# ANTIBODIES AND ASSAYS FOR DETECTION OF CD37

## CROSS REFERENCE TO RELATED APPLICATIONS

**[0001]** This application claims the priority benefit of U.S. Provisional Application No. 62/211,455, filed August 28, 2015, and U.S. Provisional Application No. 62/212,183, filed August 31, 2015, each of which is herein incorporated by reference in its entirety.

## FIELD OF THE INVENTION

**[0002]** The field of this invention generally relates to diagnostic assays and kits for CD37-based therapies and antibodies that bind to human CD37.

## BACKGROUND OF THE INVENTION

**[0003]** Cancer is one of the leading causes of death in the developed world, with over one million people diagnosed with cancer and 500,000 deaths per year in the United States alone. Overall it is estimated that more than 1 in 3 people will develop some form of cancer during their lifetime.

**[0004]** Leukocyte antigen CD37 (“CD37”), also known as GP52-40, tetraspanin-26, or TSPAN26, is a transmembrane protein of the tetraspanin superfamily (Maecker et al., 1997 FASEB J. 11:428-442). It is a heavily glycosylated protein with four transmembrane domains that is expressed on B cells during the pre-B to peripheral mature B-cell stages, but is absent on terminal differentiation to plasma cells. (Link et al., 1987, J Pathol. 152:12-21). The CD37 antigen is only weakly expressed on T-cells, myeloid cells and granulocytes (Schwartz-Albiez et al. 1988, J. Immunol. 140(3):905-914). However, CD37 is also expressed on malignant B-cells such as those found in non-Hodgkin's lymphoma (NHL) and chronic lymphoid leukemia (CLL) (Moore et al. 1986, J Immunol. 137(9):3013-8). This expression profile suggests that CD37 represents a promising therapeutic target for B-cell malignancies that express CD37. However, in order for these therapies to be maximally effective, it is necessary to be able to detect a dynamic range of CD37 with sensitivity and specificity.

## BRIEF SUMMARY OF THE INVENTION

**[0005]** Anti-CD37 antibodies and antigen-binding fragments thereof as well as methods for detecting CD37, diagnosing CD37-mediated diseases and disorders (such as cancer), monitoring the efficacy of anti-CD37 therapies, and stratifying patients are all provided herein. The anti-CD37 antibodies and antigen-binding fragments thereof are particularly advantageous in that they allow for more specific and defined staining as well as staining without nuclear background. The CD37 antibodies and antigen-binding fragments thereof can bind to an epitope that includes one or more amino acids 110-137 of CD37. The CD37 antibodies and antigen-binding fragments thereof can also bind to a polypeptide comprising amino acids 107-242 of CD37 (SEQ ID NO:20) and/or to a polypeptide comprising amino acids 107-235 of CD37 (SEQ IDN O:19), but do not bind to a polypeptide consisting of amino acids 138-235 of CD37.

**[0006]** In one embodiment, an antibody or antigen-binding fragment thereof provided herein specifically binds to the same CD37 epitope as an antibody comprising the polypeptide of SEQ ID NO:9 and the polypeptide of SEQ ID NO:10.

**[0007]** In another embodiment, an antibody or antigen-binding fragment thereof provided herein specifically binds to CD37, and competitively inhibits binding to CD37 of an antibody comprising the polypeptide of SEQ ID NO:9 and the polypeptide of SEQ ID NO:10.

**[0008]** In another embodiment, the an antibody or antigen-binding fragment thereof provided herein comprises the heavy chain variable region CDR1, CDR2, and CDR3 sequences of SEQ ID NOs: 3-5, respectively, and the light chain variable region CDR1, CDR2, and CDR3 sequences of SEQ ID NOs: 6-8, respectively.

**[0009]** In another embodiment, an antibody or antigen-binding fragment thereof provided herein specifically binds to CD37, and the antibody or fragment thereof comprises the heavy chain variable region CDR1, CDR2, and CDR3 sequences of SEQ ID NOs: 3-5 and the light chain variable region CDR1, CDR2, and CDR3 sequences of SEQ ID NOs: 6-8, respectively.

**[0010]** In another embodiment, the an antibody or antigen-binding fragment thereof provided herein comprises polypeptide sequences that are at least 90% identical to the polypeptide sequences of SEQ ID NOs:9 and 10. In another embodiment, the polypeptide sequences are at least 95% identical to the polypeptide sequences of SEQ ID NOs:9 and 10. In another embodiment, the polypeptide sequences are at least 99% identical to the polypeptide sequences of SEQ ID NOs:9 and 10. In another embodiment, the polypeptide sequences comprise the amino acids of sequences of SEQ ID NOs:9 and 10.

**[0011]** In another embodiment, an antibody or antigen-binding fragment thereof provided herein specifically binds to CD37, wherein the antibody or fragment thereof comprises a heavy chain variable region comprising SEQ ID NO:9.

**[0012]** In another embodiment, an antibody or antigen-binding fragment thereof provided herein specifically binds to CD37, wherein the antibody or fragment thereof comprises a heavy chain variable region comprising SEQ ID NO:10.

**[0013]** In another embodiment, an antibody or antigen-binding fragment thereof provided herein is recombinantly produced. In another embodiment, the antibody or antigen-binding fragment thereof is murine, non-human, humanized, chimeric, or human. In another embodiment, the antibody or antigen-binding fragment thereof is resurfaced. In another embodiment, the antibody or antigen-binding fragment thereof is a full length antibody. In another embodiment, the antibody or antigen-binding fragment thereof is an antigen-binding fragment. In another embodiment, the antibody or antigen-binding fragment thereof comprises a Fab, Fab', F(ab')2, Fd, single chain Fv or scFv, disulfide linked Fv, V-NAR domain, IgNar, intrabody, IgG $\Delta$ CH2, minibody, F(ab')3, tetrabody, triabody, diabody, single-domain antibody, DVD-Ig, Fcab, mAb2, (scFv)2, or scFv-Fc. In another embodiment, the antibody or antigen-binding fragment thereof comprises a Fab, Fab', F(ab')2, single chain Fv or scFv, disulfide linked Fv, intrabody, IgG $\Delta$ CH2, minibody, F(ab')3, tetrabody, triabody, diabody, DVD-Ig, mAb2, (scFv)2, or scFv-Fc.

**[0014]** In another embodiment, the antibody or antigen-binding fragment is produced by a cell. In another embodiment, the cell is isolated. In another embodiment, a method of making an antibody or antigen-binding fragment thereof is provided herein, wherein the method comprises (a) culturing the cell; and (b) isolating the antibody or antigen-binding fragment thereof from the cultured cell.

**[0015]** In another embodiment, the antibody or antigen-binding fragment thereof binds to a human CD37 with a Kd of about 0.5 to about 10 nM. In another embodiment, the antibody or antigen-binding fragment thereof binds to a human CD37 with a Kd of about 1.0 nM or better.

**[0016]** In another embodiment, the antibody or antigen-binding fragment thereof which binds to a polypeptide comprising, consisting essentially of, or consisting of amino acids 107-242 of CD37 (SEQ ID NO:20). In another embodiment, the antibody or antigen-binding fragment thereof binds to a polypeptide comprising, consisting essentially of, or consisting of amino acids 107-235 of CD37 (SEQ ID NO:19). In another embodiment, the antibody or antigen-binding fragment thereof binds to the sequence set forth in SEQ ID NO:15. In another

embodiment, the antibody or antigen-binding fragment thereof binds to the sequence set forth in SEQ ID NO:16. In another embodiment, the antibody or antigen-binding fragment thereof binds to the sequence set forth in SEQ ID NO:17. In another embodiment, the antibody or antigen-binding fragment thereof binds to a polypeptide comprising amino acids 107-242 of CD37 (SEQ ID NO:20) but does not bind to a polypeptide consisting of amino acids 138-235 of CD37. In another embodiment, the antibody or antigen-binding fragment thereof binds to a polypeptide comprising amino acids 107-235 of CD37 (SEQ ID NO:19) but does not bind to a polypeptide consisting of amino acids 138-235 of CD37.

**[0017]** In another embodiment, an antibody or antigen-binding fragment provided herein binds to a polypeptide of SEQ ID NO:15, but does not bind to a polypeptide of SEQ ID NO:18. In another embodiment, the antibody or antigen-binding fragment thereof binds to a polypeptide of SEQ ID NO:16, but does not bind to a polypeptide of SEQ ID NO:18. In another embodiment, the antibody or antigen-binding fragment thereof binds to a polypeptide of SEQ ID NO:17, but does not bind to a polypeptide of SEQ ID NO:18. In another embodiment, the antibody or antigen-binding fragment thereof binds to at least one amino acid in amino acids 110-137 of CD37.

**[0018]** In another embodiment, the binding affinity of the antibody or antigen-binding fragment thereof is measured by flow cytometry, Biacore, ELISA, or radioimmunoassay.

**[0019]** In another embodiment, the antibody or antigen-binding fragment thereof is detectably labeled. In another embodiment, the label is selected from the group consisting of an immunofluorescent label, a chemiluminescent label, a phosphorescent label, an enzyme label, a radiolabel, avidin/biotin, a colloidal gold particle, a colored particle, and a magnetic particle.

**[0020]** In another embodiment, a composition is provided herein, wherein the composition comprises the antibody or antigen-binding fragment thereof and a buffer selected from the group consisting of: an IHC buffer, an ELISA buffer, and a FACS buffer.

**[0021]** In another embodiment, a method of detecting CD37 expression in a sample is provided herein, wherein the method comprises contacting the sample with an antibody or antigen-binding fragment thereof or a composition provided herein. In another embodiment, the antibody or antigen-binding fragment thereof is detectably labeled. In another embodiment, the label is selected from the group consisting of an immunofluorescent label, a chemiluminescent label, a phosphorescent label, an enzyme label, a radiolabel, avidin/biotin, a colloidal gold

particle, a colored particle, and a magnetic particle. In another embodiment, the label is an enzyme label.

**[0022]** In another embodiment, the CD37 expression is determined by radioimmunoassay, Western blot assay, cytometry, immunofluorescent assay, enzyme immunoassay, immunoprecipitation assay, chemiluminescent assay, or immunohistochemical assay. In another embodiment, the CD37 expression is determined by immunohistochemical assay.

**[0023]** In another embodiment, a method for increasing the efficacy of cancer therapy with a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof is provided herein, wherein said method comprises administering the therapeutically active agent to a subject having cancer, wherein increased expression of CD37 has been detected in a cancerous sample from the subject using an antibody or antigen-binding fragment thereof or a composition provided herein.

**[0024]** In another embodiment, a method for identifying a cancer as likely to respond to a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof, is provided, wherein the method comprises: (a) contacting a biological sample comprising cells from the cancer with an antibody or antigen-binding fragment thereof or a composition; (b) detecting binding of the antibody or antigen-binding fragment thereof to CD37 in the biological sample of (a); (c) assigning a score to the binding of step (b), wherein the score is assigned based on comparison to one or more reference samples; and (d) comparing the score in step (c) to the score of a reference tissue or cell, wherein a score for the cancer CD37 level that is greater than the score for a normal or low CD37 expressing reference sample or a score for the cancer CD37 level that is equal to or greater than the score for a high CD37 expressing reference sample identifies the cancer as likely to respond to an anti-CD37 antibody.

**[0025]** In another embodiment, a method of treating a patient having cancer is provided herein, wherein the method comprises: (a) determining a CD37 expression score from a detection of CD37 expression in a cancerous sample obtained from the patient, wherein the detection is performed using an antibody or antigen-binding fragment thereof or a composition; and (b) administering a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof to the patient if the score indicates the patient will benefit from administration of the therapeutically active agent.

**[0026]** In another embodiment, a method of treating a patient having cancer comprises: (a) determining a CD37 expression score from a detection of CD37 expression in a cancerous sample obtained from the patient, wherein the detection is performed using an antibody or antigen-binding fragment thereof or a composition; and (b) instructing a healthcare provider to administer a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof to the patient if the score indicates the patient will benefit from administration of the therapeutically active agent.

**[0027]** In another embodiment, a method of treating a patient having cancer comprises: (a) submitting a cancerous sample taken from a patient having cancer for determining a CD37 expression score from a detection of CD37 expression using an antibody or antigen-binding fragment thereof or a composition; and (b) administering a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof to the patient if the score indicates the patient will benefit from administration of the therapeutically active agent.

**[0028]** In another embodiment, a method of treating a patient having cancer comprises: (a) detecting CD37 expression in a cancerous sample obtained from the patient, wherein the detection is performed using an antibody or antigen-binding fragment thereof or a composition; (b) determining a CD37 expression score for the cancerous sample; and (c) administering a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof to the patient if the score indicates the patient will benefit from administration of the therapeutically active agent.

**[0029]** In another embodiment, a method of identifying a cancer as sensitive to treatment with an anti-CD37 active agent comprises: (a) detecting the level of CD37 expression in a cancerous sample from the cancer using an antibody or antigen-binding fragment thereof or a composition, wherein the detecting comprises the use of a method that distinguishes between staining intensity or staining uniformity in a CD37 expressing cancerous sample as compared to staining intensity or staining uniformity in one or more reference samples; (b) determining a CD37 staining intensity or staining uniformity score for the cancerous sample; and (c) comparing the CD37 staining intensity or staining uniformity score determined in step (b) to a relative value determined by measuring CD37 protein expression in at least one reference sample, wherein the at least one reference sample is a tissue, cell, or cell pellet sample which is not sensitive to treatment with a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof and wherein a CD37 staining intensity score for the cancerous sample

determined in step (b) that is higher than the relative value identifies the cancer as being sensitive to treatment with the therapeutically active agent.

**[0030]** In another embodiment, a method of identifying a cancer as sensitive to treatment with a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof, comprises: (a) detecting the level of CD37 expression in a cancerous sample from the cancer using an antibody or antigen-binding fragment thereof or a composition, wherein the detecting comprises the use of a method that distinguishes between staining intensity or staining uniformity in a CD37 expressing cancerous sample as compared to staining intensity or staining uniformity in one or more reference samples; (b) determining a CD37 staining intensity or staining uniformity score for the cancerous sample; and (c) comparing the CD37 staining intensity or staining uniformity score determined in step (b) to a relative value determined by measuring CD37 protein expression in at least one reference sample, wherein the at least one reference sample is a tissue, cell, or cell pellet sample which is sensitive to treatment with a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof and wherein a CD37 staining intensity score for the cancerous sample determined in step (b) that is greater than or equal to the relative value identifies the cancer as being sensitive to treatment with the therapeutically active agent.

**[0031]** In another embodiment, the method which further comprises administering a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof to the subject from whom the cancerous sample or biological sample was obtained. In another embodiment, the patient's CD37 level is detected in a cancerous sample or biological sample obtained from the patient. In another embodiment, the cancerous sample or biological sample is a fluidic extract, blood, plasma, serum, spinal fluid, lymph fluid, or a splenic preparation. In another embodiment, the detecting is by immunohistochemistry (IHC). In another embodiment, the IHC is calibrated IHC that can distinguish different levels of CD37 expression. In another embodiment, the IHC produces a range of staining intensity for samples having low CD37 expression, moderate CD37 expression, or high CD37 expression. In another embodiment, the IHC distinguishes between staining intensity and staining uniformity in a CD37 expressing cancerous sample or biological sample as compared to a reference sample. In another embodiment, the IHC is performed manually. In another embodiment, the IHC is performed using an automated system. In another embodiment, a CD37 score is determined from the IHC. In another embodiment, the detecting is by enzyme linked immunosorbent assay (ELISA). In

another embodiment, the reference sample is a positive reference sample or a negative reference sample. In another embodiment, the reference sample comprises cells, cell pellets, or tissue.

**[0032]** In another embodiment, the antibody or antigen-binding fragment thereof further comprises a detection reagent selected from the group consisting of: an immunofluorescent label, a chemiluminescent label, a phosphorescent label, an enzyme, a radiolabel, avidin/biotin, a colloidal gold particle, a colored particle, and a magnetic particle. In another embodiment, the detection reagent is an enzyme.

**[0033]** In another embodiment, the cancer is a CD37 positive cancer. In another embodiment, the cancer is a leukemia or a lymphoma. In another embodiment, the cancer is selected from the group consisting of wherein the cancer is selected from the group consisting of B cell lymphomas, NHL, precursor B cell lymphoblastic leukemia/lymphoma and mature B cell neoplasms, B cell chronic lymphocytic leukemia (CLL)/small lymphocytic lymphoma (SLL), B cell prolymphocytic leukemia, lymphoplasmacytic lymphoma, mantle cell lymphoma (MCL), follicular lymphoma (FL), low grade, intermediate-grade and high-grade (FL), cutaneous follicle center lymphoma, marginal zone B cell lymphoma, MALT type marginal zone B cell lymphoma, nodal marginal zone B cell lymphoma, splenic type marginal zone B cell lymphoma, hairy cell leukemia, diffuse large B cell lymphoma (DLBCL), Burkitt's lymphoma, plasmacytoma, plasma cell myeloma, post-transplant lymphoproliferative disorder, Waldenstrom's macroglobulinemia, and anaplastic large-cell lymphoma (ALCL). In another embodiment, the CD37 positive cancer is diffuse large B-cell lymphoma, follicular lymphoma, or mantle cell lymphoma.

**[0034]** In another embodiment, the CD37 expression is detected using at least one additional anti-CD37 antibody or antigen-binding fragment thereof. In another embodiment, the CD37 expression is measured using two anti-CD37 antibodies or antigen-binding fragments thereof. In another embodiment, the at least one additional antibody or antigen-binding fragment thereof comprises a detection agent. In another embodiment, the detection agent is a chromogenic detection agent, a fluorogenic detection agent, an enzymatic detection agent, or an electrochemiluminescent detection agent. In another embodiment, the detection agent is horseradish peroxidase (HRP).

**[0035]** In another embodiment, the at least one additional antibody or antigen-binding fragment thereof is bound to a solid support. In another embodiment, the at least one additional antibody or antigen-binding fragment thereof is bound to a microtiter plate.

**[0036]** In another embodiment, the ELISA is a sandwich ELISA.

**[0037]** In another embodiment, the therapeutically active agent comprises the CD37 antibody huCD37-3. In another embodiment, the therapeutically active agent is an antibody maytansinoid conjugate comprising the CD37 antibody huCD37-3, the maytansinoid DM1, and the non-cleavable SMCC linker (IMGN529).

**[0038]** In another embodiment, a combination diagnostic and pharmaceutical kit is provided herein, wherein the kit comprises an antibody or antigen-binding fragment thereof or composition provided herein for use in diagnosis and a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof for use in therapy.

**[0039]** In another embodiment, the detection antibody is able to detect CD37 expression by IHC. In another embodiment, the detection antibody is able to detect CD37 expression by ELISA.

**[0040]** In another embodiment, the anti-CD37 antibody in the therapeutically active agent is conjugated to a cytotoxin.

**[0041]** In another embodiment, a diagnostic kit provided herein comprises an antibody, antigen-binding fragment thereof provided herein, a reagent for IHC, and one or more standardized reference samples, wherein the standardized reference samples comprise cells, cell pellets, or formalin fixed paraffin embedded tissue samples, and wherein the one or more standardized referenced samples are from non-CD37 expressing, low-CD37 expressing, or high CD37 expressing cells, cell pellets, or tissues.

#### BRIEF DESCRIPTION OF THE DRAWINGS/FIGURES

**[0042]** **Fig. 1A and 1B** provide ELISA screening results for antibodies produced by immunization of mice with hCD37-LEL (Large Extracellular Loop) protein (SEQ ID NO:15), which contains amino acids 107 to 242 of human CD37 fused to a His-tag. Figure 1A shows that supernatant from hybridoma clone 1B11 binds to multiple versions of the CD37 antigen, hCD37-LEL, hCD37-Fc-LAGA (LAGA refers to the Fc mutations G236A and P238A), SEQ ID NO:17, containing amino acids 107 to 235 of human CD37 fused to human IgG1 Fc-domain), and hCD37-ECD-Fc (Extra Cellular Domain, SEQ ID NO:16, containing amino acids 107 to 235 of human CD37 fused to murine IgG2a Fc-domain), under both native and denaturing conditions. Figure 1B shows that supernatant from two hybridoma subclones, 1B11-2 and 1B11-20, bind to hCD37-Fc-LAGA and hCD37-LEL under both native and denaturing conditions.

**[0043]** **Fig. 2** shows that antibody 1B11-2 binds with greatly improved affinity to both native hCD37-Fc-LAGA and hCD37-LEL proteins as compared to a reference anti-CD37 antibody, NCL-CD37 (clone CT1, Leica Biosystems).

**[0044]** **Fig. 3** shows that antibody 1B11-2 binds with greatly improved affinity to denatured hCD37-LEL protein as compared to NCL-CD37.

**[0045]** **Fig. 4** shows that antibody 1B11-2 does not bind to the truncated hCD37-ECD-S2-Fc protein (S2 refers to the second segment of the large extracellular domain of CD37, containing amino acids 138 to 176, SEQ ID NO:18), while NCL-CD37 retains binding to this CD37 protein.

**[0046]** **Fig. 5** shows immunohistochemical images of human normal tonsil stained with either NCL-CD37 Mouse mAb (left) or CD37 1B11-2 Mouse mAb (right). The arrows indicate the germinal centers, the mantle zones (both of which are CD37 positive), and the intermolecular regions (CD37 negative), respectively. Black arrows indicate the germinal centers; gray arrows mantle zone (both of which are CD37 positive); and open arrows indicate the interfollicular regions (which are negative for CD37). Nuclear staining is present in both the germinal center and the mantel zone using the NCL-CD37 antibody. No nuclear staining is present using the 1B11-2 antibody.

**[0047]** **Fig. 6** shows immunohistochemical images of human normal small intestine (upper panel) and human normal pancreas (lower panel) using either NCL-CD37 Mouse monoclonal antibody (mAb) (left panel) or 1B11-2 Mouse mAb (right panel). Arrows in the left panels denote cytoplasmic blush in paneth cells (upper panel, indicated with black arrows) and islet cells (lower panel, indicated with open arrows) obtained using the NCL-CD37 Mouse mAb. Arrows in the right panels demonstrates that this staining is not observed in corresponding locations using the 1B11-2 antibody.

**[0048]** **Fig. 7** shows immunohistochemical images of diffuse large B cell lymphoma patient tissue (upper panel) and follicular lymphoma patient tissue (lower panel) stained with either NCL-CD37 Mouse mAb (left panel) or 1B11-2 Mouse mAb (right panel). Stronger, more crisp staining is visible in both cancer types using the 1B11-2 Mouse mAb.

**[0049]** **Fig. 8** shows denaturing SDS PAGE Western blots of Fc-fusions to the CD37 extracellular domain (ECD) antigens comparing the 1B11-2 mouse monoclonal antibody to a commercially available mouse monoclonal anti-CD37 antibody (Leica). Molecular weight markers in kilo Dalton (kD) are shown as primary data and as a schematic depiction on the right.

**[0050]** **Fig. 9** shows Native PAGE Western blots of Fc-fusions to CD37 extracellular domain (ECD) antigens detected by 1B11-2 mouse monoclonal antibody.

#### DETAILED DESCRIPTION OF THE INVENTION

**[0051]** The present disclosure provides methods of detecting human CD37. These methods allow for the identification of cancers characterized by the expression of CD37 in order to improve the efficacy of treatment with anti-CD37 therapeutics. The detection methods can be used for patient stratification, to monitor or determine therapeutic efficacy, or to determine the likelihood of a cancer to respond to an anti-CD37 therapy. The detection methods can detect a clinically relevant dynamic range of CD37. Novel CD37-binding polypeptides, such as antibodies and antigen-binding fragments thereof, that are useful in the CD37 detection methods (e.g., immunohistochemistry (IHC) for CD37) are also disclosed. The CD37 binding agent (e.g., an antibody or antigen-binding fragment thereof) provided herein allows for more specific and defined staining without nuclear background. The CD37 binding agent binds to an epitope that includes one or more amino acids 110-137 of CD37. The CD37 binding agent also binds to a polypeptide comprising amino acids 107-242 of CD37 (SEQ ID NO:20) or to a polypeptide comprising amino acids 107-235 of CD37 (SEQ ID NO:19) but does not bind to a polypeptide consisting of amino acids 138-235 of CD37. Related polypeptides and polynucleotides, compositions comprising the CD37-binding agents, and methods of making the CD37-binding agents are also provided.

