## Description

## SPECIFICATION

This invention pertains to an article of commerce in the form of a rectangular, preferably of a square which on one face of the square carries a multiple of surfaces for the purpose of enhancing the visual appearance of a wall, a floor, a ceiling, a roof or the like. More particularly, this invention pertains to an article of manufacture which is suitable for creating a number of variations in visual appearance due to the almost infinite variety of optical interplays of the various surfaces, creating a great variety of visual effects and optical illusions in three-dimensional space. Still further, this invention pertains to a construction element which employs lighted, shaded, and shadowed areas based on the arrangement of these construction elements. The result is surfaces which intersect or present discontinuities creating optical, visual effects ranging from extremely subtle to starkly accentuated. These effects, at the same time, optically present illusions which, upon further viewing, change.

## BACKGROUND FOR THE INVENTION

In the construction of various surfaces to achieve decorative effects, two- or three-dimensional surfaces have been created such as on floor tiles. By varying the colors of the various tiles and by changing the arrangement of the size and/or orientation, various effects are achieved. For example, these effects range from the mosaic appearance, that is, non-ordered, to completely ordered symmetrical effects. Further, floor tiles have carried various patterns which have created some optical illusions. For the most part, floor tiles have been two-dimensional or have used color and contrast for creating different appearances, i.e., such as in the Roman mosaics and the like.

Further, three-dimensional visual effects have also been created in these two-dimensional tiles, such as by imparting variously alternating wavy lines giving the appearance of a three-dimensional, wavy surface.

For facades, e.g., for buildings, walls, etc., or for interior surfaces, three-dimensional surfaces have been created by having building blocks, e.g. US-A-3 229 439, formed of three-dimensionally raised and lowered surfaces or even hollow passages, thereby creating a pleasing or striking visual appearance.

Furthermore, terra cotta construction has been employed to give exquisite details to building facades. Some of these have had a glazed surface which has created further distinguishing features, such as in color and light.

In general, the three-dimensional repeating structures that have been created have found acceptance, but for a single common element in the basic building or construction element there have been limited possibilities for creating a varied visual appearance attributable to the interplay of the light on the surfaces.

Still further, the limited application of the interplay has been based on the difficulty in assembling intricate, three-dimensional patterns, since it is difficult for the worker or artist optically to relate these patterns by working with these in such a manner as not to commit errors in the assembling or errors when using the material in building a structure.

Although almost any surface reflects light, in a manner, if it has a different angle of incidence from a surface next to it , this effect can further be enhanced if the intersections of these surfaces are presented in such a form as to cause reflection, shadow, or shade refraction in almost infinite varieties. To wit, this principle is being used such as in cut glass, i.e., crystal manufacture and shaping, and this principle has often been employed with striking results, such as in the cut crystals or chandeliers that employ this principle. However, the assembling of almost an infinite variety of structures based on only one or at most two faces of a single element is not known to the inventor.

## BRIEF DESCRIPTION OF THE PRESENT INVENTION

The invention is directed to an article of manufacture as defined in claim 1.

In construction and decoration and for enhancing the appearance of a surface, namely--a surface such as a floor, ceiling or wall, be it interior or exterior, various visual appearances are now created by selecting a standard element. This element is three-dimensional, and it relies on creating visual effects and appearances based on the orientation of a number of specifically related surfaces on one or two faces of a square element. For purposes of construction, almost an infinite variety of surface appearances may be created by the appropriate placement and orientation of a single square element and its relationship to each adjoining or juxtapositioned square elements, all of which are preferably in a pattern of a square (although these may also be produced in multiples of the single square element). Moreover, this invention pertains to the discovery that these articles of manufacture may be varied from having a very subtle appearance to a very stark appearance in terms of shaded, shadowed and lighted areas. When employing two three-dimensional, opposite faces such as in glass blocks or acrylic blocks, an added three-dimensional effect is achieved.

By lighted areas it is meant, for the disclosed element, areas on which the light impinges directly; by shaded areas it is meant where a diffused light plays on a surface, and by shadowed areas it is meant areas where a surface or a three-dimensional element either casts a distinct shadow on another surface or surfaces.

This definition is employed with reference to a single light source. When multiple light sources are directed on the exposed surfaces of the novel element, different effects appear.

