TITLE: LIGANDS AND THEIR PREPARATION

ABSTRACT: The present invention relates to secondary amines suitable for the preparation of ligands for organometallic complexes, their preparation and their use.
Ligands and their Preparation

The present invention relates inter alia to new compounds, their preparation and their use for the preparation of organometallic complexes.

Organometallic complexes have attracted much attention in the past. They can be used in a variety of applications. One of the most prominent field of application is the use organometallic complexes in electronic devices, such as organic electroluminescent devices (OLEDs - organic light emitting diodes, PLEDs - polymer light emitting diodes), organic integrated circuits (O-ICs), organic field effect transistors (O-FETs), organic thin film transistors (O-TFTs), organic light emitting transistors (O-LETs), organic solar cells (O-SCs), organic optical detectors, organic photoreceptors, organic field quenching devices (O-FQDs), light emitting electrochemical cells (LECs, OLECs, LEECs) or organic laser diodes (O-Laser).

The structure of organic electroluminescent devices (OLEDs) in which organic semiconductors are employed as functional materials is described, for example, in US 4539507, US 5151629, EP 0676461 and WO 98/27136. The emitting materials being employed here are increasingly organometallic complexes which exhibit phosphorescence instead of fluorescence (M. A. Baldo et al., Appl. Phys. Lett. 1999, 75, 46). For quantum-mechanical reasons, an up to four-fold increase in energy and power efficiency is possible using organometallic compounds as phosphorescence emitters.

In accordance with the prior art, the phosphorescent emitters employed in phosphorescent OLEDs are, in particular, iridium and platinum complexes, which are usually employed as cyclometallated complexes. The ligands here are frequently derivatives of phenylpyridine.

Further, it has been reported that an ortho-metalated platinum complexes with aryl pyridines as a ligand and with platinum as the metal is useful as a phosphorescent material (JP 2001-181617) and a platinum complex using a bi-aryl skeleton compound as a ligand has also be reported (JP 2002-175884, JP 4110173, JP 2006-232784).
WO 2005/042444 discloses a class of promising metal complexes, particularly platinum complexes, with good light emitting characteristics. The ligands comprise a bis-(phenyl-pyridin) amine core. However, the chemical synthesis of the core and the ligands has a low yield. In order to obtain an economically efficient process for mass production the yield of the preparation needs to be improved.

The principle concept of the synthesis route for the preparation of the ligand according to the prior art is shown below.

The conventional route is a two-step reaction with first formation of the primary amine and then formation of the desired ligand. Actually, step 2 covers two reactions that occur successively. At first, the primary amine R-NH₂ reacts with one of the two bromides yielding a secondary amine. The secondary amine then reacts, at least in part, with the second bromide in order to get the final product, which is a tertiary amine. However, the conversion of the secondary amine in step 2 into the product is, in many cases, not complete and the secondary amine can, therefore, be found as undesired side product in the reaction mixture. This lowers the overall yield of the reaction. Moreover, more elaborate purification of the product is required.
Furthermore, variation of the ligands is mainly due to the substituent R. Thus, for each R a new method for the preparation of R-NH₂ needs to be developed.

According to this conventional route the ligand and related ligands can be obtained with intermediate yields only. Unfortunately, by following this route only a limited number of different ligands is accessible.

The problem to be solved by the invention is, therefore, to provide a new synthesis route in order to obtain a large number of ligands for promising organic metallic complexes in high yield.

Surprisingly, a new synthesis route has been found that solves the problems of the prior art. The new process is very versatile and provides an easy access to a large number of ligands by employing different halogenated derivatives.

The new synthesis route is represented by a two step procedure. In the first step a secondary amine is prepared. This secondary amine represents the core ring structure of the ligand that is directly bound to the metal ion in the metal complex. In a second step the core structure is converted into a tertiary amine that represents the final ligand. This procedure allows to prepare a great number of ligands having different substitutions with surprisingly high yield. The following schema provides a simplified and exemplary view on the new route of preparation according to the present invention. The preparation of the core structure (step 1) can be optimized and standardized for a large amount of different ligands having different side groups R. The preparation of R-Hal can be accomplished easily by using standard techniques well known to the person skilled in the art. Via step 2 a large number of different ligands is then accessible. According to this procedure a large number of different ligands can be obtained in high yield. Furthermore, the process according to the present invention simplifies purification of the intermediates and products. Therefore, the process according to the present invention is suitable industrial application on large scale.
The method for the preparation of the core structure and the ligand can be easily extended to different core structures.

The present invention relates to a process for the preparation of an aromatic/heteroaromatic secondary amine (P) through reaction of an aromatic/heteroaromatic primary amine (E2) with an aromatic/heteroaromatic halide (E1), wherein the reactants and products are defined below.

Thus, the present invention relates to a process for the preparation of a compound of Formula (3) comprising the reaction of a compound of Formula (1) with a compound of Formula (2)
wherein Formula (1), Formula (2) and Formula (3) correspond to $E_1$, $E_2$ and $P$, respectively, and

where the following applies to the symbols and indices used:

5

$A$, $B$, $C$, $D$ each represent an aromatic or heteroaromatic ring, condensed ring system or polycyclic ring system which may or may not be substituted with one or more rests $R^1$;

$X^1$, $X^2$, $X^3$, and $X^4$ are carbon atoms (C) or nitrogen atoms (N), wherein at least two out of $X^1$, $X^2$, $X^3$, and $X^4$ represent nitrogen atoms,

preferably

$X^1 = C, X^2 = N, X^3 = C$ and $X^4 = N$ or

$X^1 = N, X^2 = C, X^3 = N$ and $X^4 = C$ or

$X^1 = N, X^2 = C, X^3 = C$ and $X^4 = N$ or

$X^1 = C, X^2 = N, X^3 = N$ and $X^4 = C$ or

$X^1 = N, X^2 = N, X^3 = C$ and $X^4 = C$ or

$X^1 = C, X^2 = C, X^3 = N$ and $X^4 = N$,

20

particularly preferably

$X^1 = C, X^2 = N, X^3 = C$ and $X^4 = N$ or

$X^1 = N, X^2 = C, X^3 = N$ and $X^4 = C$ or

25

and very particularly preferably

$X^1 = C, X^2 = N, X^3 = C$ and $X^4 = N$;

