pharmaceutical composition of this application will be at a reasonable benefit/risk ratio applicable to any medical treatment. It will be understood, however, that the total daily usage of the compounds and compositions of the present application will be decided by the attending physician within the scope of sound medical judgment. The specific inhibitory dose for any particular patient will depend upon a variety of factors including the disorder being treated and the severity of the disorder; the activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs

used in combination or coincidental with the specific compound employed; and like factors well known in the medical arts.

As used herein, the term "pharmaceutically acceptable salt" refers to those salts of the compounds formed by the process of the present application which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts are well known in the art. For example, S. M. Berge, *et al.* describes pharmaceutically acceptable salts in detail in *J. Pharmaceutical Sciences*, 66: 1-19 (1977). The salts can be prepared in situ during the final isolation and purification of the compounds of the application, or separately by reacting the free base or acid function with a suitable acid or base.

Examples of pharmaceutically acceptable salts include, but are not limited to, nontoxic acid addition salts: salts formed with inorganic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid and perchloric acid, or with organic acids such as acetic acid, maleic acid, tartaric acid, citric acid, succinic acid or malonic acid. Other pharmaceutically acceptable salts include, but are not limited to, adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hemisulfate, heptanoate, hexanoate, hydroiodide, 2-hydroxy-ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3-phenylpropionate, phosphate, picrate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, /7-toluenesulfonate, undecanoate, valerate salts, and the like. Suitable ester groups include, for example, those derived from pharmaceutically acceptable aliphatic carboxylic acids, particularly alkanolic, alkenolic,

cycloalkanoic and alkanedioic acids, in which each alkyl or alkenyl moiety advantageously has not more than 6 carbon atoms. Examples of particular esters include, but are not limited to, formates, acetates, propionates, butyrates, acrylates and ethylsuccinates.

The term "pharmaceutically acceptable prodrug", as used herein, refers to those  
5 prodrugs of the bifunctional compounds formed by the process of the present application which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals with undue toxicity, irritation, allergic response, and the like, commensurate with a reasonable benefit/risk ratio, and effective for their intended use, as well as the zwitterionic forms, where possible, of the compounds of the present application.

10 "Prodrug", as used herein, means a compound which is convertible *in vivo* by metabolic means (e.g., by hydrolysis) to afford any compound delineated by the formulae of the present application. Various forms of prodrugs are known in the art, for example, as discussed in Bundgaard, (ed.), Design of Prodrugs, Elsevier (1985); Widder, et al. (ed.), Methods in Enzymology, vol. 4, Academic Press (1985); Krogsgaard-Larsen, et al., (ed). "Design and  
15 Application of Prodrugs, Textbook of Drug Design and Development, Chapter 5, 113-191 (1991); Bundgaard, et al., Journal of Drug Deliver Reviews, 8:1-38(1992); Bundgaard, J. of Pharmaceutical Sciences, 77:285 et seq. (1988); Higuchi and Stella (eds.) Prodrugs as Novel Drug Delivery Systems, American Chemical Society (1975); and Bernard Testa & Joachim Mayer, "Hydrolysis In Drug And Prodrug Metabolism: Chemistry, Biochemistry And  
20 Enzymology," John Wiley and Sons, Ltd. (2002).

This application also encompasses pharmaceutical compositions containing, and methods of treating disorders through administering, pharmaceutically acceptable prodrugs of bifunctional compounds of the application. For example, compounds of the application having free amino, amido, hydroxy or carboxylic groups can be converted into prodrugs.

25 Prodrugs include compounds wherein an amino acid residue, or a polypeptide chain of two or more (e.g., two, three or four) amino acid residues is covalently joined through an amide or ester bond to a free amino, hydroxy or carboxylic acid group of compounds of the application. The amino acid residues include but are not limited to the 20 naturally occurring amino acids commonly designated by three letter symbols and also includes 4-hydroxyproline,  
30 hydroxylysine, demosine, isodemosine, 3-methylhistidine, norvalin, beta-alanine, gamma-aminobutyric acid, citrulline, homocysteine, homoserine, ornithine and methionine sulfone. Additional types of prodrugs are also encompassed. For instance, free carboxyl groups can be derivatized as amides or alkyl esters. Free hydroxy groups may be derivatized using groups including but not limited to hemisuccinates, phosphate esters, dimethylaminoacetates, and

