Abstract: An apparatus is provided for sealing of a damaged inflatable article, the apparatus including a container (1) for a sealant compound or composition, the container including at least one inlet means (4) which is releasably attachable to a source of pressurised air/gas, an extraction assembly (10 associated with the container (1), the extraction assembly (10 including an extraction unit having at least one outlet means (18) to be releasably coupled with or connected to the article and means (30) to be disposed within the container (1) and actuateable, upon supply of pressurised air/fluid/gas to the container (1) to allow for controlled dispensing of the sealant compound or composition from the container (1) via the extraction unit (10) to the article to be sealed.
For two-letter codes and other abbreviations, refer to the “Guidance Notes on Codes and Abbreviations” appearing at the beginning of each regular issue of the PCT Gazette.
IMPROVEMENTS IN SEALING APPARATUS

FIELD OF INVENTION

The present invention relates, in general terms, to a method and apparatus for the sealing, or more correctly re-sealing after damage, of an inflatable article. More particularly, but not exclusively, the invention relates to a method and apparatus for use in the sealing of an inflatable tyre, of the type employed in any form of vehicle, as for example an automobile, truck, lorry, van or the like, as well as in motor-cycles, bicycles, etc. Whilst throughout the ensuing description reference will be made to a particular and preferred context of usage of the method and apparatus in accordance with the present invention, namely for the sealing or re-sealing of a punctured or otherwise damaged inflatable tyre for a wheeled vehicle, it must be understood that the invention is not to be considered to be limited to that preferred context of usage. Indeed the method and apparatus in accordance with the present invention could be employed to allow for sealing or re-sealing of any form of inflatable article, regardless of its intended context of usage.

THE PRIOR ART

For any wheeled vehicle or means for travel, there always exists the possibility of damage being sustained by any one or more of the inflatable tyres or the like associated therewith. Such damage can be in the form of the sustaining of a puncture, which allows for gradual if not instantaneous deflation of the relevant tyre, thereby preventing, or at least inhibiting, further movement of the vehicle.

In the past there have been employed a number of methods and means for sealing a leak in a damaged inflatable article, such as a vehicle tyre. In one known method a special sealant mixture or compound can be introduced into a deflated or damaged tyre, as for example via a conventional tyre valve associated therewith, such sealant compound functioning to seal any puncture (or punctures) in the tyre itself, whereby to allow for such tyre to be
subsequently re-inflated to a pressure at which it will be possible to again move
the relevant vehicle, as by driving thereof. The use of such sealant compounds
has been found to provide a temporary repair for a thus damaged tyre or
(tyres), whereby to allow the vehicle to be transported or moved to a location
where a more permanent repair, or actual replacement, can be effected.

In accordance with known practices a suitable sealant compound (of
any known type), as housed within a suitable container therefor, is dispensed
from the container under pressure and then passed into the tyre, via a tyre valve
(again of any known type) invariably associated therewith. This may be
achieved either with, or without, removal of the valve insert. To bring about
such a result means are included to allow for connection of the container to a
source of air or other gas under pressure, as for example a compressor or even
a gas bottle. The principle of operation is that, by increasing the air pressure
within the container, the contents thereof can be dispensed therefrom and
injected into the tyre.

The prior art methods and apparatus have all suffered in terms of their
inability to avoid or prevent altogether the possibility or risk of back-flow of
the sealant compound in the instance of transfer of such compound from its
container to the tyre to be re-inflated being interrupted for any reason,
especially prior to the container being emptied of all its content. A number of
means have been employed in the past in attempts to avoid this possibility of
back-flow, one such involving the utilisation of a conical diaphragm or the like
intended to prevent passage of sealing compound.

The present invention seeks to address the problems associated with the
prior art by providing an apparatus wherein there is substantially no possibility
of back-flow occurring, in the instance of the dispensing of sealing compound
being interrupted in any way. With such an apparatus the integrity of any
means employed for pressurising the container of sealing compound, whereby
to allow for egress of such compound therefrom, is maintained at all times.
OBJECTS OF THE INVENTION

It is an object of the invention to provide a sealing apparatus which may be incorporated into or with a container of tyre puncture sealant compound or composition such that the container and its contents are securely packaged for handling and shipment, and yet are readily accessible for use as and where necessary.