$B^i$ ($i = 1$ or 2)

are bridging units; the bridging units $B^i$ preferably represent,

independently from each other, a single bond, rings, preferably 5-membered rings, comprising at least one N-atom, which are condensed to both neighboring rings, i.e. $B^1$ may be condensed to ring $A$ and ring $B$ or $B^2$ may be condensed to ring $C$ and $D$, single bonds or bivalent atoms or groups, preferably $C(R^1)_2$, $N-R^1$, $P-R^1$, or $Si-(R^1)_2$, particularly preferably $N-R^1$, $P-R^1$, or $Si-(R^1)_2$, very
particularly preferably B' represent a single bond between the rings A
and B or C and D;

V is a leaving group, preferably a leaving group selected from Hal or
CF₃SO₂⁻, wherein Hal is a halogen selected from F, Cl, Br or I; Hal is
preferably Br; preferably V is Br;

R¹

is, identically or differently on each occurrence, H, D, F, Cl, Br, I,
N(R²)₂, CN, NO₂, Si(R²)₂, B(OR²)₂, C(=O)R², P(=O)(R²)₂, S(=O)R²,
S(=O)₂R², OSO₂⁻, B(R²)₂, a straight-chain alkyl, alkoxy or thioalkoxy
group having 1 to 40 C atoms or a straight-chain alkenyl or alkynyl
group having 2 to 40 C atoms or a branched or cyclic alkyl, alkenyl,
alkynyl, alkoxy or thioalkoxy group having 3 to 40 C atoms, each of
which may be substituted by one or more radicals R², where one or
more non-adjacent CH₂ groups may be replaced by R²C=CR², C≡C,
Si(R²)₂, Ge(R²)₂, Sn(R²)₂, C=O, C=S, C=Se, C=NR², P(=O)(R²)₂, SO,
SO₂, NR², O, S or CONR² and where one or more H atoms may be
replaced by D, F, Cl, Br, I, CN or NO₂, or an aromatic or heteroaroma-
tic ring system having 5 to 60 aromatic ring atoms, which may in each
case be substituted by one or more radicals R², or an aryloxy or
heteroaryloxy group having 5 to 60 aromatic ring atoms, which may
be substituted by one or more radicals R², or a diarylaminogroup,
diheteroarylamino group or arylheteroarylamino group having 10 to
40 aromatic ring atoms, which may be substituted by one or more
radicals R², or a combination of two or more of these groups; two or
more radicals R¹ here may also form a mono- or polycyclic, aliphatic,
aromatic and/or benzo-fused ring system with one another;

R²

is, identically or differently on each occurrence, H, D, F, Cl, Br, I,
N(R³)₂, CN, NO₂, Si(R³)₃, B(OR³)₂, C(=O)R³, P(=O)(R³)₂, S(=O)R³,
S(=O)₂R³, OSO₂⁻, R³, a straight-chain alkyl, alkoxy or thioalkoxy group
having 1 to 40 C atoms or a straight-chain alkenyl or alkynyl group
having 2 to 40 C atoms or a branched or cyclic alkyl, alkenyl, alkynyl,
alkoxy or thioalkoxy group having 3 to 40 C atoms, each of which
may be substituted by one or more radicals $R^3$, where one or more non-adjacent $\text{CH}_2$ groups may be replaced by $R^3\text{C}=$CR$^3$, C≡C, Si(R$^3$)$_2$, Ge(R$^3$)$_2$, Sn(R$^3$)$_2$, C=O, C=S, C=Se, C=NR$^3$, P(=0)(R$^3$), SO, SO$_2$, NR$^3$, O, S or CONR$^3$ and where one or more H atoms may be replaced by D, F, Cl, Br, I, CN or NO$_2$, or an aromatic or heteroaromatic ring system having 5 to 60 aromatic ring atoms, which may in each case be substituted by one or more radicals $R^3$, or an aryloxy or heteroaryloxy group having 5 to 60 aromatic ring atoms, which may be substituted by one or more radicals $R^3$, or a diarylamino group, diheteroarylamino group or arylheteroarylamino group having 10 to 40 aromatic ring atoms, which may be substituted by one or more radicals $R^3$, or a combination of two or more of these groups; two or more adjacent radicals $R^2$ here may form a mono- or polycyclic, aliphatic or aromatic ring system with one another;

$R^3$
is, identically or differently on each occurrence, H, D, F or an aliphatic, aromatic and/or heteroaromatic hydrocarbon radical having 1 to 20 C atoms, in which, in addition, one or more H atoms may be replaced by F; two or more substituents $R^3$ here may also form a mono- or polycyclic, aliphatic or aromatic ring system with one another;

The reaction is carried out in the presence of a catalyst, preferably a metal or transition metal catalyst, particularly preferably a copper catalyst or a palladium catalyst, very particularly preferably a palladium catalyst and even more preferably a catalyst selected from $[\text{PdCl(allyl)}]_2$, $\text{Pd}_2(\text{dba})_3$ and $\text{Pd(OAc)}_2$. Particular preference is given to $\text{Pd(OAc)}_2$ as catalyst. As co-ligand (or pre-catalyst) phosphines can be used, preferably diphenylphosphinoferrocene (dpdf) can be used as co-ligand.

The reaction temperature is typically in the range between 30 and 200°C, preferably between 50 and 150°C, particularly preferably between 80 and 120°C

However, other temperatures are also possible, since the reaction temperature depends on the solvent used. The reaction is carried out
under reflux and the reaction temperature depends on the reflux temperature of the solvent.

The reaction time is between 3 and 64 hrs, preferably between 5 and 48 hrs, particularly preferably between 8 and 24 hrs and very particularly preferably the reaction time is between 12 and 20 hrs. Particular preference is given to a reaction time of ca. 16 hrs.