#### I. Definitions

**[0052]** To facilitate an understanding of the present invention, a number of terms and phrases are defined below.

**[0053]** The term "CD37" as used herein, refers to any native CD37, unless otherwise indicated. CD37 is also referred to as GP52-40, leukocyte antigen CD37, and Tetraspanin-26. The term "CD37" encompasses "full-length," unprocessed CD37 as well as any form of CD37 that results from processing in the cell. The term also encompasses naturally occurring variants of CD37, e.g., splice variants, allelic variants, and isoforms. The CD37 polypeptides described herein can be isolated from a variety of sources, such as from human biological samples or from another source, or prepared by recombinant or synthetic methods.

**[0054]** The term "increased expression" or "overexpression" of CD37 refers to a sample which contains elevated levels of CD37 expression. The CD37 can be increased or overexpressed as compared to a negative or low reference control or as compared to a healthy or non-diseased sample of the same tissue or cell type. Such increased expression or overexpression can be caused, for example, by mutation, gene amplification, increased transcription, increased translation, or increased protein stability.

**[0055]** In one example, the CD37 expression is measured by immunohistochemistry (IHC) and given a staining intensity score or a staining uniformity score by comparison to calibrated controls exhibiting defined scores (e.g., an intensity score of 3 is given to the test sample if the intensity is comparable to the level 3 calibrated control or an intensity of 2 is given to the test sample if the intensity is comparable to the level 2 calibrated control). A staining uniformity that is heterogeneous or homogeneous is also indicative of increased CD37 expression. The staining intensity and staining uniformity scores can be used alone or in combination (e.g., 2 homo, 2 hetero, 3 homo, 3 hetero, etc.). In another example, an increase in CD37 expression can be determined by detection of an increase of at least 2-fold, at least 3-fold, or at least 5-fold relative to control values (e.g., expression level in a biological sample, tissue, or cell from a subject without cancer or with a cancer that does not have elevated CD37 values). In another example, CD37 expression is given an H-score. H-scores combine staining intensity scores with uniformity scores using the calculation provided herein. In another example, CD37 expression is measured by determining the percentage of cells that have at least a particular level of staining (e.g., at least 25% of cells have a score of at least 2 or at least 75% of cells have a score of at least 2).

**[0056]** A "reference sample" can be used to correlate and compare the results obtained in the methods provided herein to a test sample. Reference samples can be cells (e.g., cell lines, cell pellets) or tissue. The CD37 levels in the "reference sample" can be an absolute or relative amount, a range of amounts, a minimum and/or maximum amount, a mean amount, and/or a median amount of CD37. The diagnostic methods provided herein involve a comparison between expression levels of CD37 in a test sample and a "reference value." In some embodiments, the reference value is the expression level of the CD37 in a reference sample. A reference value can be a predetermined value and can also be determined from reference samples (e.g., control biological samples or reference samples) tested in parallel with the test samples. A reference value can be a single cut-off value, such as a median or mean or a range of values, such as a

confidence interval. Reference values can be established for various subgroups of individuals, such as individuals predisposed to cancer, individuals having early or late stage cancer, male and/or female individuals, or individuals undergoing cancer therapy. Examples of negative reference samples or values and positive reference samples or values are described herein.

**[0057]** In some embodiments, the reference sample is a sample from a healthy tissue, in particular a corresponding tissue which is not affected by cancer or a corresponding tissue which is not affected by a cancer that overexpresses CD37. These types of reference samples are referred to as negative control samples or reference samples. In other embodiments, the reference sample is a sample from a tumor that expresses CD37. These types of reference samples are referred to as positive control samples. Positive control samples can also be used as a comparative indicator for the type (hetero versus homo), degree (0, 1, 2, 3) of staining intensity, H-score, and/or percent of cells with at least a particular level of staining, which correlates with the level of CD37 expression. Positive control comparative samples are also referred to as calibrated reference samples. Low or non-CD37 references are described herein in the Examples and also include the red pulp of the spleen (e.g., monocytes and red blood cells), T-cells, and the interfollicular region of human tonsils. CD37-expressing references are described herein in the Examples and also include white pulp of the spleen (e.g., B lymphocytes and the marginal zone of the spleen), the germinal center of human tonsils, and the mantle zone of human tonsils. For cell lines, exemplary non-expressors include 300-19 cells, and expressors include Daudi, Ramos, Namalwa, and RL non-Hodgkin's lymphoma B cells. Another positive high CD37 reference is a cell line stably or transiently transfected with CD37 (e.g., 300.19/CD37, as described in U.S. Published Application No. 2015/0093397 and PCT publication WO 2013/149171, each of which is incorporated herein by reference). Appropriate positive and negative reference levels of CD37 for a particular cancer can be determined by measuring levels of CD37 in one or more appropriate subjects, and such reference levels may be tailored to specific populations of subjects (e.g., a reference level may be age-matched so that comparisons may be made between CD37 levels in samples from subjects of a certain age and reference levels for a particular disease state, phenotype, or lack thereof in a certain age group).

**[0058]** As used herein, "immunohistochemistry" refers to histochemical and immunologic methods used to analyze, for example, cells or tissues. Thus, the terms "immunohistochemistry," "immunocytochemistry," and "immunochemistry" are used interchangeably.

**[0059]** A "sample" or "biological sample" of the present invention is of biological origin, in specific embodiments, such as from eukaryotic organisms. In some embodiments, the sample is a human sample, but animal samples can also be used in the practice of the invention. Non-limiting sources of a sample for use in the present invention include solid tissue, biopsy aspirates, fluidic extracts, blood, plasma, serum, spinal fluid, lymph fluid, the external sections of the skin, respiratory, intestinal, and genitourinary tracts, tears, saliva, milk, tumors, organs, cell cultures and/or cell culture constituents, for example. A "cancerous sample" is a sample that contains a cancerous cell. The methods provided herein can be useful for solid tissue samples where the amount of available material is small. The methods provided herein can be used to examine an aspect of expression of CD37 or a state of a sample, including, but not limited to, comparing different types of cells or tissues and detecting or determining the presence and/or type of disease or abnormality.

**[0060]** For the purposes herein, a "section" of a tissue sample refers to a single part or piece of a tissue sample, e.g., a thin slice of tissue or cells cut from a tissue sample. It is understood that multiple sections of tissue samples may be taken and subjected to analysis according to the present invention. In some cases, the selected portion or section of tissue comprises a homogeneous population of cells. In other cases, the selected portion comprises a region of tissue, e.g., the lumen as a non-limiting example. The selected portion can be as small as one cell or two cells, or could represent many thousands of cells, for example. In most cases, the collection of cells is important, and while the invention has been described for use in the detection of cellular components, the method can also be used for detecting non-cellular components of an organism (e.g., soluble components in the blood as a non-limiting example).

**[0061]** As used herein, the term "capture reagent" refers to a reagent capable of binding and capturing a target molecule in a sample such that under suitable condition, the capture reagent-target molecule complex can be separated from the rest of the sample. In one embodiment, the capture reagent is immobilized. In one embodiment, the capture reagent in a sandwich immunoassay is an antibody or antigen-binding fragment thereof or a mixture of different antibodies or antigen-binding fragments thereof against a target antigen.

**[0062]** As used herein, the term "detectable" antibody or antigen-binding fragment thereof refers to an antibody or antigen-binding fragment thereof that is capable of being detected either directly through a label amplified by a detection means, or indirectly through, e.g., another antibody or antigen-binding fragment thereof that is labeled. For direct labeling, the antibody or

antigen-binding fragment thereof is typically conjugated to a moiety that is detectable by some means. In one embodiment, the detectable antibody or antigen-binding fragment thereof is a biotinylated antibody or antigen-binding fragment thereof.

**[0063]** As used herein, the term "detection means" refers to a moiety or technique used to detect the presence of the detectable antibody or antigen-binding fragment thereof and includes detection agents that amplify the immobilized label such as label captured onto a microtiter plate. In one embodiment, the detection means is a fluorimetric detection agent such as avidin or streptavidin.

**[0064]** Commonly a "sandwich ELISA" employs the following steps: (1) microtiter plate is coated with a capture antibody or antigen-binding fragment thereof; (2) sample is added, and any antigen present binds to capture antibody or antigen-binding fragment thereof; (3) detecting antibody or antigen-binding fragment thereof is added and binds to antigen; (4) enzyme-linked secondary antibody or antigen-binding fragment thereof is added and binds to detecting antibody or antigen-binding fragment thereof; and (5) substrate is added and is converted by enzyme to detectable form.

**[0065]** The word "label" when used herein refers to a detectable compound or composition which is conjugated directly or indirectly to the antibody so as to generate a "labeled" antibody. The label can be detectable by itself (e.g. radioisotope labels or fluorescent labels) or, in the case of an enzymatic label, can catalyze chemical alteration of a substrate compound or composition which is detectable.

**[0066]** By "correlate" or "correlating" is meant comparing, in any way, the performance and/or results of a first analysis with the performance and/or results of a second analysis. For example, one may use the results of a first analysis in carrying out the second analysis and/or one may use the results of a first analysis to determine whether a second analysis should be performed and/or one may compare the results of a first analysis with the results of a second analysis. In one embodiment, increased expression of CD37 correlates with increased likelihood of effectiveness of a CD37-targeting anti-cancer therapy.

**[0067]** The term "antibody" means an immunoglobulin molecule that recognizes and specifically binds to a target, such as a protein, polypeptide, peptide, carbohydrate, polynucleotide, lipid, or combinations of the foregoing through at least one antigen recognition site within the variable region of the immunoglobulin molecule. As used herein, the term "antibody" encompasses intact polyclonal antibodies, intact monoclonal antibodies, multispecific

antibodies such as bispecific antibodies generated from at least two intact antibodies, chimeric antibodies, humanized antibodies, human antibodies, fusion proteins comprising an antibody, and any other modified immunoglobulin molecule so long as the antibodies exhibit the desired biological activity. An antibody can be of any the five major classes of immunoglobulins: IgA, IgD, IgE, IgG, and IgM, or subclasses (isotypes) thereof (e.g., IgG1, IgG2, IgG3, IgG4, IgA1 and IgA2), based on the identity of their heavy-chain constant domains referred to as alpha, delta, epsilon, gamma, and mu, respectively. The different classes of immunoglobulins have different and well known subunit structures and three-dimensional configurations. Antibodies can be naked or conjugated to other molecules such as toxins, radioisotopes, etc.

**[0068]** The term "antibody fragment" refers to a portion of an intact antibody. An "antigen-binding fragment" refers to a portion of an intact antibody that binds to an antigen. An antigen-binding fragment can contain the antigenic determining variable regions of an intact antibody. Examples of antibody fragments include, but are not limited to Fab, Fab', F(ab')<sub>2</sub>, and Fv fragments, linear antibodies, and single chain antibodies. Examples of antibody fragments encompassed within the term "antigen-binding fragment" of an antibody include (without limitation): (i) a Fab fragment, a monovalent fragment consisting of the VL, VH, CL and CH1 domains (e.g., an antibody digested by papain yields three fragments: two antigen-binding Fab fragments, and one Fc fragment that does not bind antigen); (ii) a F(ab')<sub>2</sub> fragment, a bivalent fragment comprising two Fab fragments linked by a disulfide bridge at the hinge region (e.g., an antibody digested by pepsin yields two fragments: a bivalent antigen-binding F(ab')<sub>2</sub> fragment, and a pFc' fragment that does not bind antigen) and its related F(ab') monovalent unit; (iii) a Fd fragment consisting of the VH and CH1 domains (i.e., that portion of the heavy chain which is included in the Fab); (iv) a Fv fragment consisting of the VL and VH domains of a single arm of an antibody, and the related disulfide linked Fv; and (v) a dAb (domain antibody) or sdAb (single domain antibody) fragment (Ward et al., *Nature* 341:544-546, 1989), which consists of a VH domain.

**[0069]** In some embodiments, an antibody or antigen-binding fragment thereof is a non-naturally occurring antibody. In some embodiments, an antibody or an antigen-binding fragment thereof is purified from natural components. In some embodiments, an antibody or an antigen-binding fragment thereof is recombinantly produced. In some embodiments, an antibody or an antigen-binding fragment thereof is produced by a hybridoma.

**[0070]** A "blocking" antibody or an "antagonist" antibody is one which inhibits or reduces biological activity of the antigen it binds, such as CD37. In a certain embodiment blocking antibodies or antagonist antibodies substantially or completely inhibit the biological activity of the antigen. Desirably, the biological activity is reduced by 10%, 20%, 30%, 50%, 70%, 80%, 90%, 95%, or even 100%.

**[0071]** The term "anti-CD37 antibody" or "an antibody that binds to CD37" refers to an antibody that is capable of binding CD37 with sufficient affinity such that the antibody is useful as a diagnostic and/or therapeutic agent in targeting CD37. The extent of binding of an anti-CD37 antibody to an unrelated, non-CD37 protein is less than about 10% of the binding of the antibody to CD37 as measured, e.g., by a radioimmunoassay (RIA). In certain embodiments, an antibody that binds to CD37 has a dissociation constant (Kd) of  $\leq 1 \mu\text{M}$ ,  $\leq 100 \text{ nM}$ ,  $\leq 10 \text{ nM}$ ,  $\leq 1 \text{ nM}$ , or  $\leq 0.1 \text{ nM}$ . Examples of anti-CD37 antibodies are known in the art and are disclosed, for example, in U.S. Published Application No 2011/0256153, which is herein incorporated by reference.

**[0072]** A "monoclonal" antibody or antigen-binding fragment thereof refers to a homogeneous antibody or antigen-binding fragment population involved in the highly specific recognition and binding of a single antigenic determinant, or epitope. This is in contrast to polyclonal antibodies that typically include different antibodies directed against different antigenic determinants. The term "monoclonal" antibody or antigen-binding fragment thereof encompasses intact and full-length monoclonal antibodies as well as antibody fragments (such as Fab, Fab', F(ab')2, Fv), single chain (scFv) mutants, fusion proteins comprising an antibody portion, and any other modified immunoglobulin molecule comprising an antigen recognition site. Furthermore, "monoclonal" antibody or antigen-binding fragment thereof refers to such antibodies and antigen-binding fragments thereof made in any number of manners including but not limited to by hybridoma, phage selection, recombinant expression, and transgenic animals.

**[0073]** The term "humanized" antibody or antigen-binding fragment thereof refers to forms of non-human (e.g., murine) antibodies or antigen-binding fragments that are specific immunoglobulin chains, chimeric immunoglobulins, or fragments thereof that contain minimal non-human (e.g., murine) sequences. Typically, humanized antibodies or antigen-binding fragments thereof are human immunoglobulins in which residues from the complementary determining region (CDR) are replaced by residues from the CDR of a non-human species (e.g., mouse, rat, rabbit, hamster) that have the desired specificity, affinity, and capability (Jones et al.,

1986, *Nature*, 321:522-525; Riechmann et al., 1988, *Nature*, 332:323-327; Verhoeyen et al., 1988, *Science*, 239:1534-1536). In some instances, the Fv framework region (FR) residues of a human immunoglobulin are replaced with the corresponding residues in an antibody or fragment from a non-human species that has the desired specificity, affinity, and capability. The humanized antibody or antigen-binding fragment thereof can be further modified by the substitution of additional residues either in the Fv framework region and/or within the replaced non-human residues to refine and optimize antibody or antigen-binding fragment thereof specificity, affinity, and/or capability. In general, the humanized antibody or antigen-binding fragment thereof will comprise substantially all of at least one, and typically two or three, variable domains containing all or substantially all of the CDR regions that correspond to the non-human immunoglobulin whereas all or substantially all of the FR regions are those of a human immunoglobulin consensus sequence. The humanized antibody or antigen-binding fragment thereof can also comprise at least a portion of an immunoglobulin constant region or domain (Fc), typically that of a human immunoglobulin. Examples of methods used to generate humanized antibodies are described in U.S. Pat. 5,225,539 or 5,639,641.

**[0074]** The term "primary" antibody or antigen-binding fragment thereof herein refers to an antibody or antigen-binding fragment thereof that binds specifically to the target protein antigen in a sample. A primary antibody or antigen-binding fragment thereof is generally the first antibody or antigen-binding fragment thereof used in an immunohistochemical procedure. In one embodiment, the primary antibody or antigen-binding fragment thereof is the only antibody or antigen-binding fragment thereof used in an immunohistochemical procedure. The term "secondary" antibody or antigen-binding fragment thereof herein refers to an antibody or antigen-binding fragment thereof that binds specifically to a primary antibody or antigen-binding fragment thereof, thereby forming a bridge between the primary antibody or antigen-binding fragment thereof and a subsequent reagent, if any. The secondary antibody or antigen-binding fragment thereof is generally the second antibody or antigen-binding fragment thereof used in an immunohistochemical procedure. The term "tertiary" antibody herein refers to an antibody or antigen-binding fragment thereof that binds specifically to a secondary antibody or antigen-binding fragment thereof, thereby forming a bridge between the secondary antibody or antigen-binding fragment thereof and a subsequent reagent, if any.

**[0075]** A "variable region" of an antibody or antigen-binding fragment thereof refers to the variable region of the antibody light chain or the variable region of the antibody heavy chain,

either alone or in combination. The variable regions of the heavy and light chain each consist of four framework regions (FR) connected by three complementarity determining regions (CDRs) also known as hypervariable regions. The CDRs in each chain are held together in close proximity by the FRs and, with the CDRs from the other chain, contribute to the formation of the antigen-binding site of antibodies. There are at least two techniques for determining CDRs: (1) an approach based on cross-species sequence variability (i.e., Kabat et al. Sequences of Proteins of Immunological Interest, (5th ed., 1991, National Institutes of Health, Bethesda Md.)); and (2) an approach based on crystallographic studies of antigen-antibody complexes (Al-lazikani et al (1997) *J. Molec. Biol.* 273:927-948)). In addition, combinations of these two approaches are sometimes used in the art to determine CDRs.

**[0076]** The Kabat numbering system is generally used when referring to a residue in the variable domain (approximately residues 1-107 of the light chain and residues 1-113 of the heavy chain) (e.g., Kabat et al., Sequences of Immunological Interest. 5th Ed. Public Health Service, National Institutes of Health, Bethesda, Md. (1991)).

**[0077]** The amino acid position numbering as in Kabat, refers to the numbering system used for heavy chain variable domains or light chain variable domains of the compilation of antibodies in Kabat et al., Sequences of Proteins of Immunological Interest, 5th Ed. Public Health Service, National Institutes of Health, Bethesda, Md. (1991). Using this numbering system, the actual linear amino acid sequence can contain fewer or additional amino acids corresponding to a shortening of, or insertion into, a FR or CDR of the variable domain. For example, a heavy chain variable domain can include a single amino acid insert (residue 52a according to Kabat) after residue 52 of H2 and inserted residues (e.g., residues 82a, 82b, and 82c, etc. according to Kabat) after heavy chain FR residue 82. The Kabat numbering of residues can be determined for a given antibody by alignment at regions of homology of the sequence of the antibody with a "standard" Kabat numbered sequence. Chothia refers instead to the location of the structural loops (Chothia and Lesk *J. Mol. Biol.* 196:901-917 (1987)). The end of the Chothia CDR-H1 loop when numbered using the Kabat numbering convention varies between H32 and H34 depending on the length of the loop (this is because the Kabat numbering scheme places the insertions at H35A and H35B; if neither 35A nor 35B is present, the loop ends at 32; if only 35A is present, the loop ends at 33; if both 35A and 35B are present, the loop ends at 34). The AbM hypervariable regions represent a compromise between the Kabat CDRs and Chothia structural loops, and are used by Oxford Molecular's AbM antibody modeling software.

Loop	Kabat	AbM	Chothia
L1	L24-L34	L24-L34	L24-L34
L2	L50-L56	L50-L56	L50-L56
L3	L89-L97	L89-L97	L89-L97
H1	H31-H35B	H26-H35B	H26-H32..34 (Kabat Numbering)
H1	H31-H35	H26-H35	H26-H32 (Chothia Numbering)
H2	H50-H65	H50-H58	H52-H56
H3	H95-H102	H95-H102	H95-H102

**[0078]** The term "human" antibody or antigen-binding fragment thereof means an antibody or antigen-binding fragment thereof produced by a human or an antibody or antigen-binding fragment thereof having an amino acid sequence corresponding to an antibody or antigen-binding fragment thereof produced by a human made using any technique known in the art. This definition of a human antibody or antigen-binding fragment thereof includes intact or full-length antibodies, fragments thereof.

**[0079]** The term "chimeric" antibodies or antigen-binding fragments thereof refers to antibodies or antigen-binding fragments thereof wherein the amino acid sequence is derived from two or more species. Typically, the variable region of both light and heavy chains corresponds to the variable region of antibodies or antigen-binding fragments thereof derived from one species of mammals (e.g., mouse, rat, rabbit, etc.) with the desired specificity, affinity, and capability while the constant regions are homologous to the sequences in antibodies or antigen-binding fragments thereof derived from another (usually human) to avoid eliciting an immune response in that species.

**[0080]** The term "epitope" or "antigenic determinant" are used interchangeably herein and refer to that portion of an antigen capable of being recognized and specifically bound by a particular antibody or antigen-binding fragment thereof. When the antigen is a polypeptide, epitopes can be formed both from contiguous amino acids and noncontiguous amino acids juxtaposed by tertiary folding of a protein. Epitopes formed from contiguous amino acids are typically retained upon protein denaturing, whereas epitopes formed by tertiary folding are typically lost upon protein denaturing. An epitope typically includes at least 3, and more usually, at least 5 or 8-10 amino acids in a unique spatial conformation.

**[0081]** "Binding affinity" generally refers to the strength of the sum total of noncovalent interactions between a single binding site of a molecule (e.g., an antibody) and its binding partner (e.g., an antigen). Unless indicated otherwise, as used herein, "binding affinity" refers to intrinsic binding affinity which reflects a 1:1 interaction between members of a binding pair (e.g., antibody and antigen). The affinity of a molecule X for its partner Y can generally be represented by the dissociation constant (Kd). Affinity can be measured by common methods known in the art, including those described herein. Low-affinity antibodies generally bind antigen slowly and tend to dissociate readily, whereas high-affinity antibodies generally bind antigen faster and tend to remain bound longer. A variety of methods of measuring binding affinity are known in the art, any of which can be used for purposes of the present invention. Specific illustrative embodiments are described in the following.

**[0082]** "Or better" when used herein to refer to binding affinity refers to a stronger binding between a molecule and its binding partner. "Or better" when used herein refers to a stronger binding, represented by a smaller numerical Kd value. For example, an antibody which has an affinity for an antigen of "0.6 nM or better", the antibody's affinity for the antigen is <0.6 nM, i.e., 0.59 nM, 0.58 nM, 0.57 nM etc. or any value less than 0.6 nM.

**[0083]** The phrase "substantially similar," or "substantially the same", as used herein, denotes a sufficiently high degree of similarity between two numeric values (generally one associated with an antibody of the invention and the other associated with a reference/comparator antibody) such that one of skill in the art would consider the difference between the two values to be of little or no biological and/or statistical significance within the context of the biological characteristics measured by said values (e.g., Kd values). The difference between said two values is less than about 50%, less than about 40%, less than about 30%, less than about 20%, or less than about 10% as a function of the value for the reference/comparator antibody.

**[0084]** A polypeptide, antibody, polynucleotide, vector, cell, or composition which is "isolated" is a polypeptide, antibody, polynucleotide, vector, cell, or composition which is in a form not found in nature. Isolated polypeptides, antibodies, polynucleotides, vectors, cell or compositions include those which have been purified to a degree that they are no longer in a form in which they are found in nature. In some embodiments, an antibody, polynucleotide, vector, cell, or composition which is isolated is substantially pure.

**[0085]** As used herein, "substantially pure" refers to material which is at least 50% pure (i.e., free from contaminants), at least 90% pure, at least 95% pure, at least 98% pure, or at least 99% pure.

