PYRAZOLE COMPOUNDS AND THEIR USE AS T-TYPE CALCIUM CHANNEL BLOCKERS

The present invention relates to novel pyrazole compounds and their use as T-type calcium channel blockers in the treatment or prevention of various diseases or disorders where calcium T channels are involved, to pharmaceutical compositions containing these derivatives, and to processes for their preparation.

Intracellular calcium concentrations control important life processes such as signal transduction pathways, hormones and neurotransmitter release, muscular contraction, gene expression and cell division. Control of calcium influx across the cellular membrane is in part regulated by a family of transmembrane proteins termed voltage-gated calcium channels (VOCs). They are activated by changes in electrical potential difference across the membrane and have been further classified into different subtypes based on biophysical and pharmacological considerations: Cav1.2 (L-type for Long-lasting), Cav2.1 (N-, P/Q- and R-types; N for Neuronal, P for Purkinje cells, Q (after P) and R for Remaining or Resistant) and Cav3.2 (T-type for Transient). The L, N, P and Q-type channels activate at more positive potentials (high voltage activated) and display diverse kinetics and voltage-dependent properties. The T-type class (or “low voltage-activated”) is characterized by fast inactivation (transient) and small conductance (tiny) and is composed of three members due to the different main pore-forming α1 subunits: Cav3.1 (α1G), Cav3.2 (α1H) and Cav3.3 (α1I).

Nearly all “excitable” cells, such as neurons of the central nervous system (CNS), peripheral nerve cells and muscle cells, including those of skeletal muscles, cardiac muscles, and venous and arterial smooth muscles, have voltage-dependent calcium channels. In consequence, calcium T channels have been linked to various human diseases and disorders, such as especially epilepsy, pain, neuropathic pain, sleep disorders, sleep disturbances, schizophrenia, essential tremors, Parkinson’s disease, neurodegenerative disorders, depression, anxiety, psychosis, autism, drug addiction, hypertension, cardiac arrhythmias, heart block, cancer, diabetes, infertility and sexual dysfunction (Bourinet, E.; Alloui, A.; Monteil, A.; Barrere, C.; Couette, B.; Poiriot, O.; Pages, A.; McRory, J.; Snutch, T. P.; Eschalier, A.; Nargeot, J., EMBO J 2005, 24 (2), 315-324; Flatters, S.J.L., Drugs Fut. 2005, 30(6), 573-580; Giordano, F.; Knerr, L.; Wallberg, A., Expert Opin Ther Pat 2011, 21 (1), 85-101; Huguenard, J. R.; Prince, D. A., J Neurosci 1994, 14 (9), 5485-502; Lory, P.; Mezghrani, A., iDrugs 2010, 13 (7), 467-71; McGivern, J. G., Drug Discov Today 2006, 11 (5-6), 245-53; Uslaner, J. M.; Vardigan, J. D.; Drott, J. M.; Uebele, V. N.; Renger, J. J.; Lee, A.; Li, Z.; Le, A. D.; Hutson, P. H., Biol Psychiatry 2010, 68 (8), 712-8; Wildburger, N. C.; Lin-Ye, A.; Baird, M. A.; Lei, D.; Bao, J., Mol Neurodegener 2009, 4, 44).

In the brain, T-type calcium channels are essential for regulating neuronal excitability and burst firing, both in the central and peripheral nervous system (Lambert, R. C.; Bessaih, T.; Crunelli, V.; Lerescue, N., Pflugers Arch 2014, 466 (3), 415-23). They are linked to diseases or disorders where abnormal oscillatory activity occurs in the brain, as well as diseases or disorders where there is abnormal coupling of activity, particular
through the thalamus. They are particularly linked to an increasing number of neurological disorders such as the epilepsy disorders and neuropathic pain.

T-type calcium channels play a role in regulating neuronal firing patterns under normal physiological conditions, such as during sleep rhythms (Anderson, M. P.; Mochizuki, T.; Xie, J.; Fischler, W.; Manger, J. P.; Talley, E. M.; Scammell, T. E.; Tonegawa, S., Proc Natl Acad Sci U S A 2005, 102 (5), 1743-8; Destexhe, A.; Contreras, D.; Sejnowski, T. J.; Steriade, M., J Neurophysiol 1994, 72 (2), 803-18; Lee, J.; Kim, D.; Shin, H. S., Proc Natl Acad Sci U S A 2004, 101 (52), 18195-9; Steriade, M., Trends Neurosci 2005, 28 (6), 317-24.). However, T-type calcium channels are also involved in pathophysiological conditions such as epilepsy, autism, hypertension, atrial fibrillation, congenital heart failure, pain, psychoses and cancer (for review, see Ittincu, M. C., J Med Life 2011, 4 (2), 126-38).

In another type of epilepsy, i.e. the temporal lobe epilepsy, it has been shown in the pilocarpine rodent model that T-type calcium currents were upregulated after status epilepticus and suggest a role of this channel in long-lasting modification of neuronal firing mode (regular to burst firing) and potential contribution to the development and expression of an epileptic condition after SE (Yaari, Y.; Yue, C.; Su, H., *J Physiol* 2007, 580 (Pt. 2), 435-50; Becker, A. J.; Pitts, J.; Sochivko, D.; Optiz, T.; Staniek, M.; Chen, C. C.; Campbell, K. P.; Schoch, S.; Yaari, Y.; Beck, H., *J Neurosci* 2008, 28 (49), 13341-53; Graef, J. D.; Nordskog, B. K.; Wiggins, W. F.; Godwin, D. W., *J Neurosci* 2009, 29 (14), 4430-41; Su, H.; Sochivko, D.; Becker, A.; Chen, J.; Jiang, Y.; Yaari, Y.; Beck, H., *J Neurosci* 2002, 22 (9), 3645-55).

