Specification

TNF- α Production Inhibitors

Technical Field

The present invention relates to TNF- α production inhibitors being useful as therapeutic agents for autoimmune diseases such as rheumatoid arthritis.

Background Art

TNF- α (Tumor necrosis factor- α) is recognized as a cytokine which widely participates in biophylaxis-immune mechanism through inflammation. It is known that prolonged and excessive production of TNF- α is a factor which brings about causes of tissue damage and various diseases. Examples of pathology in which TNF- α participates are many pathology such as arthrorheumatism, systemic lupus erythematosus (SLE), cachexia, acute infectious disease, allergy, pyrexia, anemia and diabetes (Yamazaki, Clinical Immunology, 27, 1270, 1995). It is also reported that TNF- α plays an important role in pathogenesis of rheumatoid arthritis and Crohn's disease, which are autoimmune diseases (Andreas Eigler et al., Immunology Today, 18, 487, 1997).

From these reports, compounds which inhibit or suppress TNF- α production are expected to be effective for treatment of the above-mentioned diseases, and various studies have been done (the

above-mentioned literatures: Yamazaki, Clinical Immunology, 27, 1270, 1995, Andreas Eigler et al., Immunology Today, 18, 487, 1997). Recently, it was also reported that metalloprotease, which is a proteolytic enzyme, participates in secretion of TNF- α and metalloprotease inhibitors have important effects on the inhibition of TNF- α production and the like (Published Japanese Translation of PCT No. 508115/1997). Japanese Laid-open Patent Publication Nos. 44533/2000 and 119249/2000 disclose compounds having inhibitory effects of TNF- α production. All of these compounds are urea derivatives having a sulfur atom in side chains.

It is meaningful to search compounds having inhibitory activities of TNF- α production and being useful as therapeutic agents for the autoimmune diseases such as rheumatoid arthritis, allergy and diabetes.

The present compounds can be prepared, for example, according to the following reaction routes 1 to 3. The present compounds can be prepared by not only these reaction routes but also various reaction routes. Detailed synthetic methods will be described in the later Examples.

Reaction route 1

The secondary amine (D) can be obtained by reducing the amide (A) or by reacting the primary amine (B) with the compound (C) having a leaving group. (The secondary amine can be also synthesized using compounds with R¹ and R² reversed in the above chemical reaction formula.) The secondary amine (G) can be obtained by reacting the compound (E) having a leaving group with the primary amine (F) similarly. The present compound [2] is obtained by reacting the primary amine (B) or the secondary amine (D) with the primary amine (F) or the secondary amine (G) in the presence of the condensing agent (H) (for example, 1,1'-carbonyldiimidazole).

Reaction route 2

The present compound [3] is obtained by reacting the primary amine (B) or the secondary amine (D) synthesized by the reaction route 1 with the carboxylic acid (I) in the presence of a condensing agent (for example, 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride).

Reaction route 3

The present compound [4] is obtained by reacting the primary amine (B) or the secondary amine (D) synthesized by the reaction route 1 with the alcohol (J) in the presence of a condensing agent (for example, *N,N'*-disuccinimidyl carbonate).

In the above-mentioned synthetic methods, when the reactant has a thiol, hydroxy or amino group in its molecule, these groups can be protected with suitable protecting groups, if necessary, and these protecting groups can also be removed by the conventional method after reaction. When the reactant has a carboxyl group in its molecule, the carboxyl group can be esterified, if necessary, and the ester can also be converted into a carboxylic acid by hydrolysis or other general methods.

The compounds obtained by the above-mentioned synthetic methods can be converted into the above-mentioned salts by the conventional method.

The inhibitory effects of TNF- α production were examined in order to study utility of the present compounds obtained by the above-mentioned synthetic methods. Also disclosed herein is a method of inhibiting TNF- α production, a method of treating the autoimmune diseases and a method of treating rheumatic diseases comprising administering to a patient a composition comprising an effective amount of the present compound or a pharmacologically acceptable salts thereof and a pharmacologically acceptable additive.

