Abstract: The present invention relates to novel synthesis routes for preparation of thiodigalactosides of the general formula (12). The method comprises the use of a 3-azido-galactosyl thiouronium salt derivative, which is activated to the corresponding thiol in situ, which in turn is directly reacted with a 3-azido-galactosyl bromide resulting in the 3,3'-di-azido-thio-di-galactoside before the thiol has a chance to reduce the azido 10 group. Hence, in situ formation of the 3-azido-galactosyl thiol from the thiouronium salt is essential in the synthesis procedure, because any other method that generate the thiol separately results in extensive unwanted azide reduction.
NOVEL SYNTHESIS OF GALACTOSIDE INHIBITORS

Technical field of the invention
The present invention relates to a novel synthesis route for the manufacture of galactoside inhibitors, as well as new intermediates.

Background Art
Galectins are proteins with a characteristic carbohydrate recognition domain (CRD) (Leffler et al., 2004) (Fig. 1). This is a tightly folded β-sandwich of about 130 aa (about 15 kDa) with the two defining features 1) a β-galactose binding site (C in Fig. 1) sufficient similarity in a sequence motif of about seven amino acids, most of which (about six residues) make up the β-galactose binding site. However, adjacent sites (A,B,D,E in Fig. 1) are required for tight binding of natural saccharides and different preferences of these give galectins different fine specificity for natural saccharides.

The recent completion of the human, mouse and rat genome sequences reveal about 15 galectins and galectin-like proteins in one mammalian genome with slight variation between species (Leffler et al., 2004).

Galectin subunits can contain either one or two CRDs within a single peptide chain. The first category, mono-CRDs galectins, can occur as monomers or dimers (two types) in vertebrates. The by far best studied galectins are the dimeric galectin-1, and galectin-3 that is a monomer in solution but may aggregate and become multimeric upon encounter with ligands (Leffler et al., 2004). These were the first discovered galectins and are abundant in many tissues. However, our recent phylogenetic analysis suggest that galectins with two CRDs within a peptide chain, bi-CRD galectins, appear to be more ancient and more central to the family than previously thought and that most of mammalian mono-CRD galectins may have descended from one or the other CRD of a bi-CRD galectin.
Potential therapeutic use of galectin-3 inhibitors.

Galectin-3 has been implicated in diverse phenomena and, hence, inhibitors may have multiple uses. It is easy to perceive this as a lack of specificity or lack of scientific focus. Therefore, the analogy with aspirin and the cyclooxygenases (COX-I and II) is useful. The COXs produce the precursor of a wide variety of prostaglandins and, hence, are involved in a diverse array of biological mechanisms. Their inhibitors, aspirin and other NSAIDs (non-steroid anti-inflammatory drugs), also have broad and diverse effects. Despite this, these inhibitors are very useful medically, and they have several different specific utilities.

So if galectins, like COXs, are part of some basic biological regulatory mechanism (as yet unknown), they are likely to be 'used by nature' for different purpose in different contexts. Galectin inhibitors, like NSAIDs, are not expected to wipe out the whole system, but to tilt the balance a bit.

Inhibition of inflammation.

A pro-inflammatory role of galectin-3 is indicated by its induction in cells at inflammatory sites, a variety of effects on immune cells (e.g. oxidative burst in neutrophils, chemotaxis in monocytes), and decrease of the inflammatory response, mainly in neutrophils and macrophages, in null mutant mice (chapters by Rabinovich et al., Sato et al., and Almkvist et al. in Leffler (editor), 2004b). Moreover, knock-out mice of Mac-2BP, a galectin-3 ligand, have increased inflammatory response. Inflammation is a protective response of the body to invading organisms and tissue injury. However, if unbalanced, frequently it is also destructive and occurs as part of the pathology in many diseases. Because of this, there is great medical interest in pharmacological modulation of inflammation. A galectin-3 inhibitor is expected to provide an important addition to the arsenal available for this.

Treatment of septic shock.

The idea of a possible role of galectin-3 in septic shock comes from our own studies. Briefly, the argument goes as follows. It is known that septic shock involves dissemination of bacterial lipopolysaccharide into the blood
stream, and that the pathological effects of this are mediated via neutrophil leukocytes. LPS does not activate the tissue-damaging response of the neutrophil. Instead, it primes the neutrophil, so that it is converted from unresponsive to responsive to other, presumably endogenous, activators. In septic shock, this priming happens prematurely in the blood stream. Endogenous activators could then induce the tissue damaging response in the wrong place and time. Several candidates have been proposed as these endogenous activators, including TNF-alfa. Inhibitors of these have been used in treatment schemes without much success. Since our own studies indicate that galectin-3 is a good candidate for being an endogenous activator of primed neutrophils (Almkvist et al. in Leffler (editor), 2004b), galectin-3 inhibitors may be very useful in septic shock.

Treatment of cancer.

A large number of immunohistochemical studies show changed expression of certain galectins in cancer (van den Brule et. al. and Bidon et al. in Leffler (editor), 2004b) Galectin-3 is now an established histochemical marker of thyroid cancer, and neoexpression of galectin-4 is a promising marker of early breast cancer. The direct evidence for a role of galectin-3 in cancer comes from mouse models, mainly by Raz et al, but also others (Takenaka et al. in Leffler (editor), 2004b). In paired tumor cell lines (with decreased or increased expression of galectin-3), the induction of galectin-3 gives more tumors and metastasis and suppression of galectin-3 gives less tumors and metastasis. Galectin-3 has been proposed to enhance tumor growth by being anti-apoptotic, promote angiogenesis, or to promote metastasis by affecting cell adhesion. From the above it is clear that inhibitors of galectin-3 might have valuable anti-cancer effects. Indeed, saccharides claimed but not proven to inhibit galectin-3 have been reported to have anti-cancer effects. In our own study a fragment of galectin-3 containing the CRD inhibited breast cancer in a mouse model by acting as a dominant negative inhibitor (John et al., 2003).

Also galectin-1 is frequently over-expressed in low differentiated cancer cells, and galectin-9 or its relatives galectin-4 and galectin-8 may be in-
duced in specific cancer types (Leffler (editor), 2004b). Galectin-1 induces apoptosis in activated T-cells and has a remarkable immunosuppressive effect on autoimmune disease in vivo (Rabinovich et al; and Pace et al in Leffler (editor), 2004b). Therefore, the over-expression of these galectins in cancers might help the tumor to defend itself against the T-cell response raised by the host.

Null mutant mice for galectins-1 and -3 have been established many years ago. These are healthy and reproduce apparently normally in animal house conditions. However recent studies have revealed subtle phenotypes in function of neutrophils and macrophages (as described above) and in bone formation for galectin-3 null mutants, and in nerve and muscle cell regeneration/differentiation for the galectin-1 null mutants (Leffler et al., 2004; Watt in Leffler (editor), 2004b). Recently galectin-7 and galectin-9 null mutant mice have been generated and are also grossly healthy in animal house conditions, but have not yet been analysed in detail. The differences in site of expression, specificity and other properties make it unlikely that different galectins can replace each other functionally. The observations in the null mutant mice would indicate that galectins are not essential for basic life supporting functions as can be observed in normal animal house conditions. Instead they may be optimizers of normal function and/or essential in stress conditions not found in animal house conditions. The lack of strong effect in null mutant mice may make galectin inhibitors more favorable as drugs. If galectin activity contributes to pathological conditions as suggested above but less to normal conditions, then inhibition of them will have less unwanted side effects.

