UNITED STATES PATENT OFFICE

ANTHONY T. KORTZ, OF GRAND RAPIDS, MICHIGAN

FURNITURE FIXTURE

Application filed September 8, 1928. Serial No. 304,635.

The present invention relates to furniture fixtures, such as card holders and the like; and its object is to provide such a fixture so formed as to be readily mounted on an article of furniture, such as a cabinet or drawer.

This and any other and more specific objects hereinafter appearing are attained by, and the invention finds preferable embodiment in, the structure hereinafter particularly described in the body of this specification and illustrated by the accompanying drawings, in which:—

Figure 1 is a face view of a furniture fixture—a card holder—mounted on the wall of an article of furniture;

Figure 2 is a sectional view thereof taken on line 2—2 of Figure 1;

Figure 3 is a view in perspective of the inner side of said fixture;

Figure 4 is a fragmentary sectional view taken on the line on which Figure 2 is taken, but illustrating the position of the extension which carries the screw bolt before said extension is bent to the position seen in Figures 2 and 3;

Figure 5 is a fragmentary view of the fixture showing in perspective the inner side of its corner, and illustrating a modified construction; and

Figure 6 is a view of one of the screw bolts.

In these drawings a metallic furniture fixture, in form a card holder, is shown mounted on the wall 1 of an article of furniture, such as the front of the metallic drawer of a cabinet or the like.

This card holder has a face or body portion 2 with an opening 3 therethrough displaying to view the markings on the card 4 held by the holder. This fixture has a peripheral inwardly extending flange 5 and, in the construction illustrated has another inwardly extending flange 5^1 parallel with flange 5 and whose free edge 6 may be spaced outwardly from the surface of wall 1 sufficiently to permit the card to be slipped into the holder through the gap 7 in the upper part of flange 5.

One of these flanges—5 or 5^1—has one or more tab-like extensions 8 or 8^1 respectively which carry mounting means for the fixture, as the threaded bolts 9 having heads 10. These heads are held between said extensions 8 or 8^1 and the body portion 2 of the fixture, when such extensions, which are of bendable material and integral with the entire fixture, are bent over from the position shown in Figure 4 and toward or into the position seen in Figures 2, 3 and 5 wherein such extensions are in approximately parallel relation with the body portion 2 or face of the fixture. By providing flat sided heads of these bolts as shown in Figure 6 the bolts are made nonturnable.

The bolts extend through orifices 11 in said extensions and holes 12 in the wall 1 and receive nuts 13 inside the wall whereby the fixture is securely mounted thereon.

This fixture and said extensions 8, 8^1 being formed of springable or resilient material, and said extensions being slightly inclined from being parallel with the wall 1, the screwing down of the nuts 13 draws the fixture toward said wall with a more or less yielding pressure.

The invention being intended to be pointed out in the claims, is not to be limited to or by details of construction of any particular embodiment thereof illustrated by the drawings or hereinbefore described.

I claim:

1. A metallic card holder adapted to be mounted on a cabinet wall and comprising a body portion with an opening therethrough for displaying the card, a peripheral flange extending inwardly from the body portion and having a bendable and springable extension provided with an orifice therethrough and bent toward approximately parallel relation with the body portion, and mounting means comprising a threaded bolt extending through the orifice and said wall and having a nut and a head nonturnably held between said extension and body portion.

2. A metallic card holder adapted to be mounted on a cabinet wall and comprising a body portion with an opening therethrough for displaying the card, a peripheral flange extending inwardly from the body portion and having a bendable extension provided with an orifice therethrough and bent toward

approximately parallel relation with the body portion, and mounting means comprising a threaded bolt extending through the orifice and said wall and having a nut and a head nonturnably held between said extension and body portion.

In testimony whereof I have hereunto set my hand at Grand Rapids, Michigan, this 30th day of August, 1928.

ANTHONY T. KORTZ.