A wide range of organic solvents can be used for the process according to the present invention. Principally all organic solvents that are typically used in organic reactions can be employed. The solvent depends on the educts and products of the specific reaction. One skilled in the art will have no difficulties to select an appropriate solvent for the specific reaction according to the present invention. One preferred organic solvent is THF and one further preferred organic solvent that can be used in toluene.

The reaction is carried out in the presence of a base. The base employed depends on the specific educts and the other components of the reaction mixture. One person skilled in the art would have no problem to choose an appropriate base. Sodium tert.-butoxide, cesium carbonate, potassium phosphate or sodium hydroxide represent some selected bases that can be used, but other weaker or stronger bases can be used. Particular preference is given to sodium tert.-butoxide.

Preferably the present invention relates to a process for the preparation of a compound of Formula (6) comprising the reaction of a compound of Formula (4) with a compound of Formula (5)

![Chemical Structures](attachment://formula_image.png)
wherein Hal, X₁, X₂, X₃ and X₄ are defined as above

and wherein the circle denotes aromaticity of the ring and wherein

5  
Y

is identically or differently on each occurrence selected from N and
CR¹, preferably Y is CR¹;

Q¹

10

is identically or differently on each occurrence selected from Y-Y, N or
S, preferably Y-Y or N, and particularly preferably Y-Y;

Q²

is identically or differently on each occurrence selected from Y-Y, Y,
N or S, preferably , wherein the groups in rings B and D are selected
in that aromaticity is achieved;

W

is identically or differently on each occurrence selected from C and N,
preferably W is C.

Particularly preferably the present invention relates to a process for the
preparation of a compound of Formula (9) comprising the reaction of a
compound of Formula (7) with a compound of Formula (8)

The secondary amines prepared in the way as outlined above, such as the compound of Formula (3), can be used to prepare further derivatives that are tertiary amines. These tertiary amines can be used as ligands for metal complexes, that are highly promising for the use in organic electronics. As an example, metal complexes bearing these ligands are often employed in
organic light emitting diodes (OLEDs) or in organic light emitting electrochemical cells (OLECs, LECs or LEECs) as light emitting compounds, particularly as phosphorescent compounds (EP 1683804).

Thus, the present invention relates to the use of the secondary amine compounds prepared as described above for the preparation of tertiary amines.

The reaction is carried out in the presence of a catalyst, preferably a metal or transition metal catalyst, particularly preferably a copper catalyst or a palladium catalyst, very particularly preferably a palladium catalyst and even more preferably a catalyst selected from [PdCl(allyl)]$_2$, Pd$_2$(dba)$_3$ and Pd(OAc)$_2$. Particular preference is given to Pd(OAc)$_2$ as catalyst. The reaction temperature is typically in the range between 30 and 200°C, preferably between 50 and 150°C, particularly preferably between 80 and 120°C. As co-ligand (or pre-catalyst) phosphines can be used, preferably used tri-tertbutyl phosphine is be used as co-ligand.

However, other temperatures are also possible, since the reaction temperature depends on the solvent used. The reaction is carried out under reflux and the reaction temperature depends on the reflux temperature of the solvent.

The reaction time is between 3 and 64 hrs, preferably between 5 and 48 hrs, particularly preferably between 8 and 24 hrs and very particularly
preferably the reaction time is between 12 and 20 hrs. Particular preference is given to a reaction time of ca. 16 hrs.

A wide range of organic solvents can be used for the process according to the present invention. Principally all organic solvents that are typically used in organic reactions can be employed. The solvent depends on the educts and products of the specific reaction. One skilled in the art will have no difficulties to select an appropriate solvent for the specific reaction according to the present invention. One preferred organic solvent is THF and one further preferred organic solvent that can be used in toluene.

The reaction is preferably carried out in the presence of a base. The base employed depends on the specific educts and the other components of the reaction mixture. One person skilled in the art would have no problem to choose an appropriate base. Sodium tert.-butoxide, cesium carbonate, potassium phosphate or sodium hydroxide represent some selected bases that can be used, but other weaker or stronger bases can be used. Particular preference is given to sodium tert.-butoxide.

The tertiary amines can be used for the preparation of metal complexes is a transition metal or metal ion, preferably a metal or metal ion selected from the Platinum Group (i.e. Fe, Co, Ni, Ru, Rh, Pd, Os, Ir, Pt) or gold, particularly preferably from Pt(II), Pd(II), Ni(II), Rh(I), Ir(I) und Au(III), very particularly preferably from Pt(II), Ir(I) und Au(III) and even more preferably from Pt(II). The preparation of these metal complexes is well known to one skilled in the art. Examples for the preparation of platinum complexes are disclosed, e.g., in EP 1683804.

The present invention also relates to a compound having the general Formula (3)
preferably the present invention relates to a compound having the general formula (9) wherein the symbols have the meanings as defined above and wherein the preferred embodiments as defined above apply as well.

preferably the present invention also relates to a compound having the general formula (12) wherein the symbols have the meanings as defined above and wherein the preferred embodiments as defined above apply as well.

preferably the present invention also relates to a compound having the general formula (15) wherein the symbols have the meanings as defined above and wherein the preferred embodiments as defined above apply as well.

particularly preferably the present invention relates to a compound having the general formula (18) wherein the symbols have the meanings as defined above and wherein the preferred embodiments as defined above apply as well.

particularly preferably the present invention also relates to a compound having the general formula (21) wherein the symbols have the meanings as defined above and wherein the preferred embodiments as defined above apply as well.

particularly preferably the present invention also relates to a compound having the general formula (24) wherein the symbols have the meanings as defined above and wherein the preferred embodiments as defined above apply as well.

particularly preferably the present invention also relates to a compound having the general formula (27) wherein the symbols have the meanings
as defined above and wherein the preferred embodiments as defined above apply as well.

Very particularly preferably the present invention relates to a compound having the general Formula (30) wherein the symbols have the meanings as defined above and wherein the preferred embodiments as defined above apply as well.

