**(54) Title:** COMPOSITIONS FOR THE TREATMENT OF HYPERTENSION**(57) Abstract:** Provided herein are pharmaceutical compositions that are useful for the treatment of hypertension comprising an angiotensin II receptor blocker, a diuretic, and a calcium channel blocker.

## COMPOSITIONS FOR THE TREATMENT OF HYPERTENSION

### CROSS REFERENCE TO RELATED APPLICATION

**[0001]** This application claims the benefit of U.S. Provisional Application No. 62/703,802, filed July 26, 2018, which is incorporated by reference in the disclosure of this application.

### BACKGROUND OF THE DISCLOSURE

**[0002]** High blood pressure, also known as hypertension, is a leading cause of preventable morbidity and mortality and it is well established that treatments that lower blood pressure (BP) are beneficial. However, despite the plethora of blood pressure lowering medicines available, many patients continue to have poor blood pressure control as evidenced by multiple large-scale population studies. Contributing factors for poor blood pressure control include poor adherence, complex guidelines recommending multiple up-titration steps, and treatment inertia. Furthermore, the majority of treated patients receive only monotherapy, which has limited potency even at high doses where side effects are increased and tolerability reduced. Accordingly, there exists a need for new treatments for lowering high blood pressure that are efficacious and tolerable.

### SUMMARY OF THE DISCLOSURE

**[0003]** Provided herein, in one aspect, is a pharmaceutical composition, comprising:

- (a) an angiotensin II receptor blocker;
- (b) a diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each (a), (b), and (c) is from about 40% to about 80% of the lowest hypertension therapeutic dose (LHTD), wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent. In some embodiments, the pharmaceutical composition is essentially free of an angiotensin-converting enzyme inhibitor or a pharmaceutically acceptable salt thereof, a beta-blocker or a pharmaceutically acceptable salt thereof, platelet function-altering agent, a serum homocysteine-lowering agent, or a combination thereof.

**[0004]** In some embodiments, the diuretic is a thiazide-like diuretic. In some embodiments, the thiazide-like diuretic is quinethazone, clopamide, chlorthalidone, mefruside, clofenamide, metolazone, meticrane, xipamide, indapamide, clorexolone, fenquizone, or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the thiazide-like diuretic is indapamide or the hydrate thereof. In some embodiments, the thiazide-like diuretic is indapamide.

**[0005]** In some embodiments, the calcium channel blocker is amlodipine, nifedipine, diltiazem, nimodipine, verapamil, isradipine, felodipine, nicardipine, nisoldipine, clevidipine,

dihydropyridine, lercanidipine, nitrendipine, cilnidipine, manidipine, mibefradil, bepridil, barnidipine, nilvadipine, gallopamil, lidoflazine, aranidipine, dotarizine, diproteverine, or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the calcium channel blocker is amlodipine or the pharmaceutically acceptable salt thereof. In some embodiments, the calcium channel blocker is amlodipine besylate.

**[0006]** In some embodiments, the angiotensin II receptor blocker is irbesartan, telmisartan, valsartan, candesartan, eprosartan, olmesartan, azilsartan, losartan, or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the angiotensin II receptor blocker is telmisartan.

**[0007]** In some embodiments, the dose of each (a), (b), and (c) is from about 40% to about 60% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the diuretic is a thiazide-like diuretic, and the dose of the thiazide-like diuretic is about 50% of the lowest hypertension therapeutic dose (LHTD) for the thiazide-like diuretic. In some embodiments, the thiazide-like diuretic is indapamide, and the dose of the indapamide is about 0.625 mg. In some embodiments, the dose of the calcium channel blocker is about 50% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the calcium channel blocker is amlodipine besylate, and the dose of amlodipine besylate is about 1.25 mg. In some embodiments, the dose of the angiotensin II receptor blocker is about 50% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the angiotensin II receptor blocker is telmisartan, and the dose of the telmisartan is about 10 mg. In some embodiments, the angiotensin II receptor blocker is telmisartan, the diuretic is indapamide, and the calcium channel blocker is amlodipine besylate. In some embodiments, the dose of telmisartan is from about 8 mg to about 12 mg, the dose of indapamide is from about 0.5 mg to about 0.75 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg. In some embodiments, the dose of telmisartan is about 10 mg, the dose of indapamide is about 0.625 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0008]** Provided in an aspect is a pharmaceutical composition, comprising:

- (a) telmisartan;
- (b) a thiazide-like diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each (a), (b), and (c) is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD), wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent.

**[0009]** In some embodiments, the pharmaceutical composition is essentially free of an angiotensin-converting enzyme inhibitor or a pharmaceutically acceptable salt thereof, a beta-

blocker or a pharmaceutically acceptable salt thereof, platelet function-altering agent, a serum homocysteine-lowering agent, or a combination thereof.

**[0010]** In some embodiments, the thiazide-like diuretic is quinethazone, clopamide, chlorthalidone, mefruside, clofenamide, metolazone, meticrane, xipamide, indapamide, clorexolone, fenquizone, or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the thiazide-like diuretic is indapamide or the hydrate thereof. In some embodiments, the thiazide-like diuretic is indapamide.

**[0011]** In some embodiments, the calcium channel blocker is amlodipine, nifedipine, diltiazem, nimodipine, verapamil, isradipine, felodipine, nicardipine, nisoldipine, clevidipine, dihydropyridine, lercanidipine, nitrendipine, cilnidipine, manidipine, mibefradil, bepridil, barnidipine, nilvadipine, gallopamil, lidoflazine, aranidipine, dotarizine, dипретеверин, or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the calcium channel blocker is amlodipine or the pharmaceutically acceptable salt thereof. In some embodiments, the calcium channel blocker is amlodipine besylate.

**[0012]** In some embodiments, the dose of each (a), (b), and (c) is from about 80% to about 120% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of the thiazide-like diuretic is about 100% of the lowest hypertension therapeutic dose (LHTD) for the thiazide-like diuretic. In some embodiments, the thiazide-like diuretic is indapamide, and the dose of the indapamide is about 1.25 mg. In some embodiments, the dose of the calcium channel blocker is about 100% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the calcium channel blocker is amlodipine besylate, and the dose of amlodipine besylate is about 2.5 mg. In some embodiments, the dose of the telmisartan is about 100% of the lowest hypertension therapeutic dose (LHTD) for telmisartan. In some embodiments, the dose of the telmisartan is about 20 mg. In some embodiments, the thiazide-like diuretic is indapamide, and the calcium channel blocker is amlodipine besylate. In some embodiments, the dose of telmisartan is from about 16 mg to about 24 mg, the dose of indapamide is from about 1 mg to about 1.5 mg, and the dose of amlodipine besylate is from about 2 mg to about 3 mg. In some embodiments, the dose of telmisartan is about 20 mg, the dose of indapamide is about 1.25 mg, and the dose of amlodipine besylate is about 2.5 mg.

**[0013]** In some embodiments for the pharmaceutical compositions disclosed herein, (a), (b), and (c) are provided in one formulation. In some embodiments, (a), (b), and (c) are each provided in a separate formulation. In some embodiments, two of the (a), (b), and (c) are provided in one formulation. In some embodiments, the pharmaceutical composition is in the form of pill, tablet, or capsule. In some embodiments, the pharmaceutical composition is suitable for oral administration.

**[0014]** Also provided herein is a method of treating hypertension in a subject in need thereof comprising administering any one of the pharmaceutical compositions disclosed herein. In some embodiments, the treatment results in a systolic blood pressure (SBP) of less than about 140 mmHg. In some embodiments, the treatment results in a reduction of systolic blood pressure (SBP) of about 10 mmHg or greater. In some embodiments, the treatment results in a diastolic blood pressure (DBP) of less than about 90 mmHg. In some embodiments, the treatment results in a reduction of diastolic blood pressure (DBP) of about 5 mmHg or greater. In some embodiments, the treatment results in a reduction in systolic blood pressure (SBP) that is greater than the reduction obtained with the full lowest hypertension therapeutic dose of any one of the (a), (b), and (c) in the pharmaceutical composition. In some embodiments, the treatment results in a reduction in diastolic blood pressure (DBP) that is greater than the reduction obtained with the full lowest hypertension therapeutic dose of any one of (a), (b), and (c) in the pharmaceutical composition. In some embodiments, the treatment results in greater long term tolerability and reduced risk of side effects when compared to treatment with the full lowest hypertension therapeutic dose of any one of (a), (b), and (c) in the pharmaceutical composition. In some embodiments, the treatment is the initial or first-line treatment of hypertension. In some embodiments, the subject is not receiving any previous hypertension therapy prior to treatment.

**[0015]** Provided herein in another aspect is a pharmaceutical composition consisting essentially of:

- (a) an angiotensin II receptor blocker;
- (b) a diuretic; and
- (c) a calcium channel blocker

wherein the dose of each (a), (b), and (c) is from about 40% to about 80% of the lowest hypertension therapeutic dose (LHTD) , wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent.

**[0016]** Provided herein in another aspect is a pharmaceutical composition consisting essentially of:

- (a) an angiotensin II receptor blocker, such as telmisartan;
- (b) a thiazide-like diuretic; and
- (c) a calcium channel blocker

wherein the dose of each (a), (b), and (c) is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is from about 80% to about 120% of the lowest hypertension therapeutic dose (LHTD) , wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent.

In some embodiments, the dose of each (a), (b), and (c) is from about 90% to about 110% of the lowest hypertension therapeutic dose (LHTD).

**[0017]** In some embodiments, the at least one cholesterol-lowering active agent is selected from an NPC1L1 inhibitor, a statin, or a combination thereof.

**[0018]** In some embodiments, the at least one cholesterol-lowering active agent is selected from an NPC1L1 inhibitor, a statin, or a combination thereof.

**[0019]** In some embodiments, the at least one cholesterol-lowering active agent is a combination of an NPC1L1 inhibitor and a statin.

**[0020]** In some embodiments, the at least one cholesterol-lowering active agent is ezetimibe, rosuvastatin, or a combination thereof.

**[0021]** In some embodiments, the at least one cholesterol-lowering active agent is a combination of ezetimibe and rosuvastatin.

**[0022]** In some embodiments, the dose of ezetimibe is about 10 mg, and wherein the dose of rosuvastatin is about 10 mg.

**[0023]** In some embodiments, (a), (b), and (c) are provided in a single formulation.

**[0024]** In some embodiments, (a), (b), (c), and the at least one cholesterol-lowering active agent are provided in a single formulation.

**[0025]** Also provided herein in another aspect is a method of treating at least one of hypertension and dyslipidemia in a subject in need thereof comprising administering the pharmaceutical compositions disclosed herein. In a refinement, the method is a first-line therapy.

**[0026]** Also provided herein in another aspect is a method of treating a combination of hypertension and dyslipidemia in a subject in need thereof comprising administering the pharmaceutical compositions disclosed herein. In a refinement, the method is a first-line therapy.

## INCORPORATION BY REFERENCE

**[0027]** All publications, patents, and patent applications mentioned in this specification are herein incorporated by reference to the same extent as if each individual publication, patent, or patent application was specifically and individually indicated to be incorporated by reference.

## BRIEF DESCRIPTION OF THE DRAWINGS

**[0028]** The novel features of the disclosure are set forth with particularity in the appended claims. A better understanding of the features and advantages of the present disclosure will be obtained by reference to the following detailed description that sets forth illustrative embodiments, in which the principles of the disclosure are utilized, and the accompanying drawings of which:

[0029] FIG. 1 shows the mean systolic blood pressure (mmHg) across time periods by treatment.

[0030] FIG. 2 shows the mean diastolic blood pressure (mmHg) across time periods by treatment.

[0031] FIG. 3 shows the mean heart rate across time periods by treatment.

### DETAILED DESCRIPTION OF THE DISCLOSURE

[0032] Provided herein are pharmaceutical compositions for the treatment of hypertension comprising an angiotensin II receptor blocker, a diuretic, and a calcium channel blocker. In some embodiments, the dose of each component is below the lowest dose approved for the treatment of hypertension. The present disclosure recognizes the technical effects of low-dose combination therapy set forth herein, including but not limited to, the use of low-doses to avoid or ameliorate side effects while retaining or improving benefits, the synergistic therapeutic benefits of certain drug combinations, the early introduction of combination therapy to improve therapeutic effects, etc. Described herein in one aspect are low-dose combination compositions for the treatment of hypertension, including the initial or first-line treatment of hypertension.

#### *Certain Terminology*

[0033] As used herein and in the appended claims, the singular forms “a,” “and,” and “the” include plural referents unless the context clearly dictates otherwise. Thus, for example, reference to “an agent” includes a plurality of such agents, and reference to “the composition” includes reference to one or more compositions (or to a plurality of compositions) and equivalents thereof known to those skilled in the art, and so forth. When ranges are used herein for physical properties, such as molecular weight, or chemical properties, such as chemical formulae, all combinations and subcombinations of ranges and specific embodiments therein are intended to be included. The term “about” when referring to a number or a numerical range means that the number or numerical range referred to is an approximation within experimental variability (or within statistical experimental error), and thus in some embodiments, the number or numerical range varies between 1% and 10% of the stated number or numerical range. The term “comprising” (and related terms such as “comprise” or “comprises” or “having” or “including”) is not intended to exclude that in other certain embodiments, for example, an embodiment of any composition of matter, composition, method, or process, or the like, described herein, may “consist of” or “consist essentially of” the described features.

#### *Definitions*

[0034] As used in the specification and appended claims, unless specified to the contrary, the following terms have the meaning indicated below.

**[0035]** “Pharmaceutically acceptable salt” as used herein includes both acid and base addition salts. In some embodiments, the pharmaceutically acceptable salt of any one of the compounds described herein is the form approved for use by the US Food and Drug Administration. Preferred pharmaceutically acceptable salts of the compounds described herein are pharmaceutically acceptable acid addition salts and pharmaceutically acceptable base addition salts.

**[0036]** “Pharmaceutically acceptable acid addition salt” refers to those salts which retain the biological effectiveness and properties of the free bases, which are not biologically or otherwise undesirable, and which are formed with inorganic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, hydroiodic acid, hydrofluoric acid, phosphorous acid, and the like. Also included are salts that are formed with organic acids such as aliphatic mono- and dicarboxylic acids, phenyl-substituted alkanoic acids, hydroxy alkanoic acids, alkanedioic acids, aromatic acids, aliphatic and aromatic sulfonic acids, etc. and include, for example, acetic acid, trifluoroacetic acid, propionic acid, glycolic acid, pyruvic acid, oxalic acid, maleic acid, malonic acid, succinic acid, fumaric acid, tartaric acid, citric acid, benzoic acid, cinnamic acid, mandelic acid, methanesulfonic acid, ethanesulfonic acid, p-toluenesulfonic acid, salicylic acid, and the like. Exemplary salts thus include sulfates, pyrosulfates, bisulfates, sulfites, bisulfites, nitrates, phosphates, monohydrogenphosphates, dihydrogenphosphates, metaphosphates, pyrophosphates, chlorides, bromides, iodides, acetates, trifluoroacetates, propionates, caprylates, isobutyrates, oxalates, malonates, succinate suberates, sebacates, fumarates, maleates, mandelates, benzoates, chlorobenzoates, methylbenzoates, dinitrobenzoates, phthalates, benzenesulfonates, toluenesulfonates, phenylacetates, citrates, lactates, malates, tartrates, methanesulfonates, and the like. Also contemplated are salts of amino acids, such as arginates, gluconates, and galacturonates (see, for example, Berge S.M. et al., “Pharmaceutical Salts,” *Journal of Pharmaceutical Science*, 66:1-19 (1997), which is hereby incorporated by reference in its entirety). Acid addition salts of basic compounds may be prepared by contacting the free base forms with a sufficient amount of the desired acid to produce the salt according to methods and techniques with which a skilled artisan is familiar.

**[0037]** “Pharmaceutically acceptable base addition salt” refers to those salts that retain the biological effectiveness and properties of the free acids, which are not biologically or otherwise undesirable. These salts are prepared from addition of an inorganic base or an organic base to the free acid. Pharmaceutically acceptable base addition salts may be formed with metals or amines, such as alkali and alkaline earth metals or organic amines. Salts derived from inorganic bases include, but are not limited to, sodium, potassium, lithium, ammonium, calcium, magnesium, iron, zinc, copper, manganese, aluminum salts and the like. Salts derived from organic bases include, but are not limited to, salts of primary, secondary, and tertiary amines, substituted amines including naturally occurring substituted amines, cyclic amines and basic ion exchange resins, for example,

isopropylamine, trimethylamine, diethylamine, triethylamine, tripropylamine, ethanolamine, diethanolamine, 2-dimethylaminoethanol, 2-diethylaminoethanol, dicyclohexylamine, lysine, arginine, histidine, caffeine, procaine, *N,N*-dibenzylethylenediamine, chloroprocaine, hydrabamine, choline, betaine, ethylenediamine, ethylenedianiline, *N*-methylglucamine, glucosamine, methylglucamine, theobromine, purines, piperazine, piperidine, *N*-ethylpiperidine, polyamine resins and the like. See Berge et al., *supra*.

**[0038]** As used herein, “hydrates” are compounds that contain either stoichiometric or non-stoichiometric amounts of water, and, in some embodiments, are formed during the process of crystallization with water. Hydrates are meant to include the hydrates of any one of the compounds described herein that is approved for use by the US Food and Drug Administration.

**[0039]** The term “acceptable” with respect to a formulation, composition or ingredient, as used herein, means having no persistent detrimental effect on the general health of the subject being treated.

**[0040]** The terms “administer,” “administering,” “administration,” and the like, as used herein, refer to the methods that may be used to enable delivery of compounds or compositions to the desired site of biological action. These methods include, but are not limited to, oral routes, intraduodenal routes, parenteral injection (including intravenous, subcutaneous, intraperitoneal, intramuscular, intravascular or infusion), topical, and rectal administration. Those of skill in the art are familiar with administration techniques that can be employed with the compounds and methods described herein. In some embodiments, the compounds and compositions described herein are administered orally.

**[0041]** The term “subject” or “patient” encompasses mammals. Examples of mammals include, but are not limited to, any member of the Mammalian class: humans, non-human primates such as chimpanzees, and other apes and monkey species; farm animals such as cattle, horses, sheep, goats, swine; domestic animals such as rabbits, dogs, and cats; laboratory animals including rodents, such as rats, mice and guinea pigs, and the like. In one aspect, the mammal is a human.

**[0042]** As used herein, “treatment” or “treating” or “palliating” or “ameliorating” are used interchangeably herein. These terms refers to an approach for obtaining beneficial or desired results including but not limited to therapeutic benefit and/or a prophylactic benefit. By “therapeutic benefit” is meant eradication or amelioration of the underlying disorder being treated. Also, a therapeutic benefit is achieved with the eradication or amelioration of one or more of the physiological symptoms associated with the underlying disorder such that an improvement is observed in the patient, notwithstanding that the patient may still be afflicted with the underlying disorder. For prophylactic benefit, the compositions may be administered to a patient at risk of developing a particular disease, or to a patient reporting one or more of the

physiological symptoms of a disease, even though a diagnosis of this disease may not have been made.

*Triple Compositions*

**[0043]** Described herein are pharmaceutical compositions comprising (a) an angiotensin II receptor blocker; (b) a diuretic; and (c) a calcium channel blocker; wherein the dose of each (a), (b), and (c) is from about 40% to about 80% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 40% to about 60% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 50% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 60% to about 80% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 66% of the lowest hypertension therapeutic dose (LHTD).

**[0044]** In some embodiments, the pharmaceutical composition comprises a blood pressure-lowering combination of blood pressure-lowering active agents, wherein the blood pressure-lowering active agents consists of an angiotensin II receptor blocker, a diuretic, and a calcium channel blocker.

**[0045]** In another aspect described herein are pharmaceutical compositions comprising (a) an angiotensin II receptor blocker, such as telmisartan; (b) a thiazide-like diuretic; and (c) a calcium channel blocker; wherein the dose of each (a), (b), and (c) is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 80% to about 120% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 90% to about 110% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 95% to about 105% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 100% of the lowest hypertension therapeutic dose (LHTD).

**[0046]** In some embodiments, the pharmaceutical compositions disclosed herein are essentially free of an angiotensin-converting enzyme inhibitor (ACE inhibitor) or a pharmaceutically acceptable salt thereof. In some embodiments, the angiotensin-converting enzyme inhibitor includes, but is not limited to, benazepril, captopril, enalapril, fosinopril, lisinopril, moexipril, perindopril, quinapril, ramipril, trandolapril or a pharmaceutically acceptable salt or hydrate thereof.

**[0047]** Also, described herein are pharmaceutical compositions consisting essentially (a) an angiotensin II receptor blocker; (b) a diuretic; and (c) a calcium channel blocker; wherein the dose of each (a), (b), and (c) is from about 40% to about 80% of the lowest hypertension

therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 40% to about 60% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 50% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 60% to about 80% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 66% of the lowest hypertension therapeutic dose (LHTD).

**[0048]** Also, described herein are pharmaceutical compositions consisting essentially (a) an angiotensin II receptor blocker, such as telmisartan; (b) a thiazide-like diuretic; and (c) a calcium channel blocker; wherein the dose of each (a), (b), and (c) is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 80% to about 120% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 90% to about 110% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 95% to about 105% of the lowest hypertension therapeutic dose (LHTD). In some embodiments, the dose of each (a), (b), and (c) is about 100% of the lowest hypertension therapeutic dose (LHTD).

**[0049]** In some embodiments, the pharmaceutical compositions disclosed herein achieve a significant blood pressure reduction in a subject with modestly elevated blood pressure. In some embodiments, the pharmaceutical compositions disclosed herein achieve a significant blood pressure reduction in a subject with modestly elevated blood pressure with minimum, insignificant or no side effects.

#### *Beta-Blockers*

**[0050]** In some embodiments, the pharmaceutical compositions disclosed herein are essentially free of a beta blocker or a pharmaceutically acceptable salt thereof. In some embodiments, beta-blockers are compounds that inhibit the receptor sites for the endogenous catecholamines epinephrine (adrenaline) and norepinephrine (noradrenaline) on adrenergic beta receptors, of the sympathetic nervous system. In some embodiments, beta-blockers include, but are not limited to, beta-adrenergic blocking agents, beta antagonists, beta-adrenergic antagonists, beta-adrenoreceptor antagonists, or beta adrenergic receptor antagonists. In some embodiments, beta-blockers inhibit activation of all types of  $\beta$ -adrenergic receptors. In some embodiments, beta-blockers inhibit both  $\beta$ -adrenergic receptors and  $\alpha$ -adrenergic receptors. In some embodiments, beta-blockers are selective for one of following beta receptors:  $\beta 1$ ,  $\beta 2$ , and  $\beta 3$  receptors.