The visual appearance of the elements is such that with different indicental light, there is a subtle and constant interplay of the light striking the surfaces. These changes occur in an almost kaleidoscopical manner as the light plays on the surface of the novel element, for example, sunlight on the exterior of the building as the sun ascends and descends during the course of the day.

Furthermore, by having the surfaces arranged in almost an infinite variety, a great number of patterns may be created which may take on various effects as the light strikes each of the patterns. Thus a domain may be created of these elements arranged in one form, and adjacent to it a domain may be created where the elements are arranged in another form. Because the arrangement is based on a square element which has a number of surfaces, the almost infinite variety of the domains are also possible within an overall surface. At the same time, assembly of these elements in each domain is very easy by appropriate rotation, offsetting and juxtapositioning of these elements and the finishing of the boundary regions.

Typically for the present invention, the elements have equilateral sides and have five surfaces of which one is in a plan view a square, and the others are fractions of the same square, again in a plan view. Furthermore, by dividing this square with five surfaces in four sections, mirror image sections may be created which, upon orientation, become identical. Two of these four subsections can then be used to complete any border portion or boundary area of the surface which needs to be completed. Moreover, also the bisecting of the surface, that is by dividing the surface with a straight line and creating two equal portions, a rectangular section may be created which also my be used for completing the boundary areas of a surface which is being finished with these elements, such as for the above-mentioned different domains.

However, for purposes of construction and ease of assembling including the ready production, it has been found most convenient to use a square element which has five surfaces in plan view or the two subunits thereof that have four surfaces in plan view. These and other variations and applications of these surfaces will be further explained herein.

Still further, each of the surfaces for any given application may be further distinguished by color reflection or refraction properties of the surface or any combination of these to achieve further the infinite varieties in which these elements can be combined.

## DETAILED DESCRIPTION OF THE INVENTION,

 THE EMBODIMENTS THEREOF AND THE DRAWINGS THEREOFIn presenting the invention and the various elements thereof, the reference is made to the drawings, wherein:

Figure 1 is an isometric view of a terra cotta facing of the novel article;

Figure 2 is a top plan view of the face of the terra cotta article shown in Figure 1;

Figure 3 is an upper edge plan view of Figure 2 of the article;

Figure 4 is a lower edge plan view of the article shown in Figure 2;

Figure 5 is a plan view of the right-hand side of the article shown in Figure 2;

Figure 6 is a plan view of the left-hand side of the article shown in Figure 2;

Figure 7 is a bottom view of the article shown in Figure 1;

Figure 8 is a cross sectional view of the article shown along cross section lines $8-8$ of Figure 2;

Figure 9 is a cross sectional view of the article shown along cross section lines 9-9 of the article in Figure 2;

Figure 10 illustrates the angular and equidistant relationships of the various surfaces and points on the element shown in Figure 1 and along cross sectional lines 10 of Figure 11;

Figure 11 shows a plan view of the article shown in Figure 1 with the cross sectional lines 1010 as an imaginary line and 12-12 as another imaginary line which illustrate the cross sections and the angular relationship and spatial relationships for a novel article;

Figure 12 shows the cross sectional and spatial relationship of the article shown in Figure 11 along cross sectional lines 12 and the angles thereof, including the distances thereof;

Figure 13 is an isometric view of a further embodiment of this invention, namely--a concrete block;

Figure 14 is a top view of the block shown in Figure 13;

Figure 15 is a front plan view of the block shown in Figure 13;

Figure 16 is a right-hand plan view of the block shown in Figure 13;

Figure 17 is a left-hand plan view of the block shown in Figure 13;

Figure 18 is a cross sectional view along lines 18 of Figure 14;

Figure 19 is a cross sectional view of the block shown in Figure 15 along cross sectional lines 19;

Figure 20 is an isometric view of a glass construction block;

Figure 21 is a plan view of one of the faces of the glass block shown in Figure 20;

Figure 22 is a plan view of the top edge shown in Figure 20;

Figure 23 is a plan view of the bottom edge shown in Figure 20;

Figure 24 is a plan view of the left-hand side of the article shown in Figure 20;

Figure 25 is a right-hard plan view of the article shown in Figure 20;

Figure 26 is a bottom view of the article shown in Figure 20;

Figure 27 is a cross sectional view along cross sectional lines 27-27 of Figure 21;

Figure 28 is a cross sectional view along the cross sectional line 28 of Figure 21.