It has been shown that T-type calcium (Ca) channels in the CNS are closely associated with repetitive burst discharges or neuronal oscillations (Llinas, R.; Yarom, Y., J Physiol 1986, 376, 163-82; Gutnick, M. J.; Yarom, Y., J Neurosci Methods 1989, 28 (1-2), 93-9; Iftina, M. C.; Zamponi, G. W., Trends Pharmacol Sci 2009, 30 (1), 32-40). Tremor is a common encountered involuntary movements, and it is associated with various neurological diseases or pathological conditions such as essential tremor (ET) and Parkinson's disease (PD) and its related disorders. As tremor-related neuronal activities may be closely related to repetitive or oscillatory activities in the CNS, controlling T-type Ca channels may have therapeutic effects. This hypothesis is supported by neuro-anatomical and functional expression of expression of T-type calcium channels in area involved pathophysiological mechanisms underlying harmaline-induced tremor, a pharmacological model of ET in rodents (Llinas, R.; Yarom, Y., J Physiol 1986, 376, 163-82; Cavelier, P.; Lohof, A. M.; Lorchamp, E.; Beekenkamp, H.; Mariani, J; Bossu, J. L., Neuroreport 2008, 19 (3), 299-303). Moreover, animal data involving selective knockdown of the Cav3.1 gene or mice lacking the Cav3.1 gene showed that Cav3.1 channels play a specific role in ET (Park, Y. G.; Park, H. Y.; Lee, C. J.; Choi, S.; Jo, S.; Choi, H.; Kim, Y. H.; Shin, H. S.; Llinas, R.; Kim, D., Proc Natl Acad Sci U S A 2010, 107 (23), 10731-6). On the other hand, the role of the other isoform of the T-type calcium channels (Cav3.2 and Cav 3.3) in this pathology is not known but cannot be excluded (Miwa, H.; Kondo, T., Cerebellum 2011, 10 (3), 563-9).

In Parkinson's disease (PD) patients, deep brain stimulation of the subthalamic nucleus has been shown to be an effective treatment for parkinsonian symptoms indicating a pivotal role of this area in the pathogenesis of PD: in patients, as well as in animal models of PD, this area seems to have an abnormal pattern of firing with an increase of the burst firing mode. And this burst firing mode has been shown to involve the T-type Ca2+ channels (for review, see Yang, Y. C.; Tai, C. H.; Pan, M. K.; Kuo, C. C., Pflugers Arch 2014, 466 (4), 747-55).
The compounds of the present invention are potent calcium T channel blockers and therefore useful for the prevention or treatment of diseases or disorders where calcium T channels are involved.

The compounds of formula (I) may contain one or more stereogenic or asymmetric centers, such as one or more asymmetric carbon atoms. The compounds of formula (I) may thus be present as mixtures of stereoisomers or preferably as pure stereoisomers. Mixtures of stereoisomers may be separated in a manner known to a person skilled in the art.

Furthermore, in some instances, the compounds of the present invention may be present in tautomeric forms. Any such tautomeric form is encompassed. For example, it is well understood that, in case a benzimidazole moiety is unsubstituted on the ring nitrogen having a free valency such benzimidazole moiety represents
tautomeric forms. Thus, further substituents of the benzimidazole moiety may be attached in the position(s)
ortho to the bridgehead atoms (i.e. attached in position(s) 4 and/or 7), and/or in the position(s) meta to the
bridgehead atoms, (i.e. attached in position(s) 5 and/or 6). It is understood that the two ortho, and,
respectively, the two meta positions are considered equivalent. For example, the group 4-methyl-1H-
benzoimidazol-2-yl is understood to signify the same group as 7-methyl-1H-benzoimidazol-2-yl and 4-methyl-
3H-benzoimidazol-2-yl and 7-methyl-3H-benzoimidazol-2-yl.

The present invention also includes isotopically labelled, especially ²H (deuterium) labelled compounds of
formula (I) according to embodiments 1) to 29), which compounds are identical to the compounds of formula
(I) except that one or more atoms have each been replaced by an atom having the same atomic number but
an atomic mass different from the atomic mass usually found in nature. Isotopically labelled, especially ²H
(deuterium) labelled compounds of formula (I) and salts thereof are within the scope of the present invention.
Substitution of hydrogen with the heavier isotope ²H (deuterium) may lead to greater metabolic stability,
resulting e.g. in increased in-vivo half-life or reduced dosage requirements, or may lead to reduced inhibition
of cytochrome P450 enzymes, resulting e.g. in an improved safety profile. In one embodiment of the invention,
the compounds of formula (I) are not isotopically labelled, or they are labelled only with one or more deuterium
atoms. In a sub-embodiment, the compounds of formula (I) are not isotopically labelled at all. Isotopically
labelled compounds of formula (I) may be prepared in analogy to the methods described hereinafter, but using
the appropriate isotopic variation of suitable reagents or starting materials.

In this patent application, variably attached bonds may be used for substituents or groups (e.g. \( \text{R}^1 \)) and
\( \text{R}^2 \)). In such case it is meant that any such substituent or group may be attached to any carbon atom of the
ring system to which the variable attached bond is drawn into, provided that said carbon atom is not already
substituted.

In this patent application, a bond drawn as a dotted line shows the point of attachment of the radical drawn.
For example, the radical drawn below

\[ \text{N} \]

is a 1H-pyrazol-1,3-dyl group.

Where the plural form is used for compounds, salts, pharmaceutical compositions, diseases and the like, this
is intended to mean also a single compound, salt, pharmaceutical composition, disease or the like.

Any reference to compounds of formula (I) according to embodiments 1) to 29) is to be understood as
referring also to the salts (and especially the pharmaceutically acceptable salts) of such compounds, as
appropriate and expedient.
The term "pharmaceutically acceptable salts" refers to salts that retain the desired biological activity of the subject compound and exhibit minimal undesired toxicological effects. Such salts include inorganic or organic acid and/or base addition salts depending on the presence of basic and/or acidic groups in the subject compound. For reference see for example "Handbook of Pharmaceutical Salts. Properties, Selection and Use," P. Heinrich Stahl, Camille G. Wermuth (Eds.), Wiley-VCH, 2008; and "Pharmaceutical Salts and Co-crystals", Johan Wouters and Luc Quéré (Eds.), RSC Publishing, 2012.

Definitions provided herein are intended to apply uniformly to the compounds of formula (I), as defined in any one of embodiments 1) to 29), and, mutatis mutandis, throughout the description and the claims unless an otherwise expressly set out definition provides a broader or narrower definition. It is well understood that a definition or preferred definition of a term defines and may replace the respective term independently of (and in combination with) any definition or preferred definition of any or all other terms as defined herein.