phosphoryloxymethyloxy carbonyls, as outlined in *Advanced Drug Delivery Reviews*, 1996, 19, 115. Carbamate prodrugs of hydroxy and amino groups are also included, as are carbonate prodrugs, sulfonate esters and sulfate esters of hydroxy groups. Derivatization of hydroxy groups as (acyloxy)methyl and (acyloxy)ethyl ethers wherein the acyl group may be an alkyl ester, optionally substituted with groups including but not limited to ether, amine and carboxylic acid functionalities, or where the acyl group is an amino acid ester as described above, are also encompassed. Prodrugs of this type are described in *J. Med. Chem.* 1996, 39, 10. Free amines can also be derivatized as amides, sulfonamides or phosphoramides. All of these prodrug moieties may incorporate groups including but not limited to ether, amine and carboxylic acid functionalities.

The application also provides for a pharmaceutical composition comprising a therapeutically effective amount of a bifunctional compound of the application, or an enantiomer, diastereomer, stereoisomer, or pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier.

In another aspect, the application provides a kit comprising a bifunctional compound capable of inhibiting TRIM24 activity selected from one or more compounds disclosed herein, or a pharmaceutically acceptable salt, hydrate, solvate, prodrug, stereoisomer, or tautomer thereof, optionally in combination with a second agent and instructions for use in treating cancer.

In another aspect, the application provides a method of synthesizing a bifunctional compound disclosed herein.

The synthesis of the bifunctional compounds of the application can be found herein and in the Examples below.

Other embodiments are a method of making a bifunctional compound of any of the formulae herein using any one, or combination of, reactions delineated herein. The method can include the use of one or more intermediates or chemical reagents delineated herein.

Another aspect is an isotopically labeled bifunctional compound of any of the formulae delineated herein. Such compounds have one or more isotope atoms which may or may not be radioactive (*e.g.*,  $^3\text{H}$ ,  $^2\text{H}$ ,  $^{14}\text{C}$ ,  $^{13}\text{C}$ ,  $^{18}\text{F}$ ,  $^{35}\text{S}$ ,  $^{32}\text{P}$ ,  $^{125}\text{I}$ , and  $^{131}\text{I}$ ) introduced into the bifunctional compound. Such compounds are useful for drug metabolism studies and diagnostics, as well as therapeutic applications.

A bifunctional compound of the application can be prepared as a pharmaceutically acceptable acid addition salt by reacting the free base form of the compound with a pharmaceutically acceptable inorganic or organic acid. Alternatively, a pharmaceutically

acceptable base addition salt of a bifunctional compound of the application can be prepared by reacting the free acid form of the bifunctional compound with a pharmaceutically acceptable inorganic or organic base.

Alternatively, the salt forms of the bifunctional compounds of the application can be prepared using salts of the starting materials or intermediates.

The free acid or free base forms of the bifunctional compounds of the application can be prepared from the corresponding base addition salt or acid addition salt from, respectively. For example, a bifunctional compound of the application in an acid addition salt form can be converted to the corresponding free base by treating with a suitable base (*e.g.*, ammonium hydroxide solution, sodium hydroxide, and the like). A bifunctional compound of the application in a base addition salt form can be converted to the corresponding free acid by treating with a suitable acid (*e.g.*, hydrochloric acid, *etc.*).

Prodrugs of the bifunctional compounds of the application can be prepared by methods known to those of ordinary skill in the art (*e.g.*, for further details see Saulnier et al., (1994), *Bioorganic and Medicinal Chemistry Letters*, Vol. 4, p. 1985). For example, appropriate prodrugs can be prepared by reacting a non-derivatized bifunctional compound of the application with a suitable carbamylating agent (*e.g.*, 1,1-acyloxyalkylcarbanochloridate, para-nitrophenyl carbonate, or the like).

Protected derivatives of the bifunctional compounds of the application can be made by means known to those of ordinary skill in the art. A detailed description of techniques applicable to the creation of protecting groups and their removal can be found in T. W. Greene, "Protecting Groups in Organic Chemistry", 3rd edition, John Wiley and Sons, Inc., 1999.