As previously discussed, a terra cotta article of manufacture has been shown in Figures 1 to 9. The principle for the use of the decorative element has been explained in Figures 10 to 12. A concrete block embodiment has been shown in Figures 12 to 19, and a two-faced glass block in Figures 20 to 28.

The description of terra cotta materials is found in publications such as Terra Cotta by Landmarks Preservation Council of Tllinois, 407 So. Dearborn Street, Chicago, lllinois 60605, 1984.

Olin et al., "Construction, Principles, Materials and Methods", 3rd Ed., The Institute of Financial Education, Chicago, lllinois, 1975, describe concrete block, masonry wall, and ceramic tile finishes, as well as glass block usage. Hence, the description of the various materials from which the novel element can be made may be found in literature readily available.

Turning now to the Figures, Figure 1 is an isometric view of the element 3 shown for purposes of illustration as a terra cotta facing suitable for a building surface such as for an exterior building surface.

In Figure 2, the surfaces on the square element 3 are five in number and have been labeled as 11 to 15.

In Figure 3, the relationship of these surfaces is illustrated by the following. Edge 16 defines the zero elevation plane of the element; point 17 in Figure 1, and also as indicated in Figures 2 and 3 and elsewhere in the drawings, defines the minus one point of the element, and point 18 defines the plus one point of the element 3 . These may also be expressed as planes, but as these are points these have been labeled as such, i.e., 17 and 18.

Thus line 16 defines the zero elevation plane of the element 3 with point $16 \mathrm{a}, 17$ and 18 being in the middle of the square element 3 and equidistant from each corner 7 for the respective points along rior angle beta shown in Figure 13 on one edge of the element is further used to define these blocks. For example, for the block in which alpha is $45^{\circ}$ on
surface 22 shown in Figure 1, the angle beta about point 18 is $90^{\circ}$. A complementary angle 17 a in Figure 5 for point 17 will, together with angle beta, define $360^{\circ}$.

An embodiment which utilizes various possibilities of an element where alpha is $45^{\circ}$ and beta is $90^{\circ}$ will be further described herein.

Likewise an angle beta such as $120^{\circ}$ around point 18 allows the formation of a series of hexagonal repeats if the element 3 is placed on edge 22.

When these elements are placed on edge 22, thus various other shapes may be obtained, for example for the element where the angle alpha is $45^{\circ}$ and the angle beta about point 18 is $90^{\circ}$, a square arrangement may be obtained. These possibilities further enhance the ability of element 3 to function, not only when it is laid flat on its back surface such as when it is laid on rim 19, but also when it is laid on edge 22. For this purpose, however, the point 17 must not be offset, such as by the offset amount 21 shown in Figure 8.

Turning now to the further description of the element 3 , when it is placed on a side such as shown in Figure 10, the edge 22 as previously mentioned must be two units high vis-a-vis the reference point 17. One of the intersection points 16a thus defines one equal unit.

As it is evident from Figures 1 and 2, each of the surfaces 11 to 15 may also carry different colored glazing and/or different reflective coatings. Thus a multiple of variations are possible on each of the surfaces. An assembly of these in a wide variety of combinations having an almost infinite variety of surface texture possibilities are evident.

Turning now to the previously mentioned illustration where the angle alpha is $45^{\circ}$ and the angle beta about point 18 is $90^{\circ}$, when the element with such angles is placed on edge 22, four of these blocks will define in the interior thereof a square in a plan view. That is, viewing down from the top, the upper edges, that is the edge 23 opposite to edge 22, will form a square in the interior surfaces thereof, defined each corner with point 17. The figure will resemble a cross in the form of a "Red Cross". Again, these assemblies can then be used in a number of runs such as on a wall or a ceiling. Accordingly, these will form an appropriate wall covering projecting only towards the viewer a multiple of squares and a form of "Red Cross".

Similarly, when the angle beta that is about point 18 defines $120^{\circ}$ and the elements are placed on the edge 22, then a hexagonal will be formed by three of the elements and a series of hexagonals will be formed with each assembly of three with a hexagonal void space therebetween. The hexagonal void space will be equivalent to two elements 3 placed back to back.

Consequently, if in the void space the two elements are placed back to back, that is, where points 17 are against each other and points 18 are opposite to each other, a void space precursor for a hexagonal is partially formed with the adjacent hexagonal three element unit.