**[0051]** In some embodiments, the beta-blocker is a non-selective beta-adrenoceptor antagonist. Examples of non-selective beta-adrenoceptor antagonists include, but are not limited to, pindolol, propranolol, oxprenolol, sotalol, timolol, carteolol, penbutolol, and nadolol. In some

embodiments, the beta-blocker is a compound with combined  $\beta$ - and  $\alpha$ -adrenoceptor blocking action. Suitable examples include, but are not limited to, carvedilol, bucindolol and labetolol. In some embodiments, the beta-blocker is a  $\beta_1$ -selective adrenoceptor antagonist. Examples of  $\beta_1$  selective adrenoceptor antagonist include, but are not limited to, atenolol, bisoprolol, betaxolol, metoprolol, celiprolol, esmolol, nebivolol, and acebutolol. In some embodiments, the beta-blocker is  $\beta_2$ -selective adrenoceptor antagonist, such as butaxamine.

**[0052]** In some embodiments, the beta-blocker is acebutolol, atenolol, betaxolol, bisoprolol, carteolol, esmolol, penbutolol, metoprolol, nadolol, nebivolol, pindolol, sotalol, propranolol, carvedilol, labetalol, timolol, esmolol, celiprolol, oxprenolol, levobunolol, practolol, metipranolol, landiolol, bopindolol, pronethalol, butaxamine, bevantolol, tertatolol, arotinolol, levobetaxolol, befunolol, amosulalol, tilisolol, or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the beta-blocker is acebutolol, atenolol, betaxolol, bisoprolol, carteolol, esmolol, penbutolol, metoprolol, nadolol, nebivolol, pindolol, sotalol, propranolol, carvedilol, labetalol or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the beta-blocker is acebutolol, atenolol, betaxolol, bisoprolol, celiprolol, oxprenolol, metoprolol, nadolol, nebivolol, pindolol, propranolol, carvedilol, labetalol, timolol, or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the beta-blocker is atenolol. In some embodiments, the beta-blocker is bisoprolol or the pharmaceutically acceptable salt.

*Platelet Function-Altering Agent*

**[0053]** In some embodiments, the pharmaceutical compositions disclosed herein are essentially free of a platelet function-altering agent. In some embodiments, the platelet function-altering agent is aspirin, ticlopidine, dipyridamole, or clopidogrel. In some embodiments, the platelet function-altering agent is a glycoprotein IIb/IIIa receptor inhibitor, such as abciximab. In some embodiments, the platelet function-altering agent is a non-steroidal anti-inflammatory drug, such as ibuprofen. In some embodiments, the platelet function-altering agent is aspirin, ticlopidine, dipyridamole, clopidogrel, abciximab, or ibuprofen. In some embodiments, the platelet function-altering agent is aspirin.

*Serum Homocysteine-Lowering Agent*

**[0054]** In some embodiments, the pharmaceutical compositions disclosed herein are essentially free of a serum homocysteine-lowering agent. In some embodiments, the serum homocysteine-lowering agent is folic acid, vitamin B6, or vitamin B12, or a combination thereof. In some embodiments, the serum homocysteine-lowering agent is folic acid.

*Angiotensin II Receptor Antagonist/Blocker*

**[0055]** As used herein, angiotensin II receptor antagonists or blockers (ARBs) are compounds that modulate the action of angiotensin II by preventing angiotensin II from binding to angiotensin II receptors on the muscles surrounding blood vessels. In some embodiments, the angiotensin II receptor blocker is olmesartan, azilsartan, losartan, valsartan, candesartan, eprosartan, irbesartan, telmisartan, or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the angiotensin II receptor blocker is losartan. In some embodiments, the angiotensin II receptor blocker is valsartan. In some embodiments, the angiotensin II receptor blocker is candesartan. In some embodiments, the angiotensin II receptor blocker is eprosartan. In some embodiments, the angiotensin II receptor blocker is irbesartan. In some embodiments, the angiotensin II receptor blocker is telmisartan.

*Diuretics*

**[0056]** As used herein, diuretics refer to compounds that increase urinary flow rate. Diuretics are classified by chemical structure (thiazide diuretics and thiazide-like diuretics), site of action (such as loop diuretic), or pharmacologic effect (such as osmotic diuretics, carbonic anhydrase inhibitors, and potassium sparing diuretics).

**[0057]** In some embodiments, the pharmaceutical compositions disclosed herein comprise a thiazide diuretic. In some embodiments, the pharmaceutical compositions disclosed herein comprise a thiazide-like diuretic. In some embodiments, the pharmaceutical compositions disclosed herein comprise a loop diuretic. In some embodiments, the pharmaceutical compositions disclosed herein comprise an osmotic diuretic. In some embodiments, the pharmaceutical compositions disclosed herein comprise a carbonic anhydrase inhibitor. In some embodiments, the pharmaceutical compositions disclosed herein comprise a potassium sparing diuretic.

*Thiazide Diuretics*

**[0058]** As used herein, thiazide diuretics refer to compounds that contain the benzothiadiazine molecular structure. In some embodiments, thiazide diuretics inhibit sodium and chloride reabsorption in the distal tubule of the kidney, which results in increased urinary excretion of sodium and water. Examples of thiazide diuretics include, but are not limited to, altizide, bendroflumethiazide, chlorothiazide, cyclopenthiazide, cyclothiazide, epitizide, hydrochlorothiazide, hydroflumethiazide, mebutizide, methyclothiazide, polythiazide, and trichlormethiazide.

**[0059]** In some embodiments, the thiazide diuretic is altizide, bendroflumethiazide, chlorothiazide, cyclopenthiazide, cyclothiazide, epitizide, hydrochlorothiazide, hydroflumethiazide, mebutizide, methyclothiazide, polythiazide, trichlormethiazide, or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the thiazide diuretic

is altizide. In some embodiments, the thiazide diuretic is bendroflumethiazide. In some embodiments, the thiazide diuretic is chlorothiazide. In some embodiments, the thiazide diuretic is cyclopenthiazide. In some embodiments, the thiazide diuretic is cyclothiazide. In some embodiments, the thiazide diuretic is epitizide. In some embodiments, the thiazide diuretic is hydrochlorothiazide. In some embodiments, the thiazide diuretic is hydroflumethiazide. In some embodiments, the thiazide diuretic is mebutizide. In some embodiments, the thiazide diuretic is methyclothiazide. In some embodiments, the thiazide diuretic is polythiazide. In some embodiments, the thiazide diuretic is trichlormethiazide.

*Thiazide-Like Diuretics*

**[0060]** As used herein, a thiazide-like diuretic is a sulfonamide diuretic that has similar physiological properties to a thiazide diuretic, but does not have the chemical properties of a thiazide (i.e. does not have the benzothiadiazine core). Examples of thiazide-like diuretics include, but are not limited to, quinethazone, clopamide, chlorthalidone, mefruside, clofenamide, metolazone, meticrane, xipamide, indapamide, clorexolone, and fenquizone.

**[0061]** In some embodiments, the thiazide-like diuretic is quinethazone, clopamide, chlorthalidone, mefruside, clofenamide, metolazone, meticrane, xipamide, indapamide, clorexolone, fenquizone, or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the thiazide-like diuretic is quinethazone. In some embodiments, the thiazide-like diuretic is clopamide. In some embodiments, the thiazide-like diuretic is chlorthalidone. In some embodiments, the thiazide-like diuretic is mefruside. In some embodiments, the thiazide-like diuretic is clofenamide. In some embodiments, the thiazide-like diuretic is metolazone. In some embodiments, the thiazide-like diuretic is meticrane. In some embodiments, the thiazide-like diuretic is xipamide. In some embodiments, the thiazide-like diuretic is indapamide or the hydrate thereof. In some embodiments, the thiazide-like diuretic is indapamide. In some embodiments, the thiazide-like diuretic is clorexolone. In some embodiments, the thiazide-like diuretic is fenquizone.

*Loop Diuretics*

**[0062]** As used herein, loop diuretics are compounds that act on the  $\text{Na}^+/\text{K}^+/2\text{Cl}^-$  cotransporter in the thick ascending loop of Henle to inhibit sodium, chloride, and potassium reabsorption. Examples of loop diuretics include, but are not limited to, furosemide, bumetanide, etacrynic acid, etozolin, muzolimine, ozolinone, piretanide, tienilic acid, and torasemide. In some embodiments, the loop diuretic is furosemide, bumetanide, etacrynic acid, etozolin, muzolimine, ozolinone, piretanide, tienilic acid, torasemide, or a pharmaceutically acceptable salt or hydrate thereof.

*Other Diuretics*

**[0063]** Osmotic diuretics are compounds that cause water to be retained within the proximal tubule and descending limb of loop of Henle. In some embodiments, the osmotic diuretic expands fluid and plasma volume and increases blood flow to the kidney. Examples include, but are not limited to, mannitol and glycerol.

*Carbonic Anhydrase Inhibitors*

**[0064]** Carbonic anhydrase inhibitors as used herein are compounds that are inhibitors of carbonic anhydrase. In some embodiments, the carbonic anhydrase inhibitor increases the excretion of bicarbonate with accompanying sodium, potassium, and water, which results in an increased flow of alkaline urine. In some embodiments, the carbonic anhydrase inhibitor inhibits the transport of bicarbonate into the interstitium from the proximal convoluted tubule, which leads to less sodium being reabsorbed and provides greater sodium, bicarbonate and water loss in the urine. Examples of such compounds include, but are not limited to, acetazolamide, dichlorphenamide, and methazolamide.

*Potassium-Sparing Diuretics*

**[0065]** Potassium-sparing diuretics are compounds that either compete with aldosterone for intracellular cytoplasmic receptor sites, or directly block sodium channels, specifically epithelial sodium channels (ENaC). Examples of potassium-sparing diuretics include, but are not limited to, amiloride, spironolactone, eplerenone, triamterene, potassium canrenoate.

**[0066]** Other diuretics contemplated for use also include, but are not limited to, caffeine, theophylline, theobromine, tolvaptan, conivaptan, dopamine, and pamabrom.

**[0067]** In some embodiments, the diuretic is dichlorphenamide, amiloride, pamabrom, mannitol, acetazolamide, methazolamide, spironolactone, triamterene, or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the diuretic is dichlorphenamide. In some embodiments, the diuretic is amiloride. In some embodiments, the diuretic is pamabrom. In some embodiments, the diuretic is mannitol. In some embodiments, the diuretic is acetazolamide. In some embodiments, the diuretic is methazolamide. In some embodiments, the diuretic is spironolactone. In some embodiments, the diuretic is triamterene.

*Calcium Channel Blockers*

**[0068]** As used herein, calcium channel blockers are compounds that promote vasodilator activity by reducing calcium influx into vascular smooth muscle cells. In some embodiments, the calcium channel blocker is amlodipine, nifedipine, diltiazem, nimodipine, verapamil, isradipine, felodipine, nicardipine, nisoldipine, clevidipine, dihydropyridine, lercanidipine, nitrendipine, cilnidipine, manidipine, mibefradil, bepridil, barnidipine, nilvadipine, gallopamil, lidoflazine, aranidipine, dotarizine, diprotaverine, or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the calcium channel blocker is amlodipine, nifedipine,

diltiazem, nimodipine, verapamil, isradipine, felodipine, nicardipine, nisoldipine, clevidipine or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the calcium channel blocker is amlodipine or a pharmaceutically acceptable salt thereof. In some embodiments, the calcium channel blocker is amlodipine besylate. In some embodiments, the calcium channel blocker is nifedipine. In some embodiments, the calcium channel blocker is diltiazem. In some embodiments, the calcium channel blocker is nimodipine. In some embodiments, the calcium channel blocker is verapamil. In some embodiments, the calcium channel blocker is isradipine. In some embodiments, the calcium channel blocker is felodipine. In some embodiments, the calcium channel blocker is nicardipine. In some embodiments, the calcium channel blocker is nisoldipine. In some embodiments, the calcium channel blocker is clevidipine.

*Lowest Hypertension Therapeutic Dose*

**[0069]** As used herein, the lowest hypertension therapeutic dose (LHTD) refers to the lowest strength dose for the single agent for hypertension approved by the US Food and Drug Administration and is not marked as “discontinued” by the Orange Book database (<http://www.accessdata.fda.gov/scripts/cder/ob/>) as of the filing date of this application. The lowest hypertension therapeutic dose does not include the lowest manufactured dose for cases wherein the lowest hypertension therapeutic dose is not the same as the lowest manufactured dose. Furthermore, the lowest hypertension therapeutic dose does not include the dose as recommended by a physician for cases wherein the lowest hypertension therapeutic dose is not the same dose as recommended by a physician. Further, the lowest hypertension dose of the angiotensin II receptor blocker, diuretic, or calcium channel blocker described herein refers to the dose of the form of angiotensin II receptor blocker, diuretic, or calcium channel blocker approved for use by the US Food and Drug Administration, which includes the free base, a pharmaceutically acceptable salt, or a hydrate thereof.

**[0070]** In some embodiments, the dose of the angiotensin II receptor blocker is from about 40% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 40% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 40% to about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 40% to about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 45% to about 55% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 50% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the

angiotensin II receptor blocker is from about 50% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 50% to about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 60% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 60% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 70% to about 80% of the lowest hypertension therapeutic dose.

**[0071]** In some embodiments, the dose of the angiotensin II receptor blocker is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, or about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, or about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, or about 71% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is about 66% of the lowest hypertension therapeutic dose.

**[0072]** In some embodiments, the dose of the diuretic is from about 40% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is from about 40% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is from about 40% to about 60% of the lowest hypertension therapeutic dose.

In some embodiments, the dose of the diuretic is from about 40% to about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is from about 45% to about 55% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is from about 50% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is from about 50% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is from about 50% to about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is from about 60% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is from about 60% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is from about 70% to about 80% of the lowest hypertension therapeutic dose.

**[0073]** In some embodiments, the dose of the diuretic is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, or about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, or about 55% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the diuretic is about 66% of the lowest hypertension therapeutic dose.

**[0074]** In some embodiments, the dose of the thiazide diuretic is from about 40% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is from about 40% to about 70% of the lowest hypertension therapeutic dose. In some

embodiments, the dose of the thiazide diuretic is from about 40% to about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is from about 40% to about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is from about 45% to about 55% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is from about 50% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is from about 50% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is from about 50% to about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is from about 60% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is from about 60% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is from about 70% to about 80% of the lowest hypertension therapeutic dose.

**[0075]** In some embodiments, the dose of the thiazide diuretic is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, or about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, or about 55% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, or about 71% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide diuretic is about 66% of the lowest hypertension therapeutic dose.

**[0076]** In some embodiments, the dose of the thiazide-like diuretic is from about 40% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 40% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 40% to about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 40% to about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 45% to about 55% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 50% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 50% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 50% to about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 60% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 70% to about 80% of the lowest hypertension therapeutic dose.

**[0077]** In some embodiments, the dose of the thiazide-like diuretic is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, or about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, or about 55% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In

some embodiments, the dose of the thiazide-like diuretic is about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, or about 71% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is about 66% of the lowest hypertension therapeutic dose.

**[0078]** In some embodiments, the dose of the loop diuretic is from about 40% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is from about 40% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is from about 40% to about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is from about 40% to about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is from about 45% to about 55% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is from about 50% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is from about 50% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is from about 50% to about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is from about 60% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is from about 60% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is from about 70% to about 80% of the lowest hypertension therapeutic dose.

**[0079]** In some embodiments, the dose of the loop diuretic is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, or about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, or about 55% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about

66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, or about 71% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the loop diuretic is about 66% of the lowest hypertension therapeutic dose.

**[0080]** In some embodiments, the dose of the calcium channel blocker is from about 40% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 40% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 40% to about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 40% to about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 45% to about 55% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 50% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 50% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 50% to about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 60% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 60% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 70% to about 80% of the lowest hypertension therapeutic dose.

**[0081]** In some embodiments, the dose of the calcium channel blocker is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, or about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, or about 60% of the lowest hypertension therapeutic dose.

about 53%, about 54%, or about 55% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, or about 71% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is about 66% of the lowest hypertension therapeutic dose.

**[0082]** In some embodiments, the lowest hypertension therapeutic dose (LHTD) and the corresponding proposed dose and proposed dose range for the following compounds are as described in the following table:

**Table 1.**

Agent	Lowest Hypertension Therapeutic Dose (mg)	Proposed Dose (mg) (% LHTD)	Proposed Dose Range (mg) (% LHTD)
Amlodipine besylate	2.5	1.25 (50% of LHTD) or 1.65 (66% of LHTD)	1-1.5 (40%-60% of LHTD) or 1.5-2 (60%-80% of LHTD)
Chlorthalidone	25	12.5 (50% of LHTD) or 16.5 (66% of LHTD)	10-15 (40%-60% of LHTD) or 15-20 (60%-80% of LHTD)
Hydrochlorothiazide	12.5	6.25 (50% of LHTD) or 8.25 (66% of LHTD)	5-7.5 (40%-60% of LHTD) or 7.5-10 (60%-80% of LHTD)
Indapamide	1.25	0.625 (50% of LHTD) or 0.825 (66% of LHTD)	0.5-0.75 (40%-60% of LHTD) or 0.75-1.0 (60%-80% of LHTD)
Irbesartan	75	37.5 (50% of LHTD) or 49.5 (66% of LHTD)	30-45 (40%-60% of LHTD) or 45-60 (60%-80% of LHTD)
Telmisartan	20	10 (50% of LHTD) or 13.2 (66% of LHTD)	8-12 (40%-60% of LHTD) or 12-16 (60%-80% of LHTD)

**[0083]** In some embodiments, the pharmaceutical composition comprises: (a) irbesartan as an angiotensin II receptor blocker; (b) hydrochlorothiazide as a thiazide diuretic; and (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of irbesartan is from about 30 mg to about 45 mg, the dose of hydrochlorothiazide is from about 5 mg to about 7.5 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg. In some embodiments, the dose of irbesartan is about 37.5 mg, the dose of hydrochlorothiazide is about 6.25 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0084]** In some embodiments, the pharmaceutical composition comprises: (a) telmisartan as an angiotensin II receptor blocker; (b) hydrochlorothiazide as a thiazide diuretic; and (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of telmisartan is from about 8 mg to about 12 mg, the dose of hydrochlorothiazide is from about 5 mg to about 7.5 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg. In some embodiments, the dose of telmisartan is about 10 mg, the dose of hydrochlorothiazide is about 6.25 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0085]** In some embodiments, the pharmaceutical composition comprises: (a) irbesartan as an angiotensin II receptor blocker; (b) indapamide as a thiazide-like diuretic; and (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of irbesartan is from about 30 mg to about 45 mg, the dose of indapamide is from about 0.5 mg to about 0.75 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg. In some embodiments, the dose of irbesartan is about 37.5 mg, the dose of indapamide is about 0.625 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0086]** In some embodiments, the pharmaceutical composition comprises: (a) telmisartan as an angiotensin II receptor blocker; (b) indapamide as a thiazide-like diuretic; (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of telmisartan is from about 8 mg to about 12 mg, the dose of indapamide is from about 0.5 mg to about 0.75 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg. In some embodiments, dose of telmisartan is about 10 mg, the dose of indapamide is about 0.625 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0087]** In some embodiments, the pharmaceutical composition comprises: (a) telmisartan as an angiotensin II receptor blocker; (b) chlorthalidone as a thiazide-like diuretic; and (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of telmisartan is from about 8 mg to about 12 mg, the dose of chlorthalidone is from about 10 mg to about 15 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg. In some embodiments, dose of telmisartan is about 10 mg, the dose of chlorthalidone is about 12.5 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0088]** In some embodiments, the pharmaceutical composition comprises: (a) irbesartan as an angiotensin II receptor blocker; (b) chlorthalidone as a thiazide-like diuretic; and (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of irbesartan is from about 30 mg to about 45 mg, the dose of chlorthalidone is from about 10 mg to about 15 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg. In some embodiments, dose of irbesartan is about 37.5 mg, the dose of chlorthalidone is about 12.5 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0089]** In some embodiments, the pharmaceutical composition comprises: (a) irbesartan as an angiotensin II receptor blocker; (b) hydrochlorothiazide as a thiazide diuretic; and (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of irbesartan is from about 45 mg to about 60 mg, the dose of hydrochlorothiazide is from about 7.5 mg to about 10 mg, and the dose of amlodipine besylate is from about 1.5 mg to about 2 mg. In some embodiments, the dose of irbesartan is about 49.5 mg, the dose of hydrochlorothiazide is about 8.25 mg, and the dose of amlodipine besylate is about 1.65 mg.

**[0090]** In some embodiments, the pharmaceutical composition comprises: (a) telmisartan as an angiotensin II receptor blocker; (b) hydrochlorothiazide as a thiazide diuretic; and (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of telmisartan is from about 12 mg to about 16 mg, the dose of hydrochlorothiazide is from about 7.5 mg to about 10 mg, and the dose of amlodipine besylate is from about 1.5 mg to about 2 mg. In some embodiments, the dose of telmisartan is about 13.2 mg, the dose of hydrochlorothiazide is about 8.25 mg, and the dose of amlodipine besylate is about 1.65 mg.

**[0091]** In some embodiments, the pharmaceutical composition comprises: (a) irbesartan as an angiotensin II receptor blocker; (b) indapamide as a thiazide-like diuretic; and (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of irbesartan is from about 45 mg to about 60 mg, the dose of indapamide is from about 0.75 mg to about 1.0 mg, and the dose of amlodipine besylate is from about 1.5 mg to about 2 mg. In some embodiments, the dose of irbesartan is about 49.5 mg, the dose of indapamide is about 0.825 mg, and the dose of amlodipine besylate is about 1.65 mg.

**[0092]** In some embodiments, the pharmaceutical composition comprises: (a) telmisartan as an angiotensin II receptor blocker; (b) indapamide as a thiazide-like diuretic; (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of telmisartan is from about 12 mg to about 16 mg, the dose of indapamide is from about 0.75 mg to about 1.0 mg, and the dose of amlodipine besylate is from about 1.5 mg to about 2 mg. In some embodiments, dose of telmisartan is about 13.2 mg, the dose of indapamide is about 0.825 mg, and the dose of amlodipine besylate is about 1.65 mg.

**[0093]** In some embodiments, the pharmaceutical composition comprises: (a) telmisartan as an angiotensin II receptor blocker; (b) chlorthalidone as a thiazide-like diuretic; and (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of telmisartan is from about 12 mg to about 16 mg, the dose of chlorthalidone is from about 15 mg to about 20 mg, and the dose of amlodipine besylate is from about 1.5 mg to about 2 mg. In some embodiments, dose of telmisartan is about 13.2 mg, the dose of chlorthalidone is about 16.5 mg, and the dose of amlodipine besylate is about 1.65 mg.

**[0094]** In some embodiments, the pharmaceutical composition comprises: (a) irbesartan as an angiotensin II receptor blocker; (b) chlorthalidone as a thiazide-like diuretic; and (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of irbesartan is from about 45 mg to about 60 mg, the dose of chlorthalidone is from about 15 mg to about 20 mg, and the dose of amlodipine besylate is from about 1.5 mg to about 2 mg. In some embodiments, dose of irbesartan is about 49.5 mg, the dose of chlorthalidone is about 16.5 mg, and the dose of amlodipine besylate is about 1.65 mg.