Very particularly preferably the present invention also relates to a compound having the general Formula (33) wherein the symbols have the meanings as defined above and wherein the preferred embodiments as defined above apply as well.

Even more preferably the present invention relates to a compound having the general Formula (36) wherein the symbols have the meanings as defined above and wherein the preferred embodiments as defined above apply as well.

Even more preferably the present invention also relates to a compound having the general Formula (39).

Even more preferably the present invention also relates to a compound having the general Formula (42).

Even more preferably the present invention also relates to a compound having the general Formula (45).

Even more preferably the present invention also relates to a compound having the general Formula (48).

Even more preferably the present invention also relates to a compound having the general Formula (51).

Even more preferably the present invention also relates to a compound having the general Formula (54).
Preferably the present invention relates to a compound having the general Formula (57) wherein the symbols have the meanings as defined above and wherein the preferred embodiments as defined above apply as well.

Preferably the present invention relates to a compound having the general Formula (60) wherein the symbols have the meanings as defined above and wherein the preferred embodiments as defined above apply as well.

Preferably the present invention relates to a compound having the general Formula (63) wherein the symbols have the meanings as defined above and wherein the preferred embodiments as defined above apply as well.

Some selected preferred compounds according to the present invention are the compounds having the Formulae (67) to (126).

The present invention also relates to a formulation comprising at least one of the compounds according to the present invention and at least one solvent.

The compounds according to the present invention can be used, as outlined above, for the preparation of compounds that are useful as ligands for metal complexes.

An aryl group in the sense of this invention contains 6 to 40 C atoms; a heteroaryl group in the sense of this invention contains 2 to 40 C atoms and at least one heteroatom, with the proviso that the sum of C atoms and heteroatoms is at least 5. The heteroatoms are preferably selected from N, O and/or S. An aryl group or heteroaryl group here is taken to mean either a simple aromatic ring, i.e. benzene, or a simple heteroaromatic ring, for example pyridine, pyrimidine, thiophene, etc., or a condensed aryl or heteroaryl group, for example naphthalene, anthracene, phenanthrene, quinoline, isoquinoline, etc.
An aromatic ring system in the sense of this invention contains 6 to 60 C atoms in the ring system. A heteroaromatic ring system in the sense of this invention contains 2 to 60 C atoms and at least one heteroatom in the ring system, with the proviso that the sum of C atoms and heteroatoms is at least 5. The heteroatoms are preferably selected from N, O and/or S. For the purposes of this invention, an aromatic or heteroaromatic ring system is intended to be taken to mean a system which does not necessarily contain only aryl or heteroaryl groups, but instead in which, in addition, a plurality of aryl or heteroaryl groups may be interrupted by a non-aromatic unit (preferably less than 10% of the atoms other than H), such as, for example, an sp³-hybridised C, N or O atom or a carbonyl group. Thus, for example, systems such as 9,9′-spirobifluorene, 9,9-diarylfuorene, triarylamine, diaryl ether, stilbene, etc., are also intended to be taken to mean aromatic ring systems for the purposes of this invention, and likewise systems in which two or more aryl groups are interrupted, for example, by a linear or cyclic alkyl group or by a silyl group.

A cyclic alkyl, alkoxy or thioalkoxy group in the sense of this invention is taken to mean a monocyclic, bicyclic or polycyclic group.

For the purposes of the present invention, a C₁- to C₄₀-alkyl group, in which, in addition, individual H atoms or CH₂ groups may be substituted by the above-mentioned groups, is taken to mean, for example, the radicals methyl, ethyl, n-propyl, i-propyl, n-butyl, i-butyl, s-butyl, t-butyl, 2-methylbutyl, n-pentyl, s-pentyl, tert-pentyl, 2-pentyl, cyclopentyl, n-hexyl, s-hexyl, tert-hexyl, 2-hexyl, 3-hexyl, cyclohexyl, 2-methylpentyl, n-heptyl, 2-heptyl, 3-heptyl, 4-heptyl, cycloheptyl, 1-methylcyclohexyl, n-octyl, 2-ethylhexyl, cyclooctyl, 1-bicyclo[2.2.2]octyl, 2-bicyclo[2.2.2]octyl, 2-(2,6-dimethyl)octyl, 3-(3,7-dimethyl)octyl, tris(trifluoromethyl)pentfluoroethyl or 2,2,2-trifluoroethyl. An alkenyl group is taken to mean, for example, ethenyl, propenyl, butenyl, pentenyl, cyclopentenyl, hexenyl, cyclohexenyl, heptenyl, cycloheptenyl, octenyl, cyclooctenyl or cyclooctadienyl. An alkynyl group is taken to mean, for example, ethynyl, propynyl, butynyl, pentynyl, hexynyl, heptynyl or octynyl. A C₁- to C₄₀-alkoxy group is taken to mean, for example, methoxy, trifluoromethoxy, ethoxy, n-propoxy, i-propoxy, n-butoxy, i-butoxy, s-butoxy, t-butoxy or 2-methylbutoxy. An aromatic or heteroaromatic ring
system having 5 - 60 aromatic ring atoms, which may also in each case be substituted by the radicals R mentioned above and which may be linked to the aromatic or heteroaromatic ring system via any desired positions, is taken to mean, for example, groups derived from benzene, naphthalene, anthracene, benzanthracene, phenanthrene, benzophenanthrene, pyrene, chrysene, perylene, fluoranthene, benzofluoranthene, naphthacene, pentacene, benzoperylene, biphenyl, biphenylene, terphenyl, terphenylene, fluorene, spirobifluorene, dihydrophenanthrene, dihydropyrene, tetrahydropyrene, cis- or trans-indenofluorene, cis- or trans-monobenzo-indenofluorene, cis- or trans-dibenzoindenofluorene, truxene, isotruxene, spirotruxene, spiroisotruxene, furan, benzo[2,1-b]furan, dibenzo[2,3-b:3,2-b]furan, thiophene, benzothiophene, isobenzothiophene, dibenzothiophene, pyrrole, indole, isoindole, carbazole, pyridine, quinoline, isoquinoline, acridine, phenanthridine, benzo-5,6-quinoline, benzo-6,7-quinoline, benzo-7,8-quinoline, phenothiazine, phenoxazine, pyrazole, indazole, imidazole, benzimidazole, naphthimidazole, phenanthrimidazole, pyrimidinimidazole, pyrazinimidazole, quinoxalinimidazole, oxazole, benzoxazole, naphthoxazole, anthracoxazole, phenanthroxazole, isoazole, 1,2-thiazole, 1,3-thiazole, benzothiazole, pyridazine, benzopyridazine, pyrimidine, benzopyrimidine, quinoxaline, 1,5-diazaanthracene, 2,7-diazapyrene, 2,3-diazapyrene, 1,6-diazapyrene, 1,8-diazapyrene, 4,5-diazapyrene, 4,5,9,10-tetraazaperylene, pyrazine, phenazine, phenoxazine, phenothiazine, fluorubin, naphthyridine, azacarbazole, benzocarboline, phenanthrolidine, 1,2,3-triazole, 1,2,4-triazole, benzotriazole, 1,2,3-oxadiazole, 1,2,4-oxadiazole, 1,2,5-oxadiazole, 1,3,4-oxadiazole, 1,2,3-thiadiazole, 1,2,4-thiadiazole, 1,2,5-thiadiazole, 1,3,4-thiadiazole, 1,3,5-triazine, 1,2,4-triazine, 1,2,3-triazine, tetrazole, 1,2,4,5-tetrazine, 1,2,3,4-tetrazine, 1,2,3,5-tetrazine, purine, pteridine, indolizine and benzothiadiazole.