It is a further object of the invention to provide an improved apparatus, for use in the repair/re-sealing of a damaged inflatable article, which is operated by gas/air pressure from an external source but which, upon relaxation of such pressure, is substantially proof against unwanted back-flow of residual sealant compound remaining in said container.

In accordance with one aspect of the present invention there is provided an apparatus for the sealing of an inflatable article, as for example a vehicle tyre or the like, said apparatus including: a container adapted to contain a sealant compound or composition, said container including at least one inlet means adapted to be releasably attachable to a source of pressurised air/gas; an extraction assembly adapted to be associated with said container, said extraction assembly including an extraction unit including at least one outlet means adapted to be releasably coupled or connected to said article to be sealed; and means adapted to be disposed within said container and actuatatable, upon supply of pressurised air/fluid/gas to said container, to allow for transfer/egress of said sealant compound or composition from said container to said article to be sealed.

In accordance with another aspect of the invention there is provided a method for the sealing or re-sealing of a damaged inflatable article, as for example a tyre or the like, employing the apparatus as set out in the preceding paragraph, said method including the steps of: connecting the container to a source of pressurised air/fluid/gas; pressurising said container whereby to allow for controlled egress of said sealant compound or composition therefrom; transporting said sealant compound or compound to said inflatable article; and re-inflating said inflatable article as required.
In accordance with a further aspect of the present invention there is provided an extraction assembly, for use with a container of sealant compound or composition, for the sealing/repair of a damaged inflatable article, said assembly including: an extraction unit which is adapted, in use, to be releasably associated with or connected to a container of said sealant compound or composition, said extraction unit including at least one outlet means which is adapted, in use, to be releasably connected to said inflatable article whereby to allow for flow of said sealant compound or composition from said container, via said extraction unit, into said inflatable article; and means adapted to be disposed within said container, in flow connection with said extraction unit, which is actuable upon supply of pressurised air/fluid/gas to said container to allow for controlled dispensing of said sealant compound or composition therefrom.

With regard to the apparatus the at least one inlet means, in the form of a tyre valve or the equivalent, in an especially preferred embodiment such is adapted to be appropriately disposed in a recess sited at or in the vicinity of a shoulder of the container, and remote from the extraction assembly, with the container itself being in the form of a bottle. It should be realised, however, that such at least one inlet means could, in alternative embodiments, be located at other places on the container or bottle, remote from the extraction assembly. By way of example only, such at least one inlet means may be located in the base of the container, with the base of such container not being substantially flat, but rather being recessed in such a way as to include a plurality of supporting legs.

The extraction assembly is adapted to be releasably attachable to the container, as for example by interaction between mating threaded sections.

The at least one outlet means provided in the extraction assembly is preferably in the form of a duct adapted to protrude laterally of the extraction assembly itself to at least some extent, said duct preferably having, at or in the vicinity of the outer free end thereof, means allowing for ready connection with or to further ducting or tubing, to allow for passage of sealant compound to said article to be sealed. In an especially preferred embodiment one or more
barbs or the like projections may be formed on the outer periphery of the outlet duct, at or in the vicinity of the outer free end thereof, whereby to facilitate connection with a length of tubing or ducting. Alternatively, both the outlet duct and the tube or ducting can have threaded means adapted to be associated therewith.

Preferably the apparatus further includes a sealing means which is adapted, in use, to be associated with said extraction assembly, with or without the interposition of one or more lengths of tubing. The sealing assembly includes, preferably, a cap or the like member including a base and a downwardly dependent spigot adapted to receive or releasably retain a separate sealing means, as for example an O-ring, together with one or more apertures extending therethrough whereby to allow for selective flow of sealant compound into the extraction assembly.