The term "halogen" means fluorine, chlorine, bromine, or iodine, preferably fluorine or chlorine, especially fluorine.

The term "cyano" refers to a group -CN.

The term "alkyl", used alone or in combination, refers to a saturated straight or branched chain hydrocarbon group containing one to six (especially one to four) carbon atoms. The term "(C<sub>x</sub>)alkyl" (x and y each being an integer), refers to an alkyl group as defined before, containing x to y carbon atoms. In case a (C<sub>1</sub>)alkyl group (or, in general, a (C<sub>x</sub>)alkyl group) is used in combination with another substituent, the term means that said substituent is linked through a (C<sub>1</sub>)alkyl group (or a (C<sub>x</sub>)alkyl group, respectively) to the rest of the molecule. In some instances such group is also referred to as (C<sub>1</sub>)alkylene. For example a (C<sub>1</sub>)alkyl group contains from one to six carbon atoms. Examples of (C<sub>1</sub>)alkyl groups are the (C<sub>1</sub>)alkyl groups methyl, ethyl, n-propyl, isopropyl, n-butyl, sec.-butyl, tert.-butyl, and isobutyl, as well as n-pentyl, and isopentyl. Preferred are methyl, ethyl, n-propyl, and isopropyl. Most preferred is methyl. For the substituent R<sup>1</sup> preferred examples of (C<sub>2</sub>)alkyl are isopropyl, tert.-butyl, and isobutyl; especially tert.-butyl.

Examples of (C<sub>2</sub>)alkyl groups which are mono-substituted with cyano, or (C<sub>1</sub>)alkoxy as used for R<sup>1</sup> are 1-methoxy-ethyl, and 1-cyano-1-methyl-ethyl.

The term "alkoxy" means a group of the formula alkyl-O- in which the term alkyl has the previously given significance. The term "(C<sub>x</sub>)alkoxy" (x and y each being an integer) refers to a straight or branched chain alkoxy group containing x to y carbon atoms. Examples of alkoxy groups are the (C<sub>1</sub>)alkoxy groups methoxy, ethoxy, n-propoxy, isopropoxy, n-butoxy, isobutoxy, sec-butoxy and tert.-butoxy. Preferred is methoxy.

The term "fluoroalkyl" refers to an alkyl group as defined before containing one to three carbon atoms in which one or more (and possibly all) hydrogen atoms have been replaced with fluorine. The term "(C<sub>x</sub>)fluoroalkyl" (x and y each being an integer) refers to a fluoroalkyl group as defined before containing x to y carbon atoms. For example a (C<sub>1</sub>)fluoroalkyl group contains from one to three carbon atoms in which one to seven
hydrogen atoms have been replaced with fluorine. A preferred example is trifluoromethyl. Examples of 
(C_2)fluoroalkyl groups include 2-fluoroethyl, 2,2-difluoroethyl and 2,2,2-trifluoroethyl (especially 2-fluoroethyl 
and 2,2,2-trifluoroethyl). In the specific case of (C_1)fluoroalkyl groups, the fluoroalkyl group contains from one 
to four carbon atoms in which one to nine hydrogen atoms have been replaced with fluorine. Examples of (C_1,
4)fluoroalkyl groups as used for R^1 include trifluoromethyl, 2-fluoroethyl, 2,2-difluoroethyl, 2,2,2-trifluoroethyl, 
and 2,2,2-trifluoro-1,1-dimethyl-ethyl; especially trifluoromethyl, and 2,2,2-trifluoro-1,1-dimethyl-ethyl.

The term "fluoroalkoxy" refers to an alkoxy group as defined before containing one to three carbon atoms in 
which one or more (and possibly all) hydrogen atoms have been replaced with fluorine. The term "(C_x,
y)fluoroalkoxy" (x and y each being an integer) refers to a fluoroalkoxy group as defined before containing x to 
y carbon atoms. For example a (C_1,3)fluoroalkoxy group contains from one to three carbon atoms in which one 
to seven hydrogen atoms have been replaced with fluorine. Preferred examples are trifluoromethoxy, 
difluoromethoxy and 2,2,2-trifluoroethoxy. Representative examples of fluoroalkoxy groups as used for R^1 
include trifluoromethoxy, difluoromethoxy, 2-fluoroethoxy, 2,2-difluoroethoxy and 2,2,2-trifluoroethoxy; 
especially 2,2,2-trifluoroethoxy. An additional example of (C_1,3)fluoroalkoxy groups as used for R^1 is 3,3,3-
trifluoroproxy.

The term "cycloalkyl" refers to a saturated mono- or bicyclic carbocyclic ring containing three to eight carbon 
atoms. The term "(C_x,y)cycloalkyl" (x and y each being an integer), refers to a cycloalkyl group as defined 
before containing x to y carbon atoms. For example a (C_3,y)cycloalkyl group refers to a saturated monocyclic 
carbocyclic ring containing three to six carbon atoms. Examples of cycloalkyl groups are cyclopropyl, 
cyclobutyl, cyclopentyl, and cyclohexyl. Preferred is cyclopropyl.

The term "(C_3)cyloalkyl, wherein the cycloalkyl may optionally contain a ring oxygen atom", refers to a 
monocyclic cycloalkyl group as defined before. In addition, one ring carbon atom of said cycloalkyl may be 
replaced by an oxygen atom. For the substituent R^1, examples of such groups are especially cyclopropyl, 
cyclobutyl, and, in addition, oxetan-3-yl. Said groups are unsubstituted or substituted as explicitly defined.

The term "(C_3,3)cycloalkyl-(C_1,3)alkyl" refers to a (C_3,3)cycloalkyl group as explicitly defined which group is 
linked to the rest of the molecule through a (C_1,3)alkylene group as defined before. For the substituent R^1, the 
(C_1,3)alkylene group part of (C_3,3)cycloalkyl-(C_1,3)alkyl is in particular a methylene group.

The term "(C_3,3)cycloalkyl-oxo" refers to a (C_3,3)cycloalkyl group as explicitly defined which is linked to the rest 
of the molecule through an oxygen atom.