**[0095]** In some embodiments, the dose of the angiotensin II receptor blocker, such as telmisartan, is from about 80% to about 150% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 80% to about 140% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 80% to about 130% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 80% to about 120% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 80% to about 110% of the lowest hypertension therapeutic dose.

**[0096]** In some embodiments, the dose of the angiotensin II receptor blocker, such as telmisartan, is from about 85% to about 145% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 85% to about 135% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 85% to about 125% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 85% to about 115% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 85% to about 105% of the lowest hypertension therapeutic dose.

**[0097]** In some embodiments, the dose of the angiotensin II receptor blocker, such as telmisartan, is from about 90% to about 140% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 90% to about

130% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 90% to about 120% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 90% to about 110% of the lowest hypertension therapeutic dose.

**[0098]** In some embodiments, the dose of the angiotensin II receptor blocker, such as telmisartan, is from about 95% to about 135% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 95% to about 125% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 95% to about 115% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is from about 95% to about 105% of the lowest hypertension therapeutic dose.

**[0099]** In some embodiments, the dose of the angiotensin II receptor blocker is about 80%, about 81%, about 82%, about 83%, about 84%, about 85%, about 86%, about 87%, about 88%, about 89%, about 90%, about 91%, about 92%, about 93%, about 94%, about 95%, about 96%, about 97%, about 98%, about 99%, about 100%, about 101%, about 102%, about 103%, about 104%, about 105%, about 106%, about 107%, about 108%, about 109%, about 110%, about 111%, about 112%, about 113%, about 114%, about 115%, about 116%, about 117%, about 118%, about 119%, or about 120% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is about 90%, about 91%, about 92%, about 93%, about 94%, about 95%, about 96%, about 97%, about 98%, about 99%, about 100%, about 101%, about 102%, about 103%, about 104%, about 105%, about 106%, about 107%, about 108%, about 109%, or about 110% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is about 95%, about 96%, about 97%, about 98%, about 99%, about 100%, about 101%, about 102%, about 103%, about 104%, or about 105% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin II receptor blocker is about 100% of the lowest hypertension therapeutic dose.

**[0100]** In some embodiments, the dose of the thiazide-like diuretic is from about 80% to about 150% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 80% to about 140% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 80% to about 130% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 80% to about 120% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 80% to about 110% of the lowest hypertension therapeutic dose.

**[0101]** In some embodiments, the dose of the thiazide-like diuretic is from about 85% to about 145% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 85% to about 135% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 85% to about 125% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 85% to about 115% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 85% to about 105% of the lowest hypertension therapeutic dose.

**[0102]** In some embodiments, the dose of the thiazide-like diuretic is from about 90% to about 140% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 90% to about 130% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 90% to about 120% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 90% to about 110% of the lowest hypertension therapeutic dose.

**[0103]** In some embodiments, the dose of the thiazide-like diuretic is from about 95% to about 135% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 95% to about 125% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 95% to about 115% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is from about 95% to about 105% of the lowest hypertension therapeutic dose.

**[0104]** In some embodiments, the dose of the thiazide-like diuretic is about 80%, about 81%, about 82%, about 83%, about 84%, about 85%, about 86%, about 87%, about 88%, about 89%, about 90%, about 91%, about 92%, about 93%, about 94%, about 95%, about 96%, about 97%, about 98%, about 99%, about 100%, about 101%, about 102%, about 103%, about 104%, about 105%, about 106%, about 107%, about 108%, about 109%, about 110%, about 111%, about 112%, about 113%, about 114%, about 115%, about 116%, about 117%, about 118%, about 119%, or about 120% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is about 90%, about 91%, about 92%, about 93%, about 94%, about 95%, about 96%, about 97%, about 98%, about 99%, about 100%, about 101%, about 102%, about 103%, about 104%, about 105%, about 106%, about 107%, about 108%, about 109%, or about 110% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic is about 95%, about 96%, about 97%, about 98%, about 99%, about 100%, about 101%, about 102%, about 103%, about 102%, about 103%, about 104%, about 105%, about 106%, about 107%, about 108%, about 109%, or about 110% of the lowest hypertension therapeutic dose.

hypertension therapeutic dose. In some embodiments, the dose of the thiazide-like diuretic blocker is about 100% of the lowest hypertension therapeutic dose.

**[0105]** In some embodiments, the dose of the calcium channel blocker is from about 80% to about 150% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 80% to about 140% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 80% to about 130% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 80% to about 120% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 80% to about 110% of the lowest hypertension therapeutic dose.

**[0106]** In some embodiments, the dose of the calcium channel blocker is from about 85% to about 145% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 85% to about 135% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 85% to about 125% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 85% to about 115% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 85% to about 105% of the lowest hypertension therapeutic dose.

**[0107]** In some embodiments, the dose of the calcium channel blocker is from about 90% to about 140% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 90% to about 130% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 90% to about 120% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 90% to about 110% of the lowest hypertension therapeutic dose.

**[0108]** In some embodiments, the dose of the calcium channel blocker is from about 95% to about 135% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 95% to about 125% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 95% to about 115% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is from about 95% to about 105% of the lowest hypertension therapeutic dose.

**[0109]** In some embodiments, the dose of the calcium channel blocker is about 80%, about 81%, about 82%, about 83%, about 84%, about 85%, about 86%, about 87%, about 88%, about 89%, about 90%, about 91%, about 92%, about 93%, about 94%, about 95%, about 96%, about

97%, about 98%, about 99%, about 100%, about 101%, about 102%, about 103%, about 104%, about 105%, about 106%, about 107%, about 108%, about 109%, about 110%, about 111%, about 112%, about 113%, about 114%, about 115%, about 116%, about 117%, about 118%, about 119%, or about 120% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is about 90%, about 91%, about 92%, about 93%, about 94%, about 95%, about 96%, about 97%, about 98%, about 99%, about 100%, about 101%, about 102%, about 103%, about 104%, about 105%, about 106%, about 107%, about 108%, about 109%, or about 110% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is about 95%, about 96%, about 97%, about 98%, about 99%, about 100%, about 101%, about 102%, about 103%, about 104%, or about 105% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the calcium channel blocker is about 100% of the lowest hypertension therapeutic dose.

**[0110]** In some embodiments, the lowest hypertension therapeutic dose (LHTD) and the corresponding proposed dose and proposed dose range for the following compounds are as described in the following table:

**Table 2.**

Agent	Lowest Hypertension Therapeutic Dose (mg)	Proposed Dose (mg) (% LHTD)	Proposed Dose Range (mg) (% LHTD)
Amlodipine besylate	2.5	2.5 (100% of LHTD) or 5 (200% of LHTD)	2-3.75 (80%-150% of LHTD); 2-3 (80%-120% of LHTD); 2.25-2.75 (90%-110% of LHTD); or 3.75-6.25 (150%-250% of LHTD)
Chlorthalidone	25	25 (100% of LHTD) or 50 (200% of LHTD)	20-37.5 (80%-150% of LHTD); 20-30 (80%-120% of LHTD); 22.5-27.5 (90%-110% of LHTD); or 37.5-62.5 (150%-250% of LHTD)
Hydrochlorothiazide	12.5	12.5 (100% of LHTD) or 25 (200% of LHTD)	10-18.75 (80%-150% of LHTD); 10-15 (80%-120% of LHTD); 11.25-13.75 (90%-110% of LHTD); or 18.75-31.25 (150%-250% of LHTD)
Indapamide	1.25	1.25 (100% of LHTD) or 2.5 (200% of LHTD)	1-1.875 (80%-150% of LHTD); 1-1.5 (80%-120% of LHTD); 1.125-1.375 (90%-110% of LHTD);

Agent	Lowest Hypertension Therapeutic Dose (mg)	Proposed Dose (mg) (% LHTD)	Proposed Dose Range (mg) (% LHTD)
			or 1.875-3.125 (150%-250% of LHTD)
Irbesartan	75	75 (100% of LHTD) or 150 (200% of LHTD)	60-112.5 (80%-150% of LHTD); 60-90 (80%-120% of LHTD); 67.5-82.5 (90%-110% of LHTD); or 112.5-187.5 (150%-250% of LHTD)
Telmisartan	20	20 (100% of LHTD) or 40 (200% of LHTD)	16-30 (80%-150% of LHTD); 16-24 (80%-120% of LHTD); 18-22 (90%-110% of LHTD); or 30-50 (150%-250% of LHTD)

**[0111]** In some embodiments, the dose of any one of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker. In some embodiments, the dose of the angiotensin II receptor blocker is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the diuretic is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the calcium channel blocker is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the dose of any one of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker. In some embodiments, the dose of the angiotensin II receptor blocker is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the angiotensin II receptor blocker is substituted with about 100% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the diuretic is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the diuretic is substituted with about 100% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of

the calcium channel blocker is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the dose of the calcium channel blocker is substituted with about 100% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the dose of any one of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker. In some embodiments, the dose of the angiotensin II receptor blocker is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the angiotensin II receptor blocker is substituted with about 200% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the diuretic is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the diuretic is substituted with about 200% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the calcium channel blocker is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the dose of the calcium channel blocker is substituted with about 200% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0112]** In some embodiments, the dose of any two of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker. In some embodiments, the dose of the angiotensin II receptor blocker is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the diuretic is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the calcium channel blocker is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the dose of any two of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker. In some embodiments, the dose of the angiotensin II receptor blocker is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker.

angiotensin II receptor blocker. In some embodiments, the dose of the angiotensin II receptor blocker is substituted with about 100% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the diuretic is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the diuretic is substituted with about 100% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the calcium channel blocker is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the dose of the calcium channel blocker is substituted with about 100% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the dose of any two of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker. In some embodiments, the dose of the angiotensin II receptor blocker is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the angiotensin II receptor blocker is substituted with about 200% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the diuretic is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the diuretic is substituted with about 200% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the calcium channel blocker is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the dose of the calcium channel blocker is substituted with about 200% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0113]** In some embodiments, the dose of the angiotensin II receptor blocker, the diuretic (e.g., a thiazide diuretic or thiazide-like diuretic), and the calcium channel blocker are each independently from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker. In some embodiments, the dose of the angiotensin II receptor blocker is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the diuretic is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the calcium channel blocker is from about 80% to about 150% of the lowest hypertension

therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the dose of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker are each independently from about 80% to about 120% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker. In some embodiments, the dose of the angiotensin II receptor blocker is from about 80% to about 120% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the angiotensin II receptor blocker is about 100% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the diuretic is from about 80% to about 120% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the diuretic is about 100% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the calcium channel blocker is from about 80% to about 120% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the dose of the calcium channel blocker is about 100% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the dose of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker are each independently from about 90% to about 110% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker. In some embodiments, the dose of the angiotensin II receptor blocker is from about 90% to about 110% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the angiotensin II receptor blocker is about 100% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker. In some embodiments, the dose of the diuretic is about 90% to about 110% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the diuretic is about 100% of the lowest hypertension therapeutic dose (LHTD) for the diuretic. In some embodiments, the dose of the calcium channel blocker is from about 90% to about 110% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker. In some embodiments, the dose of the calcium channel blocker is about 100% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0114]** In some embodiments, the pharmaceutical composition comprises: (a) telmisartan as an angiotensin II receptor blocker; (b) indapamide as a thiazide-like diuretic; (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of telmisartan is from about 16 mg to about 30 mg, the dose of indapamide is from about 1 mg to about 1.875 mg, and the dose of amlodipine besylate is from about 2 mg to about 3.75 mg.

**[0115]** In some embodiments, the dose of telmisartan is from about 16 mg to about 24 mg, the dose of indapamide is from about 1 mg to about 1.5 mg, and the dose of amlodipine besylate is from about 2 mg to about 3 mg.

**[0116]** In some embodiments, the dose of telmisartan is from about 18 mg to about 22 mg, the dose of indapamide is from about 1.125 mg to about 1.375 mg, and the dose of amlodipine besylate is from about 2.25 mg to about 2.75 mg.

**[0117]** In some embodiments, dose of telmisartan is about 20 mg, the dose of indapamide is about 1.25 mg, and the dose of amlodipine besylate is about 2.5 mg.

**[0118]** In some embodiments, the pharmaceutical composition comprises: (a) telmisartan as an angiotensin II receptor blocker; (b) chlorthalidone as a thiazide-like diuretic; and (c) amlodipine besylate as a calcium channel blocker. In some embodiments, the dose of telmisartan is from about 16 mg to about 30 mg, the dose of chlorthalidone is from about 20 mg to about 37.5 mg, and the dose of amlodipine besylate is from about 2 mg to about 3.75 mg.

**[0119]** In some embodiments, the dose of telmisartan is from about 16 mg to about 24 mg, the dose of chlorthalidone is from about 20 mg to about 30 mg, and the dose of amlodipine besylate is from about 2 mg to about 3 mg.

**[0120]** In some embodiments, the dose of telmisartan is from about 18 mg to about 22 mg, the dose of chlorthalidone is from about 22.5 mg to about 27.5 mg, and the dose of amlodipine besylate is from about 2.25 mg to about 2.75 mg.

**[0121]** In some embodiments, dose of telmisartan is about 20 mg, the dose of chlorthalidone is about 25 mg, and the dose of amlodipine besylate is about 2.5 mg.

#### *Formulations*

**[0122]** In some embodiments, the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker are provided in one formulation. In some embodiments, the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker each provided in a separate formulation. In some embodiments, two of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker are provided in one formulation. In some embodiments, the angiotensin II receptor and the diuretic are provided in one formulation. In some embodiments, the angiotensin II receptor blocker and the calcium channel blocker are provided in one formulation. In some embodiments, the diuretic and the calcium channel blocker are provided in one formulation. In some embodiments, the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker are provided in one formulation. In some embodiments, the pharmaceutical composition is in the form of pill, tablet, or capsule. In some embodiments, the pharmaceutical composition is in the form of pill. In some embodiments, the pharmaceutical composition is in the form of tablet. In some embodiments, the pharmaceutical composition is in

the form of capsule. In some embodiments, the pharmaceutical composition is suitable for oral administration.

**[0123]** Other suitable formulations include, but are not limited to, those suitable for rectal, topical, buccal, parenteral (e.g., subcutaneous, intramuscular, intradermal, or intravenous) rectal, vaginal, or aerosol administration, although the most suitable form of administration in any given case will depend on the degree and severity of the condition being treated and on the nature of the particular compound being used. For example, disclosed compositions may be formulated as a unit dose.

**[0124]** Exemplary pharmaceutical compositions may be used in the form of a pharmaceutical preparation, for example, in solid, semisolid, or liquid form, which includes one or more of a disclosed compound, as an active ingredient, in admixture with an organic or inorganic carrier or excipient suitable for external, enteral, or parenteral applications. The active ingredient may be compounded, for example, with the usual non-toxic, pharmaceutically acceptable carriers for tablets, pellets, capsules, suppositories, solutions, emulsions, suspensions, and any other form suitable for use. The active object compound is included in the pharmaceutical composition in an amount sufficient to produce the desired effect upon the process or condition of the disease.

**[0125]** For preparing solid compositions such as tablets, the principal active ingredient may be mixed with a pharmaceutical carrier, e.g., conventional tableting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate or gums, and other pharmaceutical diluents, e.g., water, to form a solid preformulation composition containing a homogeneous mixture of a disclosed compound or a non-toxic pharmaceutically acceptable salt thereof. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective unit dosage forms such as tablets, pills, and capsules.

**[0126]** In solid dosage forms for oral administration (capsules, tablets, pills, dragees, powders, granules and the like), the subject composition is mixed with one or more pharmaceutically acceptable carriers, such as sodium citrate or dicalcium phosphate, and/or any of the following: (1) fillers or extenders, such as starches, lactose, sucrose, glucose, mannitol, and/or silicic acid; (2) binders, such as, for example, carboxymethylcellulose, alginates, gelatin, polyvinyl pyrrolidone, sucrose and/or acacia; (3) humectants, such as glycerol; (4) disintegrating agents, such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate; (5) solution retarding agents, such as paraffin; (6) absorption accelerators, such as quaternary ammonium compounds; (7) wetting agents, such as, for example, acetyl alcohol and glycerol monostearate; (8) absorbents, such as kaolin and bentonite clay; (9)

lubricants, such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, and mixtures thereof; and (10) coloring agents. In the case of capsules, tablets and pills, the compositions may also comprise buffering agents. Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugars, as well as high molecular weight polyethylene glycols and the like.

**[0127]** A tablet may be made by compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared using binder (for example, gelatin or hydroxypropylmethyl cellulose), lubricant, inert diluent, preservative, disintegrant (for example, sodium starch glycolate or cross-linked sodium carboxymethyl cellulose), surface-active or dispersing agent. Molded tablets may be made by molding in a suitable machine a mixture of the subject composition moistened with an inert liquid diluent. In some embodiments, capsules are prepared by encapsulating tablets in hard-gelatin capsules (e.g., overencapsulation.) Tablets, and other solid dosage forms, such as dragees, capsules, pills and granules, may optionally be scored or prepared with coatings and shells, such as enteric coatings and other coatings well known in the pharmaceutical-formulating art.

**[0128]** In some embodiments, the angiotensin II receptor blockers of the pharmaceutical compositions described herein can be replaced with angiotensin converting enzyme inhibitors (ACE inhibitors). Examples of suitable angiotensin converting enzyme inhibitors include, but are not limited to, benazepril, captopril, enalapril, fosinopril, lisinopril, moexipril, perindopril, quinapril, ramipril, trandolapril or a pharmaceutically acceptable salt or hydrate thereof. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 80% to about 150% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 80% to about 120% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 90% to about 110% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is about 100% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 40% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 40% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 40% to about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 40% to about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 45% to about 55% of the lowest hypertension therapeutic dose.

In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 50% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 50% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 50% to about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 60% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 60% to about 70% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is from about 70% to about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is about 40%, about 41%, about 42%, about 43%, about 44%, about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, or about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is about 45%, about 46%, about 47%, about 48%, about 49%, about 50%, about 51%, about 52%, about 53%, about 54%, about 55%, about 56%, about 57%, about 58%, about 59%, or about 60% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is about 50% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is about 60%, about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, about 71%, about 72%, about 73%, about 74%, about 75%, about 76%, about 77%, about 78%, about 79%, or about 80% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is about 61%, about 62%, about 63%, about 64%, about 65%, about 66%, about 67%, about 68%, about 69%, about 70%, or about 71% of the lowest hypertension therapeutic dose. In some embodiments, the dose of the angiotensin-converting enzyme inhibitor is about 66% of the lowest hypertension therapeutic dose.

#### *Methods of Treatment*

**[0129]** The pharmaceutical compositions described herein are useful for treating hypertension in a subject in need thereof. In some embodiments, the treatment results in a systolic blood pressure (SBP) of less than about 140 mmHg. In some embodiments, the treatment results in a systolic blood pressure (SBP) of less than about 135 mmHg. In some embodiments, the treatment results in a reduction of systolic blood pressure (SBP) of about 10 mmHg or greater. In some embodiments, the treatment results in a reduction of systolic blood pressure (SBP) of about 10 mmHg to about 20 mmHg. In some embodiments, the treatment results in a reduction of systolic blood pressure (SBP) of about 10 mmHg to about 30 mmHg. In some embodiments, the treatment results in a reduction of systolic blood pressure (SBP) of about 10 mmHg, about 11 mmHg, about 12 mmHg, about 13 mmHg, about 14 mmHg, about 15 mmHg, about 16 mmHg, about 17 mmHg, about 18 mmHg, about 19 mmHg, or about 20 mmHg. In some embodiments, the treatment results in a reduction of systolic blood pressure (SBP) of about 10 mmHg, about 11 mmHg, about 12 mmHg, about 13 mmHg, about 14 mmHg, about 15 mmHg, about 16 mmHg, about 17 mmHg, about 18 mmHg, about 19 mmHg, about 20 mmHg, about 21 mmHg, about 22 mmHg, about 23 mmHg, about 24 mmHg, about 25 mmHg, about 26 mmHg, about 27 mmHg, about 28 mmHg, about 29 mmHg, or about 30 mmHg. In some embodiments, the treatment results in a diastolic blood pressure (DBP) of less than about 90 mmHg. In some embodiments, the treatment results in a diastolic blood pressure (DBP) of less than about 85 mmHg. In some embodiments, treatment results in a reduction of diastolic blood pressure (DBP) of about 5 mmHg or greater. In some embodiments, treatment results in a reduction of diastolic blood pressure (DBP) of about 5 mmHg to about 10 mmHg. In some embodiments, treatment results in a reduction of diastolic blood pressure (DBP) of about 5 mmHg to about 15 mmHg. In some embodiments, treatment results in a reduction of diastolic blood pressure (DBP) of about 5 mmHg, about 6 mmHg, about 7 mmHg, about 8 mmHg, about 9 mmHg, or about 10 mmHg. In some embodiments, treatment results in a reduction of diastolic blood pressure (DBP) of about 5 mmHg, about 6 mmHg, about 7 mmHg, about 8 mmHg, about 9 mmHg, about 10 mmHg, about 11 mmHg, about 12 mmHg, about 13 mmHg, about 14 mmHg, or about 15 mmHg.

**[0130]** In some embodiments, treatment results in a reduction in systolic blood pressure (SBP) that is greater than the reduction obtained with the full lowest hypertension therapeutic dose of any one of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker in the pharmaceutical composition. In some embodiments, treatment results in a reduction in systolic blood pressure (SBP) that is greater than the reduction obtained with the full lowest hypertension therapeutic dose of the angiotensin II receptor blocker in the pharmaceutical composition. In some embodiments, treatment results in a reduction in systolic blood pressure (SBP) that is greater than the reduction obtained with the full lowest hypertension therapeutic

dose of the diuretic in the pharmaceutical composition. In some embodiments, treatment results in a reduction in systolic blood pressure (SBP) that is greater than the reduction obtained with the full lowest hypertension therapeutic dose of the calcium channel blocker in the pharmaceutical composition.

**[0131]** In some embodiments, treatment results in a reduction in diastolic blood pressure (DBP) that is greater than the reduction obtained with the full lowest hypertension therapeutic dose of any one of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker in the pharmaceutical composition. In some embodiments, treatment results in a reduction in diastolic blood pressure (DBP) that is greater than the reduction obtained with the full lowest hypertension therapeutic dose of the angiotensin II receptor blocker in the pharmaceutical composition. In some embodiments, treatment results in a reduction in diastolic blood pressure (DBP) that is greater than the reduction obtained with the full lowest hypertension therapeutic dose of the diuretic in the pharmaceutical composition. In some embodiments, treatment results in a reduction in diastolic blood pressure (DBP) that is greater than the reduction obtained with the full lowest hypertension therapeutic dose of the calcium channel blocker in the pharmaceutical composition.