As it is evident from the above discussion, these varieties then provide a great freedom for creating surface effects with elements that function both as building blocks, as decorative tiles, glass blocks or floor tiles and the like. For floor tiles, the angle of alpha in Figure 10, of course, will be very small, and the floor tile surface may then appropriately be filled to make a rectangular flat shape after it has been laid. On surfaces 11 to 15 , when an epoxy or polyurethane polymer is used to cover these, it creates a flat and pleasing yet visually three-dimensional effect. These tiles may be preformed with epoxy coating or the epoxy resin may be poured in place.

A further illustration in Figures 20 to 28 has been shown for a glass block with two opposite faces. These are useful for construction of separations and for creating various light effects. Typically glass blocks are hollow and are made in two parts. Thereafter the two parts are joined together. Edge rim 19 shown in Figure 27 in relation to spacing 21 likewise shown in Figure 27, for the glass blocks may be of the appropriate dimensions to make the two-sided glass block 9 of the selected thickness depending on the load bearing necessity. Of course, when the two-sided arrangements such as for glass block 6 are used in hot pressing or forming transparent or initial plastic sheets, the pressings allow production and assembly (in various configurations) of plastic sheets of square configuration and of great variety, again for the reason that all repeat units will be of the same size. Boundary conditions as previously described may also be employed.

Thus while previously some of these effects have been sought to be achieved with two-dimensional elements, the present invention allows the achievement of three-dimensional surfaces with far greater optical vibrancy and optically pleasing appearances which can be tailored from the most subtle to stark and contrasting and visually having a tremendous impact on the viewer. The further advantage of the various optical illusions that can now be created three-dimensionally provide great freedom in selecting, not only for the appropriate light conditions the incidence of the light, but creating an enormous variety in surfaces which heretofore have been rather uninteresting.

Various arrangements of these elements, if photographed with light at different incidence and different viewer location, produce strikingly beautiful surface effects. These photographs, especially
if taken in black and white where only a white element 3 is used, or in color where different colors and elements are used, point out beautifully the interaction of these elements with light.

Thus in the creation of these effects, great use is made of the surfaces themselves such as surfaces 11 to 15 , the surface intersections, because of the different angular relationship of the surfaces to the other at varying angles alpha and beta, and the offsetting of the various elements vis-a-vis others to introduce surface discontinuities. By surface discontinuities is meant a surface which vis-a-vis its next adjoining surface has a $90^{\circ}$ intersection with the base of the element 3 laid on the surface sought to be covered.

In addition to the above illustrations when the half or quarter elements are used for finishing edges or boundaries, these may also be used to make a transition from a pattern to a pattern for a domain of different patterns.

In the finishing operation, the one quarter of the tile elements are best used for that purpose because these are symmetrical about lines 24 or lines 25 shown in Figures 1 and 2.

The material which may be usefully employed for this purpose may be ceramic materials, plaster of Paris, fiberglass, resin or polymers such as acrylics, polyesters, reinforced resins, metals such as steel, aluminum and the like which may be further surface coated. Ceramic tiles may be fired to further use these either in their fired state or with glazes and with a variety of colors for the glazes.

Similarly, plaster of Paris may be used in natural form or painted or surface treated and the like.

As previously mentioned, the floor tiles may be of ceramic bottom and epoxy top, giving a translucent solid top and a solid bottom, where the surfaces of 11 to 15 may be of any color. Thereafter these may be laid in epoxy and the seams finished wih epoxy resin and the like.

Decorative paneling may also be obtained accordingly which may be also fiberglass, reinforced plastic, as well as metal and steel aluminum. These materials may be made in various sizes to suit the various conditions.

The materials may also be hollow, such as the terra cotta illustration shown in Figures 1 to 9 and the glass blocks of Figures 20 to 28, and again of various sizes such as from two inches to two feet when used as exterior decorating surface elements for walls. Similarly, metals such as steel or aluminum as well as fiberglass, reinforced plastics, vinyls, ABS and the like may be used as suitable for interior or exterior applications. For transparent effects as well, polyacrylic resins or glass and the like may be employed. For example, acrylic and glass material may be in any color or shading. These blocks are illustrated by those embodiments
shown in Figures 13 to 19 and Figures 20 to 28.
Load bearing exterior or interior decorative blocks are likewise used, such as concrete blocks 6 shown in Figures 14 to 20, with the surface being as defined for the elements above and the spacing 21 as shown in Figure 8 being of the necessary thickness fcr the load bearing purposes. These may be hollow or solid, but preferably with hollows 6a as it is well known, and these may be natural, painted or glazed, such as when made from various forms of concrete described by Olin et al., supra. Again, the sizes of these are typically varied such as for the concrete blocks 6 within the 8 by 8 by 8 specification, or any other variation as long as the requisite unit relationship obtains for the surface of it which is exposed to a viewer.