DESCRIPTION OF THE DRAWINGS

In order that the invention may be more clearly understood and put into practical effect, reference will now be made to preferred embodiments of an apparatus in accordance with the invention. The ensuing description is given by way of non-limitative example only and is with reference to the accompanying drawings, wherein:

FIG. 1 is a perspective view of an apparatus in accordance with the present invention, disposed in its preferred "use", or inverted, configuration;

FIG. 2 is a further perspective view similar to FIG. 1;

FIG. 3(a) is a sectional view of a first embodiment of an apparatus in accordance with the present invention, taken along the line 3-3 in FIG. 1;

FIG. 3(b) is a view, similar to FIG. 3(a), of a second embodiment of an apparatus in accordance with the present invention;

FIG. 4 is a sectioned view of a means employed in accordance with the invention to prevent, or substantially eliminate the possibility of, back-flow of sealant compound;

FIG. 5 (from left to right) shows respective bottom and top perspective and exploded views of the arrangement of FIG. 4; and
FIG. 6 is an exploded view of an apparatus in accordance with the present invention, illustrating the principle of operation thereof.

DESCRIPTION OF PREFERRED EMBODIMENTS

There are shown embodiments of an apparatus in accordance with the present invention which functions as a repair kit or set which can be carried, or in some way housed, within a vehicle for ready use in the instance of damage - as by a puncture - being sustained by a tyre of that vehicle. The apparatus includes, as principal components, a pressure-tight container 1 for housing a suitable sealant compound, such container being adapted in use to be releasably connectable to a source of pressurised air or gas, an extraction assembly adapted to be associated with the container 1, and means allowing for controlled dispensing of sealant compound from the container into a damaged tyre as and when necessary. Preferably, although not necessarily, the container 1 is such that, for use, it is disposed in its inverted position, as shown in FIGS. 1 and 2 for example, with the extraction assembly acting as a platform means or stand therefor.

With reference now to the drawings, the container 1 is preferably in the form of a bottle constructed from a suitable material, as for example a plastics material (preferably a recyclable plastics material). The container 1 has a substantially cylindrical neck 2 which, in the preferred embodiments illustrated, is provided with an external threaded section 3. In the especially preferred embodiments illustrated the container 1 further includes, as an integral part thereof, a valve means 4, preferably disposed within a recess 5 located at or in the vicinity of a shoulder 6 of the overall container 1 and remote from the neck 2. The valve means 4, which preferably is in the form of a "conventional" tyre valve (one-way action), allows for ready connection of the container 1 to a source of pressurised air or suitable gas or fluid, whether such be in the form of a bottle or the like container holding the air/gas or other fluid at an elevated pressure, or alternatively in the form of a compressor or the like (not shown), which may be either installed as part of the overall vehicle or stored separately for use as and when required.
As to the actual contents of the container 1, such does not constitute part of the invention. Any suitable compound having known sealing properties may be utilised. In an especially preferred embodiment, however, the sealing compound will not be latex-based.

The apparatus further includes an extraction assembly, which includes as one component an extraction unit generally designated 10, which is substantially cylindrical in cross-section and of a size and overall shape which is substantially complementary to that of the neck 2 of the container 1. The extraction unit 10 is also preferably formed from a suitable plastics material, as for example by moulding. It should be realised, however, that neither the material of construction nor the method of formation of both the container 1 and the extraction unit 10 constitutes part of the invention.

In the preferred embodiments illustrated the apparatus also includes means which can facilitate transport and/or storage thereof. Such may include a handle 7, constructed preferably of a suitable plastics material, which may preferably be releasably attachable to the extraction unit 10. The handle 7, of a substantial L-shape, may include an aperture at or in the vicinity of the end of one arm thereof, such aperture being adapted, in use, to have disposed therethrough a shaped stud or the like projecting member 8 formed on the outer periphery of the extraction unit 10. The handle 7 further includes a section 9 of reduced thickness at or in the vicinity of the said aperture, such acting as a hinge whereby to allow for folding of the handle 7 to facilitate storage of the overall apparatus when not in use.