**[0086]** The term "immunoconjugate" or "conjugate" as used herein refers to a compound or a derivative thereof that is linked to a cell binding agent (i.e., an anti-CD37 antibody or antigen-binding fragment thereof) and is defined by a generic formula: C-L-A, wherein C=cytotoxin, L=linker, and A=cell binding agent or anti-CD37 antibody or antigen-binding fragment thereof. Immunoconjugates can also be defined by the generic formula in reverse order: A-L-C.

**[0087]** A "linker" is any chemical moiety that is capable of linking a compound, usually a drug, such as a maytansinoid, to a cell-binding agent such as an anti CD37 antibody or a fragment thereof in a stable, covalent manner. Linkers can be susceptible to or be substantially resistant to acid-induced cleavage, light-induced cleavage, peptidase-induced cleavage, esterase induced cleavage, and disulfide bond cleavage, at conditions under which the compound or the antibody remains active. Suitable linkers are well known in the art and include, for example, disulfide groups, thioether groups, acid labile groups, photolabile groups, peptidase labile groups and esterase labile groups. Linkers also include charged linkers, and hydrophilic forms thereof as described herein and known in the art.

**[0088]** The terms "cancer" and "cancerous" refer to or describe the physiological condition in mammals in which a population of cells are characterized by unregulated cell growth. Examples of cancer include, but are not limited to, carcinoma, lymphoma, blastoma, sarcoma, and leukemia. More particular examples of "cancer" or "tumorigenic" diseases include B-cell lymphomas including NHL, precursor B-cell lymphoblastic leukemia/lymphoma and mature B-cell neoplasms, such as B-cell chronic lymphocytic leukemia (CLL)/small lymphocytic lymphoma (SLL), B-cell prolymphocytic leukemia, lymphoplasmacytic lymphoma, mantle cell lymphoma (MCL), follicular lymphoma (FL), including low-grade, intermediate-grade and high-grade FL, cutaneous follicle center lymphoma, marginal zone B-cell lymphoma (MALT type, nodal and splenic type), hairy cell leukemia, diffuse large B-cell lymphoma (DLBCL), Burkitt's lymphoma (BL), plasmacytoma, plasma cell myeloma, post-transplant lymphoproliferative disorder, and anaplastic large-cell lymphoma (ALCL). In some embodiments, the cancer is a leukemia or lymphoma.

**[0089]** "Tumor" and "neoplasm" refer to any mass that result from excessive cell growth or proliferation, either benign (noncancerous) or malignant (cancerous) including pre-cancerous lesions.

**[0090]** The terms "cancer cell," "tumor cell," and grammatical equivalents refer to the total population of cells derived from a tumor or a pre-cancerous lesion, including both non-tumorigenic cells, which comprise the bulk of the tumor cell population, and tumorigenic stem cells (cancer stem cells). As used herein, the term "tumor cell" will be modified by the term "non-tumorigenic" when referring solely to those tumor cells lacking the capacity to renew and differentiate to distinguish those tumor cells from cancer stem cells.

**[0091]** The term "subject" refers to any animal (e.g., a mammal), including, but not limited to humans, non-human primates, rodents, and the like, which is to be the recipient of a particular treatment. Typically, the terms "subject" and "patient" are used interchangeably herein in reference to a human subject.

**[0092]** A "chemotherapeutic agent" is a chemical compound useful in the treatment of cancer, regardless of mechanism of action. Classes of chemotherapeutic agents include, but are not limited to alkylating agents, antimetabolites, spindle poison plant alkaloids, cytotoxic/antitumor antibiotics, topoisomerase inhibitors, antibodies, photosensitizers, and kinase inhibitors. Chemotherapeutic agents include compounds used in "targeted therapy" and conventional chemotherapy.

**[0093]** Administration "in combination with" one or more further therapeutic agents includes simultaneous (concurrent) and consecutive administration in any order.

**[0094]** The term "pharmaceutical formulation" refers to a preparation which is in such form as to permit the biological activity of the active ingredient to be effective, and which contains no additional components which are unacceptably toxic to a subject to which the formulation would be administered. Such formulation can be sterile.

**[0095]** An "effective amount" of an antibody, antigen-binding fragment thereof, or immunoconjugate as disclosed herein is an amount sufficient to carry out a specifically stated purpose. An "effective amount" can be determined empirically and in a routine manner, in relation to the stated purpose.

**[0096]** The term "therapeutically effective amount" refers to an amount of an antibody, antigen-binding fragment thereof, or other drug effective to "treat" a disease or disorder in a subject or mammal. In the case of cancer, the therapeutically effective amount of the drug can

reduce the number of cancer cells; reduce the tumor size; inhibit (i.e., slow to some extent and in a certain embodiment, stop) cancer cell infiltration into peripheral organs; inhibit (i.e., slow to some extent and in a certain embodiment, stop) tumor metastasis; inhibit, to some extent, tumor growth; relieve to some extent one or more of the symptoms associated with the cancer; and/or result in a favorable response such as increased progression-free survival (PFS), disease-free survival (DFS), or overall survival (OS), complete response (CR), partial response (PR), or, in some cases, stable disease (SD), a decrease in progressive disease (PD), a reduced time to progression (TTP), or any combination thereof. See the definition herein of "treating." To the extent the drug can prevent growth and/or kill existing cancer cells, it can be cytostatic and/or cytotoxic. In certain embodiments, identification of increased CD37 levels allows for administration of decreased amounts of the CD37-targeting therapeutic to achieve the same therapeutic effect as seen with higher dosages. A "prophylactically effective amount" refers to an amount effective, at dosages and for periods of time necessary, to achieve the desired prophylactic result. Typically but not necessarily, since a prophylactic dose is used in subjects prior to or at an earlier stage of disease, the prophylactically effective amount will be less than the therapeutically effective amount.

**[0097]** The term "respond favorably" generally refers to causing a beneficial state in a subject. With respect to cancer treatment, the term refers to providing a therapeutic effect on the subject. Positive therapeutic effects in cancer can be measured in a number of ways (See, W.A. Weber, *J. Nucl. Med.* 50:1S-10S (2009)). For example, tumor growth inhibition, molecular marker expression, serum marker expression, and molecular imaging techniques can all be used to assess therapeutic efficacy of an anti-cancer therapeutic. With respect to tumor growth inhibition, according to NCI standards, a  $T/C \leq 42\%$  is the minimum level of anti-tumor activity. A  $T/C < 10\%$  is considered a high anti-tumor activity level, with  $T/C (\%) = \text{Median tumor volume of the treated} / \text{Median tumor volume of the control} \times 100$ . A favorable response can be assessed, for example, by increased progression-free survival (PFS), disease-free survival (DFS), or overall survival (OS), complete response (CR), partial response (PR), or, in some cases, stable disease (SD), a decrease in progressive disease (PD), a reduced time to progression (TTP), or any combination thereof.

**[0098]** PFS, DFS, and OS can be measured by standards set by the National Cancer Institute and the U.S. Food and Drug Administration for the approval of new drugs. See Johnson et al, (2003) *J. Clin. Oncol.* 21(7):1404-1411.

**[0099]** "Progression free survival" (PFS) refers to the time from enrollment to disease progression or death. For NHL patients, PFS can be measured using the standards provided in the International Harmonization Project's Revised Response Criteria for Malignant Lymphoma (Cheson *et al*, *J Clin Oncol.* 25:579-86 (2007), which is herein incorporated by reference in its entirety). For CLL patients, PFS can be measured using the standards provided in the National Cancer Institute (NCI) International Workshop on CLL Response Criteria (Hallek *et al*, *Blood*, 111:5446-56 (2008), which is herein incorporated by reference in its entirety). For Hodgkin's and non-Hodgkin's lymphoma patients, PFS can be measured using the Lugano Classification standards (Cheson *et al*, *J Clin Oncol.* 32:3059-68 (2014)). Generally, progression free survival refers to the situation wherein a patient remains alive, without the cancer getting worse.

**[0100]** "Time to Tumor Progression" (TTP) is defined as the time from enrollment to disease progression. For NHL patients, TTP can be measured using the standards provided in the International Harmonization Project's Revised Response Criteria for Malignant Lymphoma (Cheson *et al*, *J Clin Oncol.* 25:579-86 (2007), which is herein incorporated by reference in its entirety). For CLL patients, TTP can be measured using the standards provided in the National Cancer Institute (NCI) International Workshop on CLL Response Criteria (Hallek *et al*, *Blood*, 111:5446-56 (2008), which is herein incorporated by reference in its entirety). For Hodgkin's and non-Hodgkin's lymphoma patients, TTP can be measured using the Lugano Classification standards (Cheson *et al*, *J Clin Oncol.* 32:3059-68 (2014)).

**[0101]** A "complete response" or "complete remission" or "CR" indicates the disappearance of all signs of tumor or cancer in response to treatment. This does not always mean the cancer has been cured.

**[0102]** A "partial response" or "PR" refers to a decrease in the size or volume of one or more tumors or lesions, or in the extent of cancer in the body, in response to treatment.

**[0103]** "Stable disease" refers to disease without progression or relapse. In stable disease there is neither sufficient tumor shrinkage to qualify for partial response nor sufficient tumor increase to qualify as progressive disease.

**[0104]** "Progressive disease" refers to the appearance of one more new lesions or tumors and/or the unequivocal progression of existing non-target lesions. Progressive disease can also refer to a tumor growth of more than 20 percent since treatment began, either due to an increases in mass or in spread of the tumor.

**[0105]** "Disease free survival" (DFS) refers to the length of time during and after treatment that the patient remains free of disease.

**[0106]** "Overall Survival" (OS) refers to the time from patient enrollment to death or censored at the date last known alive. OS includes a prolongation in life expectancy as compared to naive or untreated individuals or patients. Overall survival refers to the situation wherein a patient remains alive for a defined period of time, such as one year, five years, etc., e.g., from the time of diagnosis or treatment.

**[0107]** Terms such as "treating" or "treatment" or "to treat" or "alleviating" or "to alleviate" refer to therapeutic measures that cure, slow down, lessen symptoms of, and/or halt progression of a diagnosed pathologic condition or disorder. Thus, those in need of treatment include those already diagnosed with or suspected of having the disorder. In certain embodiments, a subject is successfully "treated" for cancer according to the methods of the present invention if the patient shows one or more of the following: a reduction in the number of or complete absence of cancer cells; a reduction in the tumor size; inhibition of or an absence of cancer cell infiltration into peripheral organs including, for example, the spread of cancer into soft tissue and bone; inhibition of or an absence of tumor metastasis; inhibition or an absence of tumor growth; relief of one or more symptoms associated with the specific cancer; reduced morbidity and mortality; improvement in quality of life; reduction in tumorigenicity, tumorigenic frequency, or tumorigenic capacity, of a tumor; reduction in the number or frequency of cancer stem cells in a tumor; differentiation of tumorigenic cells to a non-tumorigenic state; increased progression-free survival (PFS), disease-free survival (DFS), or overall survival (OS), complete response (CR), partial response (PR), stable disease (SD), a decrease in progressive disease (PD), a reduced time to progression (TTP), or any combination thereof.

**[0108]** Prophylactic or preventative measures refer to therapeutic measures that prevent and/or slow the development of a targeted pathologic condition or disorder. Thus, those in need of prophylactic or preventative measures include those prone to have the disorder and those in whom the disorder is to be prevented.

**[0109]** As used herein, the term "healthcare provider" refers to individuals or institutions which directly interact with and administer to living subjects, e.g., human patients. Non-limiting examples of healthcare providers include doctors, nurses, technicians, therapist, pharmacists, counselors, alternative medicine practitioners, medical facilities, doctor's offices, hospitals, emergency rooms, clinics, urgent care centers, alternative medicine clinics/facilities, and any

other entity providing general and/or specialized treatment, assessment, maintenance, therapy, medication, and/or advice relating to all, or any portion of, a patient's state of health, including but not limited to general medical, specialized medical, surgical, and/or any other type of treatment, assessment, maintenance, therapy, medication and/or advice.

**[0110]** In some aspects, a healthcare provider can administer or instruct another healthcare provider to administer a therapy to treat a cancer. "Administration" of a therapy, as used herein, includes prescribing a therapy to a subject as well as delivering, applying, or giving the therapy to a subject. A healthcare provider can implement or instruct another healthcare provider or patient to perform the following actions: obtain a sample, process a sample, submit a sample, receive a sample, transfer a sample, analyze or measure a sample, quantify a sample, provide the results obtained after analyzing/measuring/quantifying a sample, receive the results obtained after analyzing/measuring/quantifying a sample, compare/score the results obtained after analyzing/measuring/quantifying one or more samples, provide the comparison/score from one or more samples, obtain the comparison/score from one or more samples, administer a therapy or therapeutic agent (*e.g.*, a CD37 binding agent), commence the administration of a therapy, cease the administration of a therapy, continue the administration of a therapy, temporarily interrupt the administration of a therapy, increase the amount of an administered therapeutic agent, decrease the amount of an administered therapeutic agent, continue the administration of an amount of a therapeutic agent, increase the frequency of administration of a therapeutic agent, decrease the frequency of administration of a therapeutic agent, maintain the same dosing frequency on a therapeutic agent, replace a therapy or therapeutic agent by at least another therapy or therapeutic agent, combine a therapy or therapeutic agent with at least another therapy or additional therapeutic agent. These actions can be performed by a healthcare provider automatically using a computer-implemented method (*e.g.*, via a web service or stand-alone computer system).

**[0111]** "Polynucleotide" or "nucleic acid," as used interchangeably herein, refer to polymers of nucleotides of any length, and include DNA and RNA. The nucleotides can be deoxyribonucleotides, ribonucleotides, modified nucleotides or bases, and/or their analogs, or any substrate that can be incorporated into a polymer by DNA or RNA polymerase. A polynucleotide can comprise modified nucleotides, such as methylated nucleotides and their analogs. If present, modification to the nucleotide structure can be imparted before or after assembly of the polymer. The sequence of nucleotides can be interrupted by non-nucleotide

components. A polynucleotide can be further modified after polymerization, such as by conjugation with a labeling component. Other types of modifications include, for example, "caps," substitution of one or more of the naturally occurring nucleotides with an analog, internucleotide modifications such as, for example, those with uncharged linkages (e.g., methyl phosphonates, phosphotriesters, phosphoamidates, cabamates, etc.) and with charged linkages (e.g., phosphorothioates, phosphorodithioates, etc.), those containing pendant moieties, such as, for example, proteins (e.g., nucleases, toxins, antibodies, signal peptides, poly-L-lysine, etc.), those with intercalators (e.g., acridine, psoralen, etc.), those containing chelators (e.g., metals, radioactive metals, boron, oxidative metals, etc.), those containing alkylators, those with modified linkages (e.g., alpha anomeric nucleic acids, etc.), as well as unmodified forms of the polynucleotide(s). Further, any of the hydroxyl groups ordinarily present in the sugars can be replaced, for example, by phosphonate groups, phosphate groups, protected by standard protecting groups, or activated to prepare additional linkages to additional nucleotides, or can be conjugated to solid supports. The 5' and 3' terminal OH can be phosphorylated or substituted with amines or organic capping group moieties of from 1 to 20 carbon atoms. Other hydroxyls can also be derivatized to standard protecting groups. Polynucleotides can also contain analogous forms of ribose or deoxyribose sugars that are generally known in the art, including, for example, 2'-O-methyl-, 2'-O-allyl, 2'-fluoro- or 2'-azido-ribose, carbocyclic sugar analogs, alpha-anomeric sugars, epimeric sugars such as arabinose, xyloses or lyxoses, pyranose sugars, furanose sugars, sedoheptuloses, acyclic analogs and abasic nucleoside analogs such as methyl riboside. One or more phosphodiester linkages can be replaced by alternative linking groups. These alternative linking groups include, but are not limited to, embodiments wherein phosphate is replaced by P(O)S ("thioate"), P(S)S ("dithioate"), (O)NR<sub>2</sub> ("amidate"), P(O)R, P(O)OR', CO or CH<sub>2</sub> ("formacetal"), in which each R or R' is independently H or substituted or unsubstituted alkyl (1-20 C) optionally containing an ether (--O--) linkage, aryl, alkenyl, cycloalkyl, cycloalkenyl or araldyl. Not all linkages in a polynucleotide need be identical. The preceding description applies to all polynucleotides referred to herein, including RNA and DNA.

**[0112]** The term "vector" means a construct, which is capable of delivering, and expressing, one or more gene(s) or sequence(s) of interest in a host cell. Examples of vectors include, but are not limited to, viral vectors, naked DNA or RNA expression vectors, plasmid, cosmid or phage vectors, DNA or RNA expression vectors associated with cationic condensing

agents, DNA or RNA expression vectors encapsulated in liposomes, and certain eukaryotic cells, such as producer cells.

**[0113]** The terms "polypeptide," "peptide," and "protein" are used interchangeably herein to refer to polymers of amino acids of any length. The polymer can be linear or branched, it can comprise modified amino acids, and it can be interrupted by non-amino acids. The terms also encompass an amino acid polymer that has been modified naturally or by intervention; for example, disulfide bond formation, glycosylation, lipidation, acetylation, phosphorylation, or any other manipulation or modification, such as conjugation with a labeling component. Also included within the definition are, for example, polypeptides containing one or more analogs of an amino acid (including, for example, unnatural amino acids, etc.), as well as other modifications known in the art. It is understood that, because the polypeptides of this invention are based upon antibodies, in certain embodiments, the polypeptides can occur as single chains or associated chains. In some embodiments, a polypeptide, peptide, or protein is non-naturally occurring. In some embodiments, a polypeptide, peptide, or protein is purified from other naturally occurring components. In some embodiments, the polypeptide, peptide, or protein is recombinantly produced.

**[0114]** The terms "identical" or percent "identity" in the context of two or more nucleic acids or polypeptides, refer to two or more sequences or subsequences that are the same or have a specified percentage of nucleotides or amino acid residues that are the same, when compared and aligned (introducing gaps, if necessary) for maximum correspondence, not considering any conservative amino acid substitutions as part of the sequence identity. The percent identity can be measured using sequence comparison software or algorithms or by visual inspection. Various algorithms and software are known in the art that can be used to obtain alignments of amino acid or nucleotide sequences. One such non-limiting example of a sequence alignment algorithm is the algorithm described in Karlin et al, 1990, *Proc. Natl. Acad. Sci.*, 87:2264-2268, as modified in Karlin et al., 1993, *Proc. Natl. Acad. Sci.*, 90:5873-5877, and incorporated into the NBLAST and XBLAST programs (Altschul et al., 1991, *Nucleic Acids Res.*, 25:3389-3402). In certain embodiments, Gapped BLAST can be used as described in Altschul et al., 1997, *Nucleic Acids Res.* 25:3389-3402. BLAST-2, WU-BLAST-2 (Altschul et al., 1996, *Methods in Enzymology*, 266:460-480), ALIGN, ALIGN-2 (Genentech, South San Francisco, California) or Megalign (DNASTAR) are additional publicly available software programs that can be used to align sequences. In certain embodiments, the percent identity between two nucleotide sequences is

determined using the GAP program in GCG software (e.g., using a NWSgapdna.CMP matrix and a gap weight of 40, 50, 60, 70, or 90 and a length weight of 1, 2, 3, 4, 5, or 6). In certain alternative embodiments, the GAP program in the GCG software package, which incorporates the algorithm of Needleman and Wunsch (*J. Mol. Biol.* (48):444-453 (1970)) can be used to determine the percent identity between two amino acid sequences (e.g., using either a Blossum 62 matrix or a PAM250 matrix, and a gap weight of 16, 14, 12, 10, 8, 6, or 4 and a length weight of 1, 2, 3, 4, 5). Alternatively, in certain embodiments, the percent identity between nucleotide or amino acid sequences is determined using the algorithm of Myers and Miller (CABIOS, 4:11-17 (1989)). For example, the percent identity can be determined using the ALIGN program (version 2.0) and using a PAM120 with residue table, a gap length penalty of 12 and a gap penalty of 4. Appropriate parameters for maximal alignment by particular alignment software can be determined by one skilled in the art. In certain embodiments, the default parameters of the alignment software are used. In certain embodiments, the percentage identity "X" of a first amino acid sequence to a second sequence amino acid is calculated as  $100 \times (Y/Z)$ , where Y is the number of amino acid residues scored as identical matches in the alignment of the first and second sequences (as aligned by visual inspection or a particular sequence alignment program) and Z is the total number of residues in the second sequence. If the length of a first sequence is longer than the second sequence, the percent identity of the first sequence to the second sequence will be longer than the percent identity of the second sequence to the first sequence.

**[0115]** As a non-limiting example, whether any particular polynucleotide has a certain percentage sequence identity (e.g., is at least 80% identical, at least 85% identical, at least 90% identical, and in some embodiments, at least 95%, 96%, 97%, 98%, or 99% identical) to a reference sequence can, in certain embodiments, be determined using the Bestfit program (Wisconsin Sequence Analysis Package, Version 8 for Unix, Genetics Computer Group, University Research Park, 575 Science Drive, Madison, WI 53711). Bestfit uses the local homology algorithm of Smith and Waterman, *Advances in Applied Mathematics* 2: 482 489 (1981), to find the best segment of homology between two sequences. When using Bestfit or any other sequence alignment program to determine whether a particular sequence is, for instance, 95% identical to a reference sequence according to the present invention, the parameters are set such that the percentage of identity is calculated over the full length of the reference nucleotide sequence and that gaps in homology of up to 5% of the total number of nucleotides in the reference sequence are allowed.

**[0116]** In some embodiments, two nucleic acids or polypeptides of the invention are substantially identical, meaning they have at least 70%, at least 75%, at least 80%, at least 85%, at least 90%, and in some embodiments at least 95%, 96%, 97%, 98%, 99% nucleotide or amino acid residue identity, when compared and aligned for maximum correspondence, as measured using a sequence comparison algorithm or by visual inspection. In certain embodiments, identity exists over a region of the sequences that is at least about 10, about 20, about 40-60 residues in length or any integral value therebetween, or over a longer region than 60-80 residues, at least about 90-100 residues, or the sequences are substantially identical over the full length of the sequences being compared, such as the coding region of a nucleotide sequence for example.

**[0117]** A "conservative amino acid substitution" is one in which one amino acid residue is replaced with another amino acid residue having a similar side chain. Families of amino acid residues having similar side chains have been defined in the art, including basic side chains (e.g., lysine, arginine, histidine), acidic side chains (e.g., aspartic acid, glutamic acid), uncharged polar side chains (e.g., asparagine, glutamine, serine, threonine, tyrosine, cysteine), nonpolar side chains (e.g., glycine, alanine, valine, leucine, isoleucine, proline, phenylalanine, methionine, tryptophan), beta-branched side chains (e.g., threonine, valine, isoleucine) and aromatic side chains (e.g., tyrosine, phenylalanine, tryptophan, histidine). For example, substitution of a phenylalanine for a tyrosine is a conservative substitution. In certain embodiments, conservative substitutions in the sequences of the polypeptides and antibodies of the invention do not abrogate the binding of the polypeptide or antibody containing the amino acid sequence, to the antigen(s), i.e., the CD37 to which the polypeptide or antibody binds. Methods of identifying nucleotide and amino acid conservative substitutions which do not eliminate antigen-binding are well-known in the art (see, e.g., Brummell et al., *Biochem.* 32: 1180-1 187 (1993); Kobayashi et al. *Protein Eng.* 12(10):879-884 (1999); and Burks et al. *Proc. Natl. Acad. Sci. USA* 94:412-417 (1997)).

**[0118]** As used in the present disclosure and claims, the singular forms "a," "an," and "the" include plural forms unless the context clearly dictates otherwise.

**[0119]** It is understood that wherever embodiments are described herein with the language "comprising," otherwise analogous embodiments described in terms of "consisting of" and/or "consisting essentially of" are also provided.

**[0120]** The term "and/or" as used in a phrase such as "A and/or B" herein is intended to include both "A and B," "A or B," "A," and "B." Likewise, the term "and/or" as used in a phrase such as "A, B, and/or C" is intended to encompass each of the following embodiments: A, B, and

C; A, B, or C; A or C; A or B; B or C; A and C; A and B; B and C; A (alone); B (alone); and C (alone).