Known inhibitors
Natural ligands.

Solid phase binding assays and inhibition assays have identified a number of saccharides and glycoconjugates with the ability to bind galectins (Leffler et al., 2004). All galectins bind lactose with a $K_d$ of 0.5 - 1 mM. The affinity of D-galactose is 50 - 100 times lower. N-Acetyllactosamine and related disaccharides bind about as well as lactose, but for certain galectins, they can bind either worse or up to 10 times better. The best small saccharide
ligands for galectin-3 were those carrying blood group A-determinants attached to lactose or lacNAc-residues and were found to bind up to about 50 times better than lactose. Galectin-1 shows no preference for these saccharides.

Larger saccharides of the polylactosamine type have been proposed as preferred ligands for galectins. In solution, using polylactosamine-carrying glycopeptides, there was evidence for this for galectin-3, but not galectin-1.

The above-described natural saccharides that have been identified as galectin-3 ligands are not suitable for use as active components in pharmaceutical compositions, because they are susceptible to acidic hydrolysis in the stomach and to enzymatic degradation. In addition, natural saccharides are hydrophilic in nature, and are not readily absorbed from the gastrointestinal tract following oral administration.

Synthetic inhibitors (Pieters, 2006).

Saccharides coupled to amino acids with anti-cancer activity were first identified as natural compounds in serum, but subsequently, synthetic analogues have been made. Among them, those with lactose or Gal coupled to the amino acid inhibit galectins, but only with about the same potency as the corresponding undehvatized sugar. A chemically modified form of citrus pectin that inhibits galectin-3 shows anti-tumor activity in vivo.

A divalent form of a lactosyl-amino acid had higher potency in a solid phase assay and clusters having up to four lactose moieties showed a strong multivalency effect when binding to galectin-3, but not to galectin-1 and -5.

Cyclodextrin-based glycoclusters with seven galactose, lactose, or N-acetyllactosamine residues also showed a strong multivalency effect against galectin-3, but less so against galectins-1 and -7. Starburst dendimers and glycopolymers, made polyvalent in lactose-residues, have been described as galectin-3 inhibitors with marginally improved potency as compared to lactose. The aforementioned synthetic compounds that have been identified as galectin-3 ligands are not suitable for use as active components in pharmaceutical compositions, because they are hydrophilic in nature and are not readily absorbed from the gastrointestinal tract following oral administration.
Natural oligosaccharides, glycoclusters, glycodendrimers, and glycopolymers described above are too polar and too large to be absorbed and in some cases are large enough to produce immune responses in patients. Furthermore, they are susceptible to acidic hydrolysis in the stomach and to enzymatic hydrolysis. Thus, there is a need for small synthetic molecules.

Thiodigalactoside is known to be a synthetic and hydrolytically stable, yet polar inhibitor, approximately as efficient as /V-acetyllactosamine. A library of pentapeptides provided inhibitors against galectin-1 and -3, but only with low affinities, similar to that of galactose. Furthermore, peptides are not ideal agents for targeting galectins in vivo, as they are susceptible to hydrolysis and are typically polar. /V-Acetyllactosamine derivatives carrying aromatic amides or substituted benzyl ethers at C-3′ have been demonstrated to be highly efficient inhibitors of galectin-3, with unprecedented IC₅₀ values as low as 320 nM, which is a 20-fold improvement in comparison with the natural N-acetyllactosamine disaccharide (Sörme et al., 2005). These derivatives are less polar overall, due to the presence of the aromatic amido moieties and are thus more suitable as agents for the inhibition of galectins in vivo. However, said 3′-amido-dehvatised compounds are still susceptible to hydrolytic degradation in vivo, due to the presence of a glycosidic bond in the N-acetyllactosamine disaccharide moiety and, although they are the best reported small molecule inhibitors of galectin-3, even further improved affinity is desirable.

WO 2005/1 13568 discloses a group of di-galactosides that have the general formula (I):

![Chemical Structure](image)

wherein

the configuration of one of the pyranose rings is β-D-ga/acfo;
X is selected from the group consisting of O, S, SO, SO₂, NH, CH₂, and NR₅,
Y is selected from the group consisting of O, S, NH, CH₂, and NR₅, or is a bond;
Z is selected from the group consisting of O, S, NH, CH₂, and NR₅, or is a bond;
R¹ and R³ are independently selected from the group consisting of CO, SO₂, SO, PO₂, PO, and CH₂ or is a bond;
R² and R⁴ are independently selected from the group consisting of:
a) an alkyl group of at least 4 carbons, an alkenyl group of at least 4 carbons, an alkyl group of at least 4 carbons substituted with a carboxy group, an alkenyl group of at least 4 carbons substituted with a carboxy group, an alkyl group of at least 4 carbons substituted with an amino group, an alkenyl group of at least 4 carbons substituted with an amino group, an alkyl group of at least 4 carbons substituted with both an amino and a carboxy group, an alkenyl group of at least 4 carbons substituted with both an amino and a carboxy group, and an alkyl group substituted with one or more halogens;
b) a phenyl group substituted with at least one carboxy group, a phenyl group substituted with at least one halogen, a phenyl group substituted with at least one alkoxy group, a phenyl group substituted with at least one nitro group, a phenyl group substituted with at least one sulfo group, a phenyl group substituted with at least one amino group, a phenyl group substituted with at least one alkylamino group, a phenyl group substituted with at least one dialkylamino group, a phenyl group substituted with at least one hydroxy group, a phenyl group substituted with at least one carbonyl group and a phenyl group substituted with at least one substituted carbonyl group,
c) a naphthyl group, a naphthyl group substituted with at least one carboxy group, a naphthyl group substituted with at least one halogen, a naphthyl group substituted with at least one alkoxy group, a naphthyl group substituted with at least one nitro group, a naphthyl group substituted with at least one sulfo group, a naphthyl group substituted with at least one amino group, a naphthyl group substituted with at least one alkylamino group, a naphthyl
group substituted with at least one dialkylamino group, a naphthyl group substituted with at least one hydroxy group, a naphthyl group substituted with at least one carbonyl group and a naphthyl group substituted with at least one substituted carbonyl group; and

d) a heteroaryl group, a heteroaryl group substituted with at least one carboxy group, a heteroaryl group substituted with at least one halogen, a heteroaryl group substituted with at least one alkoxy group, a heteroaryl group substituted with at least one nitro group, a heteroaryl group substituted with at least one sulfo group, a heteroaryl group substituted with at least one amino group, a heteroaryl group substituted with at least one alkylamino group, a heteroaryl group substituted with at least one dialkylamino group, a heteroaryl group substituted with at least one hydroxy group, a heteroaryl group substituted with at least one carbonyl group and a heteroaryl group substituted with at least one substituted carbonyl group.

R⁵ is selected from the group consisting of hydrogen, an alkyl group, an alkenyl group, an aryl group, a heteroaryl group, and a heterocycle.