Further possibilities exist such as for roof coverings and other coverings or claddings and the varieties as previously mentioned. Other possibilities exist in providing toy and game blocks for entertaining children, such as made from plastic, ABS plastic and the like.

Although these illustrations are indicative, there are many other variations, and the invention as disclosed herein is applicable to these variations without restricting the same to any particular embodiment.

## Claims

1. As an article of manufacture, a surface covering comprising a three-dimensional body having a rectangular base and further defined by:
(a) a zero plane through the body parallel to the base;
(b) a minus elevation point with respect to the zero plane;
(c) a plus elevation point with respect to the zero plane; said minus and plus elevation points equidistant in plus and minus elevation from said zero plane;
(d) a pair of first midpoints on said zero plane equidistant from two opposite edges of said body, one midpoint at one edge and another midpoint at the other edge;
(e) a pair of second midpoints, one midpoint at said minus elevation point and the other midpoint located at the plus elevation point equidistant from two other opposite edges of said zero plane, each of the midpoints of the second pair of midpoints being equidistant from the zero plane; all of said midpoints located on a plane that intersects said zero plane at the first pair of midpoints, said body having a rear face extending from said base to said plus elevation point defining with the plus elevation point and zero plane a triangle, said body having a front
face which includes the minus elevation point and two mirror image triangles, said body having two rectangular side faces which extend from the base to the zero plane.
2. As an article of manufacture, an array of the repeated runs of the individual articles as defined in claim 1.
3. An article of manufacture, wherein a subunit of the article defined in claim 1, divided by a straight line in either two or four subunits whereby the line is drawn through said pair of first midpoints and/or through said pair of second midpoints, is an edging for an array of repeated runs of the individual articles defined in Claim 1 or as finishing boundaries for said array.
4. The article of manufacture as defined in claim 1, wherein an angle between the base and intersecting at minus elevation point and plus elevation point is greater than zero but less than 45 degrees.
5. The article of manufacture as defined in claim 1, wherein the interior angle about the plus elevation point on the interior thereof is less than 90 degrees but more than 45 degrees.
6. The article of manufacture as defined in claim 1, wherein an angle about the plus elevation point on the interior thereof is 120 degrees.
7. The article of manufacture as defined in claim 1, wherein the angle between the base and intersecting with minus elevation point and plus elevation point is 45 degrees.
8. An article of manufacture as defined in claim 1, wherein the same is a floor tile with an epoxy covering parallel to said zero plane and of a sufficient thickness for wear purposes above the plus elevation point.
9. The article of manufacture as defined in claim 1 , wherein the same is a glass block.
10. The article of manufacture as defined in claim 1, wherein the same includes a unitary rectangular platform for said base.
11. The article of manufacture as defined in claim 1, wherein the same is a terra cotta facing for a building or a terra cotta construction element.
12. As an article of manufacture comprising a plu-
rality of arrays of an article as defined in claim 1.