## II. CD37-binding agents

[0121] The present disclosure provides agents that specifically bind human CD37. These agents are referred to herein as "CD37-binding agents." In certain embodiments, the CD37 binding agents are antibodies, antigen-binding fragments thereof, immunoconjugates, or polypeptides. The full-length amino acid sequences for human CD37 are known in the art and also provided herein as represented by SEQ ID NO:1, respectively.

[0122] Human CD37:

MSAQESCLSLIKYFLVFNLFFFVLGSLIFCGIWIILDKTSFVSVGLAFVPLQIWSKVLAISGIFTMGIALLGCVGALKELRCLLGLYFGMLLLLFATQITLGILISTQRAQLERSLRDVVEKTIQKYGTNPEETAAEESWDYVQFQLRCCGWHYPQDWFQVLILRGNGSEAHRVPCSCYNLSATNDSTILDKVILPQLSRLGHLARSRHSADICAVPAESHIYREGCAQGLQKWLHNNLISIVGICLGVGLLELGFMTLSIFLCRNLDHVYNRLARYR (SEQ ID NO:1)

**[0126]** CD37-binding agents include CD37-binding agents (e.g., antibodies and antigen-binding fragments thereof) that comprise the six CDR sequences of the 1B11-2 antibody provided in SEQ ID NOs:3-8.

**[0127]** The CD37-binding molecules can be CD37-binding agents (e.g., antibodies and antigen-binding fragments thereof) that comprise the CDRs of antibody 1B11-2 (i.e., SEQ ID NOs: 3-8), with up to four (i.e., 0, 1, 2, 3, or 4) conservative amino acid substitutions per CDR. The CD37-binding molecules can be CD37-binding agents (e.g., antibodies and antigen-binding fragments thereof) that comprise the CDRs of antibody 1B11-2 (i.e., SEQ ID NOs: 3-8), with up to four (i.e., 0, 1, 2, 3, or 4) conservative amino acid substitutions. The CD37-binding molecules can be CD37-binding agents (e.g., antibodies and antigen-binding fragments thereof) that comprise (i) the CDRs of SEQ ID NOs: 3, 4, 6, and 7, with up to four (i.e., 0, 1, 2, 3, or 4) conservative amino acid substitutions per CDR and (ii) the CDRs of SEQ ID NOs: 5 and 8. The CD37-binding molecules can be CD37-binding agents (e.g., antibodies and antigen-binding fragments thereof) that comprise (i) the CDRs of SEQ ID NOs: 3, 4, 6, and 7, with up to four (i.e., 0, 1, 2, 3, or 4) conservative amino acid substitutions and (ii) the CDRs of SEQ ID NOs: 5 and 8. The CD37-binding molecules can be CD37-binding agents (e.g., antibodies and antigen-binding fragments thereof) that comprise (i) the CDRs of SEQ ID NOs: 3, 4, and 6-8, with up to four (i.e., 0, 1, 2, 3, or 4) conservative amino acid substitutions per CDR and (ii) the CDR of SEQ ID NO:5. The CD37-binding molecules can be CD37-binding agents (e.g., antibodies and antigen-binding fragments thereof) that comprise (i) the CDRs of SEQ ID NOs: 3, 4, and 6-8, with up to four (i.e., 0, 1, 2, 3, or 4) conservative amino acid substitutions and (ii) the CDR of SEQ ID NO:5.

**[0128]** Polypeptides, antibodies, and antigen-binding fragments thereof can comprise the variable light chain, the variable heavy chain, or both the variable light and variable heavy chains of the 1B11-2 antibody. Also provided are polypeptides that comprise (a) a polypeptide having at least 90% sequence identity to SEQ ID NO:9 and/or (b) a polypeptide having at least 90% sequence identity to SEQ ID NO:10. In certain embodiments, the polypeptide is an antibody and/or the polypeptide specifically binds CD37. In certain embodiments, the polypeptide is a murine, chimeric, or humanized antibody that specifically binds CD37. In certain embodiments, the polypeptide having a certain percentage of sequence identity to SEQ ID NO:9 or 10 differs from SEQ ID NO:9 or 10 by conservative amino acid substitutions only.

**[0129]** In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable heavy chain domain comprising a sequence at least 95% identical to SEQ ID NO:9. In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable heavy chain domain comprising a sequence at least 96% identical to SEQ ID NO:9. In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable heavy chain domain comprising a sequence at least 97% identical to SEQ ID NO:9. In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable heavy chain domain comprising a sequence at least 98% identical to SEQ ID NO:9. In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable heavy chain domain comprising a sequence at least 99% identical to SEQ ID NO:9. In certain embodiments, the polypeptide is an antibody and/or the polypeptide specifically binds CD37. In certain embodiments, the polypeptide is a murine, chimeric, or humanized antibody that specifically binds CD37. In certain embodiments, the polypeptide having a certain percentage of sequence identity to SEQ ID NO:9 differs from SEQ ID NO:9 by conservative amino acid substitutions only. In certain embodiments, the polypeptide having a certain percentage of sequence identity to SEQ ID NO:9 differs from SEQ ID NO:9 only in amino acids outside of the CDRs. In certain embodiments, the polypeptide having a certain percentage of sequence identity to SEQ ID NO:9 differs from SEQ ID NO:9 only by conservative amino acid substitutions outside of the CDRs.

**[0130]** In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable light chain domain comprising a sequence at least 95% identical to SEQ ID NO:10. In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable light chain domain comprising a sequence at least 96% identical to SEQ ID NO: 10. In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable light chain domain comprising a sequence at least 97% identical to SEQ ID NO: 10. In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable light chain domain comprising a sequence at least 98% identical to SEQ ID NO: 10. In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable light chain domain comprising a sequence at least 99% identical to SEQ ID NO: 10. In certain embodiments, the polypeptide is an antibody and/or the polypeptide specifically binds CD37. In certain embodiments, the polypeptide is a murine, chimeric, or humanized antibody that specifically binds CD37. In certain embodiments, the polypeptide

having a certain percentage of sequence identity to SEQ ID NO:10 differs from SEQ ID NO:10 by conservative amino acid substitutions only. In certain embodiments, the polypeptide having a certain percentage of sequence identity to SEQ ID NO:10 differs from SEQ ID NO:10 only in amino acids outside of the CDRs. In certain embodiments, the polypeptide having a certain percentage of sequence identity to SEQ ID NO:10 differs from SEQ ID NO:10 only by conservative amino acid substitutions outside of the CDRs.

**[0131]** In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable heavy chain domain comprising a sequence at least 95% identical to SEQ ID NO:9 and a variable light chain domain comprising a sequence at least 95% identical to SEQ ID NO:10. In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable heavy chain domain comprising a sequence at least 96% identical to SEQ ID NO:9 and a variable light chain domain comprising a sequence at least 96% identical to SEQ ID NO:10. In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable heavy chain domain comprising a sequence at least 97% identical to SEQ ID NO:9 and a variable light chain domain comprising a sequence at least 97% identical to SEQ ID NO:10. In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable heavy chain domain comprising a sequence at least 98% identical to SEQ ID NO:9 and a variable light chain domain comprising a sequence at least 98% identical to SEQ ID NO:10. In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable heavy chain domain comprising a sequence at least 99% identical to SEQ ID NO:9 and a variable light chain domain comprising a sequence at least 99% identical to SEQ ID NO:10. In certain embodiments, the polypeptide is an antibody and/or the polypeptide specifically binds CD37. In certain embodiments, the polypeptide is a murine, chimeric, or humanized antibody that specifically binds CD37. In certain embodiments, the polypeptide having a certain percentage of sequence identity to SEQ ID NO:9 and/or 10 differs from SEQ ID NO:9 and/or 10 by conservative amino acid substitutions only. In certain embodiments, the polypeptide having a certain percentage of sequence identity to SEQ ID NO:9 and/or 10 differs from SEQ ID NO:9 and/or 10 only in amino acids outside of the CDRs. In certain embodiments, the polypeptide having a certain percentage of sequence identity to SEQ ID NO:9 and/or 10 differs from SEQ ID NO:9 and/or 10 only by conservative amino acid substitutions outside of the CDRs.

**[0132]** In certain embodiments, a polypeptide, antibody, or antigen-binding fragment thereof comprises a variable heavy chain domain comprising the sequence set forth in SEQ ID NO:9 and a variable light chain domain comprising the sequence set forth in SEQ ID NO:10.

**[0133]** Polypeptides can comprise one of the individual light chains or heavy chains described herein. Antibodies and polypeptides can also comprise both a light chain and a heavy chain. The light chain and heavy chain sequences of antibody 1B11-2 are provided in SEQ ID NOs:11 and 12.

**[0134]** Also provided are polypeptides that comprise: (a) a polypeptide having at least about 90% sequence identity to SEQ ID NO:11; and/or (b) a polypeptide having at least about 90% sequence identity to SEQ ID NO:12. In certain embodiments, the polypeptide comprises a polypeptide having at least about 95%, at least about 96%, at least about 97%, at least about 98%, or at least about 99% sequence identity to SEQ ID NO:11 or 12. Thus, in certain embodiments, the polypeptide comprises (a) a polypeptide having at least about 95% sequence identity to SEQ ID NO:11, and/or (b) a polypeptide having at least about 95% sequence identity to SEQ ID NO:12. In certain embodiments, the polypeptide comprises (a) a polypeptide having the amino acid sequence of SEQ ID NO:11; and/or (b) a polypeptide having the amino acid sequence of SEQ ID NO:12. In certain embodiments, the polypeptide is an antibody and/or the polypeptide specifically binds CD37. In certain embodiments, the polypeptide is a murine, chimeric, or humanized antibody that specifically binds CD37. In certain embodiments, the polypeptide having a certain percentage of sequence identity to SEQ ID NO:11 and/or 12 differs from SEQ ID NO:11 and/or 12 by conservative amino acid substitutions only. In certain embodiments, the polypeptide having a certain percentage of sequence identity to SEQ ID NO:11 and/or 12 differs from SEQ ID NO:11 and/or 12 only in amino acids outside of the CDRs. In certain embodiments, the polypeptide having a certain percentage of sequence identity to SEQ ID NO:11 and/or 12 differs from SEQ ID NO:11 and/or 12 only by conservative amino acid substitutions outside of the CDRs.

**[0135]** In certain embodiments, a CD37-binding agent (e.g., an antibody or antigen-binding fragment thereof) binds to the same epitope as an antibody or antigen-binding fragment thereof comprising a variable heavy chain comprising the sequence set forth in SEQ ID NO:9 and a variable light chain comprising the sequence set forth in SEQ ID NO:10. In certain embodiments, a CD37-binding agent (e.g., an antibody or antigen-binding fragment thereof) competitively inhibits the binding of an antibody or antigen-binding fragment thereof comprising

a variable heavy chain comprising the sequence set forth in SEQ ID NO:9 and a variable light chain comprising the sequence set forth in SEQ ID NO:10 to CD37. In certain embodiments, a CD37-binding agent (e.g., an antibody or antigen-binding fragment thereof) competitively inhibits the binding of an antibody or antigen-binding fragment thereof comprising a variable heavy chain comprising the sequence set forth in SEQ ID NO:9 and a variable light chain comprising the sequence set forth in SEQ ID NO:10 to CD37 and binds to an epitope that overlaps with the epitope to which an antibody or antigen-binding fragment thereof comprising a variable heavy chain comprising the sequence set forth in SEQ ID NO:9 and a variable light chain comprising the sequence set forth in SEQ ID NO:10 binds.

**[0136]** In certain embodiments, a CD37-binding agent (e.g., an antibody or antigen-binding fragment thereof) binds to and/or does not bind to the CD37 antigen sequences below as provided herein.

**[0137]** In some embodiments, the CD37 binding agent (e.g., an antibody or antigen-binding fragment thereof) binds to amino acids 107-242 of CD37 (SEQ ID NO:20). In some embodiments, the CD37 binding agent (e.g., an antibody or antigen-binding fragment thereof) binds to amino acids 107-235 of CD37 (SEQ ID NO:19).

**[0138]** In some embodiments, the CD37 binding agent (e.g., an antibody or antigen-binding fragment thereof) binds to the sequence set forth in SEQ ID NO:15. In some embodiments, the CD37 binding agent (e.g., an antibody or antigen-binding fragment thereof) binds to the sequence set forth in SEQ ID NO:16. In some embodiments, the CD37 binding agent (e.g., an antibody or antigen-binding fragment thereof) binds to the sequence set forth in SEQ ID NO:17.

**[0139]** In some embodiments, the CD37 binding agent (e.g., an antibody or antigen-binding fragment thereof) binds to amino acids 107-242 of CD37 (SEQ ID NO:20) but does not bind to amino acids 138-235 of CD37. In some embodiments, the CD37 binding agent (e.g., an antibody or antigen-binding fragment thereof) binds to amino acids 107-235 of CD37 (SEQ ID NO:19) but does not bind to amino acids 138-235 of CD37.

**[0140]** In some embodiments, the CD37-binding agent (e.g., an antibody or antigen-binding fragment thereof) binds to a polypeptide of SEQ ID NO:15, but does not bind to a

polypeptide of SEQ ID NO:18. In some embodiments, the CD37-binding agent (e.g., an antibody or antigen-binding fragment thereof) binds to a polypeptide of SEQ ID NO:16, but does not bind to a polypeptide of SEQ ID NO:18. In some embodiments, the CD37-binding agent (e.g., an antibody or antigen-binding fragment thereof) binds to a polypeptide of SEQ ID NO:17, but does not bind to a polypeptide of SEQ ID NO:18.

**[0141]** In some embodiments, the CD37 binding agent (e.g., an antibody or antigen-binding fragment thereof) binds to an epitope that includes at least one amino acid in 110-137 of SEQ ID NO:1. Amino acids 110-137 are the first segment ("S1") of the CD37 large extracellular domain.

**[0142]** The affinity or avidity of an antibody for an antigen can be determined experimentally using any suitable method well known in the art, e.g., flow cytometry, enzyme-linked immunoabsorbent assay (ELISA), or radioimmunoassay (RIA), or kinetics (e.g., BIACORE™ analysis). Direct binding assays as well as competitive binding assay formats can be readily employed. (See, for example, Berzofsky, et al., "Antibody-Antigen Interactions," In Fundamental Immunology, Paul, W. E., Ed., Raven Press: New York, N.Y. (1984); Kuby, Janis Immunology, W. H. Freeman and Company: New York, N.Y. (1992); and methods described herein. The measured affinity of a particular antibody-antigen interaction can vary if measured under different conditions (e.g., salt concentration, pH, temperature). Thus, measurements of affinity and other antigen-binding parameters (e.g., KD or Kd, K<sub>on</sub>, K<sub>off</sub>) are made with standardized solutions of antibody and antigen, and a standardized buffer, as known in the art and such as the buffer described herein.

**[0143]** In one aspect, binding assays can be performed using flow cytometry on cells expressing the CD37 antigen on the surface. For example, CD37-positive cells such as 300-19 cells can be incubated with varying concentrations of anti-CD37 antibodies using 1x10<sup>5</sup> cells per sample in 100 µL FACS buffer (RPMI-1640 medium supplemented with 2% normal goat serum).

**[0144]** Then, the cells can be pelleted, washed, and incubated for 1 h with 100 µL of FITC-conjugated goat-anti-mouse or goat-anti-human IgG-antibody (such as is obtainable from, for example Jackson Laboratory, 6 µg/mL in FACS buffer). The cells are then pelleted again, washed with FACS buffer and resuspended in 200 µL of PBS containing 1% formaldehyde. Samples can be acquired, for example, using a FACS Calibur flow cytometer with the HTS multiwell sampler and analyzed using CellQuest Pro (all from BD Biosciences, San Diego, US). For each sample the mean fluorescence intensity for FL1 (MFI) can be exported and plotted

against the antibody concentration in a semi-log plot to generate a binding curve. A sigmoidal dose-response curve is fitted for binding curves and EC50 values are calculated using programs such as GraphPad Prism v4 with default parameters (GraphPad software, San Diego, CA). EC50 values can be used as a measure for the apparent dissociation constant "K<sub>d</sub>" or "K<sub>D</sub>" for each antibody.

**[0145]** Monoclonal antibodies can be prepared using hybridoma methods, such as those described by Kohler and Milstein (1975) *Nature* 256:495. Using the hybridoma method, a mouse, hamster, or other appropriate host animal, is immunized to elicit the production by lymphocytes of antibodies that will specifically bind to an immunizing antigen. Lymphocytes can also be immunized *in vitro*. Following immunization, the lymphocytes are isolated and fused with a suitable myeloma cell line using, for example, polyethylene glycol, to form hybridoma cells that can then be selected away from unfused lymphocytes and myeloma cells. Hybridomas that produce monoclonal antibodies directed specifically against a chosen antigen as determined by, *e.g.*, immunoprecipitation, immunoblotting, or by an *in vitro* binding assay (*e.g.*, radioimmunoassay (RIA); enzyme-linked immunosorbent assay (ELISA)) can then be propagated in either *in vitro* culture using standard methods (Goding, *Monoclonal Antibodies: Principles and Practice*, Academic Press, 1986) or *in vivo* as ascites tumors in an animal. The monoclonal antibodies can then be purified from the culture medium or ascites fluid.

**[0146]** Alternatively, monoclonal antibodies can also be made using recombinant DNA methods as described in U.S. Patent 4,816,567. The polynucleotides encoding a monoclonal antibody are isolated from mature B-cells or hybridoma cells, such as by RT-PCR using oligonucleotide primers that specifically amplify the genes encoding the heavy and light chains of the antibody, and their sequence is determined using conventional procedures. The isolated polynucleotides encoding the heavy and light chains are then cloned into suitable expression vectors, which are transfected into host cells such as *E. coli* cells, simian COS cells, Chinese hamster ovary (CHO) cells, or myeloma cells that do not otherwise produce immunoglobulin protein, and monoclonal antibodies are generated by the host cells. Also, recombinant monoclonal antibodies or fragments thereof of the desired species can be isolated from phage display libraries expressing CDRs of the desired species as described (McCafferty et al., 1990, *Nature*, 348:552-554; Clackson et al., 1991, *Nature*, 352:624-628; and Marks et al., 1991, *J. Mol. Biol.*, 222:581-597).

**[0147]** The polynucleotide(s) encoding a monoclonal antibody can further be modified in a number of different manners using recombinant DNA technology to generate alternative antibodies. In some embodiments, the constant domains of the light and heavy chains of, for example, a mouse monoclonal antibody can be substituted 1) for those regions of, for example, a human antibody to generate a chimeric antibody or 2) for a non-immunoglobulin polypeptide to generate a fusion antibody. In some embodiments, the constant regions are truncated or removed to generate the desired antibody fragment of a monoclonal antibody. Site-directed or high-density mutagenesis of the variable region can be used to optimize specificity, affinity, etc. of a monoclonal antibody.

**[0148]** In some embodiments, the monoclonal antibody against the human CD37 is a humanized antibody. In certain embodiments, the humanized antibody is a resurfaced antibody.

**[0149]** Human antibodies can be directly prepared using various techniques known in the art. Immortalized human B lymphocytes immunized *in vitro* or isolated from an immunized individual that produce an antibody directed against a target antigen can be generated (See, e.g., Cole et al., Monoclonal Antibodies and Cancer Therapy, Alan R. Liss, p. 77 (1985); Boemer et al., 1991, J. Immunol., 147 (1):86-95; and U.S. Patent 5,750,373). Also, the human antibody can be selected from a phage library, where that phage library expresses human antibodies, as described, for example, in Vaughan et al., 1996, Nat. Biotech., 14:309-314, Sheets et al., 1998, Proc. Nat'l. Acad. Sci., 95:6157-6162, Hoogenboom and Winter, 1991, J. Mol. Biol., 227:381, and Marks et al., 1991, J. Mol. Biol., 222:581). Techniques for the generation and use of antibody phage libraries are also described in U.S. Patent Nos. 5,969,108, 6,172,197, 5,885,793, 6,521,404; 6,544,731; 6,555,313; 6,582,915; 6,593,081; 6,300,064; 6,653,068; 6,706,484; and 7,264,963; and Rothe et al., 2007, J. Mol. Bio., doi:10.1016/j.jmb.2007.12.018 (each of which is incorporated by reference in its entirety). Affinity maturation strategies and chain shuffling strategies (Marks et al., 1992, Bio/Technology 10:779-783, incorporated by reference in its entirety) are known in the art and can be employed to generate high affinity human antibodies.

**[0150]** Humanized antibodies can also be made in transgenic mice containing human immunoglobulin loci that are capable upon immunization of producing the full repertoire of human antibodies in the absence of endogenous immunoglobulin production. This approach is described in U.S. Patents 5,545,807; 5,545,806; 5,569,825; 5,625,126; 5,633,425; and 5,661,016.

**[0151]** In certain embodiments are provided an antibody fragment to, for example, increase tumor penetration. Various techniques are known for the production of antibody

fragments. Traditionally, these fragments are derived via proteolytic digestion of intact antibodies (for example Morimoto et al., 1993, Journal of Biochemical and Biophysical Methods 24:107-117; Brennan et al., 1985, Science, 229:81). In certain embodiments, antibody fragments are produced recombinantly. Fab, Fv, and scFv antibody fragments can all be expressed in and secreted from *E. coli* or other host cells, thus allowing the production of large amounts of these fragments. Such antibody fragments can also be isolated from the antibody phage libraries discussed above. The antibody fragment can also be linear antibodies as described in U.S. Patent 5,641,870, for example, and can be monospecific or bispecific. Other techniques for the production of antibody fragments will be apparent to the skilled practitioner.

**[0152]** According to the present invention, techniques can be adapted for the production of single-chain antibodies specific to CD37 (see U.S. Pat. No. 4,946,778). In addition, methods can be adapted for the construction of Fab expression libraries (Huse, et al., Science 246:1275-1281 (1989)) to allow rapid and effective identification of monoclonal Fab fragments with the desired specificity for CD37, or derivatives, fragments, analogs or homologs thereof. Antibody fragments can be produced by techniques in the art including, but not limited to: (a) a F(ab')2 fragment produced by pepsin digestion of an antibody molecule; (b) a Fab fragment generated by reducing the disulfide bridges of an F(ab')2 fragment, (c) a Fab fragment generated by the treatment of the antibody molecule with papain and a reducing agent, and (d) Fv fragments.

**[0153]** For the purposes of the present disclosure, it should be appreciated that modified antibodies can comprise any type of variable region that provides for the association of the antibody with the polypeptides of a human CD37. In this regard, the variable region can comprise or be derived from any type of mammal. As such, the variable region of the modified antibodies can be, for example, of human, murine, non-human primate (e.g. cynomolgus monkeys, macaques, etc.), or lupine origin. In some embodiments both the variable and constant regions of the modified immunoglobulins are human. In other embodiments the variable regions of compatible antibodies (usually derived from a non-human source) can be engineered or specifically tailored to improve the binding properties of the molecule. In this respect, variable regions useful in the present invention can be humanized or otherwise altered through the inclusion of imported amino acid sequences. In some embodiments, the variable regions of the modified antibodies can be non-human (e.g., murine) and the constant regions of the modified antibodies can be human.

**[0154]** In certain embodiments, the variable domains in both the heavy and light chains are altered by at least partial replacement of one or more CDRs and, if necessary, by partial framework region replacement and sequence changing. Although the CDRs can be derived from an antibody of the same class or even subclass as the antibody from which the framework regions are derived, it is envisaged that the CDRs will be derived from an antibody of different class and possibly from an antibody from a different species. It is not always necessary to replace all of the CDRs with the complete CDRs from the donor variable region to transfer the antigen binding capacity of one variable domain to another. Rather, in some cases it is only necessary to transfer those residues that are necessary to maintain the activity of the antigen binding site.

**[0155]** Alterations to the variable region notwithstanding, those skilled in the art will appreciate that the modified antibodies of this invention will comprise antibodies (e.g., full-length antibodies or immunoreactive fragments thereof) in which at least a fraction of one or more of the constant region domains has been deleted or otherwise altered so as to provide desired biochemical characteristics. In some embodiments, the constant region of the modified antibodies will comprise a human constant region. Modifications to the constant region can comprise additions, deletions or substitutions of one or more amino acids in one or more domains. That is, the modified antibodies disclosed herein can comprise alterations or modifications to one or more of the three heavy chain constant domains (CH1, CH2, or CH3) and/or to the light chain constant domain (CL). In some embodiments, modified constant regions wherein one or more domains are partially or entirely deleted are contemplated. In some embodiments, the modified antibodies will comprise domain deleted constructs or variants wherein the entire CH2 domain has been removed ( $\Delta$ CH2 constructs). In some embodiments, the omitted constant region domain will be replaced by a short amino acid spacer (e.g. 10 residues) that provides some of the molecular flexibility typically imparted by the absent constant region.