R⁶ and R⁸ are independently selected from the group consisting of a hydrogen, an acyl group, an alkyl group, a benzyl group, and a saccharide.

R⁷ is selected from the group consisting of a hydrogen, an acyl group, an alkyl group, and a benzyl group.

R⁹ is selected from the group consisting of a hydrogen, a methyl group, hydroxymethyl group, an acyloxymethyl group, an alkoxy-methyl group, and a benzyloxymethyl group.

Specific embodiments of the invention according to WO 2005/1 13568 are indicated in claims 3-19 of WO 2005/113568.

The synthesis route disclosed therein is however, complicated and will not provide the best yields desired for the manufacture of larger quantities. Said synthesis of the thiodigalactoside inhibitors in accordance with prior art followed methods well known to one skilled in the art and are explained in detail in WO 2005/1 13568 in the passage "Synthesis of thiodigalactosides" on pages 22-23. The synthesis of WO 2005/1 13568 diverges after the first step (see 1 in scheme 1 of WO 2005/1 13568) and for each individual inhibitor syn-
thesized five separate reactions are required; azide reduction, acylation, bro-
mination, sulfide reaction, and O-acetyl removal.

WO 2005/1 13568 gives several specific examples of preparation of di-
galactosides:

5 2,4,6-th-O-acetyl-3-deoxy-3-(3,5-dimethoxybenzamido)-α-D-galactopyranosyl
bromide - see preparation 9 on pages 27-28 of WO 2005/1 13568,
bis-(2,4,6-th-O-acetyl-3-deoxy-3-(3,5-dimethoxybenzamido)-β-D-
galactopyranosyl)sulfane - see preparation 14 on page 28 of WO
2005/1 13568,

10 bis-[3-deoxy-(3,5-dimethoxybenzamido)-β-D-galactopyranosyl]sulfane - see
preparation 19 on pages 28-29 of WO 2005/1 13568,

WO 2005/1 13569 discloses a group of galactosides
that have the general formula denoted II in WO 2005/1 13569:

\[
\begin{align*}
\text{wherein} \\
\text{the configuration of the pyranose ring is } D\text{-galacto;} \\
X \text{ is selected from the group consisting of } O, S, \text{ NH, } \text{CH}_2, \text{ and } \text{NR}^4, \text{ or} \\
\text{is a bond;} \\
Y \text{ is selected from the group consisting of } \text{CH}_2, \text{ CO, } \text{SO}_2, \text{ SO, } \text{PO}_2 \text{ and} \\
\text{PO, phenyl, or is a bond;} \\
R^1 \text{ is selected from the group consisting of;} \\
a) \text{ a saccharide;} \\
b) \text{ a substituted saccharide;} \\
c) \text{ D-galactose;} \\
d) \text{ substituted D-galactose;} \\
e) \text{ C3-[1,2,3]-thazol-1-yl-substituted D-galactose;} \\
\end{align*}
\]
f) hydrogen, an alkyl group, an alkenyl group, an aryl group, a heteroaryl group, and a heterocycle and derivatives thereof;
g) an amino group, a substituted amino group, an imino group, or a substituted imino group.

R² is selected from the group consisting of:
hydrogen, an amino group, a substituted amino group, an alkyl group, a substituted alkyl group, an alkenyl group, a substituted alkenyl group, an aryl group, a substituted aryl group, an alkynyl group, a substituted alkynyl group, an alkoxy group, a substituted alkoxy group, an alkylamino group, a substituted alkylamino group, an arylamino group, a substituted arylamino group, an aryloxy group, a substituted aryloxy group, an aryl group, a substituted aryl group, a heteroaryl group, a substituted heteroaryl group, and a heterocycle, a substituted heterocycle.

Specific embodiments of the invention according to WO 2005/1 13569 are indicated in claim 9 of WO 2005/1 13569. In other specific embodiments are Y is a phenyl group or a carbonyl group. In yet other specific embodiments X is S or O and Y is a phenyl or a carbonyl group. Other specific embodiments are listed in claim 10 of WO 2005/1 13569.

In particular, thiodigalactoside derivatives, such as bis-(3-deoxy-3-(4-(methylaminocarbonyl)-i H-[1,2,3]-thazol-1-yl)-β-D-galactopyranosyl)sulfane and analogs thereof, are high-affinity galectin inhibitors. However, the synthesis route towards the thiodigalactoside derivative bis-(3-deoxy-3-(4-(methylaminocarbonyl)-i H-[1,2,3]-thazol-1-yl)-β-D-galactopyranosyl)sulfane disclosed therein is complicated and will not provide the best yields desired for the manufacture of larger quantities. Said synthesis of the thiodigalactoside inhibitors in accordance with prior art followed methods well known to one skilled in the art and are explained in detail in WO 2005/1 13569 in the passage "Synthesis of thazoles" on pages 20-22, with particular reference to scheme 4 illustrated on page 22. The known compound 1,2,4,6-tri-O-acetyl-3-azido-3-deoxy-D-galactopyranose, which preparation involves 11 steps all requiring chromatographic purification, was reacted with methyl propioloate under copper(l) catalysis to give the thazole. The triazole was converted by treatment with hydrogen bromide in glacial acetic acid into the glycosyl bromide, which was used directly in reaction with sodium sulfide to give the pro-
tected thiodigalactoside derivative. The O-acetyl protecting groups were removed via aminolysis afford the final thiodigalactosides. Alternatively, other alkynes could be reacted with 1,2,4,6-tri-O-acetyl-3-azido-3-deoxy-D-galactopyranose to provide triazole analogs. Hence, the synthesis diverges after the first step and for each individual inhibitor synthesized four separate reactions are required; cycloaddition with an alkyne, bromination, sulfide reaction, and aminolysis.

WO 2005/1 13569 gives several specific examples of preparation of digalactosides:

1. 1,2,4,6-Tetra-O-acetyl-3-deoxy-3-[4-(methoxycarbonyl)-1H-[1,2,3]-thiazol-1-yl]-D-galactopyranose - see preparation 23 on pages 36-37 of WO 2005/1 13569,
2. 2,4,6-Th-O-acetyl-3-deoxy-3-[4-(methoxycarbonyl)-1H-1,2,3-triazoM-yl]-α-D-galactopyranosyl bromide - see preparation 24 on page 37 of WO 2005/1 13569,
3. bisi-[2,4,6-th-O-acetyl-3-deoxy-3-(4-(methoxycarbonyl)-1H-1,2,3-triazoM-yl)-β-D-galactopyranosyl]sulfane - see preparation 25 on pages 36-37 of WO 2005/1 13569,
4. bis-(3-deoxy-3-{4-[(methylamino)carbonyl]-1H-1,2,3-triazoM-yl]-β-D-galactopyranosyl)sulfane - see preparation 26 on page 38 of WO 2005/1 13569,

Brief description of the drawing

Fig. 1 illustrates a galectins which is a protein with a characteristic carbohydrate recognition domain (CRD). This is a tightly folded β-sandwich of about 130 amino acids (about 15 kDa) with the two defining features: 1) a β-galactose binding site (C in Fig. 1) sufficient similarity in a sequence motif of about seven amino acids, most of which (about six residues) make up the β-galactose binding site. However, adjacent sites (A,B,D,E) are required for tight binding of natural saccharides and different preferences of these give galectins different fine specificity for natural saccharides.
Summary of the present invention

The present invention relates to a novel synthesis method for preparation of thio-di-galactosides. One advantage of the present invention is that it provides a more efficient manufacture of thiondigalactosides compared to prior art methods.