Compounds of the present application can be conveniently prepared, or formed during the process of the application, as solvates (*e.g.*, hydrates). Hydrates of bifunctional compounds of the present application can be conveniently prepared by recrystallization from an aqueous/organic solvent mixture, using organic solvents such as dioxin, tetrahydrofuran or methanol.

Acids and bases useful in the methods herein are known in the art. Acid catalysts are any acidic chemical, which can be inorganic (*e.g.*, hydrochloric, sulfuric, nitric acids, aluminum trichloride) or organic (*e.g.*, camphorsulfonic acid, p-toluenesulfonic acid, acetic acid, ytterbium triflate) in nature. Acids are useful in either catalytic or stoichiometric amounts to facilitate chemical reactions. Bases are any basic chemical, which can be inorganic (*e.g.*, sodium bicarbonate, potassium hydroxide) or organic (*e.g.*, triethylamine,

pyridine) in nature. Bases are useful in either catalytic or stoichiometric amounts to facilitate chemical reactions.

Combinations of substituents and variables envisioned by this application are only those that result in the formation of stable compounds. The term "stable", as used herein,  
5 refers to compounds which possess stability sufficient to allow manufacture and which maintains the integrity of the compound for a sufficient period of time to be useful for the purposes detailed herein (*e.g.*, therapeutic or prophylactic administration to a subject).

When any variable (*e.g.*, R<sub>14</sub>) occurs more than one time in any constituent or formula for a compound, its definition at each occurrence is independent of its definition at every  
10 other occurrence. Thus, for example, if a group is shown to be substituted with one or more R<sub>14</sub> moieties, then R<sub>14</sub> at each occurrence is selected independently from the definition of R<sub>14</sub>. Also, combinations of substituents and/or variables are permissible, but only if such combinations result in stable compounds within a designated atom's normal valency.

In addition, some of the compounds of this application have one or more double  
15 bonds, or one or more asymmetric centers. Such compounds can occur as racemates, racemic mixtures, single enantiomers, individual diastereomers, diastereomeric mixtures, and *cis*- or *trans*- or *E*- or *Z*- double isomeric forms, and other stereoisomeric forms that may be defined, in terms of absolute stereochemistry, as (R)- or (S)-, or as (D)- or (L)- for amino acids. When the compounds described herein contain olefinic double bonds or other centers of geometric  
20 asymmetry, and unless specified otherwise, it is intended that the compounds include both E and Z geometric isomers. The configuration of any carbon-carbon double bond appearing herein is selected for convenience only and is not intended to designate a particular configuration unless the text so states; thus a carbon-carbon double bond depicted arbitrarily herein as *trans* may be *cis*, *trans*, or a mixture of the two in any proportion. All such  
25 isomeric forms of such compounds are expressly included in the present application.

Optical isomers may be prepared from their respective optically active precursors by the procedures described herein, or by resolving the racemic mixtures. The resolution can be carried out in the presence of a resolving agent, by chromatography or by repeated  
crystallization or by some combination of these techniques which are known to those skilled  
30 in the art. Further details regarding resolutions can be found in Jacques, *et al.*, *Enantiomers, Racemates, and Resolutions* (John Wiley & Sons, 1981).

"Isomerism" means compounds that have identical molecular formulae but differ in the sequence of bonding of their atoms or in the arrangement of their atoms in space. Isomers that differ in the arrangement of their atoms in space are termed "stereoisomers".

Stereoisomers that are not mirror images of one another are termed “diastereoisomers”, and stereoisomers that are non-superimposable mirror images of each other are termed “enantiomers” or sometimes optical isomers. A mixture containing equal amounts of individual enantiomeric forms of opposite chirality is termed a “racemic mixture”.

5 A carbon atom bonded to four non-identical substituents is termed a “chiral center”.

“Chiral isomer” means a compound with at least one chiral center. Compounds with more than one chiral center may exist either as an individual diastereomer or as a mixture of diastereomers, termed “diastereomeric mixture”. When one chiral center is present, a stereoisomer may be characterized by the absolute configuration (R or S) of that chiral center.