Preferred electronic devices here are selected from the group consisting of organic electroluminescent devices (OLEDs, PLEDs), organic integrated circuits (O-ICs), organic field-effect transistors (O-FETs), organic thin-film transistors (O-TFTs), organic light-emitting transistors (O-LETs), organic solar cells (O-SCs), organic optical detectors, organic photoreceptors, organic field-quench devices (O-FQDs), light-emitting electrochemical cells
(LECs) or organic laser diodes (O-lasers), comprising, in at least one layer, at least one compound of the Formula (1) indicated above. Particular preference is given to organic electroluminescent devices. Active components are generally the organic or inorganic materials, which are introduced between the anode and cathode, for example charge-injection, charge-transport or charge-blocking materials, but in particular emission materials and matrix materials. The compounds according to the invention exhibit particularly good properties as emission material in organic electroluminescent devices. Organic electroluminescent devices are therefore a preferred embodiment of the invention.

The organic electroluminescent device comprises a cathode, an anode and at least one emitting layer. Apart from these layers, it may also comprise further layers, for example in each case one or more hole-injection layers, hole-transport layers, hole-blocking layers, electron-transport layers, electron-injection layers, exciton-blocking layers, charge-generation layers and/or organic or inorganic p/n junctions. It is likewise possible for interlayers, which have, for example, an exciton-blocking function and/or control the charge balance in the electroluminescent device, to be introduced between two emitting layers. However, it should be pointed out that each of these layers does not necessarily have to be present. The organic electroluminescent device may comprise one emitting layer or a plurality of emitting layers. If a plurality of emission layers are present, these preferably have in total a plurality of emission maxima between 300 nm and 800 nm, resulting overall in white emission, i.e. various emitting compounds which are able to fluoresce or phosphoresce are used in the emitting layers. Particular preference is given to three-layer systems, where the three layers exhibit blue, green and orange or red emission (for the basic structure see, for example, WO 2005/01 1013), or systems which comprise more than three emitting layers.

The preparation of the compounds according to the present invention is distinguished by the following surprising advantages over the prior art:

1. The preparation route provides a simple way to prepare compounds that are precursors of ligands;
2. The compounds can be obtained in surprisingly high yields. The costs of goods can be lowered by using the route according to the invention. Thus, the new synthesis route is suitable for commercial production of the compounds, even for mass production;

3. The new synthesis route offers a simple way to provide a large amount of derivatives. The process according to the present invention is, thus, a more versatile and efficient way to obtain ligands for organometallic complexes as compared to the route according to the prior art.

4. The process according to the present invention requires only easy purification of the intermediates and/or products, which results in higher yields and lower production costs.

5. The compounds can be obtained with high purity. High purity of ligands is required for high performance electronic and electroluminescent devices.

It should be pointed out that variations of the embodiments described in the present invention fall within the scope of this invention. Each feature disclosed in the present invention can, unless explicitly excluded, be replaced by alternative features which serve the same, an equivalent or a similar purpose. Thus, each feature disclosed in the present invention should, unless stated otherwise, be regarded as an example of a generic series or as an equivalent or similar feature.

All features of the present invention can be combined with one another in any way, unless certain features and/or steps are mutually exclusive. This applies, in particular, to preferred features of the present invention. Equally, features of non-essential combinations can be used separately (and not in combination).

It should furthermore be pointed out that many of the features, and in particular those of the preferred embodiments of the present invention, should be regarded as inventive themselves and not merely as part of the embodiments of the present invention. Independent protection may be
granted for these features in addition or as an alternative to each invention claimed at present.

The teaching regarding technical action disclosed with the present invention can be abstracted and combined with other examples.

The invention is explained in greater detail by the following examples without wishing it to be restricted thereby.
**Working Examples**

The following syntheses are, unless indicated otherwise, carried out under a protective-gas atmosphere in dried solvents. Compound (I) can be prepared in accordance with Chem. Commun., 2010, 46, 3958 and compound (II) can be prepared according to WO 2007/000339. Compound (IV) can be prepared according to WO 2011/021689. Compounds (VIII), (IX), (XVII), (XXIII), (XXIV), (XXV), (XXIX), (XXXI) and (XXXII) are commercially available. Compound (XXII) can be prepared according to Inorg. Chem. 2011, 50, 8261. Compounds (XXVI) and (XXVII) can be prepared according to Inorg. Chem. 2010, 49, 5107. Compound (XXVIII) can be prepared according to Eur. J. Org. Chem. 2011, 1280. Compound (XXX) can be prepared according to Chem. Mater. 2011, 23, 4487.