**[0156]** In certain embodiments, modifications of the constant region can be used to eliminate disulfide linkages or oligosaccharide moieties that allow for enhanced localization due to increased antigen specificity or antibody flexibility. Modifications to the constant region can easily be made using well known biochemical or molecular engineering techniques well within the purview of the skilled artisan.

**[0157]** It will be noted that in certain embodiments, the modified antibodies can be engineered to fuse the CH3 domain directly to the hinge region of the respective modified antibodies. In other constructs it can be desirable to provide a peptide spacer between the hinge

region and the modified CH2 and/or CH3 domains. For example, compatible constructs could be expressed wherein the CH2 domain has been deleted and the remaining CH3 domain (modified or unmodified) is joined to the hinge region with a 5-20 amino acid spacer. Such a spacer can be added, for instance, to ensure that the regulatory elements of the constant domain remain free and accessible or that the hinge region remains flexible.

**[0158]** The present disclosure further embraces variants and equivalents which are substantially homologous to the mouse, chimeric, humanized and human antibodies, or antibody fragments thereof, set forth herein. These can contain, for example, conservative substitution mutations, i.e. the substitution of one or more amino acids by similar amino acids. For example, conservative substitution refers to the substitution of an amino acid with another within the same general class such as, for example, one acidic amino acid with another acidic amino acid, one basic amino acid with another basic amino acid or one neutral amino acid by another neutral amino acid. What is intended by a conservative amino acid substitution is well known in the art.

**[0159]** The polypeptides of the present disclosure can be recombinant polypeptides, natural polypeptides, or synthetic polypeptides comprising an antibody, or fragment thereof, against a human CD37. It will be recognized in the art that some amino acid sequences of the invention can be varied without significant effect of the structure or function of the protein. Thus, the invention further includes variations of the polypeptides which show substantial activity or which include regions of an antibody, or fragment thereof, against CD37 protein. Such mutants include deletions, insertions, inversions, repeats, and type substitutions.

**[0160]** The isolated polypeptides described herein can be produced by any suitable method known in the art. Such methods range from direct protein synthetic methods to constructing a DNA sequence encoding isolated polypeptide sequences and expressing those sequences in a suitable transformed host. In some embodiments, a DNA sequence is constructed using recombinant technology by isolating or synthesizing a DNA sequence encoding a wild-type protein of interest. Optionally, the sequence can be mutagenized by site-specific mutagenesis to provide functional analogs thereof. See, e.g. Zoeller et al., Proc. Nat'l. Acad. Sci. USA 81:5662-5066 (1984) and U.S. Pat. No. 4,588,585.

**[0161]** In some embodiments a DNA sequence encoding a polypeptide of interest would be constructed by chemical synthesis using an oligonucleotide synthesizer. Such oligonucleotides can be designed based on the amino acid sequence of the desired polypeptide and selecting those codons that are favored in the host cell in which the recombinant polypeptide of interest will be

produced. Standard methods can be applied to synthesize an isolated polynucleotide sequence encoding an isolated polypeptide of interest. For example, a complete amino acid sequence can be used to construct a back-translated gene. Further, a DNA oligomer containing a nucleotide sequence coding for the particular isolated polypeptide can be synthesized. For example, several small oligonucleotides coding for portions of the desired polypeptide can be synthesized and then ligated. The individual oligonucleotides typically contain 5' or 3' overhangs for complementary assembly.

**[0162]** Once assembled (by synthesis, site-directed mutagenesis or another method), the polynucleotide sequences encoding a particular isolated polypeptide of interest will be inserted into an expression vector and operatively linked to an expression control sequence appropriate for expression of the protein in a desired host. Proper assembly can be confirmed by nucleotide sequencing, restriction mapping, and expression of a biologically active polypeptide in a suitable host. As is well known in the art, in order to obtain high expression levels of a transfected gene in a host, the gene must be operatively linked to transcriptional and translational expression control sequences that are functional in the chosen expression host.

**[0163]** In certain embodiments, recombinant expression vectors are used to amplify and express DNA encoding antibodies, or fragments thereof, against human CD37. Recombinant expression vectors are replicable DNA constructs which have synthetic or cDNA-derived DNA fragments encoding a polypeptide chain of an anti-CD37 antibody, or fragment thereof, operatively linked to suitable transcriptional or translational regulatory elements derived from mammalian, microbial, viral or insect genes. A transcriptional unit generally comprises an assembly of (1) a genetic element or elements having a regulatory role in gene expression, for example, transcriptional promoters or enhancers, (2) a structural or coding sequence which is transcribed into mRNA and translated into protein, and (3) appropriate transcription and translation initiation and termination sequences, as described in detail below. Such regulatory elements can include an operator sequence to control transcription. The ability to replicate in a host, usually conferred by an origin of replication, and a selection gene to facilitate recognition of transformants can additionally be incorporated. DNA regions are operatively linked when they are functionally related to each other. For example, DNA for a signal peptide (secretory leader) is operatively linked to DNA for a polypeptide if it is expressed as a precursor which participates in the secretion of the polypeptide; a promoter is operatively linked to a coding sequence if it controls the transcription of the sequence; or a ribosome binding site is operatively linked to a

coding sequence if it is positioned so as to permit translation. Structural elements intended for use in yeast expression systems include a leader sequence enabling extracellular secretion of translated protein by a host cell. Alternatively, where recombinant protein is expressed without a leader or transport sequence, it can include an N-terminal methionine residue. This residue can optionally be subsequently cleaved from the expressed recombinant protein to provide a final product.

**[0164]** The choice of expression control sequence and expression vector will depend upon the choice of host. A wide variety of expression host/vector combinations can be employed. Useful expression vectors for eukaryotic hosts, include, for example, vectors comprising expression control sequences from SV40, bovine papilloma virus, adenovirus and cytomegalovirus. Useful expression vectors for bacterial hosts include known bacterial plasmids, such as plasmids from *Escherichia coli*, including pCR 1, pBR322, pMB9 and their derivatives, wider host range plasmids, such as M13 and filamentous single-stranded DNA phages.

**[0165]** Suitable host cells for expression of a CD37-binding polypeptide or antibody (or a CD37 protein to use as an antigen) include prokaryotes, yeast, insect or higher eukaryotic cells under the control of appropriate promoters. Prokaryotes include gram negative or gram positive organisms, for example *E. coli* or bacilli. Higher eukaryotic cells include established cell lines of mammalian origin as described below. Cell-free translation systems could also be employed. Appropriate cloning and expression vectors for use with bacterial, fungal, yeast, and mammalian cellular hosts are described by Pouwels et al. (Cloning Vectors: A Laboratory Manual, Elsevier, N.Y., 1985), the relevant disclosure of which is hereby incorporated by reference. Additional information regarding methods of protein production, including antibody production, can be found, e.g., in U.S. Patent Publication No. 2008/0187954, U.S. Patent Nos. 6,413,746 and 6,660,501, and International Patent Publication No. WO 04009823, each of which is hereby incorporated by reference herein in its entirety.

**[0166]** Various mammalian or insect cell culture systems are also advantageously employed to express recombinant protein. Expression of recombinant proteins in mammalian cells can be performed because such proteins are generally correctly folded, appropriately modified and completely functional. Examples of suitable mammalian host cell lines include the COS-7 lines of monkey kidney cells, described by Gluzman (Cell 23:175, 1981), and other cell lines capable of expressing an appropriate vector including, for example, L cells, C127, 3T3, Chinese hamster ovary (CHO), HeLa and BHK cell lines. Mammalian expression vectors can

comprise nontranscribed elements such as an origin of replication, a suitable promoter and enhancer linked to the gene to be expressed, and other 5' or 3' flanking nontranscribed sequences, and 5' or 3' nontranslated sequences, such as necessary ribosome binding sites, a polyadenylation site, splice donor and acceptor sites, and transcriptional termination sequences. Baculovirus systems for production of heterologous proteins in insect cells are reviewed by Luckow and Summers, Bio/Technology 6:47 (1988).

**[0167]** The proteins produced by a transformed host can be purified according to any suitable method. Such standard methods include chromatography (e.g., ion exchange, affinity and sizing column chromatography), centrifugation, differential solubility, or by any other standard technique for protein purification. Affinity tags such as hexahistidine, maltose binding domain, influenza coat sequence and glutathione-S-transferase can be attached to the protein to allow easy purification by passage over an appropriate affinity column. Isolated proteins can also be physically characterized using such techniques as proteolysis, nuclear magnetic resonance and x-ray crystallography.

**[0168]** For example, supernatants from systems which secrete recombinant protein into culture media can be first concentrated using a commercially available protein concentration filter, for example, an Amicon or Millipore Pellicon ultrafiltration unit. Following the concentration step, the concentrate can be applied to a suitable purification matrix. Alternatively, an anion exchange resin can be employed, for example, a matrix or substrate having pendant diethylaminoethyl (DEAE) groups. The matrices can be acrylamide, agarose, dextran, cellulose or other types commonly employed in protein purification. Alternatively, a cation exchange step can be employed. Suitable cation exchangers include various insoluble matrices comprising sulfopropyl or carboxymethyl groups. Finally, one or more reversed-phase high performance liquid chromatography (RP-HPLC) steps employing hydrophobic RP-HPLC media, e.g., silica gel having pendant methyl or other aliphatic groups, can be employed to further purify a CD37-binding agent. Some or all of the foregoing purification steps, in various combinations, can also be employed to provide a homogeneous recombinant protein.

**[0169]** Recombinant protein produced in bacterial culture can be isolated, for example, by initial extraction from cell pellets, followed by one or more concentration, salting-out, aqueous ion exchange or size exclusion chromatography steps. High performance liquid chromatography (HPLC) can be employed for final purification steps. Microbial cells employed

in expression of a recombinant protein can be disrupted by any convenient method, including freeze-thaw cycling, sonication, mechanical disruption, or use of cell lysing agents.

**[0170]** Methods known in the art for purifying antibodies and other proteins also include, for example, those described in U.S. Patent Publication Nos. 2008/0312425, 2008/0177048, and 2009/0187005, each of which is hereby incorporated by reference herein in its entirety.

### III. Polynucleotides

**[0171]** In certain embodiments, the invention encompasses polynucleotides comprising polynucleotides that encode a polypeptide that specifically binds CD37 or a fragment of such a polypeptide. For example, the invention provides a polynucleotide comprising a nucleic acid sequence that encodes an antibody to a human CD37 or encodes a fragment of such an antibody. The polynucleotides of the invention can be in the form of RNA or in the form of DNA. DNA includes cDNA, genomic DNA, and synthetic DNA; and can be double-stranded or single-stranded, and if single stranded can be the coding strand or non-coding (anti-sense) strand. In some embodiments, the polynucleotide is a cDNA or a DNA lacking one or more endogenous introns.

**[0172]** In certain embodiments, the polynucleotides provided herein are non-naturally occurring. In certain embodiments, the polynucleotides provided herein are recombinantly produced. In certain embodiments, the polynucleotides are isolated. In certain embodiments, the polynucleotides are substantially pure.

**[0173]** The present disclosure provides a polynucleotide encoding a polypeptide comprising a sequence selected from the group consisting of SEQ ID NOs:3-11.

**[0174]** In certain embodiments, a polynucleotide comprises sequences encoding the polypeptides of SEQ ID NOs:3-5. In certain embodiments, a polynucleotide comprises sequences encoding the polypeptides of SEQ ID NOs:6-8. In certain embodiments, a polynucleotide comprises sequences encoding the polypeptides of SEQ ID NOs:3-5 and SEQ ID NOs: 6-8. In certain embodiments, a vector comprises polynucleotides encoding the polypeptides of SEQ ID NOs: 3-8. In certain embodiments, a composition comprises a polynucleotide encoding the polypeptides of SEQ ID NOs:3-5 and a polynucleotide encoding the polypeptides of SEQ ID NOs:6-8. In certain embodiments, a composition comprises a vector comprising polynucleotides encoding the polypeptides of SEQ ID NOs:3-5 and a vector comprising polynucleotides encoding the polypeptides of SEQ ID NOs:6-8.

**[0175]** In certain embodiments, a composition comprises a polynucleotide encoding the polypeptide of SEQ ID NO:9 and a polynucleotide encoding the polypeptide of SEQ ID NO:10. In certain embodiments, a composition comprises a vector comprising a polynucleotide encoding the polypeptide of SEQ ID NO:9 and a vector comprising a polynucleotide encoding the polypeptide of SEQ ID NO:10. In certain embodiments, a vector comprises a polynucleotide encoding the polypeptide of SEQ ID NO:9 and a polynucleotide encoding the polypeptide of SEQ ID NO:10.

**[0176]** The present disclosure further provides a polynucleotide comprising a sequence selected from those provided in SEQ ID NOs:13 and 14.

**[0177]** Also provided is a polynucleotide having at least about 95%, at least about 96%, at least about 97%, at least about 98%, or at least about 99% sequence identity to any one of SEQ ID NOs:13 and 14.

**[0178]** Also provided is a composition comprising a polynucleotide at least about 90% identical to SEQ ID NO:13 and a polynucleotide at least about 90% identical to SEQ ID NO:14. Also provided is a composition comprising a polynucleotide at least about 95% identical to SEQ ID NO:13 and a polynucleotide at least about 95% identical to SEQ ID NO:14. Also provided is a composition comprising a polynucleotide at least about 96% identical to SEQ ID NO:13 and a polynucleotide at least about 96% identical to SEQ ID NO:14. Also provided is a composition comprising a polynucleotide at least about 97% identical to SEQ ID NO:13 and a polynucleotide at least about 97% identical to SEQ ID NO:14. Also provided is a composition comprising a polynucleotide at least about 98% identical to SEQ ID NO:13 and a polynucleotide at least about

98% identical to SEQ ID NO:14. Also provided is a composition comprising a polynucleotide at least about 99% identical to SEQ ID NO:13 and a polynucleotide at least about 99% identical to SEQ ID NO:14.

**[0179]** Also provided is a composition comprising a vector or vectors comprising a polynucleotide at least about 90% identical to SEQ ID NO:13 and a polynucleotide at least about 90% identical to SEQ ID NO:14. Also provided is a composition comprising a vector or vectors a polynucleotide at least about 95% identical to SEQ ID NO:13 and a polynucleotide at least about 95% identical to SEQ ID NO:14. Also provided is a composition comprising a vector or vectors a polynucleotide at least about 96% identical to SEQ ID NO:13 and a polynucleotide at least about 96% identical to SEQ ID NO:14. Also provided is a composition comprising a vector or vectors a polynucleotide at least about 97% identical to SEQ ID NO:13 and a polynucleotide at least about 97% identical to SEQ ID NO:14. Also provided is a composition comprising a vector or vectors a polynucleotide at least about 98% identical to SEQ ID NO:13 and a polynucleotide at least about 98% identical to SEQ ID NO:14. Also provided is a composition comprising a vector or vectors a polynucleotide at least about 99% identical to SEQ ID NO:13 and a polynucleotide at least about 99% identical to SEQ ID NO:14.

**[0180]** Also provided is a composition comprising a vector or vectors comprising the polynucleotide sequence set forth in SEQ ID NO:13 and the polynucleotide sequence set forth in SEQ ID NO:14.

**[0181]** In certain embodiments the polynucleotides comprise the coding sequence for the mature polypeptide fused in the same reading frame to a polynucleotide which aids, for example, in expression and secretion of a polypeptide from a host cell (e.g., a leader sequence which functions as a secretory sequence for controlling transport of a polypeptide from the cell). The polypeptide having a leader sequence is a preprotein and can have the leader sequence cleaved by the host cell to form the mature form of the polypeptide. The polynucleotides can also encode for a proprotein which is the mature protein plus additional 5' amino acid residues. A mature protein having a prosequence is a proprotein and is an inactive form of the protein. Once the prosequence is cleaved an active mature protein remains.

**[0182]** In certain embodiments the polynucleotides comprise the coding sequence for the mature polypeptide fused in the same reading frame to a marker sequence that allows, for example, for purification of the encoded polypeptide. For example, the marker sequence can be a hexa-histidine tag supplied by a pQE-9 vector to provide for purification of the mature

polypeptide fused to the marker in the case of a bacterial host, or the marker sequence can be a hemagglutinin (HA) tag derived from the influenza hemagglutinin protein when a mammalian host (e.g., COS-7 cells) is used.

**[0183]** The present disclosure further relates to variants of the hereinabove described polynucleotides encoding, for example, fragments, analogs, and derivatives.

**[0184]** The polynucleotide variants can contain alterations in the coding regions, non-coding regions, or both. In some embodiments the polynucleotide variants contain alterations which produce silent substitutions, additions, or deletions, but do not alter the properties or activities of the encoded polypeptide. In some embodiments, nucleotide variants are produced by silent substitutions due to the degeneracy of the genetic code. Polynucleotide variants can be produced for a variety of reasons, e.g., to optimize codon expression for a particular host (change codons in the human mRNA to those preferred by a bacterial host such as *E. coli*).

**[0185]** Vectors and cells comprising the polynucleotides described herein are also provided.

#### IV. Biological samples

**[0186]** Biological samples are often fixed with a fixative. Aldehyde fixatives such as formalin (formaldehyde) and glutaraldehyde are typically used. Tissue samples fixed using other fixation techniques such as alcohol immersion (Battifora and Kopinski, *J. Histochem. Cytochem.* (1986) 34:1095) are also suitable. The samples used may also be embedded in paraffin. In one embodiment, the samples are both formalin-fixed and paraffin-embedded (FFPE). In another embodiment, the FFPE block is hematoxylin and eosin stained prior to selecting one or more portions for analysis in order to select specific area(s) for the FFPE core sample. Methods of preparing tissue blocks from these particulate specimens have been used in previous IHC studies of various prognostic factors, and/or is well known to those of skill in the art (see, for example, Abbondanzo et al., *Am J Clin Pathol.* 1990 May;93(5):698-702; Allred et al., *Arch Surg.* 1990 Jan;125(1):107-13).

**[0187]** Briefly, any intact organ or tissue may be cut into fairly small pieces and incubated in various fixatives (e.g. formalin, alcohol, etc.) for varying periods of time until the tissue is "fixed". The samples may be virtually any intact tissue surgically removed from the body. The samples may be cut into reasonably small piece(s) that fit on the equipment routinely used in histopathology laboratories. The size of the cut pieces typically ranges from a few

millimeters to a few centimeters. The biological sample can also be fluidic extracts, blood, plasma, serum, spinal fluid, lymph fluid, and or splenic preparations.

V. Correlation of CD37 expression and therapeutic efficacy

**[0188]** Anti-CD37 immunoconjugates are provided in U.S. Published Application No 2011/0256153, which is incorporated herein by reference in its entirety. In certain embodiments, the anti-CD37 immunoconjugate is IMGN529. IMGN529 contains the huCD37-3 antibody (comprising the CDRs represented by SEQ ID NOs:22-27, the VH of SEQ ID NO:28 and the VL of SEQ ID NO:29), the SMCC linker, and the DM1 maytansinoid. Sequences of the huCD37-3 antibody are provided below.

huCD37-3 VH-CDR1: TSGVS (SEQ ID NO:22)

huCD37-3 VH-CDR2: VIWGDGSTN (SEQ ID NO:23)

huCD37-3 VH-CDR3: GGYSLAH (SEQ ID NO:24)

**[0189]** In certain embodiments, the immunoconjugate can contain a CD37 antibody produced from the hybridoma of ATCC Deposit Designation PTA-10664, deposited with the American Type Culture Collection (ATCC) at 10801 University Boulevard, Manassas, Virginia 20110 on February 18, 2010, or an antigen binding fragment thereof. In certain embodiments, the antibody or antigen-binding fragment thereof comprises the VH-CDRs and the VL-CDRs of the antibody produced from the hybridoma of PTA-10664.

**[0190]** IMGN529 is currently in clinical development for treating leukemias and lymphomas. Methods of administering IMGN529 are provided in U.S. Application No. 14/710,354 (Publication No. 2015/0343077), and Stathis, et al., "Preliminary Findings from a phase I, multi-center, open-label study of the anti-CD37 antibody-drug conjugate (ADC), IMGN529, in adult patients with relapsed or refractory non-Hodgkin Lymphoma (NHL)," Abstract Number 8526, ASCO Annual Meeting (2014) each of which is incorporated herein by reference.

**[0191]** In certain embodiments, the present disclosure provides a method for identifying subjects that are likely to respond favorably to CD37-targeting therapies due to elevated expression levels of CD37 in the subject, in particular using antibodies and antigen-binding fragments thereof provided herein that can detect a dynamic range of CD37 expression levels, e.g., in IHC.

**[0192]** Evaluation of patient samples and correlation to *in vivo* efficacy using xenograft models demonstrates the power of the expression analysis for selecting subjects more likely to respond to treatment. IHC provides a score for CD37 expression on tumor cells: 0 (no expression) to 3 (very high levels of expression). Samples scoring 1, 2, or 3 for CD37 expression (or 2 or 3) have an increased likelihood to respond to CD37-targeted anti-cancer therapies at clinically-relevant doses of CD37 immunoconjugates (see e.g., WO 2013/149171, which is incorporated herein by reference). Thus, identification of individuals having an elevated CD37 score would help identify those individuals who might respond to a clinically relevant dosage. Moreover, expression of more uniform levels of CD37 provides better correlation with therapeutic benefit. Thus, a homogenous staining uniformity or a combination of increased staining with heterogeneous staining uniformity can indicate increased CD37 expression. For example, scores of greater than 2 hetero may be used as a patient selection criterion for treatment with a CD37 therapeutic agent. In addition, patient selection criteria can be based on the percentage of cells in a sample that are found to express membrane CD37 at a specified level that reflects both the staining intensity (e.g., 1, 2, or 3) and uniformity (e.g., heterogeneous or homogeneous (see Table 3)). For example, a sample could be characterized as having e.g., at least 25% of cells staining for CD37 positivity at least 2 or greater or at least 75% of the cells staining for CD37 positivity at 2 or greater. In another example, a sample could be characterized as having, e.g., at least 25% of cells staining for CD37 positivity of at least 3 or at least 75% of the cells staining for CD37 positivity at 3. In another example, CD37 expression is given an H-score. In addition, immunological detection (by immunohistochemistry) of CD37 can be scored using H-scores. H-scores combine staining intensity scores with uniformity scores using the calculation provided herein. As described in more detail below, H-scores can range from 1 to 300.

**[0193]** CD37 expression analysis can also be used to identify patients in whom decreased levels of a CD37-targeting anti-cancer therapy ("low dose therapy") can be effective to cause anti-tumor responses. As is appreciated in the art, compounds are generally administered at the smallest dosage that achieves the desired therapeutic response. This is specifically important for therapeutics that cause clinical, and often undesired, side effects. The ability to recognize those subjects with elevated CD37 expression levels allows for potential minimization of the dosage of the CD37-targeting therapeutic, thus decreasing possible side effects, while maintaining therapeutic efficacy.

## VI. Immunodetection Methods

**[0194]** In certain embodiments, the CD37-binding agents (e.g., antibodies and antigen-binding fragments thereof) can be used in immunodetection methods to identify samples and/or subjects with increased expression or overexpression of CD37. Immunodetection methods include, for example, immunohistochemistry (IHC), enzyme linked immunosorbent assay (ELISA), Western blot, flow cytometry, and fluorescence activated cell sorting (FACS) to mention a few.

**[0195]** In general, the immunodetection methods include obtaining a sample suspected of comprising CD37, and contacting the sample with a first CD37-binding agent (e.g., an anti-CD37 antibody or antigen binding fragment thereof) under conditions effective to allow the formation of immunocomplexes.