10 Absolute configuration refers to the arrangement in space of the substituents attached to the chiral center. The substituents attached to the chiral center under consideration are ranked in accordance with the *Sequence Rule* of Cahn, Ingold and Prelog. (Cahn *et al.*, *Angew. Chem. Inter. Edit.* 1966, 5, 385; errata 511; Cahn *et al.*, *Angew. Chem.* 1966, 78, 413; Cahn and Ingold, *J. Chem. Soc.* 1951 (London), 612; Cahn *et al.*, *Experientia* 1956, 12, 81; Cahn, *J.*  
15 *Chem. Educ.* 1964, 41, 116).

“Geometric isomer” means the diastereomers that owe their existence to hindered rotation about double bonds. These configurations are differentiated in their names by the prefixes cis and trans, or Z and E, which indicate that the groups are on the same or opposite side of the double bond in the molecule according to the Cahn-Ingold-Prelog rules.

20 Furthermore, the structures and other compounds discussed in this application include all atropic isomers thereof. “Atropic isomers” are a type of stereoisomer in which the atoms of two isomers are arranged differently in space. Atropic isomers owe their existence to a restricted rotation caused by hindrance of rotation of large groups about a central bond. Such atropic isomers typically exist as a mixture, however as a result of recent advances in  
25 chromatography techniques; it has been possible to separate mixtures of two atropic isomers in select cases.

“Tautomer” is one of two or more structural isomers that exist in equilibrium and is readily converted from one isomeric form to another. This conversion results in the formal migration of a hydrogen atom accompanied by a switch of adjacent conjugated double bonds.

30 Tautomers exist as a mixture of a tautomeric set in solution. In solid form, usually one tautomer predominates. In solutions where tautomerization is possible, a chemical equilibrium of the tautomers will be reached. The exact ratio of the tautomers depends on several factors, including temperature, solvent and pH. The concept of tautomers that are interconvertible by tautomerizations is called tautomerism.

Of the various types of tautomerism that are possible, two are commonly observed. In keto-enol tautomerism a simultaneous shift of electrons and a hydrogen atom occurs. Ring-chain tautomerism arises as a result of the aldehyde group (-CHO) in a sugar chain molecule reacting with one of the hydroxy groups (-OH) in the same molecule to give it a cyclic (ring-shaped) form as exhibited by glucose. Common tautomeric pairs are: ketone-enol, amide-nitrile, lactam-lactim, amide-imidic acid tautomerism in heterocyclic rings (*e.g.*, in nucleobases such as guanine, thymine and cytosine), amine-enamine and enamine-enamine. The compounds of this application may also be represented in multiple tautomeric forms, in such instances, the application expressly includes all tautomeric forms of the compounds described herein (*e.g.*, alkylation of a ring system may result in alkylation at multiple sites, the application expressly includes all such reaction products).

In the present application, the structural formula of the bifunctional compound represents a certain isomer for convenience in some cases, but the present application includes all isomers, such as geometrical isomers, optical isomers based on an asymmetrical carbon, stereoisomers, tautomers, and the like. In the present specification, the structural formula of the compound represents a certain isomer for convenience in some cases, but the present application includes all isomers, such as geometrical isomers, optical isomers based on an asymmetrical carbon, stereoisomers, tautomers, and the like.

Additionally, the compounds of the present application, for example, the salts of the bifunctional compounds, can exist in either hydrated or unhydrated (the anhydrous) form or as solvates with other solvent molecules. Non-limiting examples of hydrates include monohydrates, dihydrates, *etc.* Non-limiting examples of solvates include ethanol solvates, acetone solvates, *etc.*

“Solvate” means solvent addition forms that contain either stoichiometric or non stoichiometric amounts of solvent. Some compounds have a tendency to trap a fixed molar ratio of solvent molecules in the crystalline solid state, thus forming a solvate. If the solvent is water the solvate formed is a hydrate; and if the solvent is alcohol, the solvate formed is an alcoholate. Hydrates are formed by the combination of one or more molecules of water with one molecule of the substance in which the water retains its molecular state as H<sub>2</sub>O.