**[0132]** In some embodiments, treatment results in greater long term tolerability and reduced risk of side effects when compared to treatment with the full lowest hypertension therapeutic dose of any one of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker in the pharmaceutical composition. In some embodiments, the treatment results in greater long term tolerability and reduced risk of side effects when compared to treatment with the full lowest hypertension therapeutic dose of the angiotensin II receptor blocker in the pharmaceutical composition. In some embodiments, the treatment results in greater long term tolerability and reduced risk of side effects when compared to treatment with the full lowest hypertension therapeutic dose of the diuretic in the pharmaceutical composition. In some embodiments, the treatment results in greater long term tolerability and reduced risk of side effects when compared to treatment with the full lowest hypertension therapeutic dose of the calcium channel blocker in the pharmaceutical composition.

**[0133]** In some embodiments, treatment results in a reduction in systolic blood pressure (SBP) that is greater than or equal to the reduction obtained with the combination of any two of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker in the pharmaceutical composition, wherein the dose of each angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is about 50% of the lowest hypertension therapeutic dose. In some embodiments, treatment results in a reduction in diastolic blood pressure (DBP) that is greater than or equal to the reduction obtained with a combination of any two of the

angiotensin II receptor blocker, the diuretic, and the calcium channel blocker in the pharmaceutical composition, wherein the dose of each the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is about 50% of the lowest hypertension therapeutic dose. In some embodiments, the treatment results in greater long term tolerability and reduced risk of side effects when compared to treatment with a combination of any two of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker in the pharmaceutical composition, wherein the dose of each the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is about 50% of the lowest hypertension therapeutic dose.

**[0134]** In some embodiments, the treatment is the initial or first-line treatment of hypertension. In some embodiments, the subject has a very mild elevation of blood pressure prior to treatment. In some embodiments, the subject is not on any previous hypertension therapy prior to treatment. In some embodiments, the subject has a very mild elevation of blood pressure prior to treatment and is not on any previous hypertension therapy prior to treatment.

**[0135]** This present disclosure recognizes that the use of the angiotensin II receptor blocker in the pharmaceutical compositions disclosed herein in some embodiments provides beneficial therapeutic effects, which include, but are not limited to, significant reduction in blood pressure, significant reduction in blood pressure among subjects with mild elevation in blood pressure, greater long term tolerability, and reduced risk of side effects. This present disclosure recognizes that the exclusion of a platelet function-altering agent, a serum homocysteine-lowering agent, or a combination thereof in the pharmaceutical compositions disclosed herein in some embodiments provides beneficial therapeutic effects, which include, but are not limited to, significant reduction in blood pressure, significant reduction in blood pressure among subjects with mild elevation in blood pressure, greater long term tolerability, and reduced risk of side effects.

**[0136]** It is also recognized herein that in some embodiments, the triple combination described herein comprising an angiotensin II receptor blocker, a diuretic, and a calcium channel blocker with each component at about 40% to about 80% of the lowest hypertension therapeutic dose provide significantly larger reductions in blood pressure (such as systolic blood pressure, diastolic blood pressure, or both) than a triple combination comprising angiotensin II receptor blocker (such as losartan), a diuretic (such as hydrochlorothiazide), and a calcium channel blocker (amlodipine besylate) with each component at 100% of the lowest hypertension therapeutic dose. In some embodiments, the triple combination described herein comprising an angiotensin II receptor blocker, a diuretic, and a calcium channel blocker with each component at about 40% to about 60% of the lowest hypertension therapeutic dose provide significantly

larger reductions in blood pressure (such as systolic blood pressure, diastolic blood pressure, or both) than a triple combination comprising angiotensin II receptor blocker (such as losartan), a diuretic (such as hydrochlorothiazide), and a calcium channel blocker (amlodipine besylate) with each component at 100% of the lowest hypertension therapeutic dose.

**[0137]** It is also recognized herein that in some embodiments, the triple combination described herein comprising telmisartan, a thiazide-like diuretic, and a calcium channel blocker with each component at about 80% to about 150% of the lowest hypertension therapeutic dose provide significantly larger reductions in blood pressure (such as systolic blood pressure, diastolic blood pressure, or both) than a triple combination comprising losartan as angiotensin II receptor blocker, a thiazide diuretic (such as hydrochlorothiazide), and a calcium channel blocker (amlodipine besylate). In some embodiments, the triple combination described herein comprising telmisartan, a thiazide-like diuretic, and a calcium channel blocker with each component at about 80% to about 120% of the lowest hypertension therapeutic dose provide significantly larger reductions in blood pressure (such as systolic blood pressure, diastolic blood pressure, or both) than a triple combination comprising losartan as angiotensin II receptor blocker, a thiazide diuretic (such as hydrochlorothiazide), and a calcium channel blocker (amlodipine besylate).

**[0138]** In an aspect, there is provided a method of treating hypertension and/or dyslipidemia in a subject in need thereof, comprising administering to the subject:

- (a) an angiotensin II receptor blocker;
- (b) a diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each of (a), (b), and (c) is from about 40% to about 80% of the lowest hypertension therapeutic dose (LHTD), and wherein the method further comprises at least one cholesterol-lowering active agent.

**[0139]** In some embodiments of the methods provided herein, the method is essentially free of an angiotensin-converting enzyme inhibitor or a pharmaceutically acceptable salt thereof, a beta-blocker or a pharmaceutically acceptable salt thereof, platelet function-altering agent, a serum homocysteine-lowering agent, or combinations thereof. In some embodiments of the methods provided herein, the method does not include, comprise, or consist of administering an angiotensin-converting enzyme inhibitor or a pharmaceutically acceptable salt thereof, a beta-blocker or a pharmaceutically acceptable salt thereof, platelet function-altering agent, a serum homocysteine-lowering agent, or combinations thereof.

**[0140]** In some embodiments of the methods provided herein, the angiotensin II receptor blocker is irbesartan, telmisartan, valsartan, candesartan, eprosartan, olmesartan, azilsartan, losartan, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0141]** In some embodiments of the methods provided herein, the angiotensin II receptor blocker is telmisartan.

**[0142]** In some embodiments of the methods provided herein, the dose of each (a), (b), and (c) is from about 40% to about 60% of the lowest hypertension therapeutic dose (LHTD).

**[0143]** In some embodiments of the methods provided herein, the diuretic is a thiazide-like, and the dose of the thiazide-like diuretic is about 50% of the lowest hypertension therapeutic dose (LHTD) for the thiazide-like diuretic.

**[0144]** In some embodiments of the methods provided herein, the thiazide-like diuretic is indapamide, and the dose of the indapamide is about 0.625 mg.

**[0145]** In some embodiments of the methods provided herein, the dose of the calcium channel blocker is about 50% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0146]** In some embodiments of the methods provided herein, the calcium channel blocker is amlodipine besylate, and the dose of amlodipine besylate is about 1.25 mg.

**[0147]** In some embodiments of the methods provided herein, the dose of the angiotensin II receptor blocker is about 50% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0148]** In some embodiments of the methods provided herein, the angiotensin II receptor blocker is telmisartan, and the dose of the telmisartan is about 10 mg.

**[0149]** In some embodiments of the methods provided herein, the angiotensin II receptor blocker is telmisartan, the diuretic is indapamide, and the calcium channel blocker is amlodipine besylate.

**[0150]** In some embodiments of the methods provided herein, the dose of telmisartan is from about 8 mg to about 12 mg, the dose of indapamide is from about 0.5 mg to about 0.75 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg.

**[0151]** In some embodiments of the methods provided herein, the dose of telmisartan is about 10 mg, the dose of indapamide is about 0.625 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0152]** Provided herein is method of treating hypertension and/or dyslipidemia in a subject in need thereof, comprising administering to the subject:

- (a) telmisartan;
- (b) a thiazide-like diuretic; and

(c) a calcium channel blocker,

wherein the dose of each (a), (b), and (c) is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD), and wherein the method further comprises at least one cholesterol-lowering active agent.

**[0153]** In some embodiments of the methods provided herein, the method is essentially free of an angiotensin-converting enzyme inhibitor or a pharmaceutically acceptable salt thereof, a beta-blocker or a pharmaceutically acceptable salt thereof, platelet function-altering agent, a serum homocysteine-lowering agent, or a combination thereof.

**[0154]** In some embodiments of the methods provided herein, the diuretic is a thiazide-like diuretic.

**[0155]** In some embodiments of the methods provided herein, the thiazide-like diuretic is quinethazone, clopamide, chlorthalidone, mefruside, clofenamide, metolazone, meticrane, xipamide, indapamide, clorexolone, fenquizone, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0156]** In some embodiments of the methods provided herein, the thiazide-like diuretic is indapamide or a hydrate thereof.

**[0157]** In some embodiments of the methods provided herein, the thiazide-like diuretic is indapamide.

**[0158]** In some embodiments of the methods provided herein, the calcium channel blocker is amlodipine, nifedipine, diltiazem, nimodipine, verapamil, isradipine, felodipine, nicardipine, nisoldipine, clevidipine, dihydropyridine, lercanidipine, nitrendipine, cilnidipine, manidipine, mibefradil, bepridil, barnidipine, nilvadipine, gallopamil, lidoflazine, aranidipine, dotarizine, diproterverine, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0159]** In some embodiments of the methods provided herein, the calcium channel blocker is amlodipine or a pharmaceutically acceptable salt thereof.

**[0160]** In some embodiments of the methods provided herein, the calcium channel blocker is amlodipine besylate.

**[0161]** In some embodiments of the methods provided herein, the dose of each (a), (b), and (c) is from about 80% to about 120% of the lowest hypertension therapeutic dose (LHTD).

**[0162]** In some embodiments of the methods provided herein, the dose of the thiazide-like diuretic is about 100% of the lowest hypertension therapeutic dose (LHTD) for the thiazide-like diuretic.

**[0163]** In some embodiments of the methods provided herein, the thiazide-like diuretic is indapamide, and the dose of the indapamide is about 1.25 mg.

**[0164]** In some embodiments of the methods provided herein, the dose of the calcium channel blocker is about 100% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0165]** In some embodiments of the methods provided herein, the calcium channel blocker is amlodipine besylate, and the dose of amlodipine besylate is about 2.5 mg.

**[0166]** In some embodiments of the methods provided herein, the angiotensin II receptor blocker is telmisartan and the dose of the telmisartan is about 100% of the lowest hypertension therapeutic dose (LHTD) for telmisartan.

**[0167]** In some embodiments of the methods provided herein, the angiotensin II receptor blocker is telmisartan and the dose of the telmisartan is about 20 mg.

**[0168]** In some embodiments of the methods provided herein, the thiazide-like diuretic is indapamide, the calcium channel blocker is amlodipine besylate, and the angiotensin II receptor blocker is telmisartan.

**[0169]** In some embodiments of the methods provided herein, the dose of telmisartan is from about 16 mg to about 24 mg, the dose of indapamide is from about 1 mg to about 1.5 mg, and the dose of amlodipine besylate is from about 2 mg to about 3 mg.

**[0170]** In some embodiments of the methods provided herein, the dose of telmisartan is about 20 mg, the dose of indapamide is about 1.25 mg, and the dose of amlodipine besylate is about 2.5 mg.

**[0171]** In some embodiments of the methods provided herein, the at least one cholesterol-lowering active agent is selected from an NPC1L1 inhibitor, a statin, or a combination thereof.

**[0172]** In some embodiments of the methods provided herein, the at least one cholesterol-lowering active agent is a combination of an NPC1L1 inhibitor and a statin.

**[0173]** In some embodiments of the methods provided herein, the at least one cholesterol-lowering active agent is ezetimibe, rosuvastatin, or a combination thereof.

**[0174]** In some embodiments of the methods provided herein, the at least one cholesterol-lowering active agent is a combination of ezetimibe and rosuvastatin.

**[0175]** In some embodiments of the methods provided herein, the dose of ezetimibe is about 10 mg, and wherein the dose of rosuvastatin is about 10 mg.

**[0176]** In some embodiments of the methods provided herein, (a), (b), (c), and the at least one cholesterol-lowering active agent are provided in a single formulation.

**[0177]** In some embodiments of the methods provided herein, (a), (b), (c), and the at least one cholesterol-lowering active agent are provided in at least two separate formulations.

**[0178]** In some embodiments of the methods provided herein, at least two of (a), (b), (c), and the at least one cholesterol-lowering active agent are provided in a single formulation.

**[0179]** In some embodiments of the methods provided herein, at least three of (a), (b), (c), and the at least one cholesterol-lowering active agent are provided in a single formulation.

**[0180]** In some embodiments of the methods provided herein, the at least one cholesterol-lowering active agent is a combination of ezetimibe and rosuvastatin.

**[0181]** In some embodiments of the methods provided herein, (a), (b), (c) are provided in a single formulation and the combination of ezetimibe and rosuvastatin are provided in another formulation.

## EXAMPLES

### **Example 1: Cardiovascular Measurement in Spontaneously Hypertensive Rats Receiving Combinations of Anti-Hypertensive Drugs**

#### *Summary*

**[0182]** The purpose of this study was to evaluate the comparative effects on blood pressure of three different combinations of an angiotensin II receptor blocker, a calcium channel blocker, and a diuretic (a thiazide diuretic or a thiazide-like diuretic). The main objectives were to assess whether there were differences in the effects of combinations utilizing different drugs from the same class, and differences between combinations utilizing the same drugs at different doses, including very low doses (i.e., doses below the lowest doses approved and manufactured, such as those at 50% of the lowest hypertension therapeutic dose (LHTD)).

**[0183]** The specific combinations studied were:

- Combination 1: telmisartan, amlodipine besylate, and indapamide, all at 50% of the lowest hypertension therapeutic dose (LHTD) or one-quarter of the FDA recommended usual maintenance dose (corresponds to telmisartan 10 mg, amlodipine besylate 1.25 mg, and indapamide 0.625 mg);
- Combination 2: telmisartan, amlodipine, and indapamide, all at 100% of the lowest hypertension therapeutic dose (LHTD) or one-half of the FDA recommended usual maintenance dose (corresponds to telmisartan 20 mg, amlodipine besylate 2.5 mg, and indapamide 1.25 mg); and
- Combination 3: losartan, amlodipine besylate, and hydrochlorothiazide, all at 100% of the lowest hypertension therapeutic dose (LHTD) or one-half of the FDA recommended usual maintenance dose (corresponds to losartan 25 mg, amlodipine besylate 2.5 mg, and hydrochlorothiazide 12.5 mg).

**[0184]** The study was conducted in spontaneously hypertensive rats (SHR), the most commonly-used animal model for the study of hypertension (See: Pinto YM, Paul M, Ganten D. "Lessons from rat models of hypertension: from Goldblatt to genetic engineering".

*Cardiovascular Research.* 39 (1): 77–88.). Drug doses were calculated using standard allometric

scaling methods and data from the published literature on  $C_{max}$  and AUC for each of the six antihypertensive agents. Each animal was exposed to a single dose of every drug combination in a Latin square design.

*Methods*

**[0185]** The following was used as the vehicle for the following study: 0.5% methylcellulose (w/v) and 0.25% polysorbate 80 (v/v) in 25 mM phosphate buffer at pH 8+/- 0.2.

**[0186]** The following animals were used in the study: Spontaneous Hypertensive rats (Strain: SHR/NCrl). The rats were obtained from Charles River Laboratories, Inc., Kingston, New York. The age at initiation of dosing was at approximately 12 weeks. 13 male rats were used for acclimation. 8 male rats were used for the study. The animals were identified by cage card and tattoo.

**[0187]** Telemetry Implantation: The animals were implanted with Data Science International transmitters (HD-S10) for collection for blood pressure and heart rate data. The animals were not administered dose formulations until at least 10 days after surgery.

**[0188]** Housing: The animals were individually housed in solid bottom cages equipped with water bottles.

**[0189]** Diet: Teklad Global Diet - Rodent 2014 (Envigo RMS, Inc.) were provided *ad libitum* unless otherwise specified. In some instances, the animals were fed the meal-form of this diet if indicated by health conditions.

**[0190]** Water: Greenfield city water was provided *ad libitum*.

**[0191]** Contaminants: No known contaminants were present in the diet, water, or bedding (if applicable) at levels that would interfere with this study.

**[0192]** Environment: Environmental controls for the animal room were set to maintain the following room conditions: a temperature range of 20 to 26°C, a relative humidity of 30 to 70%, and a 12-hour light/12-hour dark cycle.

**[0193]** Acclimation (Pre-dose Phase): The acclimation phase was for a maximum of 1 week.

**[0194]** Environmental and Dietary Enrichments: The animals were given various cage-enrichment devices and dietary enrichment (that do not require analyses).

**[0195]** Randomization: The animals were arbitrarily selected based on pre-dose phase mean arterial pressure values.

**[0196]** The following table shows the group designation of the rats used in the study:

**Table 3.**

Group	Number of Male Rats	Day 1	Day 8	Day 15	Day 22
1	1	Combination 1	Vehicle	Combination 3	Combination 2
2	1	Combination 2	Combination 3	Vehicle	Combination 1
3	1	Combination 3	Combination 1	Combination 2	Vehicle
4	1	Vehicle	Combination 2	Combination 1	Combination 3
5	1	Vehicle	Combination 3	Combination 2	Combination 1
6	1	Combination 3	Combination 1	Vehicle	Combination 2
7	1	Combination 2	Vehicle	Combination 1	Combination 3
8	1	Combination 1	Combination 2	Combination 3	Vehicle

**[0197]** The following table shows the dose levels administered in the study:

**Table 4.**

Test Article		Dose Level	Dose Concentration	Dose Volume
		(mg/kg/day)	(mg/mL)	(mL/kg)
Combination 1	Telmisartan	0.17	0.017	10
	Amlodipine Besylate	0.22	0.022	
	Indapamide	0.08	0.008	
Combination 2	Telmisartan	0.34	0.034	10
	Amlodipine Besylate	0.44	0.044	
	Indapamide	0.16	0.016	
Combination 3	Amlodipine Besylate	0.44	0.044	10
	Losartan Potassium	0.31	0.031	
	Hydrochlorothiazide	1.74	0.174	
Vehicle	0.5% Methylcellulose (w/v), 0.25% polysorbate 80 (v/v), in phosphate buffer, pH 8 +/- 0.2	0	0	10

**[0198]** Dosing Procedures: For Combinations 1, 2 and 3, each test combination formulation was prepared fresh on each day of dosing. A portion of the vehicle (approximately 80%) was added to the test combination formulation and mixed until the preparations were homogenous. If a homogenous suspension or solution was not obtained, 1N NaOH and/or 1N HCl was added to adjust to pH 9 + 0.2. The remainder of the vehicle added and mixed with a stir bar. The test combination formulations were stirred continuously at room temperature and protected from light for approximately 30 minutes prior to and throughout dosing. The test combination formulations were stored protected from light, stirring in a refrigerator set to maintain 2 to 8°C.

**[0199]** Dosing Procedures: For pre-dose handling, the test combination formulations were allowed to equilibrate to approximately room temperature for at least 30 minutes prior to dosing. The animals were dosed at the volume of 10 mL/kg, and the actual dose volume was based on the most recent body weight. Oral gavage was used to administer the dose. The dose interval was once daily on Days 1, 8, 15, and 22. Following dose administration, the remaining test combination formulations were disposed of according to standard operating procedures.

**[0200]** Telemetry Collections: The animals were not disturbed or manipulated immediately prior to and during telemetry data collection without prior authorization. Such disturbances include but were not limited to cage changes, bedding changes, mopping, sanitation, or anything that would disturb the natural quiet environment that was important for collection of the cardiovascular telemetry data

**[0201]** Animal Observation: Each rat was observed once daily in the morning. Any abnormal findings were recorded. The rats were observed for mortality, abnormalities, and signs of pain or distress. Any abnormal findings that were observed during the unscheduled observation periods were also noted.

**[0202]** Body Weight: The body weights were obtained at least once during the pre-dose phase and prior to each scheduled dose. Additional body weights were recorded to monitor animal health if appropriate. The animals were instrumented with a transmitter: a representative transmitter and leads were used to tare the balance prior to the collection of body weights for dose calculation purposes.

**[0203]** Telemetry Data Collection: The arterial pressure raw signals were digitized at a sampling rate of 500 Hz. Derived parameters in the pre-dose and dosing phases were the same. For pre-dose data collection, all implanted telemetry devices were checked for consistency of signal and to verify the telemetry signal was acceptable for analysis. The signal check consisted of at least one telemetry recording taken from each rat considered for the study. Telemetry data was recorded continuously for approximately 24 hours. The telemetry data was reviewed to determine if the rat was qualified for the study. The data was maintained in the study records and was used to calculate the nominal 24-hour mean arterial pressure average to support the randomization animal selection. For dosing phase data collection, continuous telemetry data was collected during the dosing phase starting at least 90 minutes prior to dosing through approximately 48 hours post-dose.

**[0204]** Nominal Dosing Time: The telemetry collection time points were based on a single nominal dosing time for all animals. The nominal dosing time for each day of the dosing phase were the end of dosing for the first half of animals dosed on that day recorded on each computer for all animals on that computer.

**[0205]** Telemetry Data Evaluation: Telemetry parameters, including heart rate (beats/minute), systolic pressure (mmHg), diastolic pressure (mmHg), mean arterial pressure (mmHg), and arterial pulse pressure (mmHg), were analyzed and reported. Telemetry data generated by Ponemah during the dosing phases were analyzed in 1-minute samples. Data was processed in 15-minute averages and were provided for data review. The 15-minute mean data was further averaged by binning into the following Analysis Periods:

- Period 1: 0.5 to 2 hours post-dose;
- Period 2: 2 to 4 hours post-dose;
- Period 3: 4-8 hours post-dose;
- Period 4: 8-12 hours post-dose;
- Period 5: 12-20 hours post-dose;
- Period 6: 20- 32 hours post-dose (second light cycle); and
- Period 7: 32 to 44 hours post-dose (second dark cycle).

#### *Analysis*

**[0206]** Blood pressure was measured over a 44-hour period using an implanted telemetry device. The primary outcome was systolic blood pressure.

**[0207]** Statistical analyses were conducted using all available data points, with weighting to reflect the non-uniform timing of measurements. Estimates of treatment effects were calculated using estimated differences between treatments using a mixed model (SAS 9.4, SAS Institute, Cary, NC) with a direct product autoregressive correlation structure to account for repeated measurements within individuals over time.

#### *Results*

**[0208]** Eight animals began the study; however, the telemetry transmitter failed in one animal. As a result, complete data was available from seven animals.

**[0209]** The following table shows the differences in systolic BP (mmHg) between treatments:

**Table 5.**

Comparison	Level	Estimate (95% CI)	P-value
<b>Overall difference between treatments</b>			0.0004
<b>Systolic BP (95% CI)</b>	Control	177.4 (174.4 - 180.3)	--
	Combination 1	172.1 (169.3 - 174.9)	--

Comparison	Level	Estimate (95% CI)	P-value
	Combination 2	169.0 (166.1 - 171.9)	--
	Combination 3	175.4 (172.5 - 178.3)	--
Treatment comparisons	Control vs Combination 1	-5.3 (-8.7 - 1.8)	0.0048
	Control vs Combination 2	-8.4 (-11.5 - 5.2)	<.0001
	Control vs Combination 3	-2.0 (-5.6 - 1.7)	0.2663
	Combination 1 vs Combination 2	-3.1 (-6.5 - 0.3)	0.0720
	Combination 1 vs Combination 3	3.3 (0.3 - 6.3)	0.0342
	Combination 2 vs Combination 3	6.4 (3.0 - 9.8)	0.0009

**[0210]** **FIG. 1** shows the mean systolic blood pressure (mmHg) across time periods by treatment. **FIG. 2** shows the mean diastolic blood pressure (mmHg) across time periods by treatment. **FIG. 3** shows the mean heart rate across time periods by treatment.