The term "(C_3,3)cycloalkyl-(C_1,2)alkylene-oxo" refers to a (C_3,3)cycloalkyl group as explicitly defined which is 
linked to the rest of the molecule through a -(C_1,2)-O- group. For the substituent R^1, the -(C_1,2)alkylene-oxo 
group part of (C_3,3)cycloalkyl-(C_1,2)alkylene-oxo is in particular a -(C_1,2)-O- group.

The term "(C_1,3)alkoxy-(C_3,3)alkoxy" refers to a (C_1,3)alkoxy-group as defined before which is attached to the 
rest of the molecule through a (C_2,5)alkoxy group as defined before. An example is 2-methoxy-ethoxy.
The term "[(C₃₃)alkoxy-(C₂₃)alkyl]" means a ((C₃₃)alkoxy-group as defined before which is attached to the rest of the molecule through a (C₂₃)alkylene group as defined before. An example is 2-methoxy-ethyl.

The term "aryl", used alone or in combination, means phenyl or naphthyl, preferably phenyl. Likewise, an arylene group is an aryl group as defined before having two points of attachment to the respective rests of the molecule. The above-mentioned aryl / arylene groups are unsubstituted or substituted as explicitly defined.

The term "heteroaryl", used alone or in combination, means a 5- to 10-membered monocyclic or bicyclic aromatic ring containing one to a maximum of four heteroatoms, each independently selected from oxygen, nitrogen and sulfur. Examples of such heteroaryl groups are 5-membered heteroaryl such as furanyl, oxazolyl, isoxazolyl, oxadiazolyl, thiophenyl, thiazolyl, isothiazolyl, thiadiazolyl, pyrrolyl, imidazolyl, pyrazolyl, triazolyl; 6-membered heteroaryl such as pyridinyl, pyrimidinyl, pyridazinyl, pyrazinyl; and bicyclic heteroaryl such as indolyl, isoindolyl, benzofuranyl, isobenzofuranyl, benzothiophenyl, indazolyl, benzimidazolyl, benzoxazolyl, benzisoxazolyl, benzothiazolyl, benzoisothiazolyl, benzoatriazolyl, benzoazadiazolyl, benzothiadiazolyl, quinolinyl, isoquinolinyl, naphthyridinyl, cinnolinyl, quinoxalinyl, phthalazinyl, pyrrolopyridinyl, pyrazolo[3,4-d]pyridinyl, pyrazolo[4,3-d]pyrimidinyl, pyrrolopyrazinyl, imidazopyridinyl, imidazo[1,2-a]pyridinyl, and imidazothiazolyl. Examples of heteroaryl groups as used for R¹ are especially oxadiazolyl, pyrazinyl, pyrimidinyl, and pyridinyl. The above-mentioned heteroaryl groups are unsubstituted or substituted as explicitly defined.

In case two substituents form an aromatic 5- or 6-membered ring optionally containing one or two nitrogen atoms which ring is fused to a phenyl / pyridine ring, examples of such thus formed bicyclic heteroaryl rings are pyrrolo[2,3-b]pyridinyl, indolyl, indazolyl, quinoxalinyl, benzoimidazolyl, and quinolinyl. The above-mentioned groups do not carry further substituents on the phenyl / pyridine part of the ring, whereas said aromatic 5- or 6-membered ring may be unsubstituted or substituted as explicitly defined.

In case two substituents form a non-aromatic 5- or 6-membered ring optionally containing one or two heteroatoms, which ring is fused to a phenyl / pyridine ring, examples of such thus formed bicyclic partially aromatic rings are 2,3-dihydro-benzoxazolyl, 3,4-dihydro-2H-benzo[1,4]oxazinyl, 2,3-dihydro-1H-indolyl, and 2,3-dihydro-benzofuranyl. A further example is chromanyl. The above-mentioned groups do not carry further substituents on the phenyl / pyridine part of the ring, whereas said non-aromatic 5- or 6-membered ring may be unsubstituted or substituted as explicitly defined.

It is to be understood, that a stereogenic center in a compound disclosed above, which stereogenic center is not specifically assigned, may be in absolute (R)- or absolute (S)-configuration; for example a compound listed as N-[1-{(5-cyano-pyridin-2-ylmethyl)-1H-pyrazol-3-yl}-2-(3-methyl-chroman-7-yl)-acetamide may be N-[1-{(5-cyano-pyridin-2-ylmethyl)-1H-pyrazol-3-yl}-2-{(R)-3-methyl-chroman-7-yl}-acetamide, N-[1-{(5-cyano-pyridin-2-ylmethyl)-1H-pyrazol-3-yl}-2-{(S)-3-methyl-chroman-7-yl}-acetamide or any mixture thereof.

The compounds of formula (I) according to embodiments 1) to 31) and their pharmaceutically acceptable salts can be used as medicaments, e.g. in the form of pharmaceutical compositions for enteral (such especially oral) or parenteral administration (including topical application or inhalation).

The production of the pharmaceutical compositions can be effected in a manner which will be familiar to any person skilled in the art (see for example Remington, *The Science and Practice of Pharmacy*, 21st Edition (2005), Part 5, "Pharmaceutical Manufacturing" [published by Lippincott Williams & Wilkins]) by bringing the described compounds of formula (I), or their pharmaceutically acceptable salts, optionally in combination with other therapeutically valuable substances, into a galenical administration form together with suitable, non-toxic, inert, therapeutically compatible solid or liquid carrier materials and, if desired, usual pharmaceutical adjuvants.

The present invention also relates to a method for the prevention or treatment of a disease or disorder mentioned herein comprising administering to a subject a pharmaceutically active amount of a compound of formula (I) as defined in any one of embodiments 1) to 31).

In a preferred embodiment of the invention, the administered amount is comprised between 1 mg and 1000 mg per day, particularly between 5 mg and 500 mg per day, more particularly between 25 mg and 400 mg per day, especially between 50 mg and 200 mg per day.

Whenever the word “between” is used to describe a numerical range, it is to be understood that the end points of the indicated range are explicitly included in the range. For example: if a temperature range is described to be between 40 °C and 80 °C, this means that the end points 40 °C and 80 °C are included in the range; or if a variable is defined as being an integer between 1 and 4, this means that the variable is the integer 1, 2, 3, or 4.