The synthesized bifunctional compounds can be separated from a reaction mixture and further purified by a method such as column chromatography, high pressure liquid chromatography, or recrystallization. As can be appreciated by the skilled artisan, further methods of synthesizing the bifunctional compounds of the formulae herein will be evident to those of ordinary skill in the art. Additionally, the various synthetic steps may be performed

in an alternate sequence or order to give the desired compounds. In addition, the solvents, temperatures, reaction durations, *etc.* delineated herein are for purposes of illustration only and one of ordinary skill in the art will recognize that variation of the reaction conditions can produce the desired bridged macrocyclic products of the present application. Synthetic  
5 chemistry transformations and protecting group methodologies (protection and deprotection) useful in synthesizing the compounds described herein are known in the art and include, for example, those such as described in R. Larock, *Comprehensive Organic Transformations*, VCH Publishers (1989); T.W. Greene and P.G.M. Wuts, *Protective Groups in Organic Synthesis*, 2d. Ed., John Wiley and Sons (1991); L. Fieser and M. Fieser, *Fieser and Fieser's*  
10 *Reagents for Organic Synthesis*, John Wiley and Sons (1994); and L. Paquette, ed., *Encyclopedia of Reagents for Organic Synthesis*, John Wiley and Sons (1995), and subsequent editions thereof.

The compounds of this application may be modified by appending various functionalities via any synthetic means delineated herein to enhance selective biological  
15 properties. Such modifications are known in the art and include those which increase biological penetration into a given biological system (*e.g.*, blood, lymphatic system, central nervous system), increase oral availability, increase solubility to allow administration by injection, alter metabolism and alter rate of excretion.

The compounds of the application are defined herein by their chemical structures and/or chemical names. Where a compound is referred to by both a chemical structure and a  
20 chemical name, and the chemical structure and chemical name conflict, the chemical structure is determinative of the compound's identity.

The recitation of a listing of chemical groups in any definition of a variable herein includes definitions of that variable as any single group or combination of listed groups. The  
25 recitation of an embodiment for a variable herein includes that embodiment as any single embodiment or in combination with any other embodiments or portions thereof.

#### Method of Synthesizing the Compounds

Compounds of the present application can be prepared in a variety of ways using  
30 commercially available starting materials, compounds known in the literature, or from readily prepared intermediates, by employing standard synthetic methods and procedures either known to those skilled in the art, or which will be apparent to the skilled artisan in light of the teachings herein. Standard synthetic methods and procedures for the preparation of organic molecules and functional group transformations and manipulations can be obtained from the

relevant scientific literature or from standard textbooks in the field. Although not limited to any one or several sources, classic texts such as Smith, M. B., March, J., *March's Advanced Organic Chemistry: Reactions, Mechanisms, and Structure*, 5<sup>th</sup> edition, John Wiley & Sons: New York, 2001; and Greene, T.W., Wuts, P.G. M., *Protective Groups in Organic Synthesis*, 3<sup>rd</sup> edition, John Wiley & Sons: New York, 1999, incorporated by reference herein, are useful and recognized reference textbooks of organic synthesis known to those in the art. The following descriptions of synthetic methods are designed to illustrate, but not to limit, general procedures for the preparation of compounds of the present application. The processes generally provide the desired final compound at or near the end of the overall process, although it may be desirable in certain instances to further convert the compound to a pharmaceutically acceptable salt, ester or prodrug thereof. Suitable synthetic routes are depicted in the schemes below.

Those skilled in the art will recognize if a stereocenter exists in the compounds disclosed herein. Accordingly, the present application includes both possible stereoisomers (unless specified in the synthesis) and includes not only racemic compounds but the individual enantiomers and/or diastereomers as well. When a compound is desired as a single enantiomer or diastereomer, it may be obtained by stereospecific synthesis or by resolution of the final product or any convenient intermediate. Resolution of the final product, an intermediate, or a starting material may be affected by any suitable method known in the art. See, for example, "Stereochemistry of Organic Compounds" by E. L. Eliel, S. H. Wilen, and L. N. Mander (Wiley-Interscience, 1994).

The compounds of the present application can be prepared in a number of ways well known to those skilled in the art of organic synthesis. By way of example, compounds of the present application can be synthesized using the methods described below, together with synthetic methods known in the art of synthetic organic chemistry, or variations thereon as appreciated by those skilled in the art. Preferred methods include but are not limited to those methods described below.