The extraction assembly itself, as a first principal component, an extraction unit 10 which includes a first substantially cylindrical section 11 having a series or plurality of internal threads 12 provided therein, such threads 12 being of a size and shape complementary to those provided on the exterior of the neck 2 of the container, to allow for engagement with the threaded section 3 of the neck 2 of the container 1. Preferably the neck 2 of the container 1 and the first section 11 of the extraction unit 10 are of substantially the same length.
The extraction unit further includes, at the free end thereof opposite to the first section 11, a second substantially cylindrical section 13 which, in use, provides a support base or pedestal and thereby allows for the overall apparatus to be supported on any given surface, in the configuration or disposition shown in FIGS. 1, 2, 3(a), 3(b) and 6. Extending transversely of the extraction unit 10, at or in the vicinity of the junction of sections 11 and 13, is a transverse plate or wall 14 which has, disposed substantially centrally thereof and extending upwardly therefrom in the direction of the first section 11, a substantially hollow tubular duct 15. Preferably the duct 15 will be of a length sufficient to project beyond the uppermost extremity of the first section 11 of the extraction unit 10 and therefore into the main body of the container 1. The plate or wad 14 further includes a plurality of circumferential, spaced-apart beads or the like 16 and 17, with bead 16 functioning to facilitate location of the extraction unit 10 relative to threaded neck 2 of the container 1 as shown, for example, in FIGS. 3(a) and 3(b).

In the preferred embodiments illustrated the duct 15 extends downwardly into a hollowed-out lower section of the extraction unit 10, merging into an outlet duct 18 which, in a manner to be explained later, allows for passage of sealant compound from the container 1 to the article to be sealed, as and when desired. Preferably the outlet duct 18 will have, at its outermost free end which projects outwardly from the extraction unit 10 as shown, means allowing for connection to a length of hose or tubing (not shown) via which the overall apparatus (container 1 and associated extraction assembly) can be connected as and when required to an article to be sealed. Preferably the free end of the outlet duct 18 is provided with a portion 19 of greater or enlarged outside diameter, with one or more barbs or the like elements 20 being formed on and extending at least partially around the external surface thereof, to assist in releasably retaining a length of hose or tubing thereon. In one alternative arrangement the free end of the outlet duct 18 may be threaded, to allow for releasable connection to a complementary configured length of hose or tube, in turn to be connected to the article to be sealed.
To allow for controlled dispensing of sealant compound from the container 1 and also to minimise, if not remove altogether, the possibility of back-flow of sealant compound, the apparatus in accordance with the invention further includes a dip-tube assembly, generally designated 30, which is adapted to be housed or located within the container 1 and to be in flow connection with the duct 15 of the extraction unit 10 of the extraction assembly. In an especially preferred embodiment - see for example Fig. 3(a) - the dip-tube assembly 30 takes the form of a length of tubing 31 adapted, in use, to have one end thereof disposed over the duct 15, and to extend along substantially the height dimension of the container 1 itself, with that end of the tubing 31 including a peripheral flange 32 of a dimension such that, as shown in the drawings, when the tubing 31 is in place the outer periphery thereof is in contact with the surface of the plate 14 and the circumferential bead 17 thereof. In the alternative embodiment of Fig 3(b) the dip-tube assembly 30 is in the form of two separate juxtaposed lengths of tubing 31(a) and 31(b), with tubing 31(a) being disposed over the duct 15 of the extraction unit 10, and the second length of tubing 31(b) being disposed, in a pressure-type fit, over the free end of said first length of tubing 31(a). To triat end, and as shown in FIG. 3(b), in the vicinity of the free end of the first length of tubing 31(a) there is provided a section 33 of a reduced external diameter. In each instance, at the free end of the tubing 31, as shown in FIG. 3(a), or tubing 31(a), as shown in FIG. 3(b), there is provided a sealing assembly, generally designated 40. In a further alternative embodiment, not shown, the sealing assembly 40 may be disposed directly on and over the free end of the duct 15, without interposition of any tubing.