**[0211]** In this non-limiting example, the results demonstrated that Combination 1 produced significantly larger reductions in systolic blood pressure than Combination 3, and Combination 2 produced significantly larger reductions in systolic blood pressure than either Combination 3 or 1. These differences persisted over the full 44-hour period of observation. The results demonstrated that both Combination 1 and Combination 2 produced significantly larger reductions in systolic blood pressure than Combination 3. These differences persisted over the full 44-hour period of observation. There were similar differences between the three combinations in the reduction in DPB, and no differences between the combinations in heart rate.

**[0212]** In this non-limiting example, these results demonstrate unexpected differences between the telmisartan, amlodipine besylate, indapamide combinations and the losartan, amlodipine besylate, hydrochlorothiazide combination. Specifically, at equivalent or lower doses, the telmisartan, amlodipine besylate, and indapamide combination produced significantly larger reductions in blood pressure than the combination of losartan, amlodipine besylate, and

hydrochlorothiazide. As the amlodipine besylate dose was the same in Combination 2 and 3, the results demonstrate previously unknown differences in the effectiveness of specific angiotensin II receptor blockers and specific diuretics (such as a thiazide diuretic versus a thiazide-like diuretic) when provided in parallel with amlodipine besylate.

**Example 2: Triple Combination Composition Therapy for the Treatment of Hypertension**  
*Methods*

**[0213]** This study is a randomized, placebo-controlled, double-blind cross-over trial. The study is divided into three phases. During the first phase (4 weeks) participants are randomized (1:1) to either receive the triple combination composition therapy or Placebo. This is followed by a two week washout (placebo) and subsequently participants are crossed over to the opposite arm to receive the other treatment for four weeks. Participants are recruited from the community, predominantly through community general practices in western Sydney, Australia.

*Participants*

**[0214]** Participants are eligible if they met the following inclusion criteria: 1) adults aged 18 years and over, 2) office SBP>140mmHg and/or DBP> 90 mmHg on 2 readings on separate days; plus baseline ambulatory SBP > 135 and/or DBP >85; 3) Not on medical treatment for hypertension. Exclusion criteria included: No definite contraindication to one or more component medications in the triple combination composition; the responsible clinician felt a change in current therapy would place the patient at risk; severe or accelerated hypertension; pregnancy; inability to provide informed consent; and medical illness with anticipated life expectancy less than 3 months.

*Intervention*

**[0215]** For these studies, either the triple combination with each component at 50% of the lowest hypertension therapeutic dose (LHTD) or the triple combination with each component at 100 % of the lowest hypertension therapeutic dose (LHTD) will be tested.

**[0216]** If the study is testing the triple combination with each component at 50% of the lowest hypertension therapeutic dose (LHTD), then the test composition is as follows. The triple combination composition is a single encapsulated pill containing the three following components in the specified amounts: telmisartan 10 mg, amlodipine besylate 1.25 mg, and indapamide 0.625 mg. The placebo capsule appears identical and contains placebo tablets of similar weight to those in the triple combination composition.

**[0217]** If the study is testing the triple combination with each component at 100% of the lowest hypertension therapeutic dose (LHTD), then the test compositions is as follow. The triple combination composition is a single encapsulated pill containing the three following components in the specified amounts: telmisartan 20 mg, amlodipine besylate 2.5 mg, and

indapamide 1.25 mg. The placebo capsule appears identical and contains placebo tablets of similar weight to those in the triple combination composition.

**[0218]** Participants are administered a single pill, triple combination composition or placebo, throughout the trial. Patients are instructed to take the tablets at the same time each day and are encouraged to take this in the morning, but the time of the day (morning or evening) is at the patient's preference.

**[0219]** All trial medicines are prepared by a TGA- cGMP (Therapeutic Goods Australia – certificate of Good Manufacturing Practice) licensed manufacturing facility. If appropriate, low strength doses are obtained by halving half-strength doses using a pill splitting device, without crushing, and are weighed to ensure accuracy of halving doses. The low strength doses are then encapsulated using gelatin capsules (DBCaps- Capsugel). The capsules are stored in a cool dry place and monitored using temperature loggers, until they are dispensed.

**[0220]** Treatment allocations are blinded to both study staff and participants. In addition to the study drugs, all participants are offered education on healthier lifestyle options as recommended by guidelines for hypertension management.

#### *Randomization*

**[0221]** A computer assisted randomization sequence is generated by a statistician and supplied to the pharmaceutical packaging company. The research assistant, recruitment team, investigators are blinded to this sequence. For each patient i.e. allocated randomization number, the pills are packaged into three child-resistant packs corresponding to three phases of the study. All packs have identical appearance ensuring blinding of patient and research staff.

Subsequently the medication packs are prescribed in an organized sequence.

#### *Outcomes and data collection*

**[0222]** The primary outcome is reduction in mean 24 hour systolic blood pressure at 4 weeks using ambulatory blood pressure monitoring (ABP). The secondary outcomes include:

- a. Reduction in mean 24 hour diastolic blood pressure, and in daytime and nighttime SBP and DBP at 4 weeks
- b. Reduction in office SBP and DBP as measured by a standardized automated blood pressure cuff
- c. Proportion with controlled blood pressure at 4 weeks, defined as <135/85 mmHg 24 hour BP and <140/90 mmHg office BP
- d. Adverse events and pre-specified adverse events by laboratory parameters: Rise in transaminases (ALT/AST) more than 3x upper limit of normal or doubling if baseline levels known to be elevated; drop in estimated

glomerular filtration rate by > 20% as estimated from serum creatinine; sodium, potassium and uric acid levels

e. Assessment of acceptability and tolerability

**[0223]** Patients will undergo 24 hour ABP monitoring 4 times - baseline (off study drug), 4 weeks (on phase 1 drug), 6 weeks (on placebo), and 10 weeks (on phase 3 drug). In order to minimize inconvenience, patients are referred for ABP to a lab. The ABP units are calibrated at regular intervals by the lab according to the manufacturer's specification. To minimize variability, the follow up readings are repeated from the same collection center using the same brand device. Participants are reimbursed nominal amounts to cover travel and parking costs. Study medications and investigations are provided at no cost to participants. Office BP is recorded three times at each visit using an OMRON T9P (HEM-759-C1). The second and the third readings are averaged for study analysis. In addition at week 4 and 10 patients will undergo blood tests to assess for biochemical side effects, are administered a questionnaire for clinical side effects, and compliance is assessed by self-report and pill count. Patients will remain blinded to their treatment allocation when completing this questionnaire.

**[0224]** Drug acceptability and tolerability are also assessed at the end of the study. All adverse events are recorded. In addition, clinical adverse events possibly associated with blood pressure lowering medications: dizziness, blurred vision, syncope/ collapse, chest pain/ angina, shortness of breath, cough, wheeze, pedal oedema, skin rash, itching are specifically asked about.

**[0225]** The trial has a simplified data safety and management committee of two core members with expertise in clinical medicine, trials and statistics. A single meeting convenes when 10 patients are randomized to the trial to review safety, and the study is advised to continue.

*Statistical Considerations*

**[0226]** A sample size of 50 patients is planned to provide 90% power at  $p=0.05$  to detect a SBP difference of 12 mmHg between the intervention and control assuming a SD of the within patient difference of 12 mmHg, taking into account the possibility of a 10% loss to follow-up.

*Statistical Approach*

**[0227]** Analyses are conducted on an intention to treat basis. All tests are two-sided and the nominal level of  $\alpha$  is 5%. All statistical analyses are unadjusted for prognostic covariates. We will report compliance to the study drug using data on pills (doses) taken and missed doses over the time period.

**[0228]** A linear mixed model is used to estimate the effect of the treatment on change in blood pressure from baseline for each treatment period, according to the Kenward and Roger approach (Kenward MG, Roger JH. The use of baseline covariates in crossover studies. *Biostatistics* 2010; 11(1): 1-17.) In order to appropriately adjust for baseline levels, collected at the beginning of

each treatment period (week 0, week 6), this method uses all measurements (baseline and follow-up, in both period) as outcomes, but accounts for covariance between measurements within individuals (Liu GF, Lu K, Mogg R, Mallick M, Mehrotra DV. Should baseline be a covariate or dependent variable in analyses of change from baseline in clinical trials? *Stat Med* 2009; 28(20): 2509-30). A linear contrast between the variables denoting period (first/second), type of measurement (baseline/final), and treatment received (placebo/triple combination composition) produces an unbiased estimate of effect of the triple combination composition on change in blood pressure compared to the placebo. All available data are included in the model, no missing data is imputed. If a patient is missing data for one period, data from the available period are used. A sensitivity analysis is carried including only patients with data available from both periods to see if the effect of treatment is modified. There is also adjustment of the denominator degrees of freedom of Kenward and Roger (2009) that is optimal for smaller sample sizes (Kenward MG, Roger JH. An improved approximation to the precision of fixed effects from restricted maximum likelihood. *Computational Statistics & Data Analysis* 2009; 53(7): 2583-95).

**[0229]** Testing for carry over will use an unpaired t-test of the main outcome with order as an effect. Period effect is tested by using a paired t-test comparing the main outcome in period 1 with main outcome in period 2 from the same patient. A sensitivity analysis is also performed using normal paired t-test to compare primary outcome between different period (different treatment) from the same patient, ignoring the baseline level of each period.

**[0230]** Continuous secondary endpoints with baseline values (e.g., daytime/ night-time ambulatory SBP/DBP) are analyzed similarly to the primary endpoint. Other continuous variables without a baseline value in each period are analyzed with a paired t-test. Counts and percentages of all adverse events are reported. As a sensitivity analysis, the analyses are repeated on the complete cases (i.e. full data for each measurement period).

**[0231]** Tests for interaction of treatment effect with age ( $\leq 60$  vs.  $> 60$  years), gender, and BMI ( $\leq 30$  vs.  $< 30 \text{ kg/m}^2$ ). Subgroup analyses for each variable are also conducted. All analyses are conducted using SAS 9.4 (Cary, NC, USA) on software.

### **Example 3: Comparative Study of Low-Dose Combination Composition versus Standard Dose Monotherapy for the Treatment of Hypertension**

#### *Objectives*

**[0232]** The primary objective of this study is to investigate in a double blind randomized controlled trial whether initiating treatment with a low-dose combination therapy will lower blood pressure more effectively, and with fewer side effects, compared to initiating standard dose monotherapy as per current guidelines in patients with hypertension. The secondary

objective is to assess if this approach is safe and has fewer side effects compared to standard care.

### *Study Design*

**[0233]** This will be a 12-week double blind randomized controlled trial (1:1) of 650 patients with grade 1 and 2 essential hypertension. Subjects will be randomized through a central computer-based randomization service, to initial therapy with the triple combination composition or to an angiotensin receptor blocker (ARB), with option to add a calcium channel blocker (CCB) as required, as per current Australian Hypertension guidelines. The primary outcome will be reduction in mean systolic blood pressure using standardized automated BP cuff at 12 weeks. Secondary outcomes will include: proportion with controlled blood pressure at 6 weeks, 12 weeks, ambulatory blood pressure (ABP) measures and tolerability/ occurrence of adverse events.

### *Eligibility Criteria*

**[0234]** The inclusion criteria are as follows:

- Adults ( $\geq 18$  years)
- Treatment naïve, or currently not on treatment (not taken in last 4 weeks), or taking one BP lowering drug (angiotensin converting enzyme inhibitor, angiotensin receptor blocker, calcium channel blocker, beta-blocker, aldosterone antagonist, alpha-blocker)
- SBP 140-179 mmHg and/or DBP 90-109 mmHg documented on two occasions more than a week apart
- At least one of the measures should be documented by study staff with study automatic BP device OR recorded as daytime average SBP  $\geq 135$  mmHg and/or DBP  $\geq 85$  mmHg on 24 hour ambulatory BP monitoring
- At least one of these measures should be recent (in last 12 weeks)
- 24 hour Ambulatory BP monitoring daytime average SBP  $\geq 135$  mmHg and/or DBP  $\geq 85$  mmHg –documented within 12 weeks of randomization

The exclusion criteria are as follows:

- Contraindication to telmisartan, amlodipine, or indapamide
- Evidence of secondary cause of hypertension e.g. renal artery stenosis; Significant renal impairment (eGFR  $< 50$ ), raised serum potassium (above lab normal limit)
- Women who are pregnant, breast feeding and/ or of childbearing potential and not using medically acceptable form of contraception throughout the study (pharmacological or barrier methods)

-Concomitant illness, physical impairment or mental condition which in the opinion of the study team/ primary care physician could interfere with the conduct of the study including outcome assessments

-Participation in a concurrent interventional medical investigation or clinical trial. Patients in observational, natural history and/or epidemiological studies not involving an intervention are eligible.

-Participant's responsible primary care or other responsible physician believes it is not appropriate for participant to switch current monotherapy

-Inability or unwillingness to provide written informed consent

-Unable to complete study procedures including 24 hour Ambulatory BP

-Definite indication for combination therapy

#### *Study treatment*

**[0235]** For these studies, either the triple combination with each component at 50% of the lowest hypertension therapeutic dose (LHTD) or the triple combination with each component at 100 % of the lowest hypertension therapeutic dose (LHTD) will be tested.

**[0236]** If the study is testing the triple combination with each component at 50% of the lowest hypertension therapeutic dose (LHTD), then the test composition is as follows. Patients who meet criteria for inclusion will be randomized to: 1) A combination pill comprising the following three components- telmisartan 10 mg, amlodipine besylate 1.25 mg, and indapamide 0.625 mg; or 2) telmisartan 40 mg.

**[0237]** If the study is testing the triple combination with each component at 100% of the lowest hypertension therapeutic dose (LHTD), then the test composition is as follows. Patients who meet criteria for inclusion will be randomized to: 1) A combination pill comprising the following three components- telmisartan 20 mg, amlodipine besylate 2.5 mg, and indapamide 1.25 mg; or 2) telmisartan 40 mg.

**[0238]** Patients who are currently on monotherapy will be asked to stop their treatment while they are taking the study treatment. At 6 weeks if the BP is greater than 140/90 mmHg in either arm amlodipine besylate (5 mg) will be added by study staff.

#### *Outcomes*

**[0239]** The primary outcome will be the difference between groups in mean automated office systolic blood pressure at 12 weeks adjusted for baseline values.

**[0240]** The secondary outcomes include the following:

-The 24-hour ambulatory blood pressure measures

Difference between groups in mean 24-hour SBP and DBP at 12 weeks

Difference between groups in mean change in 24-hour SBP and DBP from 0 to 12 weeks

Difference between groups in mean daytime SBP and DBP at 12 weeks Difference between groups in mean night-time SBP and DBP at 12 weeks

Difference between groups in daytime, night-time, and 24 hour BP load (percentage area under the blood pressure curve above normal day, night, and 24 hour values as per NHFA Guide to management of hypertension 2008)

Difference between groups in the proportion of non-dippers (night-time BP is not more than 10% lower than average daytime BP as per NHFA Guide to management of hypertension 2008) and coefficient of variability of BP (O'Brien, E., G. Parati, and G. Stergiou, *Hypertension*, 2013. 62(6): p. 988-94).

-Other blood pressure measures in the triple group vs control groups:

Change in mean diastolic blood pressure from baseline to 12 weeks,

Hypertension control (% with SBP <140 mmHg and DBP <90 mmHg) at 6 and 12 weeks,

Percentage requiring step-up treatment at 6 weeks

Percentage with both BP control (as defined above) and no adverse events.

Difference between groups in SBP and DBP variability

-Tolerability

Difference between groups in potentially related side-effects (dizziness, blurred vision, syncope/collapse/ fall, chest pain/ angina, shortness of breath, cough, wheeze, ankle oedema, skin rash, itching, gout, hyperkalaemia, hypokalaemia, hyponatraemia, other)

Difference between groups in mean potassium, uric acid, blood glucose, cholesterol and fractions, ALT, AST, UACR (Urine albumin-to-creatinine ratio) and creatinine levels.

Difference between groups in participant withdrawals from treatment

#### *Statistical Methods*

**[0241]** All analyses of study outcomes will be conducted according to the principle of intention-to-treat. The primary analysis of change in systolic blood pressure (SBP) at 12 weeks will be performed using an analysis of covariance (ANCOVA) including the treatment arm and baseline SBP as a covariate. Continuous secondary outcomes will be analyzed similarly. Additional analyses will include both 6-week and 12-week measurements in a longitudinal model including treatment arm, visit, and treatment by visit interaction as well as the baseline measurement.

Within-patient correlations will be modelled using generalized estimating equations. A similar approach will be applied to binary endpoints (e.g. hypertension control) with log-binomial regression used in place of linear regression. There will also be pre-defined subgroup analyses, including by baseline blood pressure, gender, age, and hypertension treatment history. A detailed analysis plan will be developed prior to unblinding.

**Example 4: Pharmaceutical Compositions 1**

**[0242]** The following pharmaceutical compositions are prepared with the specified components and doses as shown in the following table.

**Table 6.**

Agent	Proposed Dose (mg)	Proposed Dose Range (mg)
Composition A		
Amlodipine besylate	1.25	1-1.5
Hydrochlorothiazide	6.25	5-7.5
Telmisartan	10	8-12
Ezetimibe	10	8-12
Rosuvastatin	10	8-12
Composition B		
Amlodipine besylate	1.25	1-1.5
Indapamide	0.625	0.5-0.75
Telmisartan	10	8-12
Ezetimibe	10	8-12
Rosuvastatin	10	8-12
Composition C		
Amlodipine besylate	1.25	1-1.5
Chlorthalidone	12.5	10-15
Telmisartan	10	8-12
Ezetimibe	10	8-12
Rosuvastatin	10	8-12
Composition D		
Amlodipine besylate	1.25	1-1.5
Chlorthalidone	12.5	10-15
Irbesartan	37.5	30-45
Ezetimibe	10	8-12
Rosuvastatin	10	8-12

**Example 5: Pharmaceutical Compositions 2**

**[0243]** The following pharmaceutical compositions are prepared with the specified components and doses as shown in the following table.

Table 7.

Agent	Proposed Dose (mg)	Proposed Dose Range (mg)
Composition E		
Amlodipine besylate	1.65	1.5-2
Hydrochlorothiazide	8.25	7.5-10
Irbesartan	49.5	45-60
Ezetimibe	10	8-12
Rosuvastatin	10	8-12
Composition F		
Amlodipine besylate	1.65	1.5-2
Indapamide	0.825	0.75-1.0
Irbesartan	49.5	45-60
Ezetimibe	10	8-12
Rosuvastatin	10	8-12
Composition G		
Amlodipine besylate	1.65	1.5-2
Hydrochlorothiazide	8.25	7.5-10
Telmisartan	13.2	12-16
Ezetimibe	10	8-12
Rosuvastatin	10	8-12
Composition H		
Amlodipine besylate	1.65	1.5-2
Indapamide	0.825	0.75-1.0
Telmisartan	13.2	12-16
Ezetimibe	10	8-12
Rosuvastatin	10	8-12
Composition I		
Amlodipine besylate	1.65	1.5-2
Chlorthalidone	16.5	15-20

Chlorthalidone	25	20-37.5
Irbesartan	75	60-112.5
Ezetimibe	10	8-12
Rosuvastatin	10	8-12

**Example 7: Comparative Study of Low-Dose Combination Composition versus Standard Dose Monotherapy and Placebo to Assess Effects on Blood Pressure and Cholesterol in Subjects with Migraine**

**Objectives**

**[0245]** To investigate in a double blind randomized factorial trial whether treatment with low-dose combination BP and cholesterol lowering therapy will reduce BP and LDL levels, and to determine the safety of the interventions among participating subjects.

**Study Design:** A 12-week double blind randomized controlled 3x3 factorial trial in participants with migraine: participants were randomized to BP arm (low-dose telmisartan, amlodipine, indapamide vs standard dose propranolol vs. placebo) and a cholesterol lowering arm (low-dose rosuvastatin and ezetimibe vs. simvastatin vs. placebo). There was a 4 week screening period and another 4-week post study drug observational period.

**Eligibility Criteria**

**[0246]** The inclusion criteria were as follows:

- Migraine headache (with or without typical aura) according to the IHS ICHD-3 diagnostic criteria ICHD 3b
- 2-14 days per month with migraine headache averaged over past 3 months (90-days), as self-reported by subject
- Migraine symptoms must have been present for  $\geq 1$  year prior to enrolment in the study.
- Onset of migraine symptoms must have occurred before the age of 50 years
- Adults between 18 and 65 years
- Office SBP  $\geq 120$  mmHg and/or DBP  $\geq 75$  mmHg (average of 2<sup>nd</sup> and 3<sup>rd</sup> readings)
- No definite contraindications to any of the study medications at the doses used in this trial. (Subjects could be taking other preventive and therapeutic medications as long as they did not contraindicate study medication. Patients were be eligible if they are taking medications from the same class as the study treatments.)
- Is medically stable as determined by the Study Investigator
- If taking any concomitant migraine preventative medication(s), is on a stabilised dosage at the discretion of the Investigator
- Is willing to stay on current migraine preventative medication(s) for the duration of the study
- Is able to take oral medication, adhere to the medication regimens, and perform study procedures over the study duration.

[0247] The Exclusion criteria were as follows:

- Contraindication to any of telmisartan, amlodipine, indapamide, rosuvastatin, ezetimibe, simvastatin or propranolol
- Concomitantly taking an angiotensin receptor blocker, angiotensin converting enzyme inhibitor, calcium channel blocker, diuretic or statin.
- Definite indication to any one or more of the study medications
- Subject has history of cluster headaches
- Subject who exclusively has migraine aura without headache, migraine with brainstem aura, hemiplegic migraine or chronic migraine
- Medication overuse headaches according to IHS criteria
- Female patients who are pregnant, nursing, or those not using adequate birth control, if capable of bearing children.
- Chronic medical illnesses (e.g., lupus) that could potentially affect frequency of headache as determined by the Study Investigator
- Alcohol or substance abuse within the last year

- Any concurrent medical or psychiatric condition which, in the investigator's judgment, may interfere with study conduct or which contraindicates participation
- Abnormal creatinine or electrolytes on screening.
- Inability to provide informed consent.
- Treatment for migraine with botulinum toxin injections or nerve stimulation in the past three months
- Participation in an interventional medical investigation or clinical trial currently or within the past 3 months. Subjects in observational, natural history and/or epidemiological studies not involving an intervention are eligible.