Unless used regarding temperatures, the term “about” (or alternatively the term “around”) placed before a numerical value “X” refers in the current application to an interval extending from X minus 10% of X to X plus 10% of X, and preferably to an interval extending from X minus 5% of X to X plus 5% of X. In the particular case of temperatures, the term “about” placed before a temperature “Y” refers in the current application to an interval extending from the temperature Y minus 10 °C to Y plus 10 °C, and preferably to an interval extending from Y minus 5 °C to Y plus 5 °C.
For avoidance of any doubt, if compounds are described as useful for the prevention or treatment of certain diseases, such compounds are likewise suitable for use in the preparation of a medicament for the prevention or treatment of said diseases.

The compounds of formula (I) as defined in any one of embodiments 1) to 31) are useful for the prevention or treatment of diseases or disorders where calcium T channels are involved.

Such diseases or disorders where calcium T channels are involved may be defined as including especially:

- epilepsy (notably absence epilepsy, childhood absence and other forms of idiopathic generalized epilepsies, temporal lobe epilepsy);
- sleep disorders and sleep disturbances;
- pain (notably inflammatory pain, neuropathic pain, peripheral pain, chronic pain associated with peripheral axonal injury);
- neurological diseases and disorders (notably essential tremors, Parkinson's disease, schizophrenia, depression, anxiety, psychosis, neurodegenerative disorders, autism, drug addiction);
- cardiovascular diseases and disorders (notably hypertension, cardiac arrhythmias, atrial fibrillation, congenital heart failure, heart block);
- cancer;
- diabetes and diabetic neuropathy; and
- infertility and sexual dysfunction.

Notably such diseases or disorders where calcium T channels are involved refer to epilepsy, neurological disorders, and pain. Preferably such diseases or disorders refer to epilepsy and pain.

The term "epilepsy" describes recurrent unprovoked seizures wherein the term "seizure" refers to an excessive and/or hypersynchronous electrical neuronal activity. Different types of "epilepsy" are disclosed for example in [Berg et al., Epilepsia. 2010: 51(4): 676-685], which reference is herewith incorporated by reference. The term "epilepsy" as used herein preferably refers to absence epilepsy, childhood absence and other forms of idiopathic generalized epilepsies, temporal lobe epilepsy.

The term "pain" preferably refers to inflammatory pain, neuropathic pain, peripheral pain, and chronic pain associated with peripheral axonal injury.

The term "neurological diseases and disorders" preferably refers to essential tremors, Parkinson's disease, schizophrenia, depression, anxiety, psychosis, neurodegenerative disorders, autism, drug addiction.

The term "cardiovascular diseases and disorders" preferably refers to hypertension, cardiac arrhythmias, atrial fibrillation, congenital heart failure, heart block.

The compounds of formula (I) as defined in embodiments 1) to 31) are also useful in a method of reducing the concentration of calcium in a neuronal cell, and wherein said reduction in calcium is achieved by blocking the
calcium T-channel present in such neuronal cell; said method comprising the administration of a compound of formula (I) as defined in embodiments 1) to 31).

The compounds of formula (I) as defined in embodiments 1) to 31) are also useful in a method of decreasing burst firing discharges in a neuronal cell and wherein said decrease of burst firing is achieved by blocking the calcium T-channel; said method comprising the administration of a compound of formula (I) as defined in embodiments 1) to 31).

**Preparation of compounds of formula (I):**

The compounds of formula (I) can be prepared by the methods given below, by the methods given in the experimental part below or by analogous methods. Optimum reaction conditions may vary with the particular reactants or solvents used, but such conditions can be determined by a person skilled in the art by routine optimisation procedures. In the schemes below, the generic groups X, Y, R₁, R₂, (R₃)ₙ, and (R₄)ₘ are as defined for the compounds of formula (I). In some instances the generic groups R₁, R₂, (R₃)ₙ, and (R₄)ₘ may be incompatible with the assembly illustrated in the schemes and so will require the use of protecting groups (PG). The use of protecting groups is well known in the art (see for example "Protective Groups in Organic Synthesis", T.W. Greene, P.G.M. Wuts, Wiley-Interscience, 1999). For the purposes of this discussion, it will be assumed that such protecting groups as necessary are in place. In some cases the final product may be further modified, for example, by manipulation of substituents to give a new final product. These manipulations may include, but are not limited to, reduction, oxidation, alkylation, acylation, and hydrolysis reactions which are commonly known to those skilled in the art. The compounds obtained may also be converted into salts, especially pharmaceutically acceptable salts in a manner known *per se.*

Compounds of general formula (II) can be prepared via an amide coupling as final step (Scheme 1). Generally, the corresponding carboxylic acid (IV) can be activated to the corresponding acid chloride, typically with oxalyl chloride. Alternatively, the carboxylic acid (IV) can be directly coupled to the amine (III) using a coupling reagent, typically HATU or HBTU. In certain instances two coupling products can be formed and are separated by preparative HPLC.

**Scheme 1**
The desired primary aminopyrazole (III) can be prepared from nitropyrazole (V) through an alkylation (compound of type (VI)) and a reduction step. For the reduction step, zinc, iron or palladium are preferentially used.

Scheme 2

Aminopyrazoles of type (III) can be prepared via a Curtius rearrangement as well (Scheme 3). A suitable ester from the pyrazole-3-carboxylic acid (VIII) can be alkylated to compound (IX). Saponification leads to carboxylic acid (X), and subsequent Curtius rearrangement leads to the aminopyrazole (III).

Scheme 3

The corresponding benzyl chlorides, benzyl bromides, or benzyl mesylates necessary for the alkylation steps described in Schemes 2 (V → VI) and 3 (VIII → IX) can be prepared according to standard literature procedures or as described in the examples below.

The carboxylic acids of type (IV) can be prepared according to known procedures. In particular, a Negishi coupling (Scheme 4), or a similar carbon-carbon coupling between an (hetero)aryl bromide of type (XI) and (2-(tert-butoxy)-2-oxoethyl)zinc(II) bromide leads to the ester of type (XII): Hydrolysis, generally under acidic
conditions, leads to the acid of type (IV). Bromide of type (XI) is either commercially available, or can be prepared according to known procedures (see experimental part).