**Example 1:**

**Preparation of compound (III)**

Synthetic procedure for the preparation of compound (III):

![Chemical structure](image)

**Preparation of compound (III)**

7.2 g (30.6 mmol) of compound (I) and 5.2 g (30.6 mmol) of compound (II) are suspended in 200 ml of toluene under Ar atmosphere. 340 mg (0.61 mmol) of 1,1-bis-(diphenylphosphino)-ferrocene and 140 mg (0.61 mmol) of Pd(OAc)₂ are added to the flask and stirred vigorously under Ar atmosphere. Then 3.5 g (36.7 mmol) of sodium t-butoxide is added to the flask under Ar. The reaction mixture is stirred under reflux for 24 h. After cooling to room temperature, the organic phase is separated off, washed three times with 100 ml of water, dried over magnesium sulfate,
filtered and subsequently evaporated to dryness. The residue is purified by column chromatography on silica gel using a mixture of ethylacetate/heptane (1:2). The yield is 8.2 g (29.4 mmol), corresponding to 96% of theory.

Example 2:
Preparation of compound (VI)

Synthetic procedure for the preparation of compound (VI):

Preparation of compound (V)
15.8 g (51.1 mmol) of compound (IV), 9.7 g (51.1 mmol) of copper iodide, 6.6 g (102.2 mmol) of sodium azide and 5.4 g (61.3 mmol) of N,N-dimethyl-ethane-1,2-diamine are stirred under reflux for 10 h in 300 mL of dimethyl-sulfoxide (DMSO). After cooling to room temperature, 200 mL of ethylacetate and 100 mL of a solution of saturated NH₄Cl are added to the
reaction mixture. The organic phase is separated off, washed three times with 300 mL of water, dried over magnesium sulfate, filtered and subsequently evaporated to dryness. The residue is recrystallised from toluene and finally dried under reduced pressure. The yield is 11.1 g (44.9 mmol), corresponding to 88% of theory.

Preparation of compound (VI)
10.5 g (34.1 mmol) of compound (IV) and 8.4 g (34.1 mmol) of compound (V) are suspended in 400 mL of toluene under Ar atmosphere. 380 mg (0.68 mmol) of 1,1-bis-(diphenylphosphino)-ferrocene and 150 mg (0.68 mmol) of Pd(OAc)$_2$ are added to the flask and stirred vigorously under Ar atmosphere. Then 3.9 g (40.9 mmol) of sodium t-butoxide is added to the flask under Ar. The reaction mixture is stirred under reflux for 24 h. After cooling to room temperature, the organic phase is separated off, washed three times with 100 mL of water, dried over magnesium sulfate, filtered and subsequently evaporated to dryness. The residue is purified by column chromatography on silica gel using a mixture of ethylacetate/heptane (1:2). The yield is 15.3 g (32.4 mmol), corresponding to 95% of theory.

Example 3:
Preparation of compound (VII)

Synthetic procedure for the preparation of compound (VII):

\[
\text{Br} \quad \text{H}_2\text{N} \quad \text{H} \\
\text{N} \quad \text{N} \quad \text{N} \\
(\text{IV}) \quad (\text{II}) \quad (\text{VII})
\]
Preparation of compound (VII)

10.5 g (34.1 mmol) of compound (IV) and 5.8 g (34.1 mmol) of compound (II) are suspended in 400 ml of toluene under Ar atmosphere. 380 mg (0.68 mmol) of 1,1-bis-(diphenylphosphino)-ferrocene and 150 mg (0.68 mmol) of Pd(OAc)$_2$ are added to the flask and stirred vigorously under Ar atmosphere. Then 3.9 g (40.9 mmol) of sodium t-butoxide is added to the flask under Ar. The reaction mixture is stirred under reflux for 24 h. After cooling, the organic phase is separated off, washed three times with 100 mL of water, dried over magnesium sulfate, filtered and subsequently evaporated to dryness. The residue is purified by column chromatography on silica gel using a mixture of ethylacetate/heptane (1:2). The yield is 11.1 g (27.9 mmol), corresponding to 82% of theory.

Example 4:
Preparation of compound (XII)

Synthetic procedure for the preparation of compound (XII):

\[
\begin{align*}
\text{(VIII)} + \text{(IX)} & \quad \xrightarrow{\text{NaN$_3$, CuI}} \quad \text{(X)} \\
\text{(X)} + \text{(XI)} & \quad \xrightarrow{\text{NaN$_3$, CuI}} \quad \text{(XII)}
\end{align*}
\]
Preparation of compound (X)
17.2 g (100.2 mmol) of compound (IX) and 20.5 g (120.2 mmol) of compound (VIII) and 16.8 g (120.2 mmol) of potassium carbonate are suspended in 600 mL of toluene and 200 mL of water. 1.1 g (1.0 mmol) of tetrakis(triphenylphosphine)palladium(0) are added to this suspension, and the reaction mixture is stirred under reflux for 24 h. After cooling to room temperature, the organic phase is separated off, washed three times with 600 mL of water, dried over sodium sulfate and subsequently evaporated to dryness. The residue is purified by column chromatography using a mixture of ethylacetate/heptane (1:3). The yield is 21.6 g (87.2 mmol), corresponding to 86% of theory.

Preparation of compound (XI)
21.6 g (87.2 mmol) of compound (X), 16.6 g (87.2 mmol) of copper iodide, 11.3 g (174.4 mmol) of sodium azide and 9.2 g (104.6 mmol) of N,N-dimethyl-ethane-1,2-diamine are stirred under reflux for 10 h in 500 mL of dimethylsulfoxide (DMSO). After cooling to room temperature, 200 mL of ethylacetate and 100 mL of a solution of saturated NH₄Cl are added to the reaction mixture. The organic phase is separated off, washed three times with 300 mL of water, dried over magnesium sulfate, filtered and subsequently evaporated to dryness. The residue is recrystallised from toluene and finally dried under reduced pressure. The yield is 14.1 g (76.7 mmol), corresponding to 88% of theory.