**[0248] Study Design:** A 12-week double blind randomized controlled 3x3 factorial trial: participants were randomized to BP arm (low-dose telmisartan, amlodipine, indapamide vs standard dose propranolol vs placebo) and a cholesterol lowering arm (low-dose rosuvastatin and ezetimibe vs simvastatin vs placebo). There was a 4-week screening period and another 4-week post study drug observational period.

**Table 9.**

<b>Group</b>	<b>BP Arm</b>	<b>Cholesterol Arm</b>
1	Low-dose BP lowering combination	Low-dose cholesterol lowering combination
2	Low-dose BP lowering combination	Simvastatin
3	Low-dose BP lowering combination	Placebo
4	Propranolol	Low-dose cholesterol lowering combination
5	Propranolol	Simvastatin
6	Propranolol	Placebo
7	Placebo	Low-dose cholesterol lowering combination
8	Placebo	Simvastatin
9	Placebo	Placebo

**[0249]** Participants were randomly assigned to BP arm (low-dose telmisartan, amlodipine, indapamide vs standard dose propranolol vs placebo) and a cholesterol arm (low-dose rosuvastatin and ezetimibe vs simvastatin vs placebo) with allocation by a computer-generated randomization schedule. Group 1 received the low-dose BP lowering combination and low-dose cholesterol lowering combination (i.e., telmisartan 20 mg + amlodipine 2.5 mg + indapamide

1.25 mg + rosuvastatin 10 mg + ezetimibe 10 mg (Composition N)). Group 2 received the low-dose BP lowering combination and simvastatin (i.e., telmisartan 20 mg + amlodipine 2.5 mg + simvastatin). Group 3 received the low-dose BP lowering combination and placebo (i.e., telmisartan 20 mg + amlodipine 2.5 mg + placebo). Group 4 received the low-dose cholesterol lowering combination and propranolol (i.e., rosuvastatin 10 mg + ezetimibe 10 mg + propranolol). Group 5 received propranolol + simvastatin. Group 6 received propranolol + placebo. Group 7 received the low-dose cholesterol lowering combination and placebo (i.e., rosuvastatin 10 mg + ezetimibe 10 mg + placebo). Group 8 received placebo + simvastatin. Group 9 received double placebo.

**[0250]** The randomization allocation was blinded to all participants and study team members except the primary study statistician and the manufacturer of the investigational products. All individual medications were over-encapsulated and concealed by identical packaging, labelling and administration scheduling.

**[0251]** *Study treatment*

**[0252]** Low-dose BP lowering combination = telmisartan 20 mg + amlodipine 2.5 mg + indapamide 1.25 mg once per day

**[0253]** Low-dose cholesterol lowering combination = rosuvastatin 10 mg + ezetimibe 10 mg once per day

**[0254]** Propranolol dose = 160 mg/day once per day

**[0255]** Simvastatin dose = 20 mg/day once per day

*Outcomes*

**[0256]** **Blood pressure and cholesterol outcomes:**

1. Change in DBP and SBP
2. Change in LDL

**[0257]** **Secondary Outcomes:**

1. Tolerability:
  - a. Difference between groups in potentially related side-effects (dizziness, blurred vision, syncope/ collapse/ fall, ankle edema, skin rash, itching, gout, hyperkalemia, hypokalemia, hyponatremia, myalgia, insomnia, nightmares, rebound hypertension)
  - b. Difference between groups in participant withdrawals from treatment
2. Safety: Percentage with any severe adverse event (SAE)
3. Medication adherence: self-reported measures, pill counts

**BP Measurement:**

**[0258]** Office BP was measured following the recommendations of the Australian National Heart Foundation. Participants were rested in the seated position for 5 minutes, an appropriate cuff size was selected and 3 measurements of BP were recorded using an Omron HEM907 monitor or equivalent validated automated digital BP monitor. Principles of automated office BP measurements were applied whereby the patient was left alone during BP recording.

**Laboratory Tests:**

**[0259]** Potassium (K<sup>+</sup>), sodium (Na<sup>+</sup>), serum creatinine and LDL were measured at screening and at the 12-week end of treatment follow-up visit.

**Safety:**

**[0260]** All participants reported SAEs and adverse events of special interest (AESI) from the time of informed consent until the end of the follow-up period and reported in the case report. AESIs included:

- Dizziness
- Hypotension
- Pedal Edema
- Headache
- Muscle cramps
- Bradycardia
- Flushing
- Hypersensitivity reactions (skin rashes, itching)
- Gastrointestinal complaints
- Myalgia
- Syncope/Collapse/Fall
- Gout
- Insomnia
- Nightmares
- Rebound hypertension
- Chest tightness/pain
- Tremor/shaking
- Irregular heartbeat/tachycardia

**Statistical Methods**

**[0261]** Statistical & Analytical Plans

**[0262]** All analyses of study outcomes were conducted according to the principle of intention-to-treat. The analyses of continuous outcomes such SBP and LDL- cholesterol at 12 weeks was performed using ANCOVA including the treatment arm and baseline values as a covariate. Additional analyses included interim measurements in a longitudinal model including treatment arm, visit, and treatment by visit interaction as well as the baseline measurement. Within-patient correlations were modelled using generalized estimating equations. A similar approach was applied to binary endpoints with log-binomial regression used in place of linear regression. There were also pre-defined subgroup analyses, baseline BP, baseline LDL, gender and age.

**[0263]** Determination of Sample Size

**[0264]** With 60 participants randomized to each BP lowering arm, and 60 to each LDL-lowering arm, the study had an 80% power at  $p=0.05$  to detect a 7mmHg SBP difference between each arm, assuming an SD of 13; and 80% power at  $p=0.05$  to detect a 0.5mmol/l LDL difference, assuming an SD of 0.7 mmol/l. Given challenges with recruitment, the full sample size was not achieved

**Table 10.** Disposition of Participants

	Number of Participants			
Run-In	44			
Randomized	30			
	BP ARM	No.	CHOLESTEROL ARM	No.
	BP lowering combination	9	Cholesterol lowering combination	10
	Propranolol	10	Simvastatin	9
	Placebo*	11	Placebo*	11

\*One patient discontinued the study at week 4. This patient was in the BP and cholesterol placebo arms. Remaining 29 participants completed the study.

## Results

## [0266] Additional Embodiments

[0267] Embodiments include the following Embodiments 1 to 161.

[0268] Embodiment 1. A pharmaceutical composition, comprising:

- (a) an angiotensin II receptor blocker;
- (b) a diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each (a), (b), and (c) is from about 40% to about 80% of the lowest hypertension therapeutic dose (LHTD) for each of the (a), (b), and (c), and wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent.

[0269] Embodiment 2. The pharmaceutical composition of Embodiment 1, wherein the pharmaceutical composition comprises a blood pressure lowering combination of blood pressure

lowering active agents, wherein the blood pressure lowering active agents consist of an angiotensin II receptor blocker, a diuretic, and a calcium channel blocker.

**[0270]** Embodiment 3. The pharmaceutical composition of Embodiment 1 or 2, wherein the pharmaceutical composition is essentially free of an angiotensin-converting enzyme inhibitor, or a pharmaceutically acceptable salt thereof.

**[0271]** Embodiment 4. The pharmaceutical composition of any one of Embodiments 1-3, wherein the pharmaceutical composition is essentially free of a beta-blocker, or a pharmaceutically acceptable salt thereof.

**[0272]** Embodiment 5. The pharmaceutical composition of any one of Embodiments 1-4, wherein the pharmaceutical composition is essentially free of platelet function-altering agent, a serum homocysteine-lowering agent, or a combination thereof.

**[0273]** Embodiment 9. The pharmaceutical composition of Embodiment 5, wherein the pharmaceutical composition is essentially free of a platelet function-altering agent.

**[0274]** Embodiment 10. The pharmaceutical composition of Embodiment 9, wherein the platelet function-altering agent is aspirin, ticlopidine, dipyridamole, clopidogrel, abciximab, or ibuprofen.

**[0275]** Embodiment 11. The pharmaceutical composition of Embodiment 9 or 10, wherein the platelet function-altering agent is aspirin.

**[0276]** Embodiment 12. The pharmaceutical composition of Embodiment 5, wherein the pharmaceutical composition is essentially free of a serum homocysteine-lowering agent.

**[0277]** Embodiment 13. The pharmaceutical composition of Embodiment 12, wherein the serum homocysteine-lowering agent is folic acid, vitamin B6, vitamin B12, or a combination thereof.

**[0278]** Embodiment 14. The pharmaceutical composition of Embodiment 12 or 13, wherein the serum homocysteine-lowering agent is folic acid.

**[0279]** Embodiment 15. The pharmaceutical composition of any one of Embodiments 1-14, wherein the diuretic is a thiazide diuretic.

**[0280]** Embodiment 16. The pharmaceutical composition of Embodiment 15, wherein the thiazide diuretic is altizide, bendroflumethiazide, chlorothiazide, cyclopenthiazide, cyclothiazide, epitizide, hydrochlorothiazide, hydroflumethiazide, mebutizide, methyclothiazide, polythiazide, trichlormethiazide, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0281]** Embodiment 17. The pharmaceutical composition of Embodiment 16, wherein the thiazide diuretic is hydrochlorothiazide.

**[0282]** Embodiment 18. The pharmaceutical composition of any one of Embodiments 1-14, wherein the diuretic is a thiazide-like diuretic.

**[0283]** Embodiment 19. The pharmaceutical composition of Embodiment 18, wherein the thiazide-like diuretic is quinethazone, clopamide, chlorthalidone, mefruside, clofenamide, metolazone, meticrane, xipamide, indapamide, clorexolone, fenquizone, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0284]** Embodiment 20. The pharmaceutical composition of Embodiment 19, wherein the thiazide-like diuretic is indapamide or a hydrate thereof.

**[0285]** Embodiment 21. The pharmaceutical composition of Embodiment 20, wherein the thiazide-like diuretic is indapamide.

**[0286]** Embodiment 22. The pharmaceutical composition of Embodiment 19, wherein the thiazide-like diuretic is chlorthalidone.

**[0287]** Embodiment 23. The pharmaceutical composition of any one of Embodiments 1-14, wherein the diuretic is a loop diuretic.

**[0288]** Embodiment 24. The pharmaceutical composition of Embodiment 23, wherein the loop diuretic is furosemide, bumetanide, etacrynic acid, etozolin, muzolimine, ozolinone, piretanide, tienilic acid, torasemide, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0289]** Embodiment 25. The pharmaceutical composition of any one of Embodiments 1-14, wherein the diuretic is dichlorphenamide, amiloride, pamabrom, mannitol, acetazolamide, methazolamide, spironolactone, triamterene, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0290]** Embodiment 26. The pharmaceutical composition of any one of Embodiments 1-25, wherein the calcium channel blocker is amlodipine, nifedipine, diltiazem, nimodipine, verapamil, isradipine, felodipine, nicardipine, nisoldipine, clevidipine, dihydropyridine, lercanidipine, nitrendipine, cilnidipine, manidipine, mibepridil, bepridil, barnidipine, nilvadipine, gallopamil, lidoflazine, aranidipine, dotarizine, diproteverine, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0291]** Embodiment 27. The pharmaceutical composition of Embodiment 26, wherein the calcium channel blocker is amlodipine, or a pharmaceutically acceptable salt thereof.

**[0292]** Embodiment 28. The pharmaceutical composition of Embodiment 27, wherein the calcium channel blocker is amlodipine besylate.

**[0293]** Embodiment 29. The pharmaceutical composition of any one of Embodiments 1-28, wherein the angiotensin II receptor blocker is irbesartan, telmisartan, valsartan, candesartan, eprosartan, olmesartan, azilsartan, losartan, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0294]** Embodiment 30. The pharmaceutical composition of Embodiment 29, wherein the angiotensin II receptor blocker is irbesartan.

**[0295]** Embodiment 31. The pharmaceutical composition of Embodiment 29, wherein the angiotensin II receptor blocker is telmisartan.

**[0296]** Embodiment 32. The pharmaceutical composition of any one of Embodiments 1-31, wherein the dose of each (a), (b), and (c) is from about 40% to about 60% of the lowest hypertension therapeutic dose (LHTD).

**[0297]** Embodiment 33. The pharmaceutical composition of Embodiment 32, wherein the diuretic is a thiazide diuretic, and the dose of the thiazide diuretic is about 50% of the lowest hypertension therapeutic dose (LHTD) for the thiazide diuretic.

**[0298]** Embodiment 34. The pharmaceutical composition of Embodiment 33, wherein the thiazide diuretic is hydrochlorothiazide, and the dose of the hydrochlorothiazide is about 6.25 mg.

**[0299]** Embodiment 35. The pharmaceutical composition of Embodiment 32, wherein the diuretic is a thiazide-like, and the dose of the thiazide-like diuretic is about 50% of the lowest hypertension therapeutic dose (LHTD) for the thiazide-like diuretic.

**[0300]** Embodiment 36. The pharmaceutical composition of Embodiment 35, wherein the thiazide-like diuretic is indapamide, and the dose of the indapamide is about 0.625 mg.

**[0301]** Embodiment 37. The pharmaceutical composition of Embodiment 35, wherein the thiazide-like diuretic is chlorthalidone, and the dose of the chlorthalidone is about 12.5 mg.

**[0302]** Embodiment 38. The pharmaceutical composition of Embodiment 32, wherein the diuretic is a loop diuretic, and the dose of the loop diuretic is about 50% of the lowest hypertension therapeutic dose (LHTD) for the loop-diuretic.

**[0303]** Embodiment 39. The pharmaceutical composition of any one of Embodiments 1-38, wherein the dose of the calcium channel blocker is about 50% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0304]** Embodiment 40. The pharmaceutical composition of Embodiment 39, wherein the calcium channel blocker is amlodipine besylate, and the dose of amlodipine besylate is about 1.25 mg.

**[0305]** Embodiment 41. The pharmaceutical composition of any one of Embodiments 1-40, wherein the dose of the angiotensin II receptor blocker is about 50% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0306]** Embodiment 42. The pharmaceutical composition of Embodiment 41, wherein the angiotensin II receptor blocker is irbesartan, and dose of the irbesartan is about 37.5 mg.

**[0307]** Embodiment 43. The pharmaceutical composition of Embodiment 41, wherein the angiotensin II receptor blocker is telmisartan, and the dose of the telmisartan is about 10 mg.

**[0308]** Embodiment 44. The pharmaceutical composition of Embodiment 32, wherein the angiotensin II receptor blocker is irbesartan, the diuretic is hydrochlorothiazide, and the calcium channel blocker is amlodipine besylate.

**[0309]** Embodiment 45. The pharmaceutical composition of Embodiment 44, wherein the dose of irbesartan is from about 30 mg to about 45 mg, the dose of hydrochlorothiazide is from about 5 mg to about 7.5 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg.

**[0310]** Embodiment 46. The pharmaceutical composition of Embodiment 45, wherein the dose of irbesartan is about 37.5 mg, the dose of hydrochlorothiazide is about 6.25 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0311]** Embodiment 47. The pharmaceutical composition of Embodiment 32, wherein the angiotensin II receptor blocker is telmisartan, the diuretic is hydrochlorothiazide, and the calcium channel blocker is amlodipine besylate.

**[0312]** Embodiment 48. The pharmaceutical composition of Embodiment 47, wherein the dose of telmisartan is from about 8 mg to about 12 mg, the dose of hydrochlorothiazide is from about 5 mg to about 7.5 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg.

**[0313]** Embodiment 49. The pharmaceutical composition of Embodiment 48, wherein the dose of telmisartan is about 10 mg, the dose of hydrochlorothiazide is about 6.25 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0314]** Embodiment 50. The pharmaceutical composition of Embodiment 32, wherein the angiotensin II receptor blocker is irbesartan, the diuretic is indapamide, and the calcium channel blocker is amlodipine besylate.

**[0315]** Embodiment 51. The pharmaceutical composition of Embodiment 50, wherein the dose of irbesartan is from about 30 mg to about 45 mg, the dose of indapamide is from about 0.5 mg to about 0.75 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg.

**[0316]** Embodiment 52. The pharmaceutical composition of Embodiment 51, wherein the dose of irbesartan is about 37.5 mg, the dose of indapamide is about 0.625 mg, and the dose of amlodipine is about 1.25 mg.

**[0317]** Embodiment 53. The pharmaceutical composition of Embodiment 32, wherein the angiotensin II receptor blocker is telmisartan, the diuretic is indapamide, and the calcium channel blocker is amlodipine besylate.

**[0318]** Embodiment 54. The pharmaceutical composition of Embodiment 53, wherein the dose of telmisartan is from about 8 mg to about 12 mg, the dose of indapamide is from about 0.5 mg to about 0.75 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg.

**[0319]** Embodiment 55. The pharmaceutical composition of Embodiment 54, wherein the dose of telmisartan is about 10 mg, the dose of indapamide is about 0.625 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0320]** Embodiment 56. The pharmaceutical composition of Embodiment 32, wherein the angiotensin II receptor blocker is telmisartan, the diuretic is chlorthalidone, and the calcium channel blocker is amlodipine besylate.

**[0321]** Embodiment 57. The pharmaceutical composition of Embodiment 56, wherein the dose of telmisartan is from about 8 mg to about 12 mg, the dose of chlorthalidone is from about 10 mg to about 15 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg.

**[0322]** Embodiment 58. The pharmaceutical composition of Embodiment 57, wherein the dose of telmisartan is about 10 mg, the dose of chlorthalidone is about 12.5 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0323]** Embodiment 59. The pharmaceutical composition of Embodiment 32, wherein the angiotensin II receptor blocker is irbesartan, the diuretic is chlorthalidone, and the calcium channel blocker is amlodipine besylate.

**[0324]** Embodiment 60. The pharmaceutical composition of Embodiment 59, wherein the dose of irbesartan is from about 30 mg to about 45 mg, the dose of chlorthalidone is from about 10 mg to about 15 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg.

**[0325]** Embodiment 61. The pharmaceutical composition of Embodiment 60, wherein the dose of irbesartan is about 37.5 mg, the dose of chlorthalidone is about 12.5 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0326]** Embodiment 62. The pharmaceutical composition of any one of Embodiments 1-31, wherein the dose of each (a), (b), and (c) is from about 60% to about 80% of the lowest hypertension therapeutic dose (LHTD).

**[0327]** Embodiment 63. The pharmaceutical composition of Embodiment 62, wherein the diuretic is thiazide diuretic, and dose of the thiazide diuretic is about 66% of the lowest hypertension therapeutic dose (LHTD) for the thiazide diuretic.

**[0328]** Embodiment 64. The pharmaceutical composition of Embodiment 63, wherein the thiazide diuretic is hydrochlorothiazide, and the dose of the hydrochlorothiazide is about 8.25 mg.

**[0329]** Embodiment 65. The pharmaceutical composition of Embodiment 62, wherein the diuretic is a thiazide-like diuretic, and dose of the thiazide-like diuretic is about 66% of the lowest hypertension therapeutic dose (LHTD) for the thiazide-like diuretic.

**[0330]** Embodiment 66. The pharmaceutical composition of Embodiment 65, wherein the thiazide-like diuretic is indapamide, and the dose of the indapamide is about 0.825 mg.

**[0331]** Embodiment 67. The pharmaceutical composition of Embodiment 65, wherein the thiazide-like diuretic is chlorthalidone, and the dose of the chlorthalidone is about 16.5 mg.

**[0332]** Embodiment 68. The pharmaceutical composition of Embodiment 62, wherein the diuretic is loop diuretic, and the dose of the loop diuretic is about 66% of the lowest hypertension therapeutic dose (LHTD) for the loop-diuretic.

**[0333]** Embodiment 69. The pharmaceutical composition of any one of Embodiments 62-68, wherein the dose of the calcium channel blocker is about 66% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0334]** Embodiment 70. The pharmaceutical composition of Embodiment 69, wherein the calcium channel blocker is amlodipine besylate and dose of amlodipine besylate is about 1.65 mg.

**[0335]** Embodiment 71. The pharmaceutical composition of any one of Embodiments 62-70, wherein the dose of the angiotensin II receptor blocker is about 66% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0336]** Embodiment 72. The pharmaceutical composition of Embodiment 71, wherein the angiotensin II receptor blocker is irbesartan, and dose of the irbesartan is about 49.5 mg.

**[0337]** Embodiment 73. The pharmaceutical composition of Embodiment 71, wherein the angiotensin II receptor blocker is telmisartan, and the dose of the telmisartan is about 13.2 mg.

**[0338]** Embodiment 74. The pharmaceutical composition of Embodiment 62, wherein the angiotensin II receptor blocker is irbesartan, the diuretic is hydrochlorothiazide, and the calcium channel blocker is amlodipine besylate.

**[0339]** Embodiment 75. The pharmaceutical composition of Embodiment 74, wherein the dose of irbesartan is from about 45 mg to about 60 mg, the dose of hydrochlorothiazide is from about 7.5 mg to about 10 mg, and the dose of amlodipine besylate is from about 1.5 mg to about 2 mg.

**[0340]** Embodiment 76. The pharmaceutical composition of Embodiment 75, wherein the dose of irbesartan is about 49.5 mg, the dose of hydrochlorothiazide is about 8.25 mg, and the dose of amlodipine besylate is about 1.65 mg.

**[0341]** Embodiment 77. The pharmaceutical composition of Embodiment 62, wherein the angiotensin II receptor blocker is telmisartan, the diuretic is hydrochlorothiazide, and the calcium channel blocker is amlodipine besylate.

**[0342]** Embodiment 78. The pharmaceutical composition of Embodiment 77, wherein the dose of telmisartan is from about 12 mg to about 16 mg, the dose of hydrochlorothiazide is from about 7.5 mg to about 10 mg, and the dose of amlodipine besylate is from about 1.5 mg to about 2 mg.

**[0343]** Embodiment 79. The pharmaceutical composition of Embodiment 78, wherein the dose of telmisartan is about 13.2 mg, the dose of hydrochlorothiazide is about 8.25 mg, and the dose of amlodipine besylate is about 1.65 mg.

**[0344]** Embodiment 80. The pharmaceutical composition of Embodiment 62, wherein the angiotensin II receptor blocker is irbesartan, the diuretic is indapamide, and the calcium channel blocker is amlodipine besylate.

**[0345]** Embodiment 81. The pharmaceutical composition of Embodiment 80, wherein the dose of irbesartan is from about 45 mg to about 60 mg, the dose of indapamide is from about 0.75 mg to about 1.0 mg, and the dose of amlodipine besylate is from about 1.5 mg to about 2 mg.

**[0346]** Embodiment 82. The pharmaceutical composition of Embodiment 81, wherein the dose of irbesartan is about 49.5 mg, the dose of indapamide is about 0.825 mg, and the dose of amlodipine is about 1.65 mg.

**[0347]** Embodiment 83. The pharmaceutical composition of Embodiment 62, wherein the angiotensin II receptor blocker is telmisartan, the diuretic is indapamide, and the calcium channel blocker is amlodipine besylate.