As to the sealing assembly 40, such takes the form of a cap member 41 which is adapted to be releasably associated with or attachable to a peripheral flange 34 provided at the free end of the tubing 31, 31(b). In the especially preferred embodiment illustrated the cap 41 takes the form of a substantially cylindrical member having a substantially flat base 42 and a peripheral skirt 43 depending downwardly therefrom. The base 42 includes, disposed substantially centrally thereof, a downwardly directed spigot 44, which is
substantially cylindrical in shape but with adjacent or contiguous sections of different external diameter, with a shoulder 45 formed therebetween. The base 42 further includes one or more apertures 46, preferably disposed symmetrically relative to the downwardly depending spigot 44. The sealing assembly 40 preferably further includes an O-ring seal 47 or the like sealing member, of any suitable material as for example rubber, which is adapted in use to be disposed within the sealing assembly 40, to "sit" against the shoulder 45, as shown in FIG. 4.

The principle of operation of the overall apparatus will now be explained in more detail, with particular reference to FIG. 6.

When it is desired to re-seal a punctured tyre the container 1 (with sealant compound resident therein) is first connected to a source of pressurized air/gas/ fluid, via the valve 4 and appropriate tubing. Further tubing is then connected to the outlet duct 18 of the extraction unit 10, and from there to the tyre itself. When air or other gas, under pressure, is injected into the container 1, as represented diagrammatically by the full arrows (➡️) in FIG. 6, the internal pressure increases within the container 1 and acts to force the O-ring seal 47 to slide off the spigot 44, away from the shoulder 45 and along the tube 31, 31(a), thereby allowing the sealant compound, as represented diagrammatically by the open arrows, to flow from the container 1, through the apertures 46 provided in the base 42 of cap member 41, into the dip-tube 31, 31(a), along the dip-tube length and then through duct 15 into outlet duct 18 of the extractor unit 10, for subsequent injection into the tyre itself.

The sealing mechanism may, in practice, be placed on the end of the dip-tube 31 or, in an alternative arrangement, may be located directly into the first section 11 of the extraction unit. This will mean that the container may be capable of being emptied even in the inverted position.

The present applicant's arrangement allows for the container 1 to be used, in an inverted or upright position, and yet still be emptied. Further, the present arrangement functions to substantially remove the risk of back-flow of sealant compound into the source of pressurised air or other gas. If transfer of sealant compound is interrupted before the container is emptied, the dip-tube
with associated sealing means acts to prevent back-flow, in that once the pressure within the container reduces, then the O-ring seal will move back into position on the shoulder 45 of spigot 44, preventing further egress of sealant compound through the apertures 46 of cap member 41.

In a further preferred embodiment, not shown, the extraction assembly may be in the form of an apparatus of a known type, as shown for example in U.S. Patent No. 4,308,766, which includes both a tyre valve core remover (and subsequent replacer), as well as an injection means for injecting a liquid tyre sealant composition into an inflatable tyre.

Finally, it is to be understood that the foregoing description refers merely to preferred embodiments of the invention, and that variations and modifications will be possible thereto without departing from the spirit and scope of the invention, the ambit of which is to be determined from the following claims.
CLAIMS

1. An apparatus for the sealing of inflatable articles, said apparatus including: a container adapted to contain a sealant compound or composition, said container including at least one inlet means adapted to be releasably attachable to a source of pressurised air/gas; an extraction assembly adapted to be associated with said container, said extraction assembly including an extraction unit including at least one outlet means adapted to be releasably coupled with or connected to said article to be sealed, and means adapted to be disposed within said container and actutable, upon supply of pressurised air/fluid/gas to said container, to allow for controlled dispensing of said sealant compound or composition from said container via said extraction unit to said article to be sealed.

2. The apparatus as claimed in claim 1, wherein the pressure source is an air compressor with which air under pressure can be introduced into the container via said at least one inlet means, wherein said at least one inlet means is a one-way valve associated with said container.

3. The apparatus as claimed in claim 2, wherein said pressure source is at least one bottle or the like container of pressurized air/gas, adapted to be releasably connectable to said container via said at least one inlet means, and wherein said at least one inlet means includes a one-way valve.

4. The apparatus as claimed in claim 3, wherein said extraction unit is provided with a standing or supporting surface at the end thereof remote from said container.