#### 20 Biological Assays

##### *Destabilization of TRIM24 in Cells treated with a TRIM24 inhibitor*

The percent (%) of TRIM24 in cells treated with vehicle or compounds of the application is determined by treating cells with vehicle or compounds of the application, or combinations thereof, at various concentrations. Cells are harvested and lysed using buffer

with protease inhibitors and benzonase. Total protein is quantified using a BCA assay. TRIM24 and actin antibodies are used. Blots are imaged using secondary antibodies and band intensities are quantified. TRIM24 signal is normalized to the actin loading control. DMSO signal is set to 1, and all other treatment conditions are normalized to the DMSO  
5 condition per immunoblot to determine the percent (%) TRIM24.

#### *Immunoblot Measurement of TRIM24*

Primary antibodies used are TRIM24 as well as actin. Blots are imaged using secondary antibodies. Band intensities are quantified using software. TRIM24 signal is normalized to the actin loading control. DMSO signal was set to 1, and all other treatment  
10 conditions are normalized to the DMSO condition per immunoblot to determine the percent (%) TRIM24.

#### *TRIM24 Binding in Alpha Assay*

The alpha TRIM24 binding assay is used to assess the binding of the compounds of the application. Compounds are added at various concentrations as well as a vehicle control.  
15 Compounds that bind to TRIM24 compete away the interaction between the PHD-bromodomain of TRIM24 bound to the donor bead, and the H3K23ac histone peptide bound to the acceptor bead, which causes a decrease in signal. IC50 values are calculated.

Injectable compositions can be aqueous isotonic solutions or suspensions, and suppositories can be prepared from fatty  
25 emulsions or suspensions. The compositions may be sterilized and/or contain adjuvants, such as preserving, stabilizing, wetting or emulsifying agents, solution promoters, salts for regulating the osmotic pressure and/or buffers. In addition, they may also contain other therapeutically valuable substances. Suitable formulations for transdermal applications include an effective amount of a compound of the present application with a carrier. A  
30 carrier can include absorbable pharmacologically acceptable solvents to assist passage through the skin of the host. For example, transdermal devices are in the form of a bandage comprising a backing member, a reservoir containing the compound optionally with carriers, optionally a rate controlling barrier to deliver the compound to the skin of the host at a controlled and predetermined rate over a prolonged period of time, and means to secure the

device to the skin. Matrix transdermal formulations may also be used. Suitable formulations for topical application, *e.g.*, to the skin and eyes, are preferably aqueous solutions, ointments, creams or gels well-known in the art. Such may contain solubilizers, stabilizers, tonicity enhancing agents, buffers and preservatives.

5           The pharmaceutical compositions of the present application comprise a therapeutically effective amount of a compound of the present application formulated together with one or more pharmaceutically acceptable carriers. As used herein, the term "pharmaceutically acceptable carrier" means a non-toxic, inert solid, semi-solid or liquid filler, diluent, encapsulating material or formulation auxiliary of any type. Some examples of  
10 materials which can serve as pharmaceutically acceptable carriers include, but are not limited to, ion exchangers, alumina, aluminum stearate, lecithin, serum proteins, such as human serum albumin, buffer substances such as phosphates, glycine, sorbic acid, or potassium sorbate, partial glyceride mixtures of saturated vegetable fatty acids, water, salts or electrolytes, such as protamine sulfate, disodium hydrogen phosphate, potassium hydrogen  
15 phosphate, sodium chloride, zinc salts, colloidal silica, magnesium trisilicate, polyvinyl pyrrolidone, polyacrylates, waxes, polyethylenepolyoxy propylene-block polymers, wool fat, sugars such as lactose, glucose and sucrose; starches such as corn starch and potato starch; cellulose and its derivatives such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatin; talc; excipients such as cocoa butter and  
20 suppository waxes, oils such as peanut oil, cottonseed oil; safflower oil; sesame oil; olive oil; corn oil and soybean oil; glycols such a propylene glycol or polyethylene glycol; esters such as ethyl oleate and ethyl laurate, agar; buffering agents such as magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogen-free water, isotonic saline; Ringer's solution; ethyl alcohol, and phosphate buffer solutions, as well as other non-toxic compatible  
25 lubricants such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the composition, according to the judgment of the formulator.