The method comprises the use of a 3-azido-galactosyl thiouronium salt derivative, which is activated to the corresponding thiol in situ, which in turn is directly reacted with a 3-azido-galactosyl bromide resulting in the 3,3'-di-azido-thio-di-galactoside before the thiol has a chance to reduce the azido group. Hence, in situ formation of the 3-azido-galactosyl thiol from the thiouronium salt is essential in the synthesis procedure, because any other method that generate the thiol separately results in extensive unwanted azide reduction.

One aspect of the invention relates to a method for preparation of a 3,3'-di-azido-thio-digalactoside by reacting a compound of formula (8) with a compound of formula (9) to form an azido compound of formula (10):

Another aspect of the invention relates to a method for preparing thio-di-galactosides of the general formula (12)
wherein

the configuration of one of the pyranose rings is $\beta$-D-ga/acfo;

Y and Z are independently selected from being CONH or a 1H-1,2,3-triazole ring;

R$^1$ and R$^2$ are independently selected from the group consisting of:

a) an alkyl group of at least 4 carbons, an alkenyl group of at least 4 carbons, an alkynyl group of at least 4 carbons;

b) a carbamoyl group, a carbamoyl group substituted with an alkyl group, a carbamoyl group substituted with an alkenyl group, a carbamoyl group substituted with an alkynyl group, a carbamoyl group substituted with an aryl group, a carbamoyl group substituted with an substituted alkyl group, and a carbamoyl group substituted with an substituted aryl group;

c) a phenyl group substituted with at least one carboxy group, a phenyl group substituted with at least one halogen, a phenyl group substituted with at least one alkyl group, a phenyl group substituted with at least one alkoxy group, a phenyl group substituted with at least one trifluoromethyl group, a phenyl group substituted with at least one trifluoromethoxy group, a phenyl group substituted with at least one sulfo group, a phenyl group substituted with at least one hydroxy group, a phenyl group substituted with at least one carbonyl group, and a phenyl group substituted with at least one substituted carbonyl group;

d) a naphthyl group, a naphthyl group substituted with at least one carboxy group, a naphthyl group substituted with at least one halogen, a naphthyl group substituted with at least one alkyl group, a naphthyl group substituted with at least one alkoxy group, a naphthyl group substituted with at least one sulfo group, a naphthyl group substituted with at least one hydroxy group, a naphthyl group substituted with at least one carbonyl group, and a naphthyl group substituted with at least one substituted carbonyl group;

e) a heteroaryl group, a heteroaryl group substituted with at least one carboxy group, a heteroaryl group substituted with at least one halogen, a heteroaryl group substituted with at least one alkyl group, a heteroaryl group substituted with at least one alkoxy group, a heteroaryl group substituted with at least one sulfo group, a heteroaryl group substituted with at least one hydroxy group, a heteroaryl group substituted with at least one carbonyl group, and a heteroaryl group substituted with at least one substituted carbonyl group.
one halogen, a heteroaryl group substituted with at least one alkoxy group, a heteroaryl group substituted with at least one sulfo group, a heteroaryl group substituted with at least one arylamino group, a heteroaryl group substituted with at least one hydroxy group, a heteroaryl group substituted with at least one halogen, a heteroaryl group substituted with at least one carbonyl group, and a heteroaryl group substituted with at least one substituted carbonyl group; and

f) a thiényl group, a thiényl group substituted with at least one carboxy group, a thiényl group substituted with at least one halogen, a thiényl thiényl group substituted with at least one alkoxy group, a thiényl group substituted with at least one sulfo group, a thiényl group substituted with at least one arylamino group, a thiényl group substituted with at least one hydroxy group, a thiényl group substituted with at least one halogen, a thiényl group substituted with at least one carbonyl group, and a thiényl group substituted with at least one substituted carbonyl group.

One embodiment of the invention provides a method for the preparation of thio-di-galactosides of the general formula (13)

R is selected from the group consisting of: hydrogen, an amino group, a substituted amino group, an alkyl group, a substituted alkyl group, an alkenyl group, a substituted alkenyl group, an alkynyl group, a substituted alkynyl group, an alkoxy group, a substituted alkoxy group, an alkylamino group, a substituted alkylamino group, an arylamino group, a substituted arylamino group, and a bond.
group, an aryloxy group, a substituted aryloxy group, an aryl group, a substituted aryl group, a heteroaryl group, a substituted heteroaryl group, and a heterocycle, a substituted heterocycle.

Detailed description of the present invention

The novel route of synthesis is clearly shown in Scheme 1 below, and relates in particular to the reaction of compounds of formulae (8) and (9) in the final step to form a compound of formula (10), which thiodigalactoside compound is further deprotected to form compound of formula (11) and then further reacted to form the compounds of formula (12) or (13).

Scheme 1:
In a further aspect of the invention it relates to intermediates as well, in particular the intermediates of the compounds (2) to (7) and (9) above.

The phenyl group present on the acetal carbon may be substituted with a methyl, methoxy, alkyl, alkoxy, or aryl or fused with an aryl group as well.

The phenyl group present on the S-atom, the thio group, may be substituted with a methyl, methoxy, alkyl, alkoxy, halo, nitro, or amido group as well.

In addition to acetates, the esters of compounds (2) to (10) may be aliphatic esters of 1 to 6 carbon atoms, aromatic esters, or substituted aromatic ester.

As explained above, the reaction of the invention illustrated in scheme 1 results in a thiodigalactoside compound of formula (10), which is further deprotected to form compound of formula (11) and then further reacted include substituents to form the desired final compound of formula (12) or the particular embodiment of formula (13).

The deprotection is performed by means known per se: Treatment of compound (10) with methanolic sodium methoxide gives compound (11). ...

Also the further reaction is performed using methods and synthesis steps known per se: Reduction of (11) followed by acylation give amido compounds (12) and reaction of compound (11) with terminal acetylenes in the presence of Cu(I) gives thazole compounds (13). ....

Further, the invention relates to certain new thio-di-galactosides of formula (13):

![Diagram of compound (13)]

wherein

the configuration of at least one of the pyranose rings is D-galacto;

X is a bond
R is a phenyl group, which is substituted in any position with one or more substituents selected from the group consisting of methyl, ethyl, isopropyl, tert-butyl, fluoro, chloro, bromo and trifluormethyl, and/or of formula (14)

wherein R is one or more thfluoromethyl, preferably in meta and/or para position.

In the present disclosure, the term "alkyl group" is meant to comprise from 1 to 12 carbon atoms. Said alkyl group may be straight- or branched-chain. Said alkyl group may also form a cycle comprising from 3 to 12 carbon atoms.

In the present disclosure, the term "alkenyl group" is meant to comprise from 2 to 12 carbon atoms. Said alkenyl group comprises at least one double bond.