5. The apparatus as claimed in claim 4, wherein said container is a bottle or the like which includes a neck portion extending substantially normally from
the top thereof, said neck portion being disposed substantially centrally of said top of said container.

6. The apparatus as claimed in claim 5, wherein said neck portion has a plurality of external threads extending along at least part of the length dimension thereof.

7. The apparatus as claimed in claim 6, wherein said extraction unit is releasably connectable to said neck portion of said container.

8. The apparatus as claimed in claim 7, wherein said extraction unit includes a plurality of internal threads extending along at least part of the length dimension thereof, said extraction unit being of a substantially cylindrical shape when viewed in cross-section.

9. The apparatus as claimed in claim 8, wherein said extraction unit is of a unitary construction and includes, at a position intermediate the ends thereof, a wall or closure means extending laterally thereof, said wall or closure means dividing said extraction unit into two sections, a first section adapted, in use, to be disposed within said neck portion of said container, and a second section adapted, in use, to extend or project from the neck portion of said container.

10. The apparatus as claimed in claim 9 wherein said first section includes, disposed substantially centrally thereof and in flow connection with an aperture extending through said wall or closure means, a hollow cylindrical protrusion of a length at least the equivalent of the length of said first section, said protrusion being adapted, in use, to extend into said container.

11. The apparatus as claimed in claim 10 wherein said second section includes an outlet duct or means, in flow connection with said aperture of said wall or closure means, projecting transversely of said extraction unit, said outlet duct or means including means allowing for releasable connection with
tubing, hosing or the like to allow for passage therethrough of the contents of said container.

12. The apparatus as claimed in claim 11, wherein said container is manufactured from a plasies material.

13. The apparatus as claimed in claim 12, wherein said extraction unit is of a unitary construction and is manufactured from a plasies material.

14. The apparatus as claimed in either claim 12 or claim 13, wherein said plasies material is a recyclable plasies material.

15. The apparatus as claimed in claim 11, wherein the free end of said outlet duct or means is chamfered.

16. The apparatus as claimed in claim 15, wherein the extraction unit includes an at least substantially cylindrical connection section, with a pedestal section adjoining the end of said connection section, with the side of said pedestal section remote from said container being formed as a standing surface.

17. The apparatus as claimed in claim 16, wherein a filling line is adapted to be connected to said outlet duct or means of said second section of said extraction unit, said filling line being capable of being coupled to a valve of the article to be sealed.

18. The apparatus as claimed in claim 16, wherein said filling line is a hose.

19. The apparatus as claimed in claim 18, wherein said dispensing means is adapted in use to be disposed within said container and to be in flow connection with said hollow protrusion of said first section of said extraction unit, said dispensing means being in the form of a length of tubing having a
flow control assembly associated with the free end thereof remote from said extraction unit.

20. The apparatus as claimed in claim 19, wherein said flow control assembly includes: a substantially cylindrical cap-like member adapted to be mounted on/associated with said free end of said tubing, said cap-like member including a base having a peripheral skirt extending therefrom, said base including a spigot disposed substantially centrally thereof, and a sealing means adapted, in use, to be associated with said spigot, and wherein said base includes opposed apertures extending therethrough to allow for directional flow of said sealant compound or composition.

21. The apparatus as claimed in claim 20, wherein said spigot, projecting normally of said base of said cap-like member, includes juxtaposed lengths of different diameter, with a shoulder at the line of juncture thereof, and wherein a sealing means, preferably in the form of an O-ring, is movable under pressure into and out of engagement with said shoulder, whereby to control flow of sealant compound into said tubing.

22. An extraction assembly, for use with a container of sealant compound or composition, for the sealing/repair of a damaged inflatable article, said assembly including: an extraction unit which is adapted, in use, to be releasably associated with or connected to a container of said sealant compound or composition, said extraction unit including at least one outlet means which is adapted, in use, to be releasably connected to said inflatable article whereby to allow for flow of said sealant compound or composition from said container, via said extraction unit, into said inflatable article; and means adapted to be disposed within said container, in flow connection with said extraction unit, which is actutable upon supply of pressurised air/fluid/gas to said container to allow for controlled dispensing of said sealant compound or composition therefrom.
23. The extraction assembly as claimed in claim 22, wherein said extraction unit is provided with a standing or supporting surface at one end thereof, being that end which is, in use, remote from said container.

