Kingdom of Great Britain & Northern Ireland
Farnborough, Hampshire GU14 0LX (GB)**

(54) **Addressable matrix arrays**

(57) A ferroelectric liquid crystal display panel 10 comprises a layer of ferroelectric liquid crystal material contained between two substrates and bearing first and second electrode structures on their inside surfaces. The first and second electrode structures comprise respectively a series of row and column electrode tracks 4 and 5 which cross one another to form a matrix array of switching elements. The addressing of the switching elements is controlled by a data signal generator 14 and a strobe signal generator 15 by applying data waveforms in parallel to the column electrode tracks $4_1, 4_2, \dots, 4_n$ and by sequentially applying a strobe waveform to the row electrode tracks $5_1, 5_2, \dots, 5_m$ so as to switch selected switching elements along each row from one state to another. In order to compensate for differential waveform distortion across the display due to the effects of the different electrode track resistances seen at each column driver input, the data signal generator 14 is coupled to the column electrode tracks by compensating resistances R_1, R_2, R_3 , etc. having resistance values which vary from the first to the last columns. It is therefore possible to substantially equalise the picture quality across the display, and to ensure that temperature variations across the display caused by the different power components of the different waveforms are substantially equalised.

**ANNEX TO THE EUROPEAN SEARCH REPORT
ON EUROPEAN PATENT APPLICATION NO.**

EP 00 30 0444

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report. The members are as contained in the European Patent Office EDP file on The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