In the present disclosure the term "aryl group" is meant to comprise from 4 to 18 carbon atoms. Said aryl group may be a phenyl group or a naphthyl group.

In the present disclosure, the term "alkoxy group" is meant to comprise from 1 to 12 carbon atoms. Said alkoxy group may be a methoxy group or an ethoxy group.

In the present disclosure, the term "alkylamino group" is meant to comprise from 1 to 12 carbon atoms.

In the present disclosure, the term "arylamino group" is meant to comprise from 4 to 12 carbon atoms. Said "arylamino group" may be aniline, carboxylated aniline or halogenated aniline.

In the present disclosure, the term "heteroaryl group" is meant to comprise from 4 to 18 carbon atoms, wherein at least one atom of the ring is a he-
teroatom, i.e. not a carbon. Preferably, said heteroatom is N, O or S. Said heteroaryl group may be a quinoline, isoquinoline pyridine, a pyrrole, a furan or a thiophene group.

In the present disclosure, the term "acyl group" is meant to be aliphatic or aromatic to comprise from 2 to 7 carbon atoms. Said acyl group may be a benzyol, acetyl, naphthoyl, or a trimethylacetyl group.

In the present disclosure, the term "acyloxy group" is meant to be aliphatic or aromatic and to comprise from 2 to 7 carbon atoms. Said acyloxy group may be a benzyloxy, acetoxy, naphthoxyloxy, or a trimethylacetoxy group.

The above-mentioned groups may naturally be substituted with any other known substituents within the art of organic chemistry. The groups may also be substituted with two or more of the substituents. Examples of substituents are halogen, alkoxy having 1 to 4 carbon atoms, nitro, sulfo, amino, hydroxy, and carbonyl groups.

**Detailed embodiments**

Compound 1 is known in the literature. Compounds 3, 5, 7 are crystalline and can thus easily be purified.

The applicability of compound (11) in the synthesis of galectin inhibitors is exemplified below with the preparation of di-(3-deoxy-3-{4-[2-fluorophenyl]-1/-1,2,3-thazol-1-yl}-β-D-galactopyranosyl)sulfane (26) and di-(3-deoxy-3-{4-[2-thflouromethyl-phenyl]-1 H-1,2,3-thazol-1-yl]-β-D-galactopyranosyl)sulfane (27):
Experimental section

Phenyl 2-O-acetyl-4,6-O-benzylidene-1-thio-3-O-trifluoromethane-sulfonyl-β-D-galactopyranoside (2)

Compound 1 (10.5 g, 29.2 mmol) was dissolved in dried pyridine (4.73 ml, 58.4 mmol) and dried CH₂Cl₂ (132 ml). The reaction mixture was cooled, under stirring, until -20 °C (ice and NaCl bath 3:1). Slowly and under N₂ atmosphere, Tf₂O (5.68 ml, 33.6 mmol) was added. The reaction mixture was monitored by TLC (heptane:EtOAc, 1:1 and toluene:acetone, 10:1). When the reaction was complete, AcCl (2.29 ml, 32.1 mmol) was added and keeping stirring, the temperature was increased to room temperature. This mixture was monitored by TLC too (heptane:EtOAc, 1:1 and toluene:acetone, 10:1). When it was complete, it was quenched with CH₂Cl₂ and washed with 5 % HCl, NaHCO₃ (sat) and NaCl (sat). The organic layer was dried over MgSO₄, filtered and concentrated under reduced pressure.

Phenyl 2-O-acetyl-4,6-O-benzylidene-1-thio-β-D-gulopyranoside (3)

Tetrabutylammonium nitrite (25.3 g, 87.7 mmol) was added to a solution of compound 2 (15.6 g, 29.2 mmol) in DMF (110 mL) and was kept stirring, under N₂ atmosphere, at 50 °C. (The reaction started being purple and turned garnet). The reaction was monitored by TLC (heptane:EtOAc, 1:1 and toluene:acetone, 10:1) and quenched with CH₂Cl₂. The mixture was washed with 5 % HCl, NaHCO₃ (sat) and NaCl (sat). The organic layer was dried over MgSO₄, filtered and concentrated under reduced pressure followed by purification by flash chromatography (Eluent heptane:EtOAc, 1:1 and heptane:EtOAc, 1:2) and recrystallized from a mixture of EtOAc and Heptane (1:3). ¹H NMR in CDCl₃ δ 7.60-7.57 (m, 2H, Ar), 7.43-7.40 (m, 2H, Ar), 7.37-7.34 (m, 3H, Ar), 7.29-7.25 (m, 3H, Ar), 5.50 (s, 1H, PhCH), 5.15 (d, 1H, J=1 0.29 Hz, H-1), 5.10 (dd, 1H, J=1 0.27 Hz, 2.85 Hz, H-2), 4.36 (dd, 1H, J= 12.49 Hz, 1.4 Hz, H-6), 4.18 (br s, 1H, H-3), 4.08 (dd, 1H, J= 3.59 Hz, 1.04 Hz, H-6), 4.03 (dd, 1H, J= 12.53 Hz, 1.75 Hz, H-4), 3.88 (s, 2H, H-5 + OH), 2.12 (s, 3H, OAc).
Phenyl 2-O-acetyl-4,6-O-benzylidene-1-thio-3-O-trifluoromethanesulfonyl-β-D-gulopyranoside (4)

Compound 3 (1.00 g, 2.48 mmol) was dissolved in dried \( \text{CH}_2\text{Cl}_2 \) (12.5 mL) and dried pyridine (0.40 mL, 4.96 mmol). The reaction mixture was cooled, under stirring, until -20 °C (Ice and NaCl bath 3:1). Slowly and under \( \text{N}_2 \) atmosphere, \( \text{Tf}_2\text{O} \) (0.48 mL, 2.85 mmol) was added. The reaction mixture was monitored by TLC (heptane:EtOAc, 1:1) and when it was complete, it was quenched with \( \text{CH}_2\text{Cl}_2 \) and washed with 5 % HCl, NaHCO\(_3\) (sat) and NaCl (sat). The organic layer was dried over MgSO\(_4\), filtered and concentrated under reduced pressure until being dry.

Phenyl 2-O-acetyl-3-azido-4,6-O-benzylidene-3-deoxy-1-thio-β-D-galactopyranoside (5)

Tetrabutylammonium azide (2.12 g, 7.44 mmol) was added carefully to a solution of compound 4 (1.3256 g, 2.48 mmol) in DMF (10 mL) and was kept stirring, under \( \text{N}_2 \) atmosphere, at 50 °C. The reaction was monitored by TLC (E:H, 1:1) and concentrated under reduced pressure followed by purification by flash chromatography (Eluent heptane:EtOAc, 2:1 and heptane:EtOAc, 1:1). \(^1\)H NMR in CDCl\(_3\) \( \delta \) 7.61-7.58 (m, 2H, Ar), 7.44-7.41 (m, 2H, Ar), 7.09-7.36 (m, 3H, Ar), 7.30-7.24 (m, 3H, Ar), 5.59 (s, 1H, PhCH), 5.35 (t, 1H, J = 9.95 Hz, H-2), 4.73 (d, 1H, J = 9.63 Hz, H-1), 4.44 (dd, 1H, J = 6.24 Hz, 1.60 Hz, H-6), 4.35-4.34 (dd, 1H, J = 3.33 Hz, 0.88 Hz, H-4), 4.11 (dd, 1H, J = 12.48 Hz, 1.67 Hz, H-6), 3.57 (d, 1H, J = 1.15 Hz, H-5), 3.44 (dd, 1H, J = 10.21 Hz, 3.29 Hz, H-3), 2.17 (s, 3H, OAc).