The present compound can be administered orally or parenterally. Examples of dosage forms are tablets, capsules, granules, powders, injections and the like. The present compound can be formulated into preparations by the conventional methods. For example, oral preparations such as tablets, capsules, granules and powders can be produced by adding optionally a diluent such as lactose, crystalline cellulose, starch or vegetable oil; a lubricant such as magnesium stearate or talc; a binder such as hydroxypropylcellulose or polyvinyl pyrrolidone; a disintegrator such as calcium carboxymethylcellulose or low-substituted hydroxypropylmethylcellulose; a coating agent such as hydroxypropylmethylcellulose, macrogol or silicone resin; or a film forming agent such as gelatin film.

The dosage of the present compound can be selected suitably according to the symptom, age, dosage form and the like. In case of the oral preparation, the present compound can be administered once to several times per day with a daily dose of 0.1 to 5000 mg, preferably 1 to 1000 mg.

Examples of preparations of intermediates, examples of

preparations and formulations of the present compounds and results of pharmacological test are shown below. These examples do not limit the scope of the invention, but are intended to make the invention more clearly understandable.

Preparation Example 1

•2-(1-Adamantyl)-*N*-pentylethylamine hydrochloride (Intermediate No. 1-1)

Pentylamine (2.69 ml, 23.2 mmol), potassium carbonate (2.14 g, 15.5 mmol) and sodium iodide (2.30 g, 15.3 mmol) were added to a solution of 2-(1-adamantyl)ethyl methanesulfonate (2.07 g, 8.01 mmol) in ethanol (45.8 ml), and the mixture was refluxed for 17 hours. The reaction mixture was concentrated under reduced pressure, and the concentrate was diluted with chloroform (100 ml). This was washed with a 1 N aqueous sodium hydroxide solution (100 ml) and a saturated aqueous sodium chloride solution (100 ml) successively, and the organic layer was dried over magnesium sulfate. The solvent was evaporated under reduced pressure, and the residue was purified by silica gel column chromatography. A 4 N solution of hydrogen chloride in ethyl acetate (3.1 ml) was added to a solution of the resulting free form (1.52 g, 6.10 mmol) of the titled compound in ethyl acetate (0.50 ml). The precipitated solid was washed with ethyl acetate and filtered off to give 1.33 g (60%) of the titled compound.

[D] Pharmacological Test

Inhibitory effects on TNF- α production induced by lipopolysaccharide (LPS) stimulation were studied by in vivo tests according to the method of Tsuji et al. (Inflamm. res. 46 (1997) 193-198).

Female rats (five per group), body weight of about 200 g, about eight weeks old, were used as test animals. LPS from *Salmonella* was dissolved in physiological saline to prepare an LPS solution (1 mg/ml). Each test substance was dissolved or uniformly suspended in a 1% methylcellulose solution to give test substance-

preparation liquids.

The above-mentioned LPS solution (0.5 ml/kg) was administered to a footpad of the rat. Immediately after the LPS administration, the test substance-preparation liquid (containing 10 mg/kg or 3 mg/kg test substance) was orally administered. Two hours after the LPS administration, blood was collected from abdominal aorta and was centrifuged at 4°C and 3000 rpm for ten minutes. TNF- α levels in the obtained plasma were measured with a rat TNF- α -specific ELISA kit. TNF- α was not observed in the plasma with respect to an LPS-non-administered group (control).

Inhibition rates of TNF- α production of the test substances were determined by the following equation.

$$\text{Inhibition rate (\%)} = [(A - B) / A] \times 100$$

A: TNF- α level in plasma of test substance-nonadministered group

B: TNF- α level in plasma of test substance-administered group

(Results)

Calculating TNF- α production inhibition rates (%) when administered the test substances (10 mg/kg or 3 mg/kg) orally to the rats, many of the present compounds exhibited high inhibition rates of production. Table 1 shows typical test results by oral administration of 10 mg/kg, and Table 2 shows typical test results by oral administration of 3 mg/kg.