Preparation of compound (XII)
14.0 g (56.6 mmol) of compound (IV) and 10.4 g (56.6 mmol) of compound (XI) are suspended in 300 mL of toluene under Ar atmosphere. 620 mg (1.1 mmol) of 1,1-bis-(diphenylphosphino)-ferrocene and 250 mg (1.1 mmol) of Pd(OAc)₂ are added to the flask, stirred vigorously under Ar atmosphere then 6.5 g (68.0 mmol) of sodium t-butoxide is added to the flask under Ar. The reaction mixture is stirred under reflux for 24 h. After cooling to room temperature, the organic phase is separated off, washed
three times with 200 mL of water, dried over magnesium sulfate, filtered and subsequently evaporated to dryness. The residue is purified by column chromatography on silica gel using a mixture of ethylacetate/heptane (1:2). The yield is 18.3 g (52.1 mmol), corresponding to 92% of theory.

**Example 5:**
**Preparation of compound (XIV)**

Synthetic procedure for the preparation of compound (XIV):

![Chemical Structures](image)

Preparation of compound (XIV)

6.8 g (21.1 mmol) of compound (III) and 3.3 g (21.1 mmol) of compound (XIII) are suspended in 120 mL of toluene under Ar atmosphere. 94 mg (0.42 mmol) of Pd(OAc)2 are added to the flask and stirred under Ar atmosphere then 0.8 mL of a 1 M tri-tert-butylphosphine solution and 2.4 g (25.4 mmol) of sodium t-butoxide are added to the flask. The reaction mixture is stirred under reflux for 24 h. After cooling, the organic phase is separated off, washed three times with 60 mL of water, dried over magnesium sulfate, filtered and subsequently evaporated to dryness. The residue is purified by column chromatography on silica gel using a mixture of ethylacetate/heptane (1:2). The yield is 8.0 g (20.0 mmol), corresponding to 95% of theory.

Claims

1. Method for the preparation of a secondary amine (P) by the reaction of a compound (E1) and a primary amine (E2), characterized in that 

- **E1** is defined by a compound of Formula (1), 
- **E2** is defined by a compound of Formula (2) and 
- **P** is defined by a compound of Formula (3)

where the following applies to the symbols and indices used:

- A, B, C, D each represent an aromatic or heteroaromatic ring, condensed ring system or polycyclic ring system which may or may not be substituted with one or more rests R₁;

- X₁, X₂, X³, and X⁴ are carbon atoms (C) or nitrogen atoms (N), wherein at least two out of X₁, X₂, X³, and X⁴ represent nitrogen atoms,

- B' (i = 1 or 2) are bridging units which are independent from each other and are selected from a single bond, rings, preferably 5-membered rings, comprising at least one N-atom, which are condensed to both neighboring rings, bivalent atoms or groups, preferably C(R₁)₂, N-R₁, P-R₁, or Si-(R₁)₂, particularly preferably N-R₁, P-R₁, or Si-(R₁)₂.
V is a leaving group, preferably selected from Hal or CF3SO3 (OTf or Tf), wherein Hal is a halogen selected from F, Cl, Br or I. preferably V is Br;

R1 is, identically or differently on each occurrence, H, D, F, Cl, Br, I, N(R2)2, CN, NO2, Si(R2)3, B(OR2)2, C(=O)R2, P(=O)(R2)2, S(=O)R2, S(=O)2R2, OSO2R2, B(R2)2, a straight-chain alkyl, alkoxy or thioalkoxy group having 1 to 40 C atoms or a straight-chain alkenyl or alkynyl group having 2 to 40 C atoms or a branched or cyclic alkyl, alkenyl, alkoxy or thioalkoxy group having 3 to 40 C atoms, each of which may be substituted by one or more radicals R2, where one or more non-adjacent CH2 groups may be replaced by R2C=CR2, C≡C, Si(R2)2, Ge(R2)2, Sn(R2)2, C=O, C=S, C=Se, C=NR2, P(=O)(R2), SO, SO2, NR2, O, S or CONR2 and where one or more H atoms may be replaced by D, F, Cl, Br, I, CN or NO2, or an aromatic or heteroaromatic ring system having 5 to 60 aromatic ring atoms, which in each case may be substituted by one or more radicals R2, or an aryloxy or heteroaryloxy group having 5 to 60 aromatic ring atoms, which may be substituted by one or more radicals R2, or a diarylamino group, diheteroarylamino group or arylheteroarylamino group having 10 to 40 aromatic ring atoms, which may be substituted by one or more radicals R2, or a combination of two or more of these groups; two or more radicals R1 here may also form a mono- or polycyclic, aliphatic, aromatic and/or benzo-fused ring system with one another;

R2 is, identically or differently on each occurrence, H, D, F, Cl, Br, I, N(R3)2, CN, NO2, Si(R3)3, B(OR3)2, C(=O)R3, P(=O)(R3)2, S(=O)R3, S(=O)2R3, OSO2R3, a straight-chain alkyl, alkoxy or thioalkoxy group having 1 to 40 C atoms or a straight-chain alkenyl or alkynyl group having 2 to 40 C atoms or a branched or cyclic alkyl, alkenyl, alkynyl, alkoxy or thioalkoxy group having 3 to 40 C atoms, each of which may be substituted by one or more radicals R3, where one or more non-adjacent CH2 groups may be replaced by R3C=CR3, C≡C, Si(R3)2, Ge(R3)2, Sn(R3)2, C=O, C=S, C=Se, C=NR3, P(=O)(R3), SO, SO2, NR3, O, S or CONR3 and where one or more H atoms may be replaced by D, F, Cl, Br, I, CN or NO2, or an aromatic or heteroaro-
matic ring system having 5 to 60 aromatic ring atoms, which may in each case be substituted by one or more radicals $R^3$, or an aryloxy or heteroaryloxy group having 5 to 60 aromatic ring atoms, which may be substituted by one or more radicals $R^3$, or a diarylamino group, diheteroarylamino group or arylheteroarylamino group having 10 to 40 aromatic ring atoms, which may be substituted by one or more radicals $R^3$, or a combination of two or more of these groups; two or more adjacent radicals $R^2$ here may form a mono- or polycyclic, aliphatic or aromatic ring system with one another;

$R^3$ is, identically or differently on each occurrence, H, D, F or an aliphatic, aromatic and/or heteroaromatic hydrocarbon radical having 1 to 20 C atoms, in which, in addition, one or more H atoms may be replaced by F; two or more substituents $R^3$ here may also form a mono- or polycyclic, aliphatic or aromatic ring system with one another.