## Revendications

1. Eléménet fabriqué, pour recouvrement de surface, comprenant un élément à trois dimensions ayant une base rectangulaire, et défini en outre par :
(a) un plan zéro traversant la pièce parallèlement à la base ;
(b) un point de cote négative par rapport au plan zéro ;
(c) un point de cote positive par rapport au plan zéro ; les deux points de cotes négative et positive étant équidistants dans les directions plus et moins dudit plan zéro ;
(d) une paire de premiers points milieux sur ledit plan zéro, équidistants des deux bords opposés de ladite pièce, un point milieu se trouvant sur un bord et l'autre point milieu sur l'autre bord ;
(e) une paire de seconds points milieux, un premier point milieu se trouvant sur ledit point de cote négative et l'autre point milieu se trouvant sur ledit point de cote positive équidistants des deux autres bords opposés dudit plan zéro, chacun des points milieux de la seconde paire de points milieux étant à la même distance du plan zéro, tous lesdits points milieux se trouvant dans un plan qui coupe ledit plan zéro sur la première paire de points milieux, ladite pièce ayant une face arrière s'étendant de ladite base audit point de cote positive définissant un triangle avec le plan de cote positive et le plan zéro, ladite pièce ayant une face avant qui comprend le point de cote négative et deux triangles symétriques l'un par rapport à l'autre, ladite pièce ayant deux faces latérales rectangulaires qui s'étendent depuis la base jusqu'au plan zéro
2. Elément fabriqué, sous forme d'un réseau de lots répétés d'éléments individuels, selon la revendication 1.
3. Elément fabriqué, dans lequel un sous-ensemble de l'élément selon la revendication 1 partagé par une droite, soit en deux soit en quatre sous-ensembles, de façon que la ligne passe par ladite paire des deux premiers points et/ou par ladite paire des deux seconds points, constitue un bord pour un réseau de lots répétés d'articles individuels selon la revendication 1, ou de limites de finition dudit réseau
4. Elément fabriqué selon la revendication 1,
dans lequel l'angle entre la base et la droite joignant le point de cote négative et le point de cote positive est supérieur à zéro mais inférieur à $45^{\circ}$.
5. Elément fabriqué selon la revendication 1, dans lequel l'angle intérieur au point de cote positive vers l'intérieur de l'article est inférieur à $90^{\circ}$ mais supérieur à $45^{\circ}$.
6. Elément fabriqué selon la revendication 1 , dans lequel l'angle au point de cote positive à l'intérieur de l'article est de $120^{\circ}$.
7. Elément fabriqué selon la revendication 1, dans lequel l'angle entre la base et la droite joignant le point de cote positive et le point de cote négative est de $45^{\circ}$.
8. Elément fabriqué selon la revendication 1, dans lequel celui-ci est une dalle de plancher ayant un revêtement de résine époxy parallèle audit plan zéro et ayant une épaisseur suffisante pour des questions d'usure au-dessus du point de cote positive.
9. Elément fabriqué selon la revendication 1, dans lequel celui-ci est un bloc de verre.
10. Elément fabriqué selon la revendication 1, dans lequel celui-ci comporte une plate-forme rectangulaire unitaire servant pour ladite base.
11. Elément fabriqué selon la revendication 1, dans lequel celui-ci est un parement en terre cuite pour bâtiment ou un élément de construction en terre cuite.
12. Elément fabriqué comprenant un ensemble de réseaux d'éléments selon la revendication 1.

## Patentansprüche

1. Oberflächenverkleidung als Fabrikationsgegenstand mit einem dreidimensionalen Körper mit einer rechteckigen Basis und weiterhin definiert durch
a) eine Null-Ebene durch den Körper parallel zu der Basis,
b) einen Minus-Höhenlagepunkt bezüglich der Null-Ebene,
c) einen Plus-Höhenlagepunkt bezüglich der Null-Ebene, wobei die Minus- und Plus-Höhenlagepunkte gleichen Abstand von der Null-Ebene in der Plus- und Minus-Höhenlage haben,
d) ein Paar erster Mittelpunkte auf der NullEbene in gleichem Abstand von zwei einan-
der gegenüberliegenden Kanten des Körpers, einen Mittelpunkt an einer Kante und einen anderen Mittelpunkt an der anderen Kante,
2. Fabrikationsgegenstand nach Anspruch 1, bei dem der Winkel zwischen der Basis und der

Schnittlinie mit dem Minus-Höhenlagepunkt und dem Plus-Höhenlagepunkt $45^{\circ}$ ist.
8. Fabrikationsgegenstand nach Anspruch 1, der eine Bodenplatte mit einem Epoxyüberzug parallel zu der Null-Ebene und einer ausreichenden Dicke für Verschleißzwecke oberhalb des Plus-Höhenlagepunktes ist.
9. Fabrikationsgegenstand nach Anspruch 1, der ein Glasblock ist.
10. Fabrikationsgegenstand nach Anspruch 1, der eine einheitliche rechteckige Plattform für die Basis enthält.
11. Fabrikationsgegenstand nach Anspruch 1, der eine Terrakotta-Sichtfläche für ein Gebäude oder ein Terrakotta-Bauelement ist.
12. Fabrikationsgegenstand mit mehreren Anordnungen eines in Anspruch 1 definierten Gegenstandes.