Phenyl 2-O-acetyl-3-azido-3-deoxy-1-thio-β-D-galactopyranoside (6)

Compound 5 (470 mg, 1.1 mmol) was dissolved in 80% acetic acid (75 mL) and the mixture was heated at 60 °C. The reaction was monitored by TLC (heptane:EtOAc, 1:1). When the reaction was complete, the mixture was concentrated under reduced pressure and heating.
Phenyl 2,4,6-tri-O-acetyl-3-azido-3-deoxy-1-thio-\(\beta\)-D-galactopyranoside (7)

Acetic anhydride (30 ml) was added to a solution of compound 6 (373 mg, 1.1 mmol) in dry pyridine (30 ml). The reaction was monitored by TLC (heptane:EtOAc, 1:1) and when it was complete, it was concentrated under reduced pressure. \(^1\)H NMR in \(\text{CDCl}_3\) \(\delta\) 5.50 (dd, 2H, H-4), 5.23 (t, 2H, H-2, H-2'), 4.83 (d, 2H, H-1, H-1'), 3.94 (dt, 1H, H-5), 3.68 (dd, 1H, H-3), 2.18 (s, 3H, OAc), 2.15 (s, 3H, OAc), 2.06 (s, 3H, OAc).

2,4,6-tri-O-acetyl-3-azido-3-deoxy-\(\alpha\)-D-galactopyranosyl bromide (8)

Compound 7 (237.4 mg, 560 \(\mu\)mol) was dissolved in dry \(\text{CH}_2\text{Cl}_2\) (2 ml), and bromine (32 \(\mu\)l, 620 \(\mu\)mol) was added. The reaction was monitored by TLC (heptane:EtOAc, 1:1). When the reaction was complete, a small amount of ciclopentene was added to the reaction mixture to remove the rests of \(\text{Br}_2\). The mixture was concentrated under reduced pressure and purified by quick Flash chromatography (Eluyent: 500mL heptane:EtOAc, 2:1).

2,4,6-tri-O-acetyl-3-azido-3-deoxy-\(\alpha\)-D-galactopyranose-1-isothiouronium bromide (9)

The sensitive bromide 8 (70.6 mg, 180 \(\mu\)mol) was immediately dissolved in dry acetonitrile (1.7 mL) and refluxed with thiourea (13.7 mg, 180 \(\mu\)mol) under \(\text{N}_2\) for 4 hours. The reaction was monitored by TLC (heptane:EtOAc, 1:1) and when it was complete, the mixture was cooled.

Di-(2,4,6-tri-O-acetyl-3-azido-3-deoxy-\(\beta\)-D-galactopyranosyl)-sulfane (10)

The sensitive bromide 8 (77.0 mg, 196 \(\mu\)mol) and \(\text{Et}_3\text{N}\) (60 \(\mu\)l, 430 \(\mu\)mol) was added to the last mixture (9). The reaction was monitored by TLC (heptane:EtOAc, 1:1). When it was complete, the reaction mixture was concentrated under reduced pressure and without heating. The residue was purified by Flash chromatography (Eluyent: heptane:EtOAc, 1:1). \(^1\)H NMR in \(\text{CDCl}_3\) \(\delta\) 5.50 (dd, 2H, H-4), 5.23 (t, 2H, H-2, H-2'), 4.83 (d, 2H, H-1, H-1'),
4.1 5 (dd, 4H, H-6, H-6, H-6', H-6'), 3.89 (dt, 2H, H-5, H-5'), 3.70 (dd, 2H, H-3, H-3'), 2.1 9 (s, 6H, 2OAc), 2.1 5 (s, 6H, 2OAc), 2.1 8 (s, 6H, 2OAc).

**Di-(3-azido-3-deoxy-β-D-galactopyranosyl)-sulfane (11)**

Compound 10 (9 mg, 0.000014 mol) was dissolved in dry MeOH (240 µl) and dry CH₂Cl₂ (100 µl), and NaOMe (1.4 µl, 1.4 µmol) was added. The reaction was monitored by TLC (heptane:EtOAc 1:1 and D:M 5:1). When the reaction was complete, the mixture was neutralized with Duolite C436 until pH 7, filtered, and washed with MeOH. The filtered solution was concentrated under reduced pressure. ^1H NMR in CDCl₃ δ 4.72 (d, 2H, J=9.7 Hz, H-1, H-T), 3.95 (br s, 2H, H-4, H-4'), 3.84 (t, 2H, J=9.8 Hz, H-2, H-2'), 3.74 (dd, 2H, J=11.47 Hz, 7.23 Hz, H-6, H-6'), 3.64 (dd, 2H, J=11.48 Hz, 4.72 Hz, H-6, H-6'), 3.60-3.55 (ddd, 2H, 7.15 Hz, 4.67 Hz, 0.93 Hz, H-5, H-5'), 3.36 (dd, 2H, J=10 Hz, 3.05 Hz, H-3, H-3').

The applicability of compound (11) in the synthesis of galectin inhibitors is exemplified below with the preparation of di-(3-deoxy-3-[4-[2-fluorophenyl]-1 2,3-thiazol-1 -yl]-β-D-galactopyranosyl)sulfane (26) and di-(3-deoxy-3-[4-[2-thfluoromethyl-phenyl]-1 H-1,2,3-thiazol-1 -yl]-β-D-galactopyranosyl)sulfane (27):

![Diagram](image_url)

**Di-(3-deoxy-3-[4-[2-fluorophenyl]-1 H-1,2,3-triazolM -yl]-β-D-galactopyranosyl)sulfane (26)**

Compound (11) (12 mg, 0.030 mmol) was dissolved in DMF (3 ml), and 1-ethynyl-2-fluorobenzene (10.2 µl, 0.090 mmol), Cul (0.6 mg, 0.0030 mmol) and thethylamine (4.2 µl, 0.030 mmol) were added under N₂ atmosphere. The solution was kept stirring. The reaction was monitored by TLC (CH₂Cl₂:MeOH 5:1) and when complete, the mixture was concentrated under...
reduced pressure and purified by flash chromatography (CH₂C^MeOH 8:1), followed by RPJHPLC (C₁₈, waterMeCN gradient with 0.1 % trifluoroacetic acid). ¹H NMR in CDCl₃ δ 8.5 (d, 2H, J= 3.5 Hz, 2 triazole), 8.1 (dt, 2H, J= 7.63 Hz, 1.77 Hz, Ar), 7.4-7.33 (m, 2H, Ar), 7.3-7.25 (dt, 2H, J= 7.67 Hz, 1.22 Hz, Ar), 7.23-7.17 (m, 2H, Ar), 4.92 (dd, 2H, J= 10.61 , 2.92, H-3, H-3'), 4.89 (d, 2H, J= 10 Hz, H-1 , H-T), 4.8 (br t, 2H, J= 10 Hz, H-2, H-2'), 4.16 (d, 2H, J= 2.86 Hz, H-4, H-4'), 3.91-3.84 (m, 4H, H-5, H-5\ H,6, H-6'), 3.76-3.69 (m, 2H, H-6, H-6').