Scheme 4

Alternatively, a benzoic acid of type (XIII) can be transformed into an acid of type (IV) via a Wolff rearrangement (Scheme 5). The acid of type (XIII) can be reduced to an alcohol of type (XIV). This alcohol can then be activated to a compound of type (XV), wherein LG represents a leaving group such as chloride, bromide, mesylate or tosylate, and homologated to nitrile of type (XVI): Hydrolysis would then lead to an acid of type (IV).

Scheme 5

Whenever the compounds of formula (I) are obtained in the form of mixtures of enantiomers, the enantiomers can be separated using methods known to one skilled in the art: e.g. by formation and separation of diastereomeric salts or by HPLC over a chiral stationary phase such as a Regis Whelk-O1(R,R) (10 µm) column, a Daicel ChiralCel OD-H (5-10 µm) column, or a Daicel ChiralPak IA (10 µm), IC (5 µm) or AD-H (5 µm) column. Typical conditions of chiral HPLC are an isocratic mixture of eluent A (EtOH, in presence or absence of an amine such as triethylamine or diethylamine) and eluent B (heptane), at a flow rate of 0.8 to 150 mL/min.

**Preparation of Examples**

**General procedures**

*General procedure 1 for the preparation of acid chlorides.* The desired carboxylic acid (1 eq.) is dissolved in toluene (5 mL/mmole). DMF (about 1 drop/mmole) and oxalyl chloride (1.5 eq.) are added, and the mixture is stirred at rt for 2 h. The solvents are removed under reduced pressure. The excess oxalyl chloride is removed azeotropically with toluene several times under reduced pressure. The residue is dried under high vacuum to yield the desired crude acid chloride.

*General procedure 2 for an amide coupling.* To a sol. of the desired amine (1 eq.) in dioxane (5 mL/mmole) is added the acid chloride (crude, 1.1 eq.) The mixture is heated to 60 °C to 90 °C for 1 h (or longer if the reaction is not complete). The mixture is allowed to cool to rt and the solvents are removed under reduced pressure. The residue is directly purified by automated FC, or by HPLC, to yield the desired product. Alternatively, the product can be isolated by crystallization.
General procedure 3 for an amide coupling. Unless indicated otherwise, a mixture of the desired carboxylic acid (1 eq.), the desired amine (1.5 eq.), N-methylmorpholine (4 eq.) and HBTU (2 eq.) in DMF (around 20 mL / eq.) is stirred until the reaction is complete (a few hours to overnight). Other bases, coupling reagents and / or solvents can be used as well, see experimental details. The solvents are removed under reduced pressure. An aq. work-up (basic and / or acidic) is optionally realized. The residue is purified by automated FC, or by HPLC, to yield the desired product. Alternatively, the product can be isolated by crystallization.

General procedure 4 for the N-alkylation of 5-nitro-1H-pyrazole. K₂CO₃ or NaH is added to a sol. of 5-nitro-1H-pyrazole in aceton or DMF or THF. The mixture is stirred for 15-30 min. The desired electrophile and Bu₄NBr are added. The mixture is stirred efficiently at rt until the reaction is complete. The mixture is optionally filtered (if K₂CO₃ is used) or quenched with water (if NaH is used), and the filtrate is evaporated under reduced pressure. The residue is partitioned between water and EtOAc. The org. layer is dried over MgSO₄, filtered, and the solvents are removed under reduced pressure. Purification of the crude by automated FC or by HPLC yields the desired product.

General procedure 5 for the reduction of a nitro group. Fe or Zn is added to a sol. of the starting material in EtOH or acetone with aq. sat. NH₄Cl. The mixture is heated to 75 °C and stirred at this temperature until the reaction is complete (about 1 h). The mixture is allowed to cool to rt and filtered through Celite®. The solvents were removed under reduced pressure to yield the desired crude product.

General procedure 6 for a Negishi coupling. A sol. of bromoaryl / bromoheteroaryl, (2-(tert-butoxy)-2-oxoethyl)zinc(II) chloride (0.5M in Et₂O), palladium catalyst, and optionally a ligand in THF is stirred between rt and 90 °C until the starting materials are consumed. The mixture is allowed to cool to rt, and the solvents are removed under reduced pressure. Chromatographic purification yields the desired compound.

General procedure 7 for the hydrolysis of a tert-butyl ester. A sol. of the ester and an acid with optionally CH₂Cl₂ is prepared at 0 °C. This mixture is stirred between at 0 °C, optionally warming up to rt, until consumption of the starting material. The solvents are removed under reduced pressure to yield the crude desired compound.

General procedure 9 for the N-alkylation of a pyridine. A mixture of 2,5-dibromopyridine, an amine, and DBU in DMSO is stirred at 80 °C until the reaction is complete. The amine and DBU may have to be added several times. The mixture is allowed to cool to rt, and the solvents are removed under reduced pressure. Purification of the crude by FC yields the desired product.

Preparative HPLC

Reaction mixture can often be separated by preparative HPLC. A person skilled in the art will find suitable conditions for each separation.

Automated FC

Classical flash chromatography is often replaced by automated systems. This does not change the separation process per se. A person skilled in the art will be able to replace a classical FC process by an automated one, and vice versa. Typical automated systems can be used, as they are provided by Büchi, Isco (Combiflash), or Biotage for instance.

tert-Butyl 2-(4-(1-methoxycyclopropyl)phenyl)acetate. Prepared according to general procedure 6 from 1-bromo-4-(1-methoxycyclopropyl)benzene (790 mg, 2.92 mmol), (2-{(tert-butoxy)-2-oxoethyl}zinc(II) chloride (0.5M in Et(O), 11.7 mL, 5.80 mmol), Pd2(dba)3 (133 mg, 0.146 mmol), and X-Phos (72 mg, 0.15 mmol) in THF (44 mL). The reaction is complete after 2.5 h at 45 °C. Purification of the crude by automated FC (Combiflash, acetone / heptane 0:100 → 85:15, 40 g silica gel, flow 40 mL/min) yields the title product. LC-MS: \( t_{R} = 0.94 \) min, M\(^{+}\) = 263.25 (conditions 3).