The pharmaceutical compositions of this application can be administered to humans  
30 and other animals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments, or drops), buccally, or as an oral or nasal spray.

Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the

active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide, oils (in particular, 5 cottonseed, groundnut, com, germ, olive, castor, and sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof. Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

10           Injectable preparations, for example, sterile injectable aqueous, or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution, suspension or emulsion in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and 15 solvents that may be employed are water, Ringer's solution, U.S.P. and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the preparation of injectables.

20           In order to prolong the effect of a drug, it is often desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution which, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a 25 parenterally administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle.

          Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this application with suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a suppository wax which 30 are solid at ambient temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

          Solid compositions of a similar type may also be employed as fillers in soft and hard filled gelatin capsules using such excipients as lactose or milk sugar as well as high molecular weight polyethylene glycols and the like.

The active compounds can also be in micro-encapsulated form with one or more excipients as noted above. The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings, release controlling coatings and other coatings well known in the pharmaceutical formulating art. In such solid dosage forms the active compound may be admixed with at least one inert diluent such as sucrose, lactose or starch. Such dosage forms may also comprise, as is normal practice, additional substances other than inert diluents, *e.g.*, tableting lubricants and other tableting aids such a magnesium stearate and microcrystalline cellulose. In the case of capsules, tablets and pills, the dosage forms may also comprise buffering agents.

Dosage forms for topical or transdermal administration of a compound of this application include ointments, pastes, creams, lotions, gels, powders, solutions, sprays, inhalants or patches. The active component is admixed under sterile conditions with a pharmaceutically acceptable carrier and any needed preservatives or buffers as may be required. Ophthalmic formulation, ear drops, eye ointments, powders and solutions are also contemplated as being within the scope of this application.

The ointments, pastes, creams and gels may contain, in addition to an active compound of this application, excipients such as animal and vegetable fats, oils, waxes, paraffins, starch, tragacanth, cellulose derivatives, polyethylene glycols, silicones, bentonites, silicic acid, talc and zinc oxide, or mixtures thereof.

Powders and sprays can contain, in addition to the compounds of this application, excipients such as lactose, talc, silicic acid, aluminum hydroxide, calcium silicates and polyamide powder, or mixtures of these substances. Sprays can additionally contain customary propellants such as chlorofluorohydrocarbons.

Transdermal patches have the added advantage of providing controlled delivery of a compound to the body. Such dosage forms can be made by dissolving or dispensing the compound in the proper medium. Absorption enhancers can also be used to increase the flux of the compound across the skin. The rate can be controlled by either providing a rate controlling membrane or by dispersing the compound in a polymer matrix or gel.

Compounds and compositions of the application can be administered in therapeutically effective amounts in a combinational therapy with one or more therapeutic agents (pharmaceutical combinations) or modalities, *e.g.*, an anti-proliferative, anti-cancer, immunomodulatory or anti-inflammatory agent. Where the compounds of the application are administered in conjunction with other therapies, dosages of the co-administered compounds will of course vary depending on the type of co-drug employed, on the specific drug

employed, on the condition being treated and so forth. Compounds and compositions of the application can be administered in therapeutically effective amounts in a combinational therapy with one or more therapeutic agents (pharmaceutical combinations) or modalities, *e.g.*, anti-proliferative, anti-cancer, immunomodulatory or anti-inflammatory agent, and/or non-drug therapies, *etc.* For example, synergistic effects can occur with anti-proliferative, anti-cancer, immunomodulatory or anti-inflammatory substances. Where the compounds of the application are administered in conjunction with other therapies, dosages of the co-administered compounds will of course vary depending on the type of co-drug employed, on the specific drug employed, on the condition being treated and so forth.

Combination therapy includes the administration of the subject compounds in further combination with one or more other biologically active ingredients (such as, but not limited to, a second TRIM24 inhibitor, a second and different TRIM24 inhibitor, a second anti-cancer agent, *etc.*) and non-drug therapies (such as, but not limited to, surgery or radiation treatment). For instance, the compounds of the application can be used in combination with other pharmaceutically active compounds, preferably compounds that are able to enhance the effect of the compounds of the application. The compounds of the application can be administered simultaneously (as a single preparation or separate preparation) or sequentially to the other drug therapy or treatment modality. In general, a combination therapy envisions administration of two or more drugs during a single cycle or course of therapy.