10 Di-(3-deoxy-3-{4-[2-trifluoromethyl-phenyl]-1H-1,2,3-triazol-yl]-β-D-galactopyranosyl}sulfane (27)

Compound 11 (14.6 mg, 0.036 mmol) was dissolved in DMF (3.6 ml) and 1-ethynyl-2-trifluoromethylbenzene (15.0 µl, 0.108 mmol), CuI (0.7 mg, 0.0036 mmol) and thetylamine (5 µl, 0.036 mmol) were added under N₂ atmosphere. The solution was kept stirring. The reaction was monitored by TLC (CH₂Cl₂:MeOH 5:1) and when complete, the mixture was concentrated under reduced pressure and purified by flash chromatography (CH₂Cl₂:MeOH 8:1), followed by RPJHPLC (C₁₈, waterMeCN gradient with 0.1 % trifluoroacetic acid). ¹H NMR in CDCl₃ δ 8.3 (s, 2H, 2 triazole), 7.83 (d, 2H, J= 7.86 Hz, Ar), 7.76-7.67 (m, 4H, Ar), 7.59 (dt, 2H, J= 7.56 Hz, 0.73 Hz, Ar), 4.92 (dd, 2H, J= 10.7 Hz, 2.94 Hz, H-3, H-3'), 4.87 (d, 2H, J= 10.1 Hz, H-1 , H-1'), 4.71 (br t, 2H, J= 10.1 Hz, H-2, H-2'), 4.13 (d, 2H, J= 2.67 Hz, H-4, H-4'), 3.87 (dd, 2H, J= 8 Hz, 3.75 Hz, H-5, H-5'), 3.82 (dd, 2H, J= 11.10 Hz, 7.6, H-6, H-6'), 3.68 (dd, 2H, J= 11.12, 3.85, H-6, H-6').
References

1. A method for preparing a 3,3'-di-azido-thio-digalactoside by reacting a compound of formula (8) with a compound of formula (9) to form an azido compound of formula (10).

2. A method for preparing a thio-di-galactoside of the general formula (12) wherein the configuration of one of the pyranose rings is β-D-ga/acfo; Y and Z are independently selected from being CONH or a 1H-1,2,3-triazole ring; R¹ and R² are independently selected from the group consisting of:

   a) an alkyl group of at least 4 carbons, an alkenyl group of at least 4 carbons, an alkynyl group of at least 4 carbons;

   b) a carbamoyl group, a carbamoyl group substituted with an alkyl group, a carbamoyl group substituted with an alkenyl group, a carbamoyl group substituted with an alkynyl group, a carbamoyl group
substituted with an aryl group, a carbamoyl group substituted with an
substituted alkyl group, and a carbamoyl group substituted with an
substituted aryl group;

c) a phenyl group substituted with at least one carboxy group, a
phenyl group substituted with at least one halogen, a phenyl group
substituted with at least one alkyl group, a phenyl group substituted
with at least one alkoxyl group, a phenyl group substituted with at least
one trifluoromethyl group, a phenyl group substituted with at least one
trifluoromethoxy group, a phenyl group substituted with at least one
sulfo group, a phenyl group substituted with at least one hydroxy
group, a phenyl group substituted with at least one carbonyl group, and
a phenyl group substituted with at least one substituted carbonyl
group;

d) a naphthyl group, a naphthyl group substituted with at least
one carboxy group, a naphthyl group substituted with at least one halogen,
a naphthyl group substituted with at least one alkyl group, a
naphthyl group substituted with at least one alkoxyl group, a naphthyl
group substituted with at least one sulfo group, a naphthyl group sub-
tituted with at least one hydroxy group, a naphthyl group substituted
with at least one carbonyl group, and a naphthyl group substituted with
at least one substituted carbonyl group;

e) a heteroaryl group, a heteroaryl group substituted with at
least one carboxy group, a heteroaryl group substituted with at least
one halogen, a heteroaryl group substituted with at least one alkoxyl
group, a heteroaryl group substituted with at least one sulfo group, a het-	eroaryl group substituted with at least one hydroxy group, a heteroaryl
group substituted with at least one halogen, a heteroaryl group sub-
tituted with at least one carbonyl group, and a heteroaryl group substi-
tuted with at least one substituted carbonyl group; and

f) a thienyl group, a thienyl group substituted with at least one
carboxy group, a thienyl group substituted with at least one halogen, a
thienyl thienyl group substituted with at least one alkoxyl group, a
thienyl group substituted with at least one sulfo group, a thienyl group substituted with at least one arylamino group, a thienyl group substituted with at least one hydroxy group, a thienyl group substituted with at least one halogen, a thienyl group substituted with at least one carbonyl group, and a thienyl group substituted with at least one substituted carbonyl group,

by reacting a compound of formula (8) with a compound of formula (9) to form an azido compound of formula (10) which is then further substituted with the moieties Y, Z, R^1, and R^2,

which is then deprotected by means known per se, and further reacted to give a compound of formula (12) using methods and synthesis steps known per se.

3. The method according to claim 2, wherein Y in formula (12) is

4. The method according to claim 3, wherein the CONH group constituting Y is linked via the N atom to the pyranose ring.

5. The method according to any one of claims 2-4, wherein Z is CONH.
6. The method according to claim 5, wherein the CONH group constituting Z is linked via the N atom to the cyclohexane.

7. The method according to claim 2, wherein Y in formula (12) is a 1H-1,2,3-thiazole ring.

8. The method according to claim 7, wherein the 1H-1,2,3-thiazole ring constituting Y is linked via the N1 atom to the pyranose ring.

9. The method according to claim 87, wherein R1 is linked to the C4 atom of the 1H-1,2,3-thiazole ring.

10. The method according to any one of claims 7-9, wherein Z in formula (12) is a 1H-1,2,3-thiazole ring.

11. The method according to claim 10, wherein the 1H-1,2,3-triazole ring constituting Z is linked via the N1 atom to the cyclohexane.

12. The method according to claim 11, wherein R2 is linked to the C4 atom of the 1H-1,2,3-triazole ring.

13. The method according to any one of claims 2-12, wherein R1 and R2 are independently selected from the group consisting of a carbamoyl group, an alkylated carbamoyl group, an alkenylated carbamoyl group, an arylated carbamoyl group, a phenyl group, a substituted phenyl group, a halogenated phenyl group, a fluorinated phenyl group, a chlorinated phenyl group, a brominated phenyl group, an alkylated phenyl group, an alkenylated phenyl group, a thfluoromethylated phenyl group, a methoxylated phenyl group, a trifluoromethoxylated phenyl group, a naphthyl group, a substituted naphthyl group, a heteroaryl group, a substituted heteroaryl group, a thienyl group, and a substituted thienyl group.
14. The method according to any one of the claims 2-13, wherein \( R^1 \) is an alkylated carbamoyl group, a fluorinated phenyl group, or a thienyl group.