2-(4-(1-Methoxycyclopropyl)phenyl)acetic acid. Prepared according to general procedure 7 from tert-butyl 2-(4-(1-methoxycyclopropyl)phenyl)acetate (64 mg, 0.30 mmol) in TFA (0.34 mL) and CH\(_2\)Cl\(_2\) (0.35 mL). The reaction is complete after 2.5 h at 0 °C. LC-MS: \( t_{R} = 0.70 \) min (conditions 3).

The following examples were prepared according to general procedure 3, from the appropriate carboxylic acids and aminopyrazoles:

**Example 385:** N-[1-(5-Cyano-6-difluoromethyl-pyridin-2-ylmethyl)-1H-pyrazol-3-yl]-2-(4-isopropyl-phenyl)-acetamide and **Example 386:** N-[1-(5-cyano-4-difluoromethyl-pyridin-2-ylmethyl)-1H-pyrazol-3-yl]-2-(4-isopropyl-phenyl)-acetamide. To a sol. of Example 71 (205 mg, 0.57 mmol) and zinc difluoromethanesulfinate (355 mg, 1.14 mmol) in DMSO (3.2 mL), is added trifluoroacetic acid (0.0446 mL, 0.57 mmol) at rt. Luperox® TBH70X (tert-butyl hydroperoxide; 70% weight sol. in water, 0.23 mL, 1.71 mmol) is added slowly with vigorous stirring. The mixture is stirred at rt overnight. Zinc difluoromethanesulfinate (355 mg, 1.14 mmol) and
Luperox® TBH70X are added again. The mixture was stirred at r.t over 4 nights. The reaction mixture was partitioned between CH₂Cl₂ (5 mL) and aq. sat. NaHCO₃ (5 mL). The layers are separated, and the aq. phase is extracted with CH₂Cl₂ (3 x 5 mL). The combined org. layers are dried over MgSO₄, filtered, and the solvents are removed under reduced pressure. Purification of the residue by prep. HPLC (column: Waters XBridge, 30x75 mm, 10 um, UV/MS, basic conditions) yields the title products. LC-MS: t₁ = 0.90 min, MH⁺ = 410.18 and t₂ = 0.89 min, MH⁺ = 410.19 respectively (conditions 3).

2-(1,4-Diazonylidene)-1-(3,3-dimethyl-2,3-dihydrobenzofuran-6-y1)ethan-1-one and (rac.)-2-(1,4-diazonylidene)-1-(3-methylchroman-7-y1)ethan-1-one. To a mixture of 3,3-dimethyl-2,3-dihydrobenzofuran-6-carboxylic acid (710 mg, 3.69 mmol) in CH₂Cl₂ (20 mL) at -5 °C, are added oxalyl chloride, (0.474 mL, 5.54 mmol) and 4 drops of DMF. The mixture is allowed to warm up to rt over 2 h. The mixture is concentrated in vacuo (backfilled with N₂). The resulting oil is dissolved in THF (20 mL) and cooled to -5 °C. (Trimethylsilyl)diazomethane (2.0 M in hexanes, 4.15 mL, 8.31 mmol) is added and the mixture is allowed to warm to rt overnight. The solvents are removed under reduced pressure. Purification of the residue by automated FC (Combiflash, heptane → EtOAc/heptane 1:3, column : 80 g, flow : 60 mL/min,) yields a mixture of the two title products. LC-MS: t₁ = 0.80 min, MH⁺ = 217.20 for the mixture (conditions 3).

Ethyl 2-(3,3-dimethyl-2,3-dihydrobenzofuran-6-y1)acetate and (rac.)-ethyl 2-(3-methylchroman-7-y1)acetate. To a sol. of the previous mixture (280 mg, 1.29 mmol) in EtOH (30 mL), a sol. of silver benzoate (178 mg, 0.777 mmol) in Et₃N (5.0 mL) is added dropwise. The resulting black sol. is stirred at rt for 19 h. The black suspension is filtered through Celite. The pad is rinsed with EtOAc. The filtrate is concentrated in vacuo.

Purification of the crude by HPLC yielded the two separated title products. LC-MS: t₁ = 0.90 min, MH⁺ = 235.22 and t₂ = 0.90 min, respectively (conditions 3).

(rac.)-2-(3-Methylchroman-7-y1)acetic acid. To a sol. of (rac.)-ethyl 2-(3-methylchroman-7-y1)acetate (38 mg, 0.162 mmol) in DMF (1.00 mL) is added aq. NaOH (1M, 0.5 mL). The resulting sol. is stirred at rt for 4 h. The sol. is neutralized with formic acid (0.5 mL), filtered and then purified by prep. HPLC to yield the crude title product. LC-MS: t₁ = 0.74 min (conditions 3).

5-Bromo-3-fluoro-2-[(3-nitro-1H-pyrazol-1-yl)methyl]pyridine. Prepared according to general procedure 4 with K₂CO₃ (1.87 g, 13.6 mmol), 5-bromo-2-(bromomethyl)-3-fluoropyridine (760 mg, 2.71 mmol), and 5-nitro-1H-pyrazole (313 mg, 2.71 mmol) in acetone (25 mL). The reaction is complete after 2 h. The crude is not purified. LC-MS: t₁ = 0.78 min, MH⁺ = 302.98 (conditions 3).

5-Fluoro-6-[(3-nitro-1H-pyrazol-1-yl)methyl]nicotinonitrile. To a sol. of 5-bromo-3-fluoro-2-[(3-nitro-1H-pyrazol-1-yl)methyl]pyridine (1.02 g, 3.04 mmol) in N,N-dimethylacetamide (6.2 mL), are added in sequence Zn(CN)₂ (196 mg, 1.67 mmol), Pd₉(dba)₉ (60.7 mg, 0.066 mmol), 1,1'-bis-(diphenylphosphino)-ferrocene (45.5 mg, 0.082 mmol) and poly(methylhydroxiloxane) (PMHS) (0.067 mL). The resulting mixture is stirred at 150°C in a microwave during 40 min. The mixture is allowed to cool to rt, filtered over Celite, and the filtrate is...
concentrated in vacuo. Purification of the residue by automated FC (CombiFlash, EtOAc / heptane 0:100 → 40:60, column 24 g, flow 35 mL/min) yields the title product. LC-MS: t_R = 0.70 min, MH^+ = 248.17 (conditions 3).