**[0348]** Embodiment 84. The pharmaceutical composition of Embodiment 83, wherein the dose of telmisartan is from about 12 mg to about 16 mg, the dose of indapamide is from about 0.75 mg to about 1.0 mg, and the dose of amlodipine besylate is from about 1.5 mg to about 2 mg.

**[0349]** Embodiment 85. The pharmaceutical composition of Embodiment 84, wherein the dose of telmisartan is about 13.2 mg, the dose of indapamide is about 0.825 mg, and the dose of amlodipine besylate is about 1.65 mg.

**[0350]** Embodiment 86. The pharmaceutical composition of Embodiment 62, wherein the angiotensin II receptor blocker is telmisartan, the diuretic is chlorthalidone, and the calcium channel blocker is amlodipine besylate.

**[0351]** Embodiment 87. The pharmaceutical composition of Embodiment 86, wherein the dose of telmisartan is from about 12 mg to about 16 mg, the dose of chlorthalidone is from about 15 mg to about 20 mg, and the dose of amlodipine besylate is from about 1.5 mg to about 2 mg.

**[0352]** Embodiment 88. The pharmaceutical composition of Embodiment 87, wherein the dose of telmisartan is about 13.2 mg, the dose of chlorthalidone is about 16.5 mg, and the dose of amlodipine besylate is about 1.65 mg.

**[0353]** Embodiment 89. The pharmaceutical composition of Embodiment 62, wherein the angiotensin II receptor blocker is irbesartan, the diuretic is chlorthalidone, and the calcium channel blocker is amlodipine besylate.

**[0354]** Embodiment 90. The pharmaceutical composition of Embodiment 89, wherein the dose of irbesartan is from about 45 mg to about 60 mg, the dose of chlorthalidone is from about 15 mg to about 20 mg, and the dose of amlodipine besylate is from about 1.5 mg to about 2 mg.

**[0355]** Embodiment 91. The pharmaceutical composition of Embodiment 90, wherein the dose of irbesartan is about 49.5 mg, the dose of chlorthalidone is about 16.5 mg, and the dose of amlodipine besylate is about 1.65 mg.

**[0356]** Embodiment 92. The pharmaceutical composition of any one of Embodiments 1-91, wherein the dose of any one of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker.

**[0357]** Embodiment 93. The pharmaceutical composition of Embodiment 92, wherein the dose of the angiotensin II receptor blocker is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0358]** Embodiment 94. The pharmaceutical composition of Embodiment 92, wherein the dose of the diuretic is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the diuretic.

**[0359]** Embodiment 95. The pharmaceutical composition of Embodiment 92, wherein the dose of the calcium channel blocker is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0360]** Embodiment 96. The pharmaceutical composition of any one of Embodiments 92-95, wherein the dose of any one of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker.

**[0361]** Embodiment 97. The pharmaceutical composition of Embodiment 96, wherein the dose of the angiotensin II receptor blocker is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0362]** Embodiment 98. The pharmaceutical composition of Embodiment 97, wherein the dose of the angiotensin II receptor blocker is substituted with about 100% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0363]** Embodiment 99. The pharmaceutical composition of Embodiment 98, wherein the dose of the diuretic is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the diuretic.

**[0364]** Embodiment 100. The pharmaceutical composition of Embodiment 99, wherein the dose of the diuretic is substituted with about 100% of the lowest hypertension therapeutic dose (LHTD) for the diuretic.

**[0365]** Embodiment 101. The pharmaceutical composition of Embodiment 96, wherein the dose of the calcium channel blocker is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0366]** Embodiment 102. The pharmaceutical composition of Embodiment 101, wherein the dose of the calcium channel blocker is substituted with about 100% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0367]** Embodiment 103. The pharmaceutical composition of any one of Embodiments 92-95, wherein the dose of any one of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker.

**[0368]** Embodiment 104. The pharmaceutical composition of Embodiment 103, wherein the dose of the angiotensin II receptor blocker is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0369]** Embodiment 105. The pharmaceutical composition of Embodiment 104, wherein the dose of the angiotensin II receptor blocker is substituted with about 200% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0370]** Embodiment 106. The pharmaceutical composition of Embodiment 103, wherein the dose of the diuretic is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the diuretic.

**[0371]** Embodiment 107. The pharmaceutical composition of Embodiment 106, wherein the dose of the diuretic is substituted with about 200% of the lowest hypertension therapeutic dose (LHTD) for the diuretic.

**[0372]** Embodiment 108. The pharmaceutical composition of Embodiment 103, wherein the dose of the calcium channel blocker is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0373]** Embodiment 109. The pharmaceutical composition of any Embodiment 108, wherein the dose of the calcium channel blocker is substituted with about 200% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0374]** Embodiment 110. The pharmaceutical composition of any one of Embodiments 1-91, wherein the dose of any two of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is substituted with from about 80% to about 250% of the lowest hypertension

therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker.

**[0375]** Embodiment 111. The pharmaceutical composition of Embodiment 110, wherein the dose of the angiotensin II receptor blocker is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0376]** Embodiment 112. The pharmaceutical composition of Embodiment 110, wherein the dose of the diuretic is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the diuretic.

**[0377]** Embodiment 113. The pharmaceutical composition of Embodiment 110, wherein the dose of the calcium channel blocker is substituted with from about 80% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0378]** Embodiment 114. The pharmaceutical composition of any one of Embodiments 110-113, wherein the dose of any two of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker.

**[0379]** Embodiment 115. The pharmaceutical composition of Embodiment 114, wherein the dose of the angiotensin II receptor blocker is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0380]** Embodiment 116. The pharmaceutical composition of Embodiment 115, wherein the dose of the angiotensin II receptor blocker is substituted with about 100% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0381]** Embodiment 117. The pharmaceutical composition of Embodiment 114, wherein the dose of the diuretic is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the diuretic.

**[0382]** Embodiment 118. The pharmaceutical composition of Embodiment 117, wherein the dose of the diuretic is substituted with about 100% of the lowest hypertension therapeutic dose (LHTD) for the diuretic.

**[0383]** Embodiment 119. The pharmaceutical composition of Embodiment 114, wherein the dose of the calcium channel blocker is substituted with from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0384]** Embodiment 120. The pharmaceutical composition of Embodiment 119, wherein the dose of the calcium channel blocker is substituted with about 100% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0385]** Embodiment 121. The pharmaceutical composition of any one of Embodiments 110-113, wherein the dose of any two of the angiotensin II receptor blocker, the diuretic, and the calcium channel blocker is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker, the diuretic, or the calcium channel blocker.

**[0386]** Embodiment 122. The pharmaceutical composition of Embodiment 121, wherein the dose of the angiotensin II receptor blocker is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0387]** Embodiment 123. The pharmaceutical composition of Embodiment 122, wherein the dose of the angiotensin II receptor blocker is substituted with about 200% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0388]** Embodiment 124. The pharmaceutical composition of Embodiment 121, wherein the dose of the diuretic is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the diuretic.

**[0389]** Embodiment 125. The pharmaceutical composition of Embodiment 124, wherein the dose of the diuretic is substituted with about 200% of the lowest hypertension therapeutic dose (LHTD) for the diuretic.

**[0390]** Embodiment 126. The pharmaceutical composition of Embodiment 121, wherein the dose of the calcium channel blocker is substituted with from about 150% to about 250% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0391]** Embodiment 127. The pharmaceutical composition of any Embodiment 126, wherein the dose of the calcium channel blocker is substituted with about 200% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0392]** Embodiment 128: A pharmaceutical composition, comprising:

- (a) telmisartan;
- (b) a thiazide-like diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each (a), (b), and (c) is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD), and wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent.

**[0393]** Embodiment 129: The pharmaceutical composition of Embodiment 128, wherein the pharmaceutical composition is essentially free of an angiotensin-converting enzyme inhibitor or a pharmaceutically acceptable salt thereof, a beta-blocker or a pharmaceutically acceptable salt thereof, platelet function-altering agent, a serum homocysteine-lowering agent, or a combination thereof.

**[0394]** Embodiment 130: The pharmaceutical composition of Embodiment 128 or 129, wherein the thiazide-like diuretic is quinethazone, clopamide, chlorthalidone, mefruside, clofenamide, metolazone, meticrane, xipamide, indapamide, clorexolone, fenquizone, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0395]** Embodiment 131: The pharmaceutical composition of Embodiment 130, wherein the thiazide-like diuretic is indapamide or a hydrate thereof.

**[0396]** Embodiment 132: The pharmaceutical composition of Embodiment 131, wherein the thiazide-like diuretic is indapamide.

**[0397]** Embodiment 133: The pharmaceutical composition of any one of Embodiments 128-132, wherein the calcium channel blocker is amlodipine, nifedipine, diltiazem, nimodipine, verapamil, isradipine, felodipine, nicardipine, nisoldipine, clevidipine, dihydropyridine, lercanidipine, nitrendipine, cilnidipine, manidipine, mibefradil, bepridil, barnidipine, nilvadipine, gallopamil, lidoflazine, aranidipine, dotarizine, diproteverine, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0398]** Embodiment 134: The pharmaceutical composition of Embodiment 133, wherein the calcium channel blocker is amlodipine or a pharmaceutically acceptable salt thereof.

**[0399]** Embodiment 135: The pharmaceutical composition of Embodiment 134, wherein the calcium channel blocker is amlodipine besylate.

**[0400]** Embodiment 136: The pharmaceutical composition of any one of Embodiments 128-135, wherein the dose of each (a), (b), and (c) is from about 80% to about 120% of the lowest hypertension therapeutic dose (LHTD).

**[0401]** Embodiment 137: The pharmaceutical composition of any one of Embodiments 128-136, wherein the dose of the thiazide-like diuretic is about 100% of the lowest hypertension therapeutic dose (LHTD) for the thiazide-like diuretic.

**[0402]** Embodiment 138: The pharmaceutical composition of Embodiment 137, wherein the thiazide-like diuretic is indapamide, and the dose of the indapamide is about 1.25 mg.

**[0403]** Embodiment 139: The pharmaceutical composition of any one of Embodiments 128-138, wherein the dose of the calcium channel blocker is about 100% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0404]** Embodiment 140: The pharmaceutical composition of Embodiment 139, wherein the calcium channel blocker is amlodipine besylate, and the dose of amlodipine besylate is about 2.5 mg.

**[0405]** Embodiment 141: The pharmaceutical composition of any one of Embodiments 128-139, wherein the dose of the angiotensin II receptor blocker is about 100% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0406]** Embodiment 142: The pharmaceutical composition of any one of Embodiments 128-140, wherein the angiotensin II receptor blocker is telmisartan and the dose of the telmisartan is about 100% of the lowest hypertension therapeutic dose (LHTD) for telmisartan.

**[0407]** Embodiment 143: The pharmaceutical composition of Embodiment 142, wherein the dose of the telmisartan is about 20 mg.

**[0408]** Embodiment 144: The pharmaceutical composition of Embodiment 136, wherein the thiazide-like diuretic is indapamide the calcium channel blocker is amlodipine besylate, and the angiotensin II receptor blocker is telmisartan.

**[0409]** Embodiment 145: The pharmaceutical composition of Embodiment 144, wherein the dose of telmisartan is from about 16 mg to about 24 mg, the dose of indapamide is from about 1 mg to about 1.5 mg, and the dose of amlodipine besylate is from about 2 mg to about 3 mg.

**[0410]** Embodiment 146: The pharmaceutical composition of Embodiment 145, wherein the dose of telmisartan is about 20 mg, the dose of indapamide is about 1.25 mg, and the dose of amlodipine besylate is about 2.5 mg.

**[0411]** Embodiment 147. The pharmaceutical composition of any one of Embodiments 1-146, wherein (a), (b), and (c) are provided in one formulation.

**[0412]** Embodiment 148. The pharmaceutical composition of any one of Embodiments 1-146, wherein (a), (b), and (c) are each provided in a separate formulation.

**[0413]** Embodiment 149. The pharmaceutical composition of any one of Embodiments 1-146, wherein two of the (a), (b), and (c) are provided in one formulation.

**[0414]** Embodiment 150. The pharmaceutical composition of any one of Embodiments 1-149, wherein the pharmaceutical composition is in the form of pill, tablet, or capsule.

**[0415]** Embodiment 151. The pharmaceutical composition of any one of Embodiments 1-150, wherein the pharmaceutical composition is suitable for oral administration.

**[0416]** Embodiment 152: A method of treating hypertension in a subject in need thereof comprising administering to the subject the pharmaceutical composition of any one of Embodiments 1-151.

**[0417]** Embodiment 153. The method of Embodiment 152, wherein the treatment results in a systolic blood pressure (SBP) of less than about 140 mmHg.

**[0418]** Embodiment 154. The method of Embodiment 151 or 152, wherein the treatment results in a reduction of systolic blood pressure (SBP) of about 10 mmHg or greater.

**[0419]** Embodiment 155. The method of any one of Embodiments 151-154, wherein the treatment results in a diastolic blood pressure (DBP) of less than about 90 mmHg.

**[0420]** Embodiment 156. The method of any one of Embodiments 151-155, wherein the treatment results in a reduction of diastolic blood pressure (DBP) of about 5 mmHg or greater.

**[0421]** Embodiment 157. The method of any one of Embodiments 151-156, wherein treatment results in a reduction in systolic blood pressure (SBP) that is greater than the reduction obtained with the full lowest hypertension therapeutic dose of any one of the (a), (b), and (c) in the pharmaceutical composition.

**[0422]** Embodiment 158. The method of any one of Embodiments 151-157, wherein treatment results in a reduction in diastolic blood pressure (DBP) that is greater than the reduction obtained with the full lowest hypertension therapeutic dose of any one of (a), (b), and (c) in the pharmaceutical composition.

**[0423]** Embodiment 159. The method of any one of Embodiments 151-158, wherein the treatment results in greater long term tolerability and reduced risk of side effects or adverse effects when compared to treatment with the full lowest hypertension therapeutic dose of any one of (a), (b), and (c) in the pharmaceutical composition.

**[0424]** Embodiment 160. The method of any one of Embodiments 151-159, wherein the treatment is the initial or first-line treatment of hypertension.

**[0425]** Embodiment 161. The method of any one of Embodiments 151-160, wherein the subject is not receiving any previous hypertension therapy prior to treatment.

**[0426]** In some or any one of the Embodiments above, the at least one cholesterol-lowering active agent is selected from an NPC1L1 inhibitor, a statin, or a combination thereof.

**[0427]** In some or any one of the Embodiments above, the at least one cholesterol-lowering active agent is selected from an NPC1L1 inhibitor, a statin, or a combination thereof.

**[0428]** In some or any one of the Embodiments above, the at least one cholesterol-lowering active agent is a combination of an NPC1L1 inhibitor and a statin.

**[0429]** In some or any one of the Embodiments above, the at least one cholesterol-lowering active agent is selected from ezetimibe, rosuvastatin, or a combination thereof.

**[0430]** In some or any one of the Embodiments above, the at least one cholesterol-lowering active agent is a combination of ezetimibe and rosuvastatin.

**[0431]** In some or any one of the Embodiments above, the dose of ezetimibe is about 10 mg, and wherein the dose of rosuvastatin is about 10 mg.

**[0432]** In some or any one of the Embodiments above, (a), (b), and (c) are provided in a single formulation.

**[0433]** In some or any one of the Embodiments above, (a), (b), (c), and the at least one cholesterol-lowering active agent are provided in a single formulation.

**[0434]** In some or any one of the Embodiments above, (a), (b), (c), and the at least one cholesterol-lowering active agent are provided in a separate formulation.

**[0435]** Embodiments include the following Embodiments P1 to P99.

**[0436]** Embodiment P1. A pharmaceutical composition, comprising:

- (a) an angiotensin II receptor blocker;
- (b) a diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each of (a), (b), and (c) is from about 40% to about 80% of the lowest hypertension therapeutic dose (LHTD), and wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent.

**[0437]** Embodiment P2. The pharmaceutical composition of Embodiment P1, wherein the pharmaceutical composition is essentially free of an angiotensin-converting enzyme inhibitor or a pharmaceutically acceptable salt thereof, a beta-blocker or a pharmaceutically acceptable salt thereof, platelet function-altering agent, a serum homocysteine-lowering agent, or combinations thereof.

**[0438]** Embodiment P3. The pharmaceutical composition of Embodiment P1 or P2, wherein the diuretic is a thiazide-like diuretic.

**[0439]** Embodiment P4. The pharmaceutical composition of Embodiment P3, wherein the thiazide-like diuretic is quinethazone, clopamide, chlorthalidone, mefruside, clofenamide, metolazone, meticrane, xipamide, indapamide, clorexolone, fenquizone, or a pharmaceutically acceptable salt, or a hydrate thereof.

**[0440]** Embodiment P5. The pharmaceutical composition of Embodiment P4, wherein the thiazide-like diuretic is indapamide or a hydrate thereof.

**[0441]** Embodiment P6. The pharmaceutical composition of Embodiment P5, wherein the thiazide-like diuretic is indapamide.

**[0442]** Embodiment P7. The pharmaceutical composition of any one of Embodiments P1-P6, wherein the calcium channel blocker is amlodipine, nifedipine, diltiazem, nimodipine, verapamil, isradipine, felodipine, nicardipine, nisoldipine, clevidipine, dihydropyridine, lercanidipine, nitrendipine, cilnidipine, manidipine, mibefradil, bepridil, barnidipine, nilvadipine, gallopamil, lidoflazine, aranidipine, dotarizine, diproteverine, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0443]** Embodiment P8. The pharmaceutical composition of any one of Embodiments P1-P7, wherein the calcium channel blocker is amlodipine or a pharmaceutically acceptable salt thereof.

**[0444]** Embodiment P9. The pharmaceutical composition of any one of Embodiments P1-P8, wherein the calcium channel blocker is amlodipine besylate.

**[0445]** Embodiment P10. The pharmaceutical composition of any one of Embodiments P1-P9, wherein the angiotensin II receptor blocker is irbesartan, telmisartan, valsartan, candesartan,

eprosartan, olmesartan, azilsartan, losartan, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0446]** Embodiment P11. The pharmaceutical composition of any one of Embodiments P1-P10, wherein the angiotensin II receptor blocker is telmisartan.

**[0447]** Embodiment P12. The pharmaceutical composition of any one of Embodiments P1-P11, wherein the dose of each (a), (b), and (c) is from about 40% to about 60% of the lowest hypertension therapeutic dose (LHTD).

**[0448]** Embodiment P13. The pharmaceutical composition of any one of Embodiments P1-P12, wherein the diuretic is a thiazide-like, and the dose of the thiazide-like diuretic is about 50% of the lowest hypertension therapeutic dose (LHTD) for the thiazide-like diuretic.

**[0449]** Embodiment P14. The pharmaceutical composition of any one of Embodiments P1-P13, wherein the thiazide-like diuretic is indapamide, and the dose of the indapamide is about 0.625 mg.

**[0450]** Embodiment P15. The pharmaceutical composition of any one of Embodiments P1-P14, wherein the dose of the calcium channel blocker is about 50% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0451]** Embodiment P16. The pharmaceutical composition of any one of Embodiments P1-P15, wherein the calcium channel blocker is amlodipine besylate, and the dose of amlodipine besylate is about 1.25 mg.

**[0452]** Embodiment P17. The pharmaceutical composition of any one of Embodiments P1-P16, wherein the dose of the angiotensin II receptor blocker is about 50% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0453]** Embodiment P18. The pharmaceutical composition of any one of Embodiments P1-P17, wherein the angiotensin II receptor blocker is telmisartan, and the dose of the telmisartan is about 10 mg.

**[0454]** Embodiment P19. The pharmaceutical composition of any one of Embodiments P1-P18, wherein the angiotensin II receptor blocker is telmisartan, the diuretic is indapamide, and the calcium channel blocker is amlodipine besylate.

**[0455]** Embodiment P20. The pharmaceutical composition of Embodiment P19, wherein the dose of telmisartan is from about 8 mg to about 12 mg, the dose of indapamide is from about 0.5 mg to about 0.75 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg.

**[0456]** Embodiment P21. The pharmaceutical composition of Embodiment P19, wherein the dose of telmisartan is about 10 mg, the dose of indapamide is about 0.625 mg, and the dose of amlodipine besylate is about 1.25 mg.

**[0457]** Embodiment P22. A pharmaceutical composition, comprising:

- (a) telmisartan;
- (b) a thiazide-like diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each (a), (b), and (c) is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD), and wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent.

**[0458]** Embodiment P23. The pharmaceutical composition of Embodiment P22, wherein the pharmaceutical composition is essentially free of an angiotensin-converting enzyme inhibitor or a pharmaceutically acceptable salt thereof, a beta-blocker or a pharmaceutically acceptable salt thereof, platelet function-altering agent, a serum homocysteine-lowering agent, or a combination thereof.

**[0459]** Embodiment P24. The pharmaceutical composition of Embodiment P22 or P23, wherein the diuretic is a thiazide-like diuretic.

**[0460]** Embodiment P25. The pharmaceutical composition of Embodiment P24, wherein the thiazide-like diuretic is quinethazone, clopamide, chlorthalidone, mefruside, clofenamide, metolazone, meticrane, xipamide, indapamide, clorexolone, fenquizone, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0461]** Embodiment P26. The pharmaceutical composition of Embodiment P25, wherein the thiazide-like diuretic is indapamide or a hydrate thereof.

**[0462]** Embodiment P27. The pharmaceutical composition of Embodiment P26, wherein the thiazide-like diuretic is indapamide.

**[0463]** Embodiment P28. The pharmaceutical composition of any one of Embodiments P22-P27, wherein the calcium channel blocker is amlodipine, nifedipine, diltiazem, nimodipine, verapamil, isradipine, felodipine, nicardipine, nisoldipine, clevidipine, dihydropyridine, lercanidipine, nitrendipine, cilnidipine, manidipine, mibefradil, bepridil, barnidipine, nilvadipine, gallopamil, lidoflazine, aranidipine, dotarizine, diproteverine, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0464]** Embodiment P29. The pharmaceutical composition of any one of Embodiments P22-P28, wherein the calcium channel blocker is amlodipine or the pharmaceutically acceptable salt thereof.

**[0465]** Embodiment P30. The pharmaceutical composition of any one of Embodiments P22-P29, wherein the calcium channel blocker is amlodipine besylate.

**[0466]** Embodiment P31. The pharmaceutical composition of any one of Embodiments P22-P30, wherein the dose of each (a), (b), and (c) is from about 80% to about 120% of the lowest hypertension therapeutic dose (LHTD).

**[0467]** Embodiment P32. The pharmaceutical composition of any one of Embodiments P22-P31, wherein the dose of the thiazide-like diuretic is about 100% of the lowest hypertension therapeutic dose (LHTD) for the thiazide-like diuretic.

**[0468]** Embodiment P33. The pharmaceutical composition of any one of Embodiments P22-P32, wherein the thiazide-like diuretic is indapamide, and the dose of the indapamide is about 1.25 mg.