**[0196]** In terms of antigen detection, the biological sample analyzed can be any sample in which it is desirable to detect CD37 such as fluidic extract, blood, plasma, serum, spinal fluid, lymph fluid, tissue section or specimen, homogenized tissue extract, biopsy aspirates, a cell, separated and/or purified forms CD37-containing compositions, or any biological fluid. In some embodiments, blood, plasma, or lymph samples or extracts are used.

**[0197]** Contacting the chosen biological sample with the CD37-binding agent (e.g., an anti-CD37 antibody or antigen binding fragment thereof) under effective conditions and for a period of time sufficient to allow the formation of immune complexes (primary immune complexes) is generally a matter of adding the CD37-binding agent (e.g., an anti-CD37 antibody or antigen binding fragment thereof) to the sample and incubating the mixture for a period of time long enough for the CD37-binding agent (e.g., an anti-CD37 antibody or antigen binding fragment thereof) to form immune complexes with, i.e., to bind to, any CD37 present. After this time, the sample, such as a tissue section or fluid extract, ELISA plate, or western blot, will generally be washed to remove any non-specifically bound CD37-binding agent (e.g., an anti-CD37 antibody or antigen binding fragment thereof), allowing only those CD37-binding agents (e.g., an anti-CD37 antibodies or antigen binding fragments thereof) specifically bound within the primary immune complexes to be detected.

**[0198]** In general, the detection of immunocomplex formation is well known in the art and can be achieved through the application of numerous approaches. The CD37-binding agent (e.g., an anti-CD37 antibody or antigen binding fragment thereof) employed in the detection can itself be linked to a detectable label, wherein one would then simply detect this label, thereby

allowing the amount of the primary immune complexes in the composition to be determined. Alternatively, the first CD37-binding agent (e.g., an anti-CD37 antibody or antigen binding fragment thereof) that becomes bound within the primary immune complexes can be detected by means of a second binding agent (e.g., antibody or antigen-binding fragment thereof) that has binding affinity for the first CD37-binding agent (e.g., an anti-CD37 antibody or antigen binding fragment thereof). In these cases, the second binding agent can be linked to a detectable label. When the second binding agent is itself an antibody or antigen-binding fragment thereof, it can be referred to as a "secondary" antibody or antigen-binding fragment thereof. The primary immune complexes are contacted with the labeled, secondary binding agent, under effective conditions and for a period of time sufficient to allow the formation of secondary immune complexes. The secondary immune complexes are then generally washed to remove any non-specifically bound labeled secondary binding agents, and the remaining label in the secondary immune complexes is then detected.

**[0199]** Further methods include the detection of primary immune complexes by a two-step approach. A second binding agent (e.g., antibody or antigen-binding fragment thereof) that has binding affinity for the first CD37-binding agent (e.g., an anti-CD37 antibody or antigen binding fragment thereof) is used to form secondary immune complexes, as described herein. After washing, the secondary immune complexes are contacted with a third binding agent that has binding affinity for the second binding agent (e.g., antibody or antigen-binding fragment thereof), again under effective conditions and for a period of time sufficient to allow the formation of immune complexes (tertiary immune complexes). The third binding agent is linked to a detectable label, allowing detection of the tertiary immune complexes thus formed. This system may provide for signal amplification if this is desired.

**[0200]** In another embodiment, a biotinylated CD37-binding agent (e.g., an anti-CD37 antibody or antigen binding fragment thereof) is used to detect CD37, and a second binding agent (e.g., antibody or antigen-binding fragment thereof) is then used to detect the biotin. In that method, the sample to be tested is first incubated in a solution comprising the biotinylated CD37-binding agent (e.g., an anti-CD37 antibody or antigen binding fragment thereof). If CD37 is present, some of the binding agent binds to the CD37 to form a biotinylated CD37-binding agent-CD37 complex. The complex is then amplified by incubation in successive solutions of streptavidin (or avidin), biotinylated DNA, and/or complementary biotinylated DNA, with each step adding additional biotin sites to the antibody/antigen complex. The amplification steps are

repeated until a suitable level of amplification is achieved, at which point the sample is incubated in a solution comprising the second binding agent (e.g., antibody or antigen-binding fragment thereof) that binds to biotin. This second binding agent is labeled, as for example with an enzyme that can be used to detect the presence of the antibody/antigen complex by histoenzymology using a chromogen substrate. With suitable amplification, a conjugate can be produced that is macroscopically visible.

**[0201]** In one embodiment, immunohistochemistry (IHC) is used for immunological detection. Using IHC, detection of CD37 in a sample can be achieved by targeting a sample with a probe e.g., an anti-CD37 antibody or antigen-binding fragment thereof. The probe can be linked, either directly or indirectly to a detectable label or can be detected by another probe that is linked, either directly or indirectly to a detectable label.

**[0202]** In some embodiments, IHC can distinguish between different levels of protein expression, e.g., calibrated IHC. In some embodiments, the IHC can distinguish staining intensity for samples having low CD37, intermediate CD37, or high CD37 expression.

**[0203]** In one embodiment, immunological detection (by immunohistochemistry) of CD37 is scored for both intensity and uniformity (percent of stained cells – membrane only). Comparative scales for CD37 expression for intensity correlate as 0 – Negative, 0-1 - Very Weak, 1 – Weak, 1-2 - Weak to Moderate, 2 – Moderate, 2-3 - Moderate to Strong, 3 – Strong to Very Strong. Quantitatively, Score 0 represents that no staining is observed or membrane staining is observed in less than 10% of tumor cells. Score 1 or 1+ represents that a faint/barely perceptible membrane staining is detected in more than 10% of the tumor cells. The cells are only stained in part of their membrane. Scores 1 are 1+ are used interchangeably. For Score 2, a weak to moderate complete membrane staining is observed in more than 10% of the tumor cells. Lastly, Score 3 represents that a moderate to strong complete membrane staining is observed in more than 10% of the tumor cells. Those samples with 0 or 1 score for CD37 expression can be characterized as not having elevated CD37 expression, whereas those samples with 2 or 3 scores can be characterized as overexpressing or having elevated CD37. In another embodiment, using the antibodies, antigen-binding fragments thereof, or polypeptides provided herein, those samples with a 0 score for CD37 expression can be characterized as not having elevated CD37 expression, those samples with a 1 score can be characterized as having increased expression of CD37, and those samples with 2 or 3 scores can be characterized as overexpressing or having elevated CD37.

**[0204]** In certain embodiments, a score of at least 2 in a sample obtained from a subject identifies the subject as a candidate for treatment with an anti-CD37 treatment regimen (e.g., IMGN529). In certain embodiments, a score of at least 3 in a sample obtained from a subject identifies the subject as a candidate for treatment with an anti-CD37 treatment regimen (e.g., IMGN529).

**[0205]** Samples overexpressing CD37 can also be rated by immunohistochemical scores corresponding to the number of copies of CD37 molecules expressed per cell, or antibodies bound per cell (ABC), and can be determined biochemically.

**[0206]** Comparative scales for CD37 uniformity (percent cell membrane staining) are as follows: Negative = 0%; Focal = <25%; heterogeneous (hetero) = 25-75%, and homogeneous (homo) = >75%.

**[0207]** In certain embodiments, a score of at least 2 hetero in a sample obtained from a subject identifies the subject as a candidate for treatment with an anti-CD37 treatment regimen (e.g., IMGN529). In certain embodiments, a score of at least 2 homo in a sample obtained from a subject identifies the subject as a candidate for treatment with an anti-CD37 treatment regimen (e.g., IMGN529). In certain embodiments, a score of at least 3 hetero in a sample obtained from a subject identifies the subject as a candidate for treatment with an anti-CD37 treatment regimen (e.g., IMGN529). In certain embodiments, a score of at least 3 homo in a sample obtained from a subject identifies the subject as a candidate for treatment with an anti-CD37 treatment regimen (e.g., IMGN529).

**[0208]** In one embodiment, immunological detection (by immunohistochemistry) of CD37 is scored using H-scores. H-scores combine staining intensity scores (e.g., a score of 0 to 3, wherein 0 represents no staining, and 3 represents strong staining) with the percentage of cells that are positive for membrane staining (i.e., uniformity). An H-score can be calculated as follows:

H score = [0\*(percentage of cells staining at intensity 0)] + [1\*(percentage of cells staining at intensity 1)] + [2\*(percentage of cells staining at intensity 2)] + [3\*(percentage of cells staining at intensity 3)]. Accordingly, an H-score can range from 0 (no cell membranes staining) to 300 (all cell membrane staining at intensity 3).

**[0209]** By way of example, an H-score in a subject having cancer can be as follows:

H score = (75% at intensity 0) + (0% at intensity 1) + (0% at intensity 2) + (25% at intensity 3) = 75; or

H score = (0% at intensity 0) + (75% at intensity 1) + (0% at intensity 2) + (25% at intensity 3) = 150.

In another example, an H-score in a subject having cancer may be as follows:

H score = (75% at intensity 0) + (0% at intensity 1) + (25% at intensity 2) + (0% at intensity 3) = 50; or

H score = (0% at intensity 0) + (75% at intensity 1) + (25% at intensity 2) + (0% at intensity 3) = 125.

**[0210]** In one embodiment, immunological detection (by immunohistochemistry) of CD37 is scored using percent positivity and intensity across a sample. In this embodiment, selection for treatment with an anti-CD37 treatment regimen is based on the percentage of cells in a sample that are found to express membrane CD37 at a specified level that reflects both the staining intensity (e.g., 1, 2, or 3) and uniformity (e.g., heterogeneous or homogeneous (see Table 3)). For example, a sample having at least 25% (i.e., 25-75% or > 75%) of the cells staining for CD37 positivity at 3 could be characterized as "3 hetero" and "3 homo" or, collectively, as "at least 25% positive at 3."

**[0211]** IHC can be performed manually or using an automated system (e.g., using an automated strainer). IHC can be performed on cells, cell pellets, tissues, preparations from blood, plasma, serum, or lymph fluid, etc. In some embodiments, the samples are fixed samples. In some embodiments, the samples are paraffin embedded samples. In some embodiments, the samples are formalin fixed and paraffin embedded samples.

**[0212]** In one embodiment, Enzyme-Linked Immuno Sorbent Assay (ELISA) is used for immunological detection. The underlying methodology of ELISA is well known in the art. See, for example, Lequin R, "Enzyme immunoassay (EIA)/enzyme-linked immunosorbent assay (ELISA)," *Clin. Chem.* 51:2415-2418 (2005), which is herein incorporated by reference in its entirety. In one exemplary ELISA, CD37-binding agents (e.g., antibodies or antigen-binding fragments thereof) are immobilized onto a selected surface exhibiting protein affinity, such as a well in a polystyrene microtiter plate. Then, a test sample, such as a clinical sample, containing or suspected of containing CD37 is added to the wells. After binding and washing to remove non-specifically bound immunocomplexes, the bound CD37 can be detected. Detection is generally achieved by the addition of a second antibody or antigen-binding fragment thereof specific for CD37, that is linked to a detectable label. This type of ELISA is a "sandwich ELISA". Detection can also be achieved by the addition of a second antibody or antigen-binding

fragment thereof, followed by the addition of a third antibody or antigen-binding fragment thereof that has binding affinity for the second antibody or antigen-binding fragment thereof, with the third antibody or antigen-binding fragment thereof being linked to a detectable label. Color formation can be monitored spectrophotometrically and related to concentration of CD37 by calibration to a standard curve. In another exemplary ELISA, the test samples are immobilized onto the well surface and then contacted with the CD37-binding agents (e.g., antibodies or antigen-binding fragments thereof). After binding and washing to remove non-specifically bound immunocomplexes, the bound CD37 is detected. Where the initial CD37-binding agents (e.g., antibodies or antigen-binding fragments thereof) are linked to a detectable label, the immunocomplexes can be detected directly. Again, the immunocomplexes can be detected using a second binding agent that has binding affinity for the first binding, with the second binding agent being linked to a detectable label. Another ELISA in which test samples are immobilized, involves the use of competition in the detection. In this ELISA, labeled CD37-binding agents (e.g., antibodies or antigen-binding fragments thereof) are added to the wells, allowed to bind to CD37, and detected by means of their label. The amount of CD37 in a sample is then determined by mixing the sample with the labeled CD37-binding agents (e.g., antibodies or antigen-binding fragments thereof) before or during incubation with coated wells. The presence of CD37 in the sample acts to reduce the amount of CD37-binding agents (e.g., antibodies or antigen-binding fragments thereof) available for binding to the well and thus reduces the ultimate signal.

**[0213]** In one embodiment, a Western blot is used for immunological detection. For Western blot proteins are extracted from a cell sample and are subjected to electrophoresis (e.g., SDS-PAGE) and blotted to a membrane (e.g., nitrocellulose or PVDF). The membrane is then contacted with a CD37-binding agent (e.g., antibody or antigen-binding fragment thereof), which can be either directly labeled or further subjected to a secondary labeled binding agent. Detection can be, for example, by autoradiography, colorimetric reaction, or chemiluminescence. This method allows both quantitation of an amount of substrate and determination of its identity by a relative position on the membrane which is indicative of a migration distance in the acrylamide gel during electrophoresis.

**[0214]** In one embodiment, flow cytometry is used for immunological detection. Thus, for example, the number of antibodies bound per cell (ABC) can be assessed using flow cytometry. A high number of anti-CD37 antibodies bound per cell can indicate high CD37

expression levels and a high likelihood to be susceptible to treatment with an anti-CD37 antibody or immunoconjugate thereof.

**[0215]** In one embodiment, FACS is used for immunological detection. FACS analysis enables the detection of CD37 on cell membranes. Briefly, CD37-binding agents (e.g., antibodies or antigen-binding fragments thereof) are linked to fluorophores and detection is performed by means of a cell sorting machine that reads the wavelength of light emitted from each cell as it passes through a light beam. This method can employ two or more antibodies simultaneously.

## VII. Detection Agents

**[0216]** The CD37-binding agents provided herein can be linked to at least one agent to form a detection conjugate. In addition, the CD37-binding agents provided herein can be detected by a detection agent that is linked to at least one agent to form a detection conjugate. Detection molecules and moieties are well known in the art. In order to increase the efficacy of antibody molecules as diagnostic it is conventional to link or covalently bind or complex at least one desired molecule or moiety. Such a molecule or moiety may be, but is not limited to, at least one reporter molecule. A reporter molecule is defined as any moiety that may be detected using an assay. Non-limiting examples of reporter molecules that have been conjugated to antibodies include enzymes, radiolabels, haptens, fluorescent labels, phosphorescent molecules, chemiluminescent molecules, chromophores, luminescent molecules, photoaffinity molecules, colored particles and/or ligands, such as biotin.

**[0217]** Antibody or antigen-binding fragment detection conjugates contemplated in the present invention include those for use *in vitro*, where the antibody or fragment is linked to a secondary binding ligand and/or to an enzyme (an enzyme tag) that will generate a colored product upon contact with a chromogenic substrate. The CD37 antibodies and antigen-binding fragments thereof provided herein are particularly useful for conjugates methods because, for example, they are able to detect a dynamic range of CD37. Examples of suitable enzymes include urease, alkaline phosphatase, (horseradish) hydrogen peroxidase and/or glucose oxidase. In some embodiments, secondary binding ligands are biotin and/or avidin and streptavidin compounds.

**[0218]** In the case of enzymes, the amount of color developed and measured will be a direct measurement of the amount of CD37 present. If HRP is the label, the color can be detected using the substrate 3,3',5,5'-tetramethyl benzidine (TMB), e.g., at 450 nm absorbance. Alternatively, other chromogenic substrates for HRP such as 3,3'-Diaminobenzidine (DAB) or

2,2'-azino-bis(3-ethylbenzothiazoline-6-sulphonic acid) (ABTS). Substrates such as TMB, DAB, and ABTS can be used, for example, in immunodetection methods using ELISA.

**[0219]** 3,3'-diaminobenzidine (DAB) is a substrate for enzymes such as HRP that produces a brown end product that is highly insoluble in alcohol and other organic solvents. Oxidation of DAB also causes polymerization, resulting in the ability to react with osmium tetroxide, and thus increasing its staining intensity and electron density. Of the several metals and methods used to intensify the optical density of polymerized DAB, gold chloride in combination with silver sulfide appears to be the most successful.

**[0220]** 3-Amino-9-ethylcarbazole (AEC), is a substrate for enzymes such as HRP, and upon oxidation, forms a rose-red end product that is alcohol soluble. Therefore, specimens processed with AEC must not be immersed in alcohol or alcoholic solutions (e.g., Harris' hematoxylin). Instead, an aqueous counterstain and mounting medium should be used.

**[0221]** 4-Chloro-1-naphthol (CN) is a substrate for enzymes such as HRP that precipitates as a blue end product. Because CN is soluble in alcohol and other organic solvents, the specimen must not be dehydrated, exposed to alcoholic counterstains, or coverslipped with mounting media containing organic solvents. Unlike DAB, CN tends to diffuse from the site of precipitation.

**[0222]** p-Phenylenediamine dihydrochloride/pyrocatechol (Hanker-Yates reagent) is a substrate for enzymes such as HRP that gives a blue-black reaction product that is insoluble in alcohol and other organic solvents. Like polymerized DAB, this reaction product can be osmicated. Varying results have been achieved with Hanker-Yates reagent in immunoperoxidase techniques.

**[0223]** Chemiluminescent substrates, such as ECL, can be used. Substrates such as ECL can be used, for example, in immunodetection methods using Western blotting.

**[0224]** Exemplary fluorescent labels contemplated for use as binding agent (e.g., antibody) conjugates include Alexa 350, Alexa 430, Alexa 488, AMCA, BODIPY 630/650, BODIPY 650/665, BODIPY-FL, BODIPY-R6G, BODIPY-TMR, BODIPY-TRX, Cascade Blue, Cy3, Cy5,6-FAM, Dylight 488, Fluorescein Isothiocyanate (FITC), Green fluorescent protein (GFP), HEX, 6-JOE, Oregon Green 488, Oregon Green 500, Oregon Green 514, Pacific Blue, Phycoerythrin, REG, Rhodamine Green, Rhodamine Red, tetramethyl rhodamin (TMR) Renographin, ROX, TAMRA, TET, Tetramethylrhodamine, Texas Red, and derivatives of these

labels (i.e., halogenated analogues, modified with isothiocynate or other linker for conjugating, etc.), for example. An exemplary radiolabel is tritium.

**[0225]** Molecules containing azido groups may also be used to form covalent bonds to proteins through reactive nitrene intermediates that are generated by low intensity ultraviolet light (Potter & Haley, 1983). In particular, 2- and 8-azido analogues of purine nucleotides have been used as site-directed photoprobes to identify nucleotide binding proteins in crude cell extracts (Owens & Haley, 1987; Atherton et al., 1985). The 2- and 8-azido nucleotides have also been used to map nucleotide binding domains of purified proteins (Khatoon et al., 1989; King et al., 1989; and Dholakia et al., 1989) and can be used as antibody binding agents.

**[0226]** In other embodiments of the invention, CD37-binding agents (e.g., antibodies and antigen-binding fragments thereof) or secondary binding agents are radiolabeled with nuclides such as tritium. In additional embodiments, nanogold particles (such as sizes from about 0.5 nm-40 nm) and/or Quantum Dots (Hayward, Calif.) are employed.

**[0227]** In some embodiments, CD37 is detected using the Optiview DAB IHC Detection reagent (Ventanna catalog # 760-700).

**[0228]** In some embodiments, CD37 is detected using the BenchMark Ultra staining system.

**[0229]** In some embodiments, CD37 is detected using the BenchMark Ultra staining system using the Optiview DAB IHC Detection reagent (Ventanna catalog # 760-700).

### VIII. Compositions and Kits

**[0230]** Also provided herein are compositions and kits for use in the practice of the methods disclosed herein. Such kits may comprise containers, each with one or more of the various reagents (typically in concentrated form) utilized in the methods, including, for example, one or more CD37-binding agents (e.g., antibodies or antigen-binding fragments thereof), buffers, and/or reagents and instrumentation for the detection of CD37 to support the practice of the invention. The kit can further comprise a second binding agent that binds to the CD37-binding agent, and optionally a third binding agent that binds to the second binding agent. The CD37-binding agent, the second binding agent, or the third binding agent can be bound to a detection reagent or the kit can comprise reagents for coupling a detection reagent to the CD37-binding agent, the second binding agent, or the third binding agent. A label or indicator describing, or a set of instructions for use of, kit components in a ligand detection method of the

present invention, will also be typically included, where the instructions may be associated with a package insert and/or the packaging of the kit or the components thereof.

**[0231]** In certain embodiments, a kit comprises a first antibody or antigen-binding fragment that binds to CD37, a second antibody or antigen-binding fragment that binds to the first antibody or antigen-binding fragment, a third antibody or antigen-binding fragment that binds to the second antibody or antigen binding fragment, wherein the third antibody or antigen-binding fragment is linked to detection reagent (e.g., an enzyme tag), optionally a substrate for the detection reagent (e.g., TMB, DAB, or ABTS), and optionally a CD37 protein or cell sample containing CD37 (e.g., a paraffin-embedded sample). The kits can further comprise a therapeutic agent for the treatment of cancer, such as an anti-CD37 immunoconjugate.

**[0232]** In one embodiment, the CD37-binding agent is 1B11-2 or an antigen-binding fragment thereof. In one embodiment, the CD37-binding agent is an antibody or antigen-binding fragment that binds to the same CD37 epitope as 1B11-2. In one embodiment, the CD37-binding agent is an antibody or antigen-binding fragment that comprises the six CDRs of 1B11-2. In one embodiment, the CD37-binding agent is an antibody or antigen-binding fragment that comprises the VH and VL of 1B11-2.

**[0233]** In one embodiment the CD37-specific antibody or antigen-binding fragment thereof is included at a concentration of about 0.1 to about 20  $\mu$ g/mL, about 0.1 to about 15  $\mu$ g/mL, about 0.1 to about 10  $\mu$ g/mL, about 0.5 to about 20  $\mu$ g/mL, about 0.5 to about 15  $\mu$ g/mL, about 0.5 to about 10  $\mu$ g/mL, about 1 to about 20  $\mu$ g/mL, about 1 to about 15  $\mu$ g/mL, about 1 to about 10  $\mu$ g/mL, about 2 to about 20  $\mu$ g/mL, about 2 to about 15  $\mu$ g/mL, or about 2 to about 10  $\mu$ g/mL. In another embodiment, the CD37-specific antibody or antigen-binding fragment thereof is included at a concentration of about 1.5  $\mu$ g/mL, about 2  $\mu$ g/mL, about 3  $\mu$ g/mL, about 4  $\mu$ g/mL, about 5  $\mu$ g/mL, about 6  $\mu$ g/mL, about 7  $\mu$ g/mL, about 8  $\mu$ g/mL, about 9  $\mu$ g/mL, or about 10  $\mu$ g/mL. In another embodiment, the CD37-specific antibody or antigen-binding fragment thereof is included at a concentration of about 2  $\mu$ g/mL. In another embodiment, the CD37-specific antibody or antigen-binding fragment thereof is included at a concentration of about 10  $\mu$ g/mL.

**[0234]** In another embodiment, the antibody or antigen-binding fragment thereof is included in concentrated solution with instructions for dilutions to achieve a final concentration of about 1 to about 20  $\mu$ g/mL, about 1 to about 15  $\mu$ g/mL, about 1 to about 10  $\mu$ g/mL, about 2 to about 20  $\mu$ g/mL, about 2 to about 15  $\mu$ g/mL, or about 2 to about 10  $\mu$ g/mL. In another

embodiment, the antibody or antigen-binding fragment thereof is included in concentrated solution with instructions for dilutions to achieve a final concentration of about 1.5  $\mu$ g/mL, about 2  $\mu$ g/mL, about 3  $\mu$ g/mL, about 4  $\mu$ g/mL, about 5  $\mu$ g/mL, about 6  $\mu$ g/mL, about 7  $\mu$ g/mL, about 8  $\mu$ g/mL, about 9  $\mu$ g/mL, or about 10  $\mu$ g/mL. In another embodiment, the antibody or antigen-binding fragment thereof is included in concentrated solution with instructions for dilutions to achieve a final concentration of about 2  $\mu$ g/mL. In another embodiment, the antibody or antigen-binding fragment thereof is included in concentrated solution with instructions for dilutions to achieve a final concentration of about 2.1  $\mu$ g/mL. In another embodiment, the antibody or antigen-binding fragment thereof is included in concentrated solution with instructions for dilutions to achieve a final concentration of about 4.2  $\mu$ g/mL. In another embodiment, the antibody or antigen-binding fragment thereof is included in concentrated solution with instructions for dilutions to achieve a final concentration of about 8.4  $\mu$ g/mL. In another embodiment, the antibody or antigen-binding fragment thereof is included in concentrated solution with instructions for dilutions to achieve a final concentration of about 10  $\mu$ g/ml. The kit can also include instructions for detection and scoring of CD37 expression. The kit can also include control or reference samples. Non-limiting examples of control or reference samples include cell pellets or tissue culture cell lines derived from normal (normal control) or tumor (positive control) samples. Exemplary cell lines include cell lines stably or transiently transfected with an expression vector that expresses CD37. Additional examples include cell pellets and tissue samples described in the Examples. Positive cell lines include Daudi cells (high expression), Ramos cells (moderate expression) and Namalwa cells (moderate to low expression). Human tonsil serves as both a positive and negative control tissue as the germinal centers and mantle zones show high expression and the interfollicular region shows no expression. In some embodiments, the control or reference samples are paraffin-embedded samples.