24. The extraction assembly as claimed in claim 23, wherein said container is a bottle or the like which includes a neck portion extending substantially normally from the top thereof, said neck portion being disposed substantially centrally of said top of said container.

25. The extraction assembly as claimed in claim 24, wherein said neck portion has a plurality of external threads extending along at least part of the length dimension thereof.

26. The extraction assembly as claimed in claim 25, wherein said extraction unit is releasably connectable to said neck portion of said container.

27. The extraction assembly as claimed in claim 26, wherein said extraction unit includes a plurality of internal threads extending along at least part of the length dimension thereof, said extraction unit being of a substantially cylindrical shape when viewed in cross-section.

28. The extraction assembly as claimed in claim 27, wherein said extraction unit is of a unitary construction and includes, at a position intermediate the ends thereof, a wall or closure means extending laterally thereof, said wall or closure means dividing said extraction unit into two sections, a first section adapted, in use, to be disposed within said neck portion of said container, and a second section adapted, in use, to extend or project from the neck portion of said container.

29. The extraction assembly as claimed in claim 28 wherein said first section includes, disposed substantially centrally thereof and in flow connection with an aperture extending through said wall or closure means,
hollow cylindrical protrusion of a length at least the equivalent of the length of said first section, said protrusion being adapted, in use, to extend into said container.

30. The extraction assembly as claimed in claim 29 wherein said second section includes an outlet duct or means, in flow connection with said aperture of said wall or closure means, projecting transversely of said extraction unit, said outlet duct or means including means allowing for releasable connection with tubing, hosing or the like to allow for passage therethrough of the contents of said container.

31. The extraction assembly as claimed in claim 30, wherein said container is manufactured from a plastics material.

32. The extraction assembly as claimed in claim 31, wherein said extraction unit is of a unitary construction and is manufactured from a plastics material.

33. The extraction assembly as claimed in either claim 31 or claim 32, wherein said plastics material is a recyclable plastics material.

34. The extraction assembly as claimed in claim 33, wherein the free end of said outlet duct or means of said extraction unit is chamfered.

35. The extraction assembly as claimed in claim 34, wherein the extraction unit includes an at least substantially cylindrical connection section, with a pedestal section adjoining the end of said connection section, with the side of said pedestal section remote from said container being formed as a standing surface.

36. The extraction assembly as claimed in claim 35, wherein a filling line is adapted to be connected to said outlet duct or means of said second section of
said extraction unit, said filling line being capable of being coupled to a valve of the article to be sealed.

37. The extraction assembly as claimed in claim 36, wherein said filling line is a hose.

38. The extraction assembly as claimed in claim 37, wherein said dispensing means is adapted in use to be disposed within said container and to be in flow connection with said hollow protrusion of said first section of said extraction unit, said dispensing means being in the form of a length of tubing having a flow control assembly associated with the free end thereof remote from said extraction unit.

39. The extraction assembly as claimed in claim 38, wherein said flow control assembly includes: a substantially cylindrical cap-like member adapted to be mounted on/associated with said free end of said tubing, said cap-like member including a base having a peripheral skirt extending therefrom, said base including a spigot disposed substantially centrally thereof, and a sealing means adapted, in use, to be associated with said spigot, and wherein said base includes opposed apertures extending therethrough to allow for directional flow of said sealant compound or composition.

40. The extraction assembly as claimed in claim 39, wherein said spigot, projecting normally of said base of said cap-like member, includes juxtaposed lengths of different diameter, with a shoulder at the line of juncture thereof, and wherein a sealing means, preferably in the form of an O-ring, is movable under pressure into and out of engagement with said shoulder, whereby to control flow of sealant compound into said tubing.