15. The method according to any one of the claims 2-14, wherein \( R^2 \) is an alkylated carbamoyl group, a fluorinated phenyl group, or a thienyl group.

16. A method according to any one of the claims 2-15, comprising a further step, performed prior to the reaction of the compound of the formula (8) with the compound of the formula (9), wherein a compound of formula (7)

\[
\text{AcO} \quad \text{OAc} \\
\text{O} \\
\text{N}_3 \quad \text{O} \\
\text{SR}^3 \\
\text{OAc}
\]

is reacted with bromine to form the compound of formula (8), wherein \( R^3 \) is selected from the group consisting of an alkyl group, an alkenyl group, an alkynyl group, a phenyl group, a substituted phenyl group, or an aryl group.

17. A method according to claim 16, comprising a further step, performed prior to the formation of the compound of formula (8), wherein a compound of formula (6)

\[
\text{HO} \\
\text{OH} \\
\text{N}_3 \quad \text{O} \\
\text{SR}^3 \\
\text{OAc}
\]

is reacted with acetic anhydride in pyridine to form a compound of formula (7), wherein \( R^3 \) is selected from the group consisting of an alkyl group, an alkenyl group, an alkynyl group, a phenyl group, a substituted phenyl group, or an aryl group.

18. A method according to claim 17, comprising a further step, performed prior to the formation of the compound of formula (7), wherein a compound of formula (5)
is reacted with acetic acid to form a compound of formula (6), wherein R³ and R⁴ are independently selected from the group consisting of an alkyl group, an alkenyl group, an alkynyl group, a phenyl group, a substituted phenyl group, or an aryl group.

19. A method according to claim 18, comprising a further step, performed prior to the formation of the compound of formula (6), wherein a compound of formula (4)

is reacted with a compound QN₃, or another azide source, to form a compound of formula (5), wherein R³ and R⁴ are independently selected from the group consisting of an alkyl group, an alkenyl group, an alkynyl group, a phenyl group, a substituted phenyl group, or an aryl group.

20. A method according to claim 19, comprising a further step, performed prior to the formation of the compound of formula (5), wherein a compound of formula (3)
is reacted with Tf$_2$O to form a compound of formula (4), wherein R$^3$ and R$^4$
are independently selected from the group consisting of an alkyl group, an
alkenyl group, an alkynyl group, a phenyl group, a substituted phenyl group,
or an aryl group.

21. A method according to claim 20, comprising a further step, performed prior to the formation of the compound of formula (4), wherein a compound of formula (2)
is reacted with QNO$_2$ to form a compound of formula (3), wherein R$^3$ and R$^4$
are independently selected from the group consisting of an alkyl group, an
alkenyl group, an alkynyl group, a phenyl group, a substituted phenyl group,
or an aryl group.

22. A method according to claim 21, comprising a further step, performed prior to the formation of the compound of formula (3), wherein a compound of formula (1)
is reacted with Tf₂O followed by acetylation reaction conditions to form a compound of the formula (2), wherein R³ and R⁴ are independently selected from the group consisting of an alkyl group, an alkenyl group, an alkynyl group, a phenyl group, a substituted phenyl group, or an aryl group.

23. An intermediate of the formula (9)

24. An intermediate of the formula (7)

wherein R³ is selected from the group consisting of an alkyl group, an alkenyl group, an alkynyl group, a phenyl group, a substituted phenyl group, or an aryl group.

25. An intermediate of the formula (6)
33

wherein \( R^3 \) is selected from the group consisting of an alkyl group, an alkenyl group, an alkynyl group, a phenyl group, a substituted phenyl group, or an aryl group.

26. An intermediate of the formula (5)

wherein \( R^3 \) and \( R^4 \) are independently selected from the group consisting of an alkyl group, an alkenyl group, an alkynyl group, a phenyl group, a substituted phenyl group, or an aryl group.

27. An intermediate of the formula (4)

wherein \( R^3 \) and \( R^4 \) are independently selected from the group consisting of an alkyl group, an alkenyl group, an alkynyl group, a phenyl group, a substituted phenyl group, or an aryl group.

28. An intermediate of the formula (3)
wherein $R^3$ and $R^4$ are independently selected from the group consisting of an alkyl group, an alkenyl group, an alkynyl group, a phenyl group, a substituted phenyl group, or an aryl group.

29. An intermediate of the formula (2)

wherein $R^3$ and $R^4$ are independently selected from the group consisting of an alkyl group, an alkenyl group, an alkynyl group, a phenyl group, a substituted phenyl group, or an aryl group.

30. A di-galactoside of the general formula (13)

wherein

the configuration of at least one of the pyranose rings is $D$-galacto;

$X$ is a bond;
R is a phenyl group, which is substituted in any position with one or more substituents selected from the group consisting of methyl, ethyl, isopropyl, tert-butyl, fluoro, chloro, bromo, and thfluoromethyl or R is a thiényl group.

A compound of the formula (14) wherein R is one or more thfluoromethyl, preferably in meta and/or para position.
A. CLASSIFICATION OF SUBJECT MATTER

IPC: see extra sheet
According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC: C07H

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

SE, DK, FI, NO classes as above

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

[X] Further documents are listed in the continuation of Box C. [X] See patent family annex.

- Special categories of cited documents:
  - "A" document defining the general state of the art which is not considered to be of particular relevance
  - "E" earlier application or patent but published on or after the international filing date
  - "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
  - "O" document referring to an oral disclosure, use, exhibition or other means
  - "P" document published prior to the international filing date but later than the priority date claimed

- Special symbols:
  - "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
  - "X" document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
  - "Y" document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
  - "&" document member of the same patent family

Date of the actual completion of the international search: 23 Sept 2009
Date of mailing of the international search report: 29-09-2009

Form PCT/ISA/210 (continuation of second sheet) (July 2009)
This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.☐ Claims Nos.:
   because they relate to subject matter not required to be searched by this Authority, namely:

2.☐ Claims Nos.:
   because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3.☐ Claims Nos.:
   because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

This International Searching Authority found multiple inventions in this international application, as follows:

Invention 1 according to claims 1-15 and 30-31
Claims 1-15 are directed to a method for preparing tio-di-galactosides of formula (12) by using an azido compound of formula (10). Claims 30 and 31 are directed to specific compounds of formula (12).

.../...

1.☒ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.☐ As all searchable claims could be searched without effort justifying an additional fees, this Authority did not invite payment of any additional fees.
3.☒ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4.☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest ☐ The additional search fees were accompanied by the applicant’s protest and, where applicable, the payment of a protest fee.

r-j The additional search fees were accompanied by the applicant’s protest but the applicable protest fee was not paid within the time limit specified in the invitation.

☐ No protest accompanied the payment of additional search fees.
Furthermore, claim 1 is directed to the synthesis of an azido compound of formula (10) which is an intermediate in the preparation of the compound of formula (12).

Invention 2 according to claims 16-22 and 24-29
Claims 24-29 and 16-22 are directed to compounds of formula (2-8) and methods for their preparation.

Invention 3 according to claim 23
Claim 23 is directed to an intermediate compound of formula (9).