6-((3-Amino-1H-pyrazol-1-yl)methyl)-5-fluoronicotinonitrile. To a sol. of 5-fluoro-6-((3-nitro-1H-pyrazol-1-yl)methyl)nicotinonitrile (260 mg, 0.899 mmol) in EtOAc (9.22 mL) under N_2 is added Pd (10 wt. % on activated charcoal, 52 mg, 0.489 mmol). The flask is carefully evacuated and backfilled with H_2 (3x). The black suspension was stirred at rt under an H_2 atmosphere for 30 h. The black suspension is filtered through Celite, and the Celite is rinsed with EtOAc. The filtrate is concentrated in vacuo. To a sol. of the previous residue in THF (9.22 mL) under N_2, Pd (10 wt. % on activated charcoal, 52 mg, 0.49 mmol) is added. The flask is carefully evacuated and backfilled with H_2 (3x). The black suspension is stirred at rt under an H_2 atmosphere overnight. Purification of the residue by HPLC yields the title product. LC-MS: t_R = 0.40 min, MH^+ = 218.16 (conditions 3).

tert-Butyl 2-((4-(1-cyano-3,3-difluorocyclobutyl)phenyl)acetate. Prepared according to general procedure 6 from 1-(4-bromophenyl)-3,3-difluorocyclobutane-1-carbonitrile (WO2012027322, 92.7 mg, 0.337 mmol), (2-(tert-butoxy)-2-oxoethyl)zinc(II) chloride (0.5M in Et_2O, 1.4 mL, 0.70 mmol), Pd_2(dba)_3 (15.4 mg, 0.017 mmol), and X-Phos (8.3 mg, 0.017 mmol) in THF (2.9 mL). The reaction is complete overnight at 45 °C. Purification of the crude by HPLC yields the title product. LC-MS: t_R = 0.95 min, MH^+ = 308.13 (conditions 3).

2-(4-(1-Cyano-3,3-difluorocyclobutyl)phenyl)acetic acid. Prepared according to general procedure 7 from tert-Butyl 2-((4-(1-cyano-3,3-difluorocyclobutyl)phenyl)acetate (42 mg, 0.13 mmol) in TFA (0.15 mL) and CH_2Cl_2 (0.15 mL). In vitro Methods – Measurement of calcium channel flux by means of FLIPR assays.

HEK293 cells recombinantly expressing either voltage-dependent T-type calcium channel subunit alpha-1G (Cav3.2) or voltage-dependent L-type calcium channel subunit alpha-1C (Cav1.2) are assayed for calcium flux using the calcium indicator dye Fluo-4-AM (Molecular Devices) and FLIPR technology (Fluorometric Imaging Plate Reader, Molecular Devices) (Xie X, Van Deusen AL, Vitko I, Babu DA, Davies LA, Huynh N, Cheng H, Yang N, Barrett PQ, Perez-Reyes E. Validation of high throughput screening assays against three subtypes of Cav3 T-type channels using molecular and pharmacologic approaches. Assay and Drug Development Technologies 2007, 5(2), 191-203). The HEK293 cells recombinantly expressing Cav3.2 are maintained in DMEM growth medium (Life Technologies) supplemented with 10 % Fetal Bovine Serum (FBS), 100 U/ml penicillin (Life Technologies), 100 µg/ml streptomycin (Life Technologies) and 1 mg/ml G418 (Life Technologies). HEK293 cells recombinantly expressing Cav1.2 are maintained in DMEM growth medium (Life technologies) supplemented with 10 % FBS, 0.1 mg/ml G418 (Life Technologies), 0.1 mg/ml hygromycin (Life Technologies) and 40 µg/ml zeocin (Life Technologies).
Cells are washed once with PBS, then dissociated in 0.25 % trypsin/EDTA (Life Technologies) and seeded into poly-D-lysine coated 384-well black, clear bottom plates (BD Biosciences) at a density of 30,000 cells/well. The seeded plates are incubated overnight at 37°C.

Immediately prior to performing the assay, medium is removed and cells are treated for 1 hour at 37°C with loading buffer containing HBSS 1X (137 mM NaCl; 5.4 mM KCl; 0.25 mM Na2HPO4; 1.3 mM CaCl2; 0.4 mM MgSO4; 0.5 mM MgCl2; 0.4 mM KH2PO4, pH 7.4), 0.375 g/L NaHCO3, 20 mM Heps, supplemented with 3 μM Fluo-4-AM and 0.15 % Pluronic (Life Technologies). The cells are then washed three times with assay buffer (HBSS 1X; 0.375 g/L NaHCO3; 20 mM Heps; 1 % FBS; pH 7.4) and allowed to rest in 50 μl of wash buffer for 30 minutes.

Stock solutions of test compounds are prepared to a concentration of 10 mM in DMSO. For the Cav3.2 assay, serial dilutions of the compounds are prepared in TEAC buffer (100 mM tetraethylammonium chloride; 20 mM Heps; 2.5 mM CaCl2; 5 mM KCl; 1 mM MgCl2; 1 % FBS; pH 7.2), for the Cav1.2 assay serial dilutions are prepared in assay buffer. Test compounds are added to the cells to give a 3-fold dilution range from 10 μM to 0.05 nM. The compounds are incubated with the cells for 3 minutes and Ca2+ entry is stimulated by adding either CaCl2 to a final concentration of 10 mM (Cav3.2 assay) or by adding KCl to a final concentration of 20 mM (Cav1.2 assay). The kinetics of fluorescence increase are recorded for every well and the area under the fluorescence trace for every compound concentration is used to generate inhibition curves using non-linear regression sigmoidal concentration-response curve analysis with in-house software. IC50 values are calculated and represent the compound concentration required to inhibit 50% of the signal that is obtained in the presence of vehicle instead of test compound. In analogy, antagonistic activities (IC50 values) of all exemplified compounds have been measured for the for the Cav3.1- and the Cav3.3-channel. Antagonistic activities (IC50 values) of all exemplified compounds are in the range of 0.3 to 1210 nM with respect to Cav3.1; and in the range of 0.8 to 1280 nM with respect to Cav3.3.

In the following table, IC50-values generated for the Cav3.2-channel are presented.