**[0235]** In some embodiments, a kit is a packaged combination including the basic elements of: (a) capture reagents comprised of the monoclonal antibodies against human CD37; and (b) detection reagents which can also comprise CD37 monoclonal antibodies, but can also comprise detectable (labeled or unlabeled) antibodies that bind to CD37. These basic elements are defined herein.

**[0236]** In one embodiment, the kit further comprises a solid support for the capture reagents, which can be provided as a separate element or on which the capture reagents are

already immobilized. Hence, the capture antibodies in the kit can be immobilized on a solid support, or they can be immobilized on such support that is included with the kit or provided separately from the kit.

**[0237]** In one embodiment, the capture reagent is coated on a microtiter plate. The detection reagent can be labeled antibodies detected directly or unlabeled antibodies that are detected by labeled antibodies directed against the unlabeled antibodies raised in a different species. Where the label is an enzyme, the kit will ordinarily include substrates and cofactors required by the enzyme, and where the label is a fluorophore, a dye precursor that provides the detectable chromophore. Where the detection reagent is unlabeled, the kit can further comprise a detection means for the detectable antibodies, such as the labeled antibodies directed to the unlabeled antibodies, e.g., in a fluorimetric-detected format. Where the label is an enzyme, the kit will ordinarily include substrates and cofactors required by the enzyme, where the label is a fluorophore, a dye precursor that provides the detectable chromophore, and where the label is biotin, an avidin such as avidin, streptavidin, or streptavidin conjugated to HRP or  $\beta$ -galactosidase with MUG.

**[0238]** In one embodiment, the capture reagent is the CD37 antibody 1B11-2 or an antibody comprising the sequences of antibody 1B11-2. In one embodiment, the detection reagent is the CD37 antibody 1B11-2 or an antibody comprising the sequences of antibody 1B11-2. In another embodiment, the detection reagent CD37 antibody 1B11-2 or an antibody comprising the sequences of antibody 1B11-2 is biotinylated.

**[0239]** In another embodiment, the kit further comprises a detection reagent selected from the group consisting of: an enzyme, a fluorophore, a radioactive label, and a luminophore. In another embodiment, the detection reagent is selected from the group consisting of: biotin, digoxigenin, fluorescein, tritium, and rhodamine.

**[0240]** The kit can also contain instructions for carrying out the assay, and/or CD37 protein, or fragments thereof (e.g., CD37 extracellular domain or the CD37 extracellular domain with all or a part of the GPI linkage domain) as an antigen standard, as well as other additives such as stabilizers, washing and incubation buffers, and the like. In one embodiment, the CD37 antigen standard is a CD37-protein described in the Examples herein. The kit can also include instructions for detection and scoring of CD37 expression.

**[0241]** The components of the kit can be provided in predetermined ratios, with the relative amounts of the various reagents suitably varied to provide for concentrations in solution

of the reagents that substantially maximize the sensitivity of the assay. Particularly, the reagents can be provided as dry powders, usually lyophilized, including excipients, which on dissolution will provide for a reagent solution having the appropriate concentration for combining with the sample to be tested.

**[0242]** Compositions comprising the antibodies or antigen-binding fragments described herein are also provided. In one embodiment, a composition comprises an anti-CD37 antibody or antigen-binding fragment described herein and a buffer, e.g., a buffer that can be used in a detection assay such as IHC, ELISA, or FACS. Such buffers are known to those of ordinary skill in the art and include diluents. By way of example, IHC buffers can contain, for example, casein serum or albumin (such as calf serum, goat serum, or BSA), Tween or Triton, PBS and/or sodium azide or any combination thereof. IHC buffers are also provided herein and known to those of ordinary skill in the art. ELISA buffers are also provided herein and known to those of ordinary skill in the art. ELISA buffers can contain, for example, serum or albumin (such as calf serum, goat serum, or BSA), non-fat dry milk, casein, and/or gelatin or any combination thereof. Certain FACS buffers are provided herein, e.g., in the working examples. FACS buffers can also contain, for example, serum or albumin (such as calf serum, goat serum, or BSA) and/or sodium azide. FACS buffers can also contain PBS, EDTA, and/or DNase or any combination thereof.

**[0243]** Embodiments of the present disclosure can be further defined by reference to the following non-limiting examples, which describe in detail preparation of certain antibodies of the present disclosure and methods for using antibodies of the present disclosure. It will be apparent to those skilled in the art that many modifications, both to materials and methods, can be practiced without departing from the scope of the present disclosure.

## IX. EXAMPLES

**[0244]** It is understood that the examples and embodiments described herein are for illustrative purposes only and that various modifications or changes in light thereof will be suggested to persons skilled in the art and are to be included within the spirit and purview of this application.

Example 1: Generation of CD37 hybridomas

**[0245]** Hybridomas producing anti-human CD37 monoclonal antibodies that are suitable for immunohistochemistry (IHC) staining (antibodies of the present disclosure) were selected

from approximately 4,800 hybridomas. The hybridomas were produced by immunization of wild-type Balb/c mice with recombinant CD37 antigen hCD37-LEL produced in *E. coli*. This antigen comprises amino acids 107 to 242 of CD37 with a 6xHis-tag added to the 3'end to facilitate purification (SEQ ID NO:15). The immunization with CD37 recombinant protein was done by subcutaneous injection of the protein emulsified in complete Freund's adjuvant (CFA) or incomplete Freund's adjuvant for boost (Sigma) or Magic mouse adjuvant (Creative Diagnostics). Generally, mice were immunized five times with two week intervals before receiving a final boost by intraperitoneal injection of the immunogen three days prior to fusion.

**[0246]** A total of 5 independent fusions were carried out using spleen cells that originated from the immunized wild-type Balb/c mice and murine myeloma P3X63Ag8.653 cells (P3 cells). Cell fusion was conducted using an ECM200 electrofusion machine (BTX Harvard Apparatus) according to standard protocols. Each fusion yielded more than 1,000 hybridomas.

**[0247]** Antibodies produced by these hybridomas were screened and confirmed by ELISA using different recombinant versions of the CD37 antigen. hCD37-LEL comprises amino acid 107 to 242 of human CD37 with a 6xHis-tag added to the 3'end to facilitate purification (SEQ ID NO:15) and was produced in *E. coli*. hCD37-Fc-LAGAcomprises amino acids 107 to 235 of human CD37 with a human IgG1 Fc-domain added to the 3'end to facilitate purification (SEQ ID NO:17) and was produced in HEK-293T cells. hCD37-ECD-Fc comprises amino acids 107 to 235 of human CD37 with a murine IgG2a Fc-domain added to the 3'end to facilitate purification (SEQ ID NO:16) and was produced in HEK-293T cells.

**[0248]** For native conditions, recombinant proteins were diluted directly into 50 mM Sodium bicarbonate coating buffer (Sigma-Aldrich). For denaturing conditions, recombinant proteins were incubated in 1% SDS with 50 mM DTT for 30 minutes at 65°C, followed by incubation with 100 mM Iodoacetamide for 30 minutes at room temperature prior to diluting into 50 mM Sodium bicarbonate coating buffer. Each recombinant protein was immobilized at approximately 25-100 ng/well onto microtiter plates by overnight incubation at 4°C.

**[0249]** Plates were washed once with PBS supplemented with 0.05% Tween-20 and blocked with PBS supplemented with 1% bovine serum albumin (BSA). Plates were washed three times with PBS supplemented with 0.05% Tween-20, and hybridoma supernatants were added to the plates. Plates were incubated for one hour at room temperature, washed three times as above, and incubated with HRP-labeled goat anti-murine secondary antibody (Jackson ImmunoResearch, diluted at 1:5,000) for one hour at room temperature. The plates were washed

three times as above, and bound HRP-conjugated antibody was detected by adding the HRP-substrate TMB (Bio-FX). Plates were incubated for approximately 10 minutes, and then color development was stopped with stop solution (Bio-FX). Absorbance at 450 nm was measured for each plate in a multiplate reader. Hybridoma supernatant from clone 1B11 resulted in a strong positive ELISA signal for both native and denaturing conditions (see Figure 1A) and was chosen for subcloning. Two subclones were obtained from clone 1B11: 1B11-2 and 1B11-20. Hybridoma supernatant from both subclones resulted in a strong positive ELISA signal for both native and denaturing conditions (see Figure 1B), and clone 1B11-2 was chosen for further analysis.

Example 2: Characterization of the anti-CD37 antibodies by ELISA

**[0250]** Antibody from 1B11-2 was purified using standard protein-A chromatography. An anti-CD37 antibody sold by Leica Biosystems (product code NCL-CD37) was used for comparison. The binding of the anti-CD37 antibodies was examined by ELISA with recombinant CD37 proteins used as the antigen. Each recombinant protein was immobilized at approximately 25-100 ng/well on microtiter plates in Sodium bicarbonate coating buffer (Sigma-Aldrich) using either native or denatured conditions as described above. Plates were washed once with PBS supplemented with 0.05% Tween-20 and blocked with PBS supplemented with 1% bovine serum albumin (BSA). Plates were washed three times with PBS supplemented with 0.05% Tween-20 and purified antibodies were added to the plates. Plates were incubated for one hour at room temperature, washed three times as above, and incubated with HRP-labeled goat anti-murine secondary antibody (Jackson ImmunoResearch, diluted at 1:5,000) for one hour at room temperature. The plates were washed three times as above, and bound HRP-conjugated antibody was detected by adding the HRP-substrate TMB (Bio-FX). Plates were incubated for approximately 10 minutes, and then color development was stopped with stop solution (Bio-FX). Absorbance at 450 nm was measured for each plate in a multiplate reader. Representative results are shown in Figure 2 for binding to native hCD37-Fc-LAGA and hCD37-LEL. Antibody 1B11-2 binds with greatly improved affinity to both native CD37 proteins as compared to NCL-CD37. Results are shown in Figure 3 for binding to denatured hCD37-LEL protein. Antibody 1B11-2 binds with improved affinity to denatured hCD37-LEL protein as compared to NCL-CD37.

## Example 3. Antigen epitope characterization

**[0251]** Binding of the anti-CD37 antibodies was further examined by ELISA with recombinant CD37 protein hCD37-ECD-S2-Fc used as the antigen under native conditions as described above. (S2 refers to the second segment of the large extracellular domain of CD37, containing amino acids 138 to 176). Representative results are shown in Figure 4. hCD37-ECD-S2-Fc comprises amino acids 107 to 109 and 138 to 235 of human CD37 with a murine IgG2a Fc-domain added to the 3'end to facilitate purification (SEQ ID NO:18) and was produced in HEK-293T cells. Antibody 1B11-2 does not bind to hCD37-ECD-S2-Fc, while NCL-CD37 retains binding to this CD37 protein fragment. Similar results were seen with Western blot analysis.

## Example 4. Immunohistochemical evaluation of anti-CD37 antibodies

## FFPE CD37 IHC

**[0252]** Purified antibody from clone 1B11-2 was analyzed and compared with Leica's NCL-CD37 mouse monoclonal antibody by IHC. The analysis was performed using the Leica Bond RX Automated Stainer and the reagents and conditions listed in Table 1.

Table 1. IHC Reagents and Assay Conditions

Step	Action/Reagent (Vendor)	Time
Bake	Temperature: 60°C	30 Minutes
Dewax	Bond Dewax Solution (Leica) 100% Reagent Grade Ethanol (Arantik)	Fixed
Antigen Retrieval	Bond Epitope Retrieval 1 (citrate buffer based pH 6.0 solution)	20 Minutes
Endogenous Peroxidase Block	Peroxide (Leica)	5 Minutes
Test Article	ImmunoGen, Inc. generated antibodies at varying concentrations prepared by diluting in Leica Antibody Diluent	15 Minutes
Detection	Post Primary Regent (Leica)	8 Minutes
	Polymer (Leica)	8 Minutes
	Mixed DAB (Leica)	10 Minutes
Counterstain	Hematoxylin (Leica)	5 Minutes

**[0253]** Slides containing formalin fixed paraffin embedded (FFPE) cell samples, normal tissues, diffuse large B-cell lymphoma patient tumor biopsies, follicular lymphoma patient tumor biopsies, and chronic lymphocytic leukemia/small lymphocytic lymphoma patient tumor biopsies were baked at 60°C and dewaxed using Bond Dewax Solution and 100% Ethanol. Heat induced epitope retrieval using Bond Epitope Retrieval 1 (citrate buffer based pH 6.0 solution) was performed for 20 minutes and endogenous peroxidase was blocked with peroxide for 5 minutes. Slides were incubated with ImmunoGen, Inc. generated 1B11-2 antibody, Leica/Novocastra NCL-CD37 antibody (clone CT1) or Leica/Novocastra muIgG1 control antibody at varying concentrations for 15 minutes. Bound antibodies were detected by incubation with the Leica Bond Refine detection system. Following the application of the antibodies, slides were incubated with Post Primary Reagent (rabbit anti-mouse IgG) for 8 minutes, Polymer (goat anti-rabbit polymer) for 8 minutes, and DAB (3,3-diaminobenzidine tetrahydrochloride) for 10 minutes. This resulted in a brown color signal. Slides were counterstained with hematoxylin for 5 minutes.

**[0254]** FFPE normal spleen and tonsil tissue samples were derived from human tissue blocks obtained from Mercy Health Systems and Ardais Corporationas as outlined below. FFPE cell samples were derived from the Daudi and Ramos cell lines supplied by DSMZ (German Collection of Microorganisms and Cell Cultures), and the Namalwa cell line was supplied by American Tissue Culture Collection. Slides containing sections of samples were prepared from FFPE blocks using a microtome set at 5µm and were mounted on positively charged slides. These slides were allowed to air dry overnight prior to staining. Human normal tissue arrays were purchased from Pantomics, and non-Hodgkin's lymphoma tissue micro arrays were purchased from TriStar Technology Group LLC.

Table 2. FFPE Test Samples

Human Tissue Type	Commercial Source
Normal Spleen (2)	Mercy Health Systems
Normal Tonsil (3)	Mercy Health Systems (2) and Ardais Corporation (1)
Normal Tissue Micro Array	Pantomics
Non-Hodgkin's Lymphoma Tissue Micro Array	TriStar Technology Group LLC

**[0255]** CD37 staining intensity and distribution patterns were scored relative to control IgG staining (non-specific), and 1B11-2 staining was compared with the staining observed with Leica's NCL-CD37 mouse monoclonal antibody. Intensity was scored on a scale of 0 to 3 where 0 = no staining, 1 = weak staining, 2 = moderate staining, and 3 = strong staining. Uniformity of the staining was scored as negative (no cells exhibit positive staining), focal (<25% of cells stained), heterogeneous (25-75% of cells stained), and homogeneous (>75% of cells stained). The staining intensity and scoring scales are described below. All staining was evaluated by a Board certified pathologist.

Table 3. Intensity and Uniformity of Staining

Intensity (Amount of Membrane Staining)		Uniformity (Percent of Positive Cells)	
0	Negative	0	Negative
1	Weak	Focal	<25%
2	Moderate	Heterogeneous (hetero)	25-75%
3	Strong	Homogeneous (homo)	>75%

#### Validation of Purified 1B11-2 antibody for FFPE CD37 IHC

**[0256]** Purified antibody from clone 1B11-2 diluted at 8.4  $\mu$ g/mL, 4.2  $\mu$ g/mL, and 2.1  $\mu$ g/mL in Leica Antibody Diluent (Tris-buffered saline, surfactant, and protein stabilizer with 0.35% ProClin™ 950) was used to stain CD37- positive control samples (human normal tonsil, Daudi cells, Ramos cells, and Namalwa cells). The antibody was evaluated for CD37 specificity as measured by acceptable membrane staining and specificity in CD37-positive samples. This clone was also compared with the NCL-CD37 mouse mAb (clone CT1) diluted to 4.2  $\mu$ g/mL in Leica Antibody Diluent using the same CD37 positive human tissue and cells. Leica's NCL-CD37 antibody produced acceptable membrane staining in each of the CD37 positive cell pellets, and acceptable membrane staining in the germinal centers and mantle zones of the tonsil tissue (both positive for CD37) along with some low level nuclear background, and no staining in the interfollicular region of the tonsil (which is CD37 negative). 1B11-2 exhibited acceptable membrane staining in CD37 positive samples and good specificity with the added advantage of a complete lack of nuclear background staining (see Figure 5 for images of 1B11-2 compared with Leica's NCL-CD37 Mouse mAb). 1B11-2 produced membrane staining in a pattern that was

similar to that observed with Leica's NCL-CD37 Mouse monoclonal antibody; however, this membrane staining was more specific and more clearly defined than that produced by Leica's NCL-CD37 antibody. It is also important to note that 1B11-2 did not produce staining in the interfollicular region of the tonsil (negative for CD37 expression) which demonstrates increased specificity. A suitable staining concentration of 4.2  $\mu$ g/mL was experimentally determined for 1B11-2.

**[0257]** 1B11-2 diluted at 4.2  $\mu$ g/mL in Leica Antibody Diluent was also used to stain a human normal tissue array (purchased from Pantomics) and human tonsil and spleen tissues to evaluate specificity. Again 1B11-2 was compared with Leica's NCL-CD37 mouse monoclonal antibody diluted at 4.2  $\mu$ g/mL in Leica Antibody Diluent on the same normal tonsil and spleen tissues as well as the human normal tissue array. In most normal tissues (excluding tonsil and spleen) Leica's NCL-CD37 mouse monoclonal antibody exhibited staining only in scattered lymphocyte cells leaving the remainder of the tissues negative. There was some cytoplasmic background blush observed in the paneth cells of the small intestine and in the islet cells of the pancreas (see Figure 6). Leica's NCL-CD37 antibody did produce acceptable membrane staining in the germinal centers and mantle zones of the human normal tonsil and in the marginal zone of the human normal spleen tissues albeit with some low level nuclear background. There was no staining present in the interfollicular region of the tonsil or in the red pulp of the spleen with Leica's NCL-CD37 antibody. 1B11-2 exhibited acceptable membrane staining in the germinal centers and mantle zones of the human normal tonsil and in the marginal zone of the human normal spleen tissues and only scattered lymphocyte staining in the remaining normal tissues with no background staining at all (see Figure 6). There was also no staining in the interfollicular region of the tonsil or in the red pulp of the spleen. These results demonstrate that 1B11-2 is advantageous in terms of staining sensitivity, specificity, and reduced background, all of which are critical for high quality performance and analysis of IHC assays.

Example 5. IHC evaluation of 1B11-2 CD37 antibody using human tumor samples.

**[0258]** Human tumor samples representative of diffuse large B-cell lymphoma (n=52), follicular lymphoma (n=20), and chronic lymphocytic leukemia/small lymphocytic lymphoma (n=8) (all included in a non-Hodgkin's lymphoma tissue microarray purchased from TriStar Technology Group LLC) were evaluated for CD37 expression by IHC using the 1B11-2

antibody. The intensity of CD37 staining and the distribution of scores are summarized in Table 4, below. Figure 7 shows an example of staining of diffuse large B cell lymphoma and follicular lymphoma tissues with the 1B11-2 antibody. These results demonstrate the advantages of 1B11-2 as a more specific and sensitive antibody for use in IHC assays to assess CD37 expression in non-Hodgkin's lymphoma patient tissues.

Table 4: Distribution of Scores (% Positivity)

TUMOR TYPE:	DIFFUSE LARGE B CELL LYMPHOMA n=52	FOLLICULAR LYMPHOMA n=20	CHRONIC LYMPHOCYTIC LEUKEMIA/SMALL LYMPHOCYTIC LYMPHOMA n=8
Positive (any intensity):	96%	95%	100%
≥ level 2 intensity with at least 25% tumor cells stained:	58%	35%	50%
≥ level 3 intensity with at least 25% tumor cells stained:	60%	100%	100%

**[0259]** The 1B11-2 antibody and the NCL-CD37 mouse monoclonal (Leica) antibody and were compared using a non-Hodgkin's lymphoma tissue micro array (TMA) (purchased from TriStar Technology Group LLC). Using the NCL-CD37 antibody in an IHC assay (CD37 assay), 27% of diffuse large B cell lymphoma samples (14 out of 52), 85% of follicular lymphoma samples (17 out of 20), and 37% of chronic lymphocytic leukemia/small lymphocytic lymphoma samples (3 out of 8) were scored in the highest category (level 3 staining intensity on at least 25% tumor cells, Table 5). In contrast, the 1B11-2 antibody in the IHC assay described above utilizing the Leica Bond Refine Detection Kit on a Leica Bond Rx automated slide stainer, produced staining with increased sensitivity and specificity with 59% of diffuse large B cell lymphoma samples (31 out of 52), 95% of follicular lymphoma samples (19 out of 20), and 100% of chronic lymphocytic leukemia/small lymphocytic lymphoma samples (8 out of 8) producing staining that scored in the highest category (level 3 staining intensity on at least 25% tumor cells, Table 5). The 1B11-2 antibody was also able to detect low level CD37 expression in three diffuse large B cell lymphoma samples, whereas the Leica's NCL-CD37 antibody was

unable to detect this low level of expression. These results demonstrate that 1B11-2 is advantageous in terms of staining sensitivity and specificity and produces a more dynamic range of CD37 staining.

Table 5: CD37 prevalence comparison in non-Hodgkin's lymphoma TMA

<b>Scores</b>	<b>Diffuse Large B Cell Lymphoma (n=52)</b>		<b>Follicular Lymphoma (n=20)</b>		<b>Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma (n=8)</b>	
	<b>NCL-CD37</b>	<b>1B11-2</b>	<b>NCL-CD37</b>	<b>1B11-2</b>	<b>NCL-CD37</b>	<b>1B11-2</b>
Positive (any intensity)	47 (90%)	50 (96%)	19 (95%)	19 (95%)	8 (100%)	8 (100%)
≥ level 1 intensity with at least 25% tumor cells stained:	26 (50%)	11 (21%)	0	0	0	0
≥ level 2 intensity with at least 25% tumor cells stained:	33 (63%)	30 (58%)	12 (60%)	7 (35%)	7 (88%)	4 (50%)
≥ level 3 intensity with at least 25% tumor cells stained:	14 (27%)	31 (60%)	17 (85%)	19 (95%)	3 (38%)	8 (100%)

#### Example 6. Domain mapping

##### Domain mapping by denaturing SDS PAGE Western blotting

**[0260]** The ability to recognize different preparations of Fc-fused CD37-ECDs was tested in denaturing SDS PAGE followed by Western blotting for 1B11-2 (left panel), in direct comparison with a commercially available anti-CD37 antibody (Leica; right panel). Fc-fused CD37-ECD preparations were denatured by incubation in Laemmli buffer containing 70mM  $\beta$ -mercapto-ethanol at 100 °C for 10 min, and were separated by SDS polyacrylamide gel electrophoresis, followed by electrophoretic transfer to PVDF membranes. Membranes were

blocked with 5% non-fat milk in Tris-buffered saline with 0.1% Tween-20 (TBST) for 1 hour at room temperature. Primary antibodies were applied overnight, followed by detection with secondary anti-mouse F(ab)<sub>2</sub> conjugated to horse radish peroxidase for 1h at room temperature. Blots were developed using enhanced chemiluminescence detection following standard procedures. The results are shown in Figure 8. While the Leica antibody recognizes all three Fc-CD37 ECD preparations, the 1B11-2 antibody of the invention recognizes only hCD37-ECD-Fc and hCD37-Fc-LAGA, but not hCD37-ECD-S2-Fc. The hCD37-ECD-S2-Fc construct is missing the S1 segment (amino acids 110-137) of the CD37 ECD. Thus, a region of amino acids 110-137 is critical for epitope recognition by 1B11-2, but not by the Leica antibody.