**[0469]** Embodiment P34. The pharmaceutical composition of any one of Embodiments P22-P33, wherein the dose of the calcium channel blocker is about 100% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0470]** Embodiment P35. The pharmaceutical composition of any one of Embodiments P22-P34, wherein the calcium channel blocker is amlodipine besylate, and the dose of amlodipine besylate is about 2.5 mg.

**[0471]** Embodiment P36. The pharmaceutical composition of any one of Embodiments P22-P35, wherein the angiotensin II receptor blocker is telmisartan and the dose of the telmisartan is about 100% of the lowest hypertension therapeutic dose (LHTD) for telmisartan.

**[0472]** Embodiment P37. The pharmaceutical composition of any one of Embodiments P22-P36, wherein the angiotensin II receptor blocker is telmisartan and the dose of the telmisartan is about 20 mg.

**[0473]** Embodiment P38. The pharmaceutical composition of any one of Embodiments P22-P37, wherein the thiazide-like diuretic is indapamide, the calcium channel blocker is amlodipine besylate, and the angiotensin II receptor blocker is telmisartan.

**[0474]** Embodiment P39. The pharmaceutical composition of Embodiment P38, wherein the dose of telmisartan is from about 16 mg to about 24 mg, the dose of indapamide is from about 1 mg to about 1.5 mg, and the dose of amlodipine besylate is from about 2 mg to about 3 mg.

**[0475]** Embodiment P40. The pharmaceutical composition of Embodiment P39, wherein the dose of telmisartan is about 20 mg, the dose of indapamide is about 1.25 mg, and the dose of amlodipine besylate is about 2.5 mg.

**[0476]** Embodiment P41. The pharmaceutical composition of any one of the previous Embodiments, wherein the at least one cholesterol-lowering active agent is selected from an NPC1L1 inhibitor, a statin, or a combination thereof.

**[0477]** Embodiment P42. The pharmaceutical composition of any one of the previous Embodiments, wherein the at least one cholesterol-lowering active agent is a combination of an NPC1L1 inhibitor and a statin.

**[0478]** Embodiment P43. The pharmaceutical composition of any one of the previous Embodiments, wherein the at least one cholesterol-lowering active agent is ezetimibe, rosuvastatin, or a combination thereof.

**[0479]** Embodiment P44. The pharmaceutical composition of any one of the previous Embodiments, wherein the at least one cholesterol-lowering active agent is a combination of ezetimibe and rosuvastatin.

**[0480]** Embodiment P45. The pharmaceutical composition of Embodiment P43 or P44, wherein the dose of ezetimibe is about 10 mg, and wherein the dose of rosuvastatin is about 10 mg.

**[0481]** Embodiment P46. A method of treating at least one of hypertension and dyslipidemia in a subject in need thereof, comprising administering to the subject the pharmaceutical composition of any one of the previous Embodiments.

**[0482]** Embodiment P47. A method of treating a combination of hypertension and dyslipidemia in a subject in need thereof, comprising administering to the subject the pharmaceutical composition of any one of the previous Embodiments.

**[0483]** Embodiment P48. The method of Embodiment 46 or 47, wherein the method is a first-line therapy.

**[0484]** Embodiment P49. A method of treating hypertension and/or dyslipidemia in a subject in need thereof, comprising administering to the subject:

- (a) an angiotensin II receptor blocker;
- (b) a diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each of (a), (b), and (c) is from about 40% to about 80% of the lowest hypertension therapeutic dose (LHTD), and wherein the method further comprises at least one cholesterol-lowering active agent

**[0485]** Embodiment P50. The method of Embodiment P49, wherein the method is essentially free of an angiotensin-converting enzyme inhibitor or a pharmaceutically acceptable salt thereof, a beta-blocker or a pharmaceutically acceptable salt thereof, platelet function-altering agent, a serum homocysteine-lowering agent, or combinations thereof.

**[0486]** Embodiment P51. The method of Embodiment P49 or P50, wherein the diuretic is a thiazide-like diuretic.

**[0487]** Embodiment P52. The method of Embodiment P51, wherein the thiazide-like diuretic is quinethazone, clopamide, chlorthalidone, mefruside, clofenamide, metolazone, meticrane, xipamide, indapamide, clorexolone, fenquizone, or a pharmaceutically acceptable salt, or a hydrate thereof.

**[0488]** Embodiment P53. The method of Embodiment P52, wherein the thiazide-like diuretic is indapamide or a hydrate thereof.

**[0489]** Embodiment P54. The method of Embodiment P53, wherein the thiazide-like diuretic is indapamide.

**[0490]** Embodiment P55. The method of any one of Embodiments P49-P54, wherein the calcium channel blocker is amlodipine, nifedipine, diltiazem, nimodipine, verapamil, isradipine, felodipine, nicardipine, nisoldipine, clevidipine, dihydropyridine, lercanidipine, nitrendipine, cilnidipine, manidipine, mibefradil, bepridil, barnidipine, nilvadipine, gallopamil, lidoflazine, aranidipine, dotarizine, diproteverine, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0491]** Embodiment P56. The method of any one of Embodiments P49-P55, wherein the calcium channel blocker is amlodipine or a pharmaceutically acceptable salt thereof.

**[0492]** Embodiment P57. The method of any one of Embodiments P49-P56, wherein the calcium channel blocker is amlodipine besylate.

**[0493]** Embodiment P58. The method of any one of Embodiments P49-P57, wherein the angiotensin II receptor blocker is irbesartan, telmisartan, valsartan, candesartan, eprosartan, olmesartan, azilsartan, losartan, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0494]** Embodiment P59. The method of any one of Embodiments P49-P58, wherein the angiotensin II receptor blocker is telmisartan.

**[0495]** Embodiment P60. The method of any one of Embodiments P49-P59, wherein the dose of each (a), (b), and (c) is from about 40% to about 60% of the lowest hypertension therapeutic dose (LHTD).

**[0496]** Embodiment P61. The method of any one of Embodiments P49-P60, wherein the diuretic is a thiazide-like, and the dose of the thiazide-like diuretic is about 50% of the lowest hypertension therapeutic dose (LHTD) for the thiazide-like diuretic.

**[0497]** Embodiment P62. The method of any one of Embodiments P49-P61, wherein the thiazide-like diuretic is indapamide, and the dose of the indapamide is about 0.625 mg.

**[0498]** Embodiment P63. The method of any one of Embodiments P49-P62, wherein the dose of the calcium channel blocker is about 50% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0499]** Embodiment P64. The method of any one of Embodiments P49-P63, wherein the calcium channel blocker is amlodipine besylate, and the dose of amlodipine besylate is about 1.25 mg.

**[0500]** Embodiment P65. The method of any one of Embodiments P49-P64, wherein the dose of the angiotensin II receptor blocker is about 50% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.

**[0501]** Embodiment P66. The method of any one of Embodiments P49-P65, wherein the angiotensin II receptor blocker is telmisartan, and the dose of the telmisartan is about 10 mg.

**[0502]** Embodiment P67. The method of any one of Embodiments P49-P66, wherein the angiotensin II receptor blocker is telmisartan, the diuretic is indapamide, and the calcium channel blocker is amlodipine besylate.

**[0503]** Embodiment P68. The method of Embodiment P67, wherein the dose of telmisartan is from about 8 mg to about 12 mg, the dose of indapamide is from about 0.5 mg to about 0.75 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg.

**[0504]** Embodiment P69. The method of Embodiment P67, wherein the dose of telmisartan is about 10 mg, the dose of indapamide is about 0.625 mg, and the dose of amlodipine besylate is about 1.25 mg

**[0505]** Embodiment P70. A method of treating hypertension and/or dyslipidemia in a subject in need thereof, comprising administering to the subject:

- (a) telmisartan;
- (b) a thiazide-like diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each (a), (b), and (c) is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD), and wherein the method further comprises at least one cholesterol-lowering active agent

**[0506]** Embodiment P71. The method of Embodiment P70, wherein the method is essentially free of an angiotensin-converting enzyme inhibitor or a pharmaceutically acceptable salt thereof, a beta-blocker or a pharmaceutically acceptable salt thereof, platelet function-altering agent, a serum homocysteine-lowering agent, or a combination thereof.

**[0507]** Embodiment P72. The method of Embodiment P70 or P71, wherein the diuretic is a thiazide-like diuretic.

**[0508]** Embodiment P73. The method of Embodiment P72, wherein the thiazide-like diuretic is quinethazone, clopamide, chlorthalidone, mefruside, clofenamide, metolazone, meticrane, xipamide, indapamide, clorexolone, fenquizone, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0509]** Embodiment P74. The method of Embodiment P73, wherein the thiazide-like diuretic is indapamide or the hydrate thereof.

**[0510]** Embodiment P75. The method of Embodiment P74, wherein the thiazide-like diuretic is indapamide.

**[0511]** Embodiment P76. The method of any one of Embodiments P70-P75, wherein the calcium channel blocker is amlodipine, nifedipine, diltiazem, nimodipine, verapamil, isradipine,

felodipine, nicardipine, nisoldipine, clevidipine, dihydropyridine, lercanidipine, nitrendipine, cilnidipine, manidipine, mibefradil, bepridil, barnidipine, nilvadipine, gallopamil, lidoflazine, aranidipine, dotarizine, diproteverine, or a pharmaceutically acceptable salt or a hydrate thereof.

**[0512]** Embodiment P77. The method of any one of Embodiments P70-P76, wherein the calcium channel blocker is amlodipine or the pharmaceutically acceptable salt thereof.

**[0513]** Embodiment P78. The method of any one of Embodiments P70-P77, wherein the calcium channel blocker is amlodipine besylate.

**[0514]** Embodiment P79. The method of any one of Embodiments P70-P78, wherein the dose of each (a), (b), and (c) is from about 80% to about 120% of the lowest hypertension therapeutic dose (LHTD).

**[0515]** Embodiment P80. The method of any one of Embodiments P70-P79, wherein the dose of the thiazide-like diuretic is about 100% of the lowest hypertension therapeutic dose (LHTD) for the thiazide-like diuretic.

**[0516]** Embodiment P81. The method of any one of Embodiments P70-P80, wherein the thiazide-like diuretic is indapamide, and the dose of the indapamide is about 1.25 mg.

**[0517]** Embodiment P82. The method of any one of Embodiments P70-P81, wherein the dose of the calcium channel blocker is about 100% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.

**[0518]** Embodiment P83. The method of any one of Embodiments P70-P82, wherein the calcium channel blocker is amlodipine besylate, and the dose of amlodipine besylate is about 2.5 mg.

**[0519]** Embodiment P84. The method of any one of Embodiments P70-P83, wherein the angiotensin II receptor blocker is telmisartan and the dose of the telmisartan is about 100% of the lowest hypertension therapeutic dose (LHTD) for telmisartan.

**[0520]** Embodiment P85. The method of any one of Embodiments P70-P84, wherein the angiotensin II receptor blocker is telmisartan and the dose of the telmisartan is about 20 mg.

**[0521]** Embodiment P86. The method of any one of Embodiments P70-P85, wherein the thiazide-like diuretic is indapamide, the calcium channel blocker is amlodipine besylate, and the angiotensin II receptor blocker is telmisartan.

**[0522]** Embodiment P87. The method of Embodiment P86, wherein the dose of telmisartan is from about 16 mg to about 24 mg, the dose of indapamide is from about 1 mg to about 1.5 mg, and the dose of amlodipine besylate is from about 2 mg to about 3 mg.

**[0523]** Embodiment P88. The method of Embodiment P87, wherein the dose of telmisartan is about 20 mg, the dose of indapamide is about 1.25 mg, and the dose of amlodipine besylate is about 2.5 mg.

**[0524]** Embodiment P89. The method of any one of Embodiments P49-P88, wherein the at least one cholesterol-lowering active agent is selected from an NPC1L1 inhibitor, a statin, or a combination thereof.

**[0525]** Embodiment P90. The method of any one of Embodiments P49-P89, wherein the at least one cholesterol-lowering active agent is a combination of an NPC1L1 inhibitor and a statin.

**[0526]** Embodiment P91. The method of any one of the previous Embodiments, wherein the at least one cholesterol-lowering active agent is ezetimibe, rosuvastatin, or a combination thereof.

**[0527]** Embodiment P92. The method of any one of Embodiments P49-P90, wherein the at least one cholesterol-lowering active agent is a combination of ezetimibe and rosuvastatin.

**[0528]** Embodiment P93. The method of Embodiment P91 or P92, wherein the dose of ezetimibe is about 10 mg, and wherein the dose of rosuvastatin is about 10 mg.

**[0529]** Embodiment P94. The method of any one of Embodiments P49-P93, wherein (a), (b), (c), and the at least one cholesterol-lowering active agent are provided in a single formulation.

**[0530]** Embodiment P95. The method of any one of Embodiments P49-P93, wherein (a), (b), (c), and the at least one cholesterol-lowering active agent are provided in at least two separate formulations.

**[0531]** Embodiment P96. The method of any one of Embodiments P49-P93, wherein at least two of (a), (b), (c), and the at least one cholesterol-lowering active agent are provided in a single formulation.

**[0532]** Embodiment P97. The method of any one of Embodiments P49-P93, wherein at least three of (a), (b), (c), and the at least one cholesterol-lowering active agent are provided in a single formulation.

**[0533]** Embodiment P98. The method of Embodiment P97, wherein the at least one cholesterol-lowering active agent is a combination of ezetimibe and rosuvastatin.

**[0534]** Embodiment P99. The method of Embodiment P98, wherein (a), (b), (c) are provided in a single formulation and the combination of ezetimibe and rosuvastatin are provided in another formulation.

**[0535]** In an aspect, there is provided a pharmaceutical composition, comprising at least two of:

- (a) an angiotensin II receptor blocker;
- (b) a diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each (a), (b), and (c) is from about 40% to about 80% of the lowest hypertension therapeutic dose (LHTD), wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent.

**[0536]** In another aspect, there is provided a pharmaceutical composition, comprising at least three of:

- (a) an angiotensin II receptor blocker;
- (b) a diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each (a), (b), and (c) is from about 40% to about 80% of the lowest hypertension therapeutic dose (LHTD), wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent. Provided in another aspect is a pharmaceutical composition, comprising at least two of:

- (a) telmisartan;
- (b) a thiazide-like diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each (a), (b), and (c) is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD), wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent.

**[0537]** Provided in another aspect is a pharmaceutical composition, comprising at least two of:

- (a) telmisartan;
- (b) a thiazide-like diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each (a), (b), and (c) is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD), wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent.

**[0538]** Provided in another aspect is a pharmaceutical composition, comprising at least three of:

- (a) telmisartan;
- (b) a thiazide-like diuretic; and
- (c) a calcium channel blocker,

wherein the dose of each (a), (b), and (c) is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD), wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent.

**[0539]** In some embodiments, (a), (b), (c) are provided in a single formulation and the combination of ezetimibe and rosuvastatin are provided in another formulation.

**[0540]** Also provided herein in another aspect is a method of treating at least one of hypertension and dyslipidemia in a subject in need thereof comprising administering the pharmaceutical composition disclosed in some or any one of the Embodiments above. In a refinement, the method is a first-line therapy.

**[0541]** Also provided herein in another aspect is a method of treating a combination of hypertension and dyslipidemia in a subject in need thereof comprising administering the pharmaceutical composition disclosed in some or any one of the Embodiments above. In a refinement, the method is a first-line therapy.

**[0542]** While preferred embodiments of the present disclosure have been shown and described herein, it will be obvious to those skilled in the art that such embodiments are provided by way of example only. Numerous variations, changes, and substitutions will now occur to those skilled in the art without departing from the disclosure. It should be understood that various alternatives to the embodiments of the disclosure described herein may be employed in practicing the disclosure. It is intended that the following claims define the scope of the disclosure and that methods and structures within the scope of these claims and their equivalents be covered thereby.

## CLAIMS

### WHAT IS CLAIMED IS:

1. A pharmaceutical composition comprising:
  - (a) an angiotensin II receptor blocker;
  - (b) a diuretic; and
  - (c) a calcium channel blocker,
 wherein the dose of each of (a), (b), and (c) is from about 40% to about 80% of the lowest hypertension therapeutic dose (LHTD), and wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent.
2. The pharmaceutical composition of claim 1, wherein the diuretic is a thiazide-like diuretic and the thiazide-like diuretic is quinethazone, clopamide, chlorthalidone, mefruside, clofenamide, metolazone, meticrane, xipamide, indapamide, clorexolone, fenquizone, or a pharmaceutically acceptable salt, or a hydrate thereof.
3. The pharmaceutical composition of claim 2, wherein the thiazide-like diuretic is indapamide.
4. The pharmaceutical composition of any one of claims 1-3, wherein the calcium channel blocker is amlodipine, nifedipine, diltiazem, nimodipine, verapamil, isradipine, felodipine, nicardipine, nisoldipine, clevidipine, dihydropyridine, lercanidipine, nitrendipine, cilnidipine, manidipine, mibefradil, bepridil, barnidipine, nilvadipine, gallopamil, lidoflazine, aranidipine, dotarizine, diproteverine, or a pharmaceutically acceptable salt or a hydrate thereof.
5. The pharmaceutical composition of any one of claims 1-4, wherein the calcium channel blocker is amlodipine besylate.
6. The pharmaceutical composition of any one of claims 1-5, wherein the angiotensin II receptor blocker is irbesartan, telmisartan, valsartan, candesartan, eprosartan, olmesartan, azilsartan, losartan, or a pharmaceutically acceptable salt or a hydrate thereof.
7. The pharmaceutical composition of any one of claims 1-6, wherein the angiotensin II receptor blocker is telmisartan.
8. The pharmaceutical composition of any one of claims 1-7, wherein the dose of each (a), (b), and (c) is from about 40% to about 60% of the lowest hypertension therapeutic dose (LHTD).
9. The pharmaceutical composition of any one of claims 1-8, wherein the diuretic is a thiazide-like diuretic, and the dose of the thiazide-like diuretic is about 50% of the lowest hypertension therapeutic dose (LHTD) for the thiazide-like diuretic.

10. The pharmaceutical composition of any one of claims 1-9, wherein the thiazide-like diuretic is indapamide, and the dose of the indapamide is about 0.625 mg.
11. The pharmaceutical composition of any one of claims 1-10, wherein the dose of the calcium channel blocker is about 50% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.
12. The pharmaceutical composition of any one of claims 1-11, wherein the calcium channel blocker is amlodipine besylate, and the dose of amlodipine besylate is about 1.25 mg.
13. The pharmaceutical composition of any one of claims 1-12, wherein the dose of the angiotensin II receptor blocker is about 50% of the lowest hypertension therapeutic dose (LHTD) for the angiotensin II receptor blocker.
14. The pharmaceutical composition of any one of claims 1-13, wherein the angiotensin II receptor blocker is telmisartan, and the dose of the telmisartan is about 10 mg.
15. The pharmaceutical composition of claim 8, wherein the angiotensin II receptor blocker is telmisartan, the diuretic is indapamide, and the calcium channel blocker is amlodipine besylate; and the dose of telmisartan is from about 8 mg to about 12 mg, the dose of indapamide is from about 0.5 mg to about 0.75 mg, and the dose of amlodipine besylate is from about 1 mg to about 1.5 mg.
16. A pharmaceutical composition comprising
  - (a) telmisartan;
  - (b) a thiazide-like diuretic; and
  - (c) a calcium channel blocker,wherein the dose of each (a), (b), and (c) is from about 80% to about 150% of the lowest hypertension therapeutic dose (LHTD), and wherein the pharmaceutical composition further comprises at least one cholesterol-lowering active agent.
17. The pharmaceutical composition of claim 16, wherein the diuretic is a thiazide-like diuretic and the thiazide-like diuretic is quinethazone, clopamide, chlorthalidone, mefruside, clofenamide, metolazone, meticrane, xipamide, indapamide, clorexolone, fenquizone, or a pharmaceutically acceptable salt or a hydrate thereof.
18. The pharmaceutical composition of claim 17, wherein the thiazide-like diuretic is indapamide.
19. The pharmaceutical composition of any one of claims 16-18, wherein the calcium channel blocker is amlodipine, nifedipine, diltiazem, nimodipine, verapamil, isradipine, felodipine, nicardipine, nisoldipine, clevidipine, dihydropyridine, lercanidipine, nitrendipine, cilnidipine, manidipine, mibefradil, bepridil, barnidipine, nilvadipine, gallopamil,

lidoflazine, aranidipine, dotarizine, diproterevine, or a pharmaceutically acceptable salt or a hydrate thereof.

20. The pharmaceutical composition of any one of claims 16-19, wherein the calcium channel blocker is amlodipine besylate.
21. The pharmaceutical composition of any one of claims 16-20, wherein the dose of each (a), (b), and (c) is from about 80% to about 120% of the lowest hypertension therapeutic dose (LHTD).
22. The pharmaceutical composition of any one of claims 16-21, wherein the dose of the thiazide-like diuretic is about 100% of the lowest hypertension therapeutic dose (LHTD) for the thiazide-like diuretic.
23. The pharmaceutical composition of any one of claims 16-22, wherein the thiazide-like diuretic is indapamide, and the dose of the indapamide is about 1.25 mg.
24. The pharmaceutical composition of any one of claims 16-23, wherein the dose of the calcium channel blocker is about 100% of the lowest hypertension therapeutic dose (LHTD) for the calcium channel blocker.
25. The pharmaceutical composition of any one of claims 16-24, wherein the calcium channel blocker is amlodipine besylate, and the dose of amlodipine besylate is about 2.5 mg.
26. The pharmaceutical composition of any one of claims 16-25, wherein the angiotensin II receptor blocker is telmisartan and the dose of the telmisartan is about 100% of the lowest hypertension therapeutic dose (LHTD) for telmisartan.
27. The pharmaceutical composition of any one of claims 16-26, wherein the angiotensin II receptor blocker is telmisartan and the dose of the telmisartan is about 20 mg.
28. The pharmaceutical composition of claim 21, wherein the thiazide-like diuretic is indapamide, and the calcium channel blocker is amlodipine besylate; and the dose of telmisartan is from about 16 mg to about 24 mg, the dose of indapamide is from about 1 mg to about 1.5 mg, and the dose of amlodipine besylate is from about 2 mg to about 3 mg.
29. The pharmaceutical composition of any one of the previous claims, wherein the at least one cholesterol-lowering active agent is ezetimibe, rosuvastatin, or a combination thereof.
30. The pharmaceutical composition of any one of the previous claims, wherein the at least one cholesterol-lowering active agent is a combination of ezetimibe and rosuvastatin.
31. The pharmaceutical composition of claim 29 or 30, wherein the dose of ezetimibe is about 10 mg, and wherein the dose of rosuvastatin is about 10 mg.
32. A method of treating at least one of hypertension and dyslipidemia in a subject in need thereof, comprising administering to the subject the pharmaceutical composition of any one of the previous claims.

33. A method of treating a combination of hypertension and dyslipidemia in a subject in need thereof, comprising administering to the subject the pharmaceutical composition of any one of the previous claims.