41. The extraction assembly as claimed in claim 40, wherein said container includes at least one outlet means which is adapted to be releasably attached to a source of pressurised air/gas.
42. The extraction assembly as claimed in claim 41, wherein the pressure source is an air compressor with which air under pressure can be introduced into the container via said at least one inlet means, wherein said at least one inlet means is a one-way valve associated with said container.

43. The extraction assembly as claimed in claim 42, wherein said pressure source is at least one bottle or the like container of pressurized air/gas, adapted to be releasably connectable to said container via said at least one inlet means, and wherein said at least one inlet means includes a one-way valve.

44. A flow control assembly for ensuring controlled one-directional flow of a sealant compound or composition from a container thereof, said assembly including:

- a length of tubing or the like adapted, in use, to be located within said container and in flow connection with an extraction unit as claimed in claim 22;
- a substantially cylindrical cap-like member to be mounted on the free end of said tubing or the like, said cap-like member including a base having a peripheral skirt extending therefrom and further including a spigot disposed substantially centrally of said base and depending downwardly and substantially normally thereof, and a sealing means associated with said spigot, wherein said base includes apertures extending therethrough to allow for directional flow of said sealant compound or composition.

Int. Cl.
**B29C 73/02** (2006.01)

According to International Patent Classification (IPC) or to both national classification and IPC

#### B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

**DWPI - DPC B29C 73/02, B29C 67/10, B60C 25/16 & Keywords (controB- or regulat+) or valv+ or spigot+)**

#### C. DOCUMENTS CONSIDERED TO BE RELEVANT

<table>
<thead>
<tr>
<th>Category*</th>
<th>Citation of document, with indication, where appropriate, of the relevant passages</th>
<th>Relevant to claim No.</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>EP 0867494 A (DUNLOP GMBH) 30 September 1998 Whole document and in particular: column 5 line 45-column 7 line 23, claims 9-10</td>
<td>1-8, 22-27</td>
</tr>
<tr>
<td>A</td>
<td>US 2004/0000365 A (ECKHARDT) 1 January 2004 Whole document</td>
<td>1-44</td>
</tr>
<tr>
<td>A</td>
<td>WO 2003/041949 A (ACTIVE TOOLS A/S) 22 May 2003 Whole document</td>
<td>1-44</td>
</tr>
<tr>
<td>A</td>
<td>US 4308766 A (MEYERS JR) 5 January 1982 Whole document</td>
<td>1-44</td>
</tr>
</tbody>
</table>

* Further documents are listed in the continuation of Box C

| X | See patent family annex |

<table>
<thead>
<tr>
<th>Category*</th>
<th>Special categories of cited documents</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;A&quot;</td>
<td>document defining the general state of the art which is not considered to be of particular relevance</td>
</tr>
<tr>
<td>&quot;E&quot;</td>
<td>earlier application or patent but published on or after the international filing date</td>
</tr>
<tr>
<td>&quot;L&quot;</td>
<td>document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)</td>
</tr>
<tr>
<td>&quot;O&quot;</td>
<td>document referring to an oral disclosure, use, exhibition or other means</td>
</tr>
<tr>
<td>&quot;P&quot;</td>
<td>document published prior to the international filing date but later than the priority date claimed</td>
</tr>
<tr>
<td>&quot;T&quot;</td>
<td>later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention</td>
</tr>
<tr>
<td>&quot;X&quot;</td>
<td>document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art</td>
</tr>
<tr>
<td>&quot;&amp;&quot;</td>
<td>document member of the same patent family</td>
</tr>
</tbody>
</table>

**Date of the actual completion of the international search**
02 November 2006

**Date of mailing of the international search report**
21 NOV 2006

**Name and mailing address of the ISA/AU**
AUSTRALIAN PATENT OFFICE
PO BOX 200, WODEN ACT 2606, AUSTRALIA
E-mail address: pct@ipaustralia.gov.au
Facsimile No. (02) 6285 3929

**Authorized officer**

**SERINE SAMUEL**
Telephone No: (02) 6283 2382

Form PCT/ISA/210 (second sheet) (April 2005)
This Annex lists the known "A" publication level patent family members relating to the patent documents cited in the above-mentioned international search report. The Australian Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