Domain mapping by native PAGE Western blotting

**[0261]** The ability to recognize different preparations of Fc-fused CD37-ECDs was tested in native PAGE followed by Western blotting for 1B11-2. Fc-fused CD37-ECD preparations were loaded in NativePage sample buffer and were separated by SDS polyacrylamide gel electrophoresis, followed by electrophoretic transfer to PVDF membranes or staining of the gel with Coomassie Brilliant Blue. The PVDF membrane was blocked with 5% non-fat milk in Tris-buffered saline with 0.1% Tween-20 (TBST) for 1 hour at room temperature. Primary antibody was applied overnight, followed by detection with secondary anti-mouse F(ab)<sub>2</sub> conjugated to horse radish peroxidase for 1h at room temperature. The blot was developed using enhanced chemiluminescence detection following standard procedures. The results are shown in Figure 9. Consistent with data from denaturing SDS PAGE (Figure 8) and ELISA experiments (see Figure 4), the 1B11-2 antibody of the invention recognizes only hCD37-ECD-Fc and hCD37-Fc-LAGA, but not hCD37-ECD-S2-Fc. These data demonstrate that the S1 segment (amino acids 110-137) of CD37 ECD or a portion thereof is critical for epitope recognition by 1B11-2 (left panel of Figure 9). Coomassie Brilliant Blue gel stain (right panel of Figure 9) demonstrates that hCD37-ECD-S2-Fc protein was present in sufficient amounts for detection by 1B11-2.

Example 7. Cloning and sequencing of the VL and VH regions of the anti-human CD37 antibody

**[0262]** Total cellular RNA was prepared from  $5 \times 10^6$  cells of the anti-human CD37 hybridoma 1B11-2 described above using an RNeasy kit (QIAGen) according to the manufacturer's protocol. First strand cDNA was then synthesized from the total RNA using the SuperScript III cDNA synthesis kit (Invitrogen).

**[0263]** The PCR procedures for amplifying the antibody variable region cDNAs derived from hybridoma cells were based on methods described in Wang et al. ((2000) J Immunol Methods. 233:167-77) and Co et al. ((1992) J Immunol. 148:1149-54). The variable light chain (VL) and variable heavy chain (VH) sequences were amplified by degenerate primers on the 5' end and either murine kappa or IgG1 constant region specific primers on the 3' end. The PCR reactions were then run on a 1% low melt agarose gel, followed by the excision of the 300 to 400 bp amplicon bands that were subsequently purified using Zymo DNA mini columns. The purified amplicons were sent to Beckman Coulter Genomics for sequencing utilizing the same 5' and 3' primers of the PCR reactions in order to generate the variable region cDNA sequences from both directions.

**[0264]** The degenerate primers used to clone the VL and VH cDNA sequences alter the 5' end, so additional sequencing efforts were needed to verify the complete variable region cDNA sequences. The preliminary sequences were entered into a search query of the NCBI IgBlast site ([www.ncbi.nlm.nih.gov/igblast/](http://www.ncbi.nlm.nih.gov/igblast/)) to identify the murine germline sequences from which the antibody sequences had been derived. PCR primers were then designed to anneal to the germline linked leader sequence of the murine antibody so that this new PCR reaction would yield a complete variable region cDNA sequence, unaltered by the PCR primers. The PCR reactions, band purifications, and sequencing were performed as described above.

**[0265]** The variable regions cDNA sequences obtained for the anti-human CD37 antibody were combined with germline constant region sequences to obtain full length antibody cDNA sequences. The molecular weights of the heavy and light chains were then calculated from translations of the cDNA sequences and compared with the molecular weights obtained by LC/MS analyses of the purified murine anti-human CD37 antibody. The observed molecular weights for the murine 1B11-2 light and heavy chains matched the expected values, confirming that the cDNA sequences were correct.

**[0266]** The VH and VL CDR sequences are provided in Tables 1 and 2, respectively. The VH and VL sequences are provided in Tables 3 and 4, respectively. The full length heavy chain and light chain sequences are provided in Tables 5 and 6, respectively. The polynucleotide sequences of the VH and VL are provided in Table 8.

**[0267]** All publications, patents, patent applications, internet sites, and accession numbers/database sequences (including both polynucleotide and polypeptide sequences) cited herein are hereby incorporated by reference in their entirety for all purposes to the same extent as if each individual publication, patent, patent application, internet site, or accession number/database sequence were specifically and individually indicated to be so incorporated by reference.

## WHAT IS CLAIMED IS:

1. An antibody or antigen-binding fragment thereof that specifically binds to the same CD37 epitope as an antibody comprising the polypeptide of SEQ ID NO:9 and the polypeptide of SEQ ID NO:10.
2. An antibody or antigen-binding fragment thereof that specifically binds to CD37, wherein said antibody or fragment thereof competitively inhibits binding to CD37 of an antibody comprising the polypeptide of SEQ ID NO:9 and the polypeptide of SEQ ID NO:10.
3. The antibody or antigen-binding fragment thereof of claim 1 or 2, wherein the antibody or fragment thereof comprises the heavy chain variable region (VH) CDR1, CDR2, and CDR3 sequences of SEQ ID NOs: 3-5, respectively, and the light chain variable region (VL) CDR1, CDR2, and CDR3 sequences of SEQ ID NOs: 6-8, respectively.
4. An antibody or antigen-binding fragment thereof that specifically binds to CD37, wherein said antibody or fragment thereof comprises the VH CDR1, CDR2, and CDR3 sequences of SEQ ID NOs: 3-5 and the VL CDR1, CDR2, and CDR3 sequences of SEQ ID NOs: 6-8, respectively.
5. The antibody or antigen-binding fragment thereof of any one of claims 1-4, wherein the antibody or fragment thereof comprises polypeptide sequences that are at least 90% identical to the polypeptide sequences of SEQ ID NOs:9 and 10.
6. The antibody or antigen-binding fragment thereof of claim 5, wherein the polypeptide sequences are at least 95% identical to the polypeptide sequences of SEQ ID NOs:9 and 10.
7. The antibody or antigen-binding fragment thereof of claim 6, wherein the polypeptide sequences are at least 99% identical to the polypeptide sequences of SEQ ID NOs:9 and 10.
8. The antibody or antigen-binding fragment thereof of claim 7, wherein the antibody or fragment thereof comprises the polypeptide sequences comprise the amino acids of sequences of SEQ ID NOs:9 and 10.
9. An antibody or antigen-binding fragment thereof that specifically binds to CD37, wherein the antibody or fragment thereof comprises a heavy chain variable region comprising SEQ ID NO:9.
10. An antibody or antigen-binding fragment thereof that specifically binds to CD37, wherein the antibody or fragment thereof comprises a heavy chain variable region comprising SEQ ID NO:10.

11. The antibody or antigen-binding fragment thereof of any one of claims 1-10, wherein the antibody is recombinantly produced.
12. The antibody or antigen-binding fragment thereof of any of claims 1-11, wherein said antibody or antigen-binding fragment thereof is murine, non-human, humanized, chimeric, or human.
13. The antibody or antigen-binding fragment thereof of claim 12, wherein said humanized antibody is resurfaced.
14. The antibody or antigen-binding fragment thereof of any of claims 1-13, which is a full length antibody.
15. The antibody or antigen-binding fragment thereof of any of claims 1-13, which is an antigen-binding fragment.
16. The antibody or antigen-binding fragment thereof of claim 15, wherein said antibody or antigen-binding fragment thereof comprises a Fab, Fab', F(ab')2, Fd, single chain Fv or scFv, disulfide linked Fv, V-NAR domain, IgNar, intrabody, IgGΔCH2, minibody, F(ab')3, tetrabody, triabody, diabody, single-domain antibody, DVD-Ig, Fcab, mAb2, (scFv)2, or scFv-Fc.
17. The antibody or antigen-binding fragment thereof of claim 15, wherein said antibody or antigen-binding fragment thereof comprises a Fab, Fab', F(ab')2, single chain Fv or scFv, disulfide linked Fv, intrabody, IgGΔCH2, minibody, F(ab')3, tetrabody, triabody, diabody, DVD-Ig, mAb2, (scFv)2, or scFv-Fc.
18. The antibody or antigen-binding fragment thereof of any one of claim 1-17, which binds to a human CD37 with a Kd of about 0.5 to about 10 nM.
19. The antibody or antigen-binding fragment thereof of any one of claims 1-17, which binds to a human CD37 with a Kd of about 1.0 nM or better.
20. The antibody or antigen-binding fragment thereof of any one of claims 2-19, which binds to a polypeptide comprising amino acids 107-242 of CD37 (SEQ ID NO:20).
21. The antibody or antigen-binding fragment thereof of any one of claims 2-20, which binds to a polypeptide comprising amino acids 107-235 of CD37 (SEQ ID NO:19).

22. The antibody or antigen-binding fragment thereof of any one of claims 2-21, which binds to the sequence set forth in SEQ ID NO:15.
23. The antibody or antigen-binding fragment thereof of any one of claims 2-22, which binds to the sequence set forth in SEQ ID NO:16.
24. The antibody or antigen-binding fragment thereof of any one of claims 2-23, which binds to the sequence set forth in SEQ ID NO:17.
25. The antibody or antigen-binding fragment thereof of any one of claims 2-24, which binds to a polypeptide comprising amino acids 107-242 of CD37 (SEQ ID NO:20) but does not bind to a polypeptide consisting of amino acids 138-235 of CD37.
26. The antibody or antigen-binding fragment thereof of any one of claims 2-25, which binds to a polypeptide comprising amino acids 107-235 of CD37 (SEQ ID NO:19) but does not bind to a polypeptide consisting of amino acids 138-235 of CD37.
27. The antibody or antigen-binding fragment thereof of any one of claims 2-26, which binds to a polypeptide of SEQ ID NO:15, but does not bind to a polypeptide of SEQ ID NO:18.
28. The antibody or antigen-binding fragment thereof of any one of claims 2-27, which binds to a polypeptide of SEQ ID NO:16, but does not bind to a polypeptide of SEQ ID NO:18.
29. The antibody or antigen-binding fragment thereof of any one of claims 2-28, which binds to a polypeptide of SEQ ID NO:17, but does not bind to a polypeptide of SEQ ID NO:18.
30. The antibody or antigen-binding fragment thereof of any one of claims 2-29, which binds to at least one amino acid in amino acids 110-137 of CD37.
31. The antibody or antigen-binding fragment thereof of any one of claims 18-30, wherein the binding affinity is measured by flow cytometry, Biacore, ELISA, or radioimmunoassay.
32. The antibody or antigen-binding fragment thereof of any one of claims 1-31, wherein the antibody or antigen-binding fragment thereof is detectably labeled.
33. A cell producing the antibody or antigen-binding fragment thereof of any one of claims 1-32.
34. The cell of claim 33, wherein the cell is isolated.

35. A method of making the antibody or antigen-binding fragment thereof of any one of claims 1-32, comprising (a) culturing the cell of claim 33 or 34; and (b) isolating said antibody or antigen-binding fragment thereof from said cultured cell.

36. A composition comprising the antibody or antigen-binding fragment thereof of any one of claims 1-32 and buffer selected from the group consisting of: an IHC buffer, an ELISA buffer, and a FACS buffer.

37. A method of detecting CD37 expression in a sample comprising contacting said sample with the antibody or antigen-binding fragment thereof of any of claims 1-32 or the composition of claim 36.

38. The method of claim 37, wherein said antibody or antigen-binding fragment thereof is detectably labeled.

39. The method of claim 38, wherein said label is selected from the group consisting of immunofluorescent label, chemiluminescent label, phosphorescent label, enzyme label, radiolabel, avidin/biotin, colloidal gold particle, colored particle and magnetic particle.

40. The method of claim 39, wherein said label is an enzyme label.

41. The method of any one of claims 37-40, wherein CD37 expression is determined by radioimmunoassay, Western blot assay, cytometry, immunofluorescent assay, enzyme immunoassay, immunoprecipitation assay, chemiluminescent assay, or immunohistochemical assay.

42. The method of claim 41, wherein CD37 expression is determined by immunohistochemical (IHC) assay.

43. A method for increasing the efficacy of cancer therapy with a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof, said method comprising administering the therapeutically active agent to a subject having cancer, wherein increased expression of CD37 has been detected in a cancerous sample from said subject using the antibody or antigen-binding fragment thereof of any one of claims 1-32 or the composition of claim 36.

44. A method for identifying a cancer likely to respond to a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof, said method comprising:

- a. contacting a biological sample comprising cells from said cancer with the antibody or antigen-binding fragment thereof of any one of claims 1-32 or the composition of claim 36;
- b. detecting binding of said antibody or antigen-binding fragment thereof to CD37 in said biological sample of (a);
- c. assigning a score to said binding of step (b), wherein said score is assigned based on comparison to one or more reference samples; and
- d. comparing said score in step (c) to the score of a reference tissue or cell, wherein a score for said cancer CD37 level that is greater than the score for a normal or low CD37 expressing reference sample or a score for said cancer CD37 level that is equal to or greater than the score for a high CD37 expressing reference sample identifies said cancer as likely to respond to an anti-CD37 antibody.

45. A method of treating a patient having cancer, said method comprising:

- a. determining a CD37 expression score from a detection of CD37 expression in a cancerous sample obtained from the patient, wherein the detection is performed using the antibody or antigen-binding fragment thereof of any one of claims 1-32 or the composition of claim 36; and
- b. administering a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof to the patient if the score indicates the patient will benefit from administration of the therapeutically active agent.

46. A method of treating a patient having cancer, said method comprising:

- a. determining a CD37 expression score from a detection of CD37 expression in a cancerous sample obtained from the patient, wherein the detection is performed using the antibody or antigen-binding fragment thereof of any one of claims 1-32 or the composition of claim 36; and
- b. instructing a healthcare provider to administer a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof to the patient if the score indicates the patient will benefit from administration of the therapeutically active agent.

47. A method of treating a patient having cancer, said method comprising:

- a. submitting a cancerous sample taken from a patient having cancer for determining a CD37 expression score from a detection of CD37 expression using the antibody or antigen-binding fragment thereof of any one of claims 1-32 or the composition of claim 36; and

b. administering a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof to the patient if the score indicates the patient will benefit from administration of the therapeutically active agent.

48. A method of treating a patient having cancer, said method comprising:

a. detecting CD37 expression in a cancerous sample obtained from said patient, wherein the detection is performed using the antibody or antigen-binding fragment thereof of any one of claims 1-32 or the composition of claim 36;

b. determining a CD37 expression score for said cancerous sample; and

c. administering a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof to the patient if the score indicates the patient will benefit from administration of the therapeutically active agent.

49. A method of identifying a cancer as sensitive to treatment with an anti-CD37 active agent, said method comprising:

a. detecting the level of CD37 expression in a cancerous sample from said cancer using the antibody or antigen-binding fragment thereof of any one of claims 1-32 or the composition of claim 36, wherein said detecting comprises the use of a method that distinguishes between staining intensity or staining uniformity in a CD37 expressing cancerous sample as compared to staining intensity or staining uniformity in one or more reference samples;

b. determining a CD37 staining intensity or staining uniformity score for said cancerous sample; and

c. comparing the CD37 staining intensity or staining uniformity score determined in step (b) to a relative value determined by measuring CD37 protein expression in at least one reference sample, wherein said at least one reference sample is a tissue, cell, or cell pellet sample which is not sensitive to treatment with a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof and wherein a CD37 staining intensity score for said cancerous sample determined in step (b) that is higher than said relative value identifies said cancer as being sensitive to treatment with the therapeutically active agent.

50. A method of identifying a cancer as sensitive to treatment with a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof, said method comprising:

- a. detecting the level of CD37 expression in a cancerous sample from said cancer using the antibody or antigen-binding fragment thereof of any one of claims 1-32 or the composition of claim 36, wherein said detecting comprises the use of a method that distinguishes between staining intensity or staining uniformity in a CD37 expressing cancerous sample as compared to staining intensity or staining uniformity in one or more reference samples;
- b. determining a CD37 staining intensity or staining uniformity score for said cancerous sample; and
- c. comparing the CD37 staining intensity or staining uniformity score determined in step (b) to a relative value determined by measuring CD37 protein expression in at least one reference sample, wherein said at least one reference sample is a tissue, cell, or cell pellet sample which is sensitive to treatment with a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof and wherein a CD37 staining intensity score for said cancerous sample determined in step (b) that is greater than or equal to said relative value identifies said cancer as being sensitive to treatment with the therapeutically active agent.

51. The method of any one of claims 43-50, further comprising administering a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof to the subject from whom the cancerous sample or biological sample was obtained.

52. The method of any one of claims 43-51, wherein the patient's CD37 level is detected in a cancerous sample or biological sample obtained from the patient.

53. The method of any of claims 43-52, wherein said cancerous sample or biological sample is a fluidic extract, blood, plasma, serum, spinal fluid, lymph fluid, or a splenic preparation.

54. The method of any one of claims 44-53, wherein the detecting is by immunohistochemistry (IHC).

55. The method of claim 42 or 54, wherein said IHC is calibrated IHC that can distinguish different levels of CD37 expression.

56. The method of any one of claims 42, 54, or 55, wherein said IHC produces a range of staining intensity for samples having low CD37 expression, moderate CD37 expression, or high CD37 expression.

57. The method of any one of claims 42 or 54-56, wherein said IHC distinguishes between staining intensity and staining uniformity in a CD37 expressing cancerous sample or biological sample as compared to a reference sample.

58. The method of any one of claims 42 or 54-57, wherein the IHC is performed manually.

59. The method of any one of claims 42 or 54-57, wherein the IHC is performed using an automated system.

60. The method of any one of claims 42 or 54-59, wherein a CD37 score is determined from the IHC.

61. The method of any one of claims 44-53, wherein the detecting is by enzyme linked immunosorbent assay (ELISA).

62. The method of any one of claims 44, 49, or 50, wherein said reference sample is a positive reference sample or a negative reference sample.

63. The method of any one of claims 44, 49, 50, or 51, wherein the reference sample comprises cells, cell pellets, or tissue.

64. The method of any one of claims 43-63, wherein the antibody or antigen-binding fragment thereof of any one of claims 1-32, further comprises a detection reagent selected from the group consisting of: an immunofluorescent label, a chemiluminescent label, a phosphorescent label, an enzyme, a radiolabel, avidin/biotin, a colloidal gold particle, a colored particle, and a magnetic particle.

65. The method of claim 64, wherein said detection reagent is an enzyme.

66. The method of any one of claims 43-65, wherein said cancer is a CD37 positive cancer.

67. The method of any one of claims 43-66, wherein the cancer is a leukemia or a lymphoma.

68. The method of any one of claims 43-66, wherein said cancer is selected from the group consisting of wherein said cancer is selected from the group consisting of B cell lymphomas, NHL, precursor B cell lymphoblastic leukemia/lymphoma and mature B cell neoplasms, B cell chronic lymphocytic leukemia (CLL)/small lymphocytic lymphoma (SLL), B cell prolymphocytic leukemia, lymphoplasmacytic lymphoma, mantle cell lymphoma (MCL), follicular lymphoma (FL), low grade, intermediate-grade and high-grade (FL), cutaneous follicle center lymphoma, marginal zone B cell lymphoma. MALT type marginal zone B cell lymphoma,

nodal marginal zone B cell lymphoma, splenic type marginal zone B cell lymphoma, hairy cell leukemia, diffuse large B cell lymphoma, Burkitt's lymphoma, plasmacytoma, plasma cell myeloma, post-transplant lymphoproliferative disorder, Waldenstrom's macroglobulinemia, and anaplastic large-cell lymphoma (ALCL).

69. The method of any of claims 37-68, wherein said CD37 expression is detected using at least one additional anti-CD37 antibody or antigen-binding fragment thereof.

70. The method of claim 69, wherein said CD37 expression is measured using two anti-CD37 antibodies or antigen-binding fragments thereof.

71. The method of any one of claims 69 or 70, wherein the at least one additional antibody or antigen-binding fragment thereof comprises a detection agent.

72. The method of claim 71, wherein the detection agent is a chromogenic detection agent, a fluorogenic detection agent, an enzymatic detection agent, or an electrochemiluminescent detection agent.

73. The method of claim 71 or 72, wherein the detection agent is horseradish peroxidase (HRP).

74. The method of any one of claims 70-73, wherein the at least one additional antibody or antigen-binding fragment thereof is bound to a solid support.

75. The method of 74, wherein the at least one additional antibody or antigen-binding fragment thereof is bound to a microtiter plate.

76. The method of claim 41 or 61, wherein said ELISA is a sandwich ELISA.

77. The method of any of claims 43-76, wherein the therapeutically active agent comprises the CD37 antibody huCD37-3.

78. The method of claim 77, wherein the therapeutically active agent is an antibody maytansinoid conjugate comprising the CD37 antibody huCD37-3, the maytansinoid DM1, and the non-cleavable SMCC linker (IMGN529).

79. A combination diagnostic and pharmaceutical kit comprising the antibody or antigen-binding fragment thereof of any one of claims 1-32 or the composition of claim 36 for use in diagnosis and a therapeutically active agent comprising an anti-CD37 antibody or antigen-binding fragment thereof for use in therapy.

80. The combination diagnostic and pharmaceutical kit of claim 79, wherein the detection antibody is able to detect CD37 expression by IHC.

81. The combination diagnostic and pharmaceutical kit of claim 79 or 80, wherein the detection antibody is able to detect CD37 expression by ELISA.

82. The combination diagnostic and pharmaceutical kit of any one of claims 79-81, wherein the anti-CD37 antibody in the therapeutically active agent is conjugated to a cytotoxin.

83. A diagnostic kit comprising the antibody or antigen-binding fragment thereof of any one of claims 1-32, a reagent for IHC, and one or more standardized reference samples, wherein said standardized reference samples comprise cells, cell pellets, or formalin fixed paraffin embedded tissue samples, and wherein said one or more standardized referenced samples are from non-CD37 expressing, low-CD37 expressing, or high CD37 expressing cells, cell pellets, or tissues.

\* Special categories of cited documents:

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier application or patent but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family

**INTERNATIONAL SEARCH REPORT**

International application No.

PCT/US2016/048887

**Box No. I Nucleotide and/or amino acid sequence(s) (Continuation of item 1.c of the first sheet)**

1. With regard to any nucleotide and/or amino acid sequence disclosed in the international application, the international search was carried out on the basis of a sequence listing:

- a.  forming part of the international application as filed:  
 in the form of an Annex C/ST.25 text file.  
 on paper or in the form of an image file.
- b.  furnished together with the international application under PCT Rule 13*ter*.1(a) for the purposes of international search only in the form of an Annex C/ST.25 text file.
- c.  furnished subsequent to the international filing date for the purposes of international search only:  
 in the form of an Annex C/ST.25 text file (Rule 13*ter*.1(a)).  
 on paper or in the form of an image file (Rule 13*ter*.1(b) and Administrative Instructions, Section 713).

2.  In addition, in the case that more than one version or copy of a sequence listing has been filed or furnished, the required statements that the information in the subsequent or additional copies is identical to that forming part of the application as filed or does not go beyond the application as filed, as appropriate, were furnished.

3. Additional comments:

SEQ ID NOs: 3-10 were searched.

**INTERNATIONAL SEARCH REPORT**

International application No.

PCT/US2016/048887

**Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)**

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
  
2.  Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
  
3.  Claims Nos.: 5-8, 11-83 because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
  
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**

- The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.
- The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.
- No protest accompanied the payment of additional search fees.

## 摘要

---

本发明一般涉及结合人 CD37 的抗体和基于 CD37 的疗法的诊断测定。