In another aspect of the application, the compounds may be administered in combination with one or more separate pharmaceutical agents, *e.g.*, a chemotherapeutic agent, an immunotherapeutic agent, or an adjunctive therapeutic agent.

**10 Example 33: Dose-Dependent Destabilization of TRIM24 in Cells**

Wild-type or cereblon null 293T cells, or MCF7 cells, were treated with compounds of the application. The cells were treated for 4 hours or 18 hours with representative compounds at a final concentration of 10  $\mu\text{M}$ , 5  $\mu\text{M}$ , or 0.5  $\mu\text{M}$ , or with a vehicle control. Cells were harvested and lysed using RIPA buffer with Halt protease inhibitors and 0.1%  
 15 benzonase on ice for 15 minutes. The amount of total protein was quantified using the BCA assay. Primary antibodies used were TRIM24 (Cell Signaling Technology) as well as actin (Santa Cruz). Blots were imaged using secondary antibodies (LI-COR) on the OdysseyCLxImager. Band intensities were quantified using the LI-COR software. TRIM24 signal was normalized to the actin loading control. The signal intensity of TRIM24 from  
 20 cells treated with DMSO was set to 1, and all other treatment conditions were normalized to the DMSO condition per immunoblot to determine the level of TRIM24, which was expressed as a ratio to the TRIM24 level in the DMSO treated cells. As shown in FIGs 1A, 2A-2C, 5, and 6, treatment of cells with representative compounds of the present application destabilized TRIM24.

25 In addition, MCF7 cells were treated for 24, 48, and 72 hours with representative compounds of the application at 5  $\mu\text{M}$ . As shown in FIG. 7, the level of TRIM24 in cells treated with 5  $\mu\text{M}$  Compound I-B3 significantly reduced when compared to vehicle. The decrease in the level of TRIM24 continued over a 24 h to 72 h period.

**Example 34: Destabilization of TRIM24 in the Presence of Proteosomal Degradation Inhibitors**

The level of TRIM24 cells treated with representative compounds of the application was determined. Cells were treated for 18 hours with representative compounds of the present application at a concentration of 10  $\mu$ M or 5  $\mu$ M and 0.5  $\mu$ M alone, or in the presence of MLN4924 at 1  $\mu$ M, or Carfilzomib at 500 nM. Cells were harvested and lysed using RIPA buffer with Halt protease inhibitors and 0.1% benzonase on ice for 15 minutes. The level of total protein was quantified using the BCA assay. Primary antibodies used were TRIM24 (Cell Signaling Technology) as well as actin (Santa Cruz). Blots were imaged using secondary antibodies (LI-COR) on the OdysseyCLxImager. Band intensities were quantified using the LI-COR software. TRIM24 signal was normalized to the actin loading control. The signal intensity of TRIM24 from cells treated with DMSO was set to 1, and all other treatment conditions were normalized to the DMSO condition per immunoblot to determine the level of TRIM24, which was expressed as a ratio to the TRIM24 level in the DMSO treated cells. As shown in FIGs 4A and 4B, treatment of cells with proteosomal degradation inhibitors affected the TRIM24 destabilization by the compounds of the present application.

**Example 35: TRIM24 Binding Alpha Assay**

The alpha assay was used to assess the binding of the compounds of the application to TRIM24 at various concentrations. All compounds were added at concentrations from 50  $\mu$ M to 0.002  $\mu$ M. Compounds that bind to TRIM24 compete with the PHD-bromodomain of TRIM24 in interacting with the donor bead, and the H3K23ac histone peptide bound to the acceptor bead, which causes a decrease in signal. IC<sub>50</sub> values were calculated by using Graphpad PRISM's log(inhibitor) vs. response – variable slope (four parameters). Binding to TRIM24 of Compounds I-A1 – I-A12, I-B1 – I-B4, Cmpds A-E are shown in FIGs. 3A and 3B.