2. Method according to claim 1, characterized in that $E_1$ is a compound of Formula (4), $E_2$ is a compound of Formula (5) and $P$ is a compound of Formula (6)

and wherein the circle denotes aromaticity of the ring and wherein

$Y$ is identically or differently on each occurrence selected from N and CR$^1$, preferably $Y$ is CR$^1$;
Q¹ is identically or differently on each occurrence selected from Y-Y, N or S, preferably Y-Y or N, and particularly preferably Y-Y;

Q² is identically or differently on each occurrence selected from Y-Y, Y, N or S, preferably, wherein the groups in rings B and D are selected in that aromaticity is achieved;

W is identically or differently on each occurrence selected from C and N, preferably W is C;

and wherein the other symbols have the meaning as defined in claim 1.

3. Method according to claim 1 or 2, characterized in that E₁ is a compound of Formula (7), E₂ is a compound of Formula (8) and P is a compound of Formula (9)

[Diagrams of Formulas (7), (8), and (9)]

wherein the symbols are defined as in claim 1 or 2.

4. Method according to one or more of claims 1 to 3, characterized in that E₁ is a compound of Formula (10), E₂ is a compound of Formula (11) and P is a compound of Formula (12)
wherein the symbols are defined as in claim 1 or 2.

5. Method according to one or more of claims 1 to 4, characterized in
that E₁ is a compound of Formula (13), E₂ is a compound of Formula
(14) and P is a compound of Formula (15)

wherein the symbols are defined as in claim 1 or 2.

6. Method according to one or more of claims 1 to 5, characterized in
that E₁ is a compound of Formula (34), E₂ is a compound of Formula
(35) and P is a compound of Formula (36)
7. Method according to one or more of claims 1 to 3, characterized in
that $Q^2$ is $CR^1$, N or S.

8. Method according to one or more of claims 1 to 3, characterized in
that $E_1$ is a compound of Formula (58), $E_2$ is a compound of Formula
(59) and $P$ is a compound of Formula (60)

wherein $Q^2$ is $CR^1$, N or S.

9. Method according to one or more of claims 1 to 3, characterized in
that $E_1$ is a compound of Formula (61), $E_2$ is a compound of Formula
(62) and $P$ is a compound of Formula (63)

wherein $Q^2$ is $CR^1$, N or S.
10. Method according to one or more of claims 1 to 3, characterized in that \( E_1 \) is a compound of Formula (64), \( E_2 \) is a compound of Formula (65) and \( P \) is a compound of Formula (66)

\[
\begin{align*}
\text{Formula (64)} & \quad \text{Formula (65)} & \quad \text{Formula (66)}
\end{align*}
\]

wherein \( Q^2 \) is CR, N or S.

11. Method according to one or more of claims 1 to 10, characterized in that \( X^1 = C, X^2 = N, X^3 = C \) and \( X^4 = N \) or \( X^1 = N, X^2 = C, X^3 = N \) and \( X^4 = C \), preferably \( X^1 = C, X^2 = N, X^3 = C \) and \( X^4 = N \).

12. Compound of the general Formula (3)

\[
\begin{align*}
\text{Formula (3)}
\end{align*}
\]

wherein the symbols are defined as in claim 1.

13. Compound according to claim 12, characterized in that the compound has the general Formula (6)
wherein the symbols are defined as above.

14. Compound according to claims 12 or 13, characterized in that the compound has the general Formula (12)

wherein the symbols are defined as above.

15. Compound according to one or more of claims 12 to 14, characterized in that the compound has the Formula (15)
wherein the symbols are defined as above.

16. Compound according to one or more of claims 12 to 14, characterized in that the compound has the Formula (51)

\[
\begin{align*}
\text{Formula (51)}
\end{align*}
\]

17. Use of a compound according to one or more of claims 12 to 16 for the preparation of a ligand for metal complexes, characterized in that the ligand is a tertiary amine.

18. Method for the preparation of a compound that is suitable as ligands for metal complexes by Buchwald reaction of compound P according to one or more of claims 1 to 11 or according to a compound according to one or more of claims 12 to 16 with a halide of the general Formula R^1-Hal, wherein in order to obtain a compound of Formula (128)

\[
\begin{align*}
\text{Formula (128)}
\end{align*}
\]

wherein the symbols are defined as above.
A. CLASSIFICATION OF SUBJECT MATTER

According to International Patent Classification (IPC) or to both national classification and IPC:

INV. C07D401/14 C07D213/38

ADD.

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

C07D

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

C. DOCUMENTS CONSIDERED TO BE RELEVANT

<table>
<thead>
<tr>
<th>Category</th>
<th>Citation of document, with indication, where appropriate, of the relevant passages</th>
<th>Relevant to claim No.</th>
</tr>
</thead>
</table>

Further documents are listed in the continuation of Box C.

See patent family annex.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier application or patent but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) on which the application is based

"O" document referring to an oral disclosure, use, exhibition or other special reason

"P" document published prior to the international filing date but later than the priority date

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"A" document member of the same patent family

Date of the actual completion of the international search

14 August 2013

Date of mailing of the international search report

28/08/2013

 Authorization officer
