## IMIDAZOPYRIDAZINES AS AKT KINASE INHIBITORS

**Field of application of the invention**

- 5 The invention relates to substituted Imidazopyridazines, a process for their production and the use thereof.

**Known technical background**

- 10 Cancer is the second most prevalent cause of death in the United States, causing 450,000 deaths per year. While substantial progress has been made in identifying some of the likely environmental and hereditary causes of cancer, there is a need for additional therapeutic modalities that target cancer and related diseases. In particular there is a need for therapeutic methods for  
15 treating diseases associated with dysregulated growth / proliferation.

Cancer is a complex disease arising after a selection process for cells with acquired functional capabilities like enhanced survival / resistance towards apoptosis and a limitless proliferative potential. Thus, it is preferred to develop drugs for cancer therapy addressing distinct features of established tumors.

- 20 One pathway that has been shown to mediate important survival signals for mammalian cells comprises receptor tyrosine kinases like platelet-derived growth factor receptor (PDGF-R), human epidermal growth factor 2/3 receptor (HER2/3), or the insulin-like growth factor 1 receptor (IGF-1R). After activation the respective by ligand, these receptors activate the phosphatidylinositol 3-kinase (PI3K)/Akt pathway. The phosphatidylinositol 3-kinase (PI3K)/Akt protein  
25 kinase pathway is central to the control of cell growth, proliferation and survival, driving progression of tumors. Therefore within the class of serine-threonine specific signalling kinases, Akt (protein kinase B; PKB) with the isoenzymes Akt1 (PKB $\alpha$ ), Akt2 (PKB  $\beta$ ) and Akt3 (PKB  $\gamma$ ) is of high interest for therapeutic  
30 intervention. Akt is mainly activated in a Pi3-kinase dependent manner and the activation is regulated through the tumor suppressor PTEN (phosphatase and tensin homolog), which works essentially as the functional antagonist of Pi3K.

The PI3K/Akt pathway regulates fundamental cellular functions (e.g. transcription, translation, growth and survival), and is implicated in human diseases including diabetes and cancer. The pathway is frequently overactivated in a wide range of tumor entities like breast and prostate carcinomas. Upregulation can be due to overexpression or constitutively activation of receptor tyrosine kinases (e.g. EGFR, HER2/3), which are upstream and involved in its direct activation, or gain- or loss-of-function mutants of some of the components like loss of PTEN. The pathway is targeted by genomic alterations including mutation, amplification and rearrangement more frequently than any other pathway in human cancer, with the possible exception of the p53 and retinoblastoma pathways. The alterations of the PI3K/Akt pathway trigger a cascade of biological events, that drive tumor progression, survival, angiogenesis and metastasis.

Activation of Akt kinases promotes increased nutrient uptake, converting cells to a glucose-dependent metabolism that redirects lipid precursors and amino acids to anabolic processes that support cell growth and proliferation. These metabolic phenotype with overactivated Akt lead to malignancies that display a metabolic conversion to aerobic glycolysis (the Warburg effect). In that respect the PI3K/Akt pathway is discussed to be central for survival despite unfavourable growth conditions such as glucose depletion or hypoxia.

A further aspect of the activated PI3K/Akt pathway is to protect cells from programmed cell death ("apoptosis") and is hence considered to transduce a survival signal. By acting as a modulator of anti-apoptotic signalling in tumor cells, the PI3K/Akt pathway, particularly Akt itself is a target for cancer therapy. Activated Akt phosphorylates and regulates several targets, e.g. BAD, GSK3 or FKHRL1, that affect different signalling pathways like cell survival, protein synthesis or cell movement. This PI3K/Akt pathway also plays a major part in resistance of tumor cells to conventional anti-cancer therapies. Blocking the PI3K/Akt pathway could therefore simultaneously inhibit the proliferation of tumor cells (e.g. via the inhibition of the metabolic effect) and sensitize towards pro-apoptotic agents.

Akt inhibition selectively sensitized tumor cells to apoptotic stimuli like Trail, Camptothecin and Doxorubicin. Dependent on the genetic background /

molecular apperations of tumors, Akt inhibitors might induce apoptotic cell death in monotherapy as well.

Thus Akt seems to be a suitable target for the treatment of cancer.

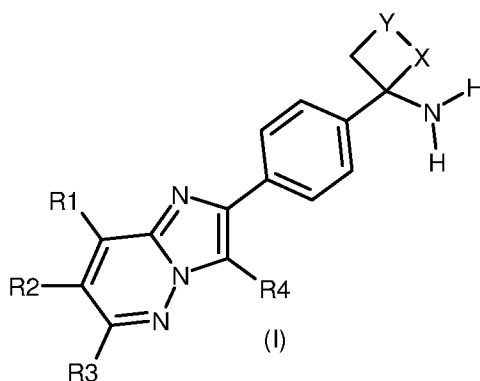

Various publications exist relating to Akt inhibiting compounds such as e.g. WO  
 5 2009/148887, WO 2009/148916, WO2010104933, WO2010114780,  
 WO2011033265.

In a recent disclosure, Y. Li et al (Bioorg. Med. Chem. Lett. 2009, 19, 834-836 and cited references therein) detail the difficulty in finding optimal Akt inhibitors. The potential application of Akt inhibitors in multiple disease settings, such as  
 10 for example, cancer, makes the provision of new Akt inhibitors to those currently available highly desirable.

### Description of the invention

15 A solution to the above problem is the provision of alternative Akt inhibitors. It has now been found that the new Imidazopyridazine compounds, which are described in detail below, are Akt inhibitors suitable for the treatment of cancer..

The compounds according to the invention and their salts can exist in the form of tautomers which are included in the embodiments of the invention.

10

The compounds of the invention may, depending on their structure, exist in different stereoisomeric forms. These forms include configurational isomers or optionally conformational isomers (enantiomers and/or diastereoisomers including those of atropisomers). The present invention therefore includes enantiomers, diastereoisomers as well as mixtures thereof. From those mixtures of enantiomers and/or diastereoisomers pure stereoisomeric forms can be isolated with methods known in the art, preferably methods of chromatography, especially high pressure liquid chromatography (HPLC) using achiral or chiral phase. The invention further includes all mixtures of the stereoisomers mentioned above independent of the ratio, including the racemates.

20

Some of the compounds and salts according to the invention may exist in different crystalline forms (polymorphs) which are within the scope of the invention.

25

Furthermore, derivatives of the compounds of formula (I) and the salts thereof which are converted into a compound of formula (I) or a salt thereof in a biological system (bioprecursors or pro-drugs) are covered by the invention. Said biological system is e.g. a mammalian organism, particularly a human subject. The bioprecursor is, for example, converted into the compound of formula (I) or a salt thereof by metabolic processes.

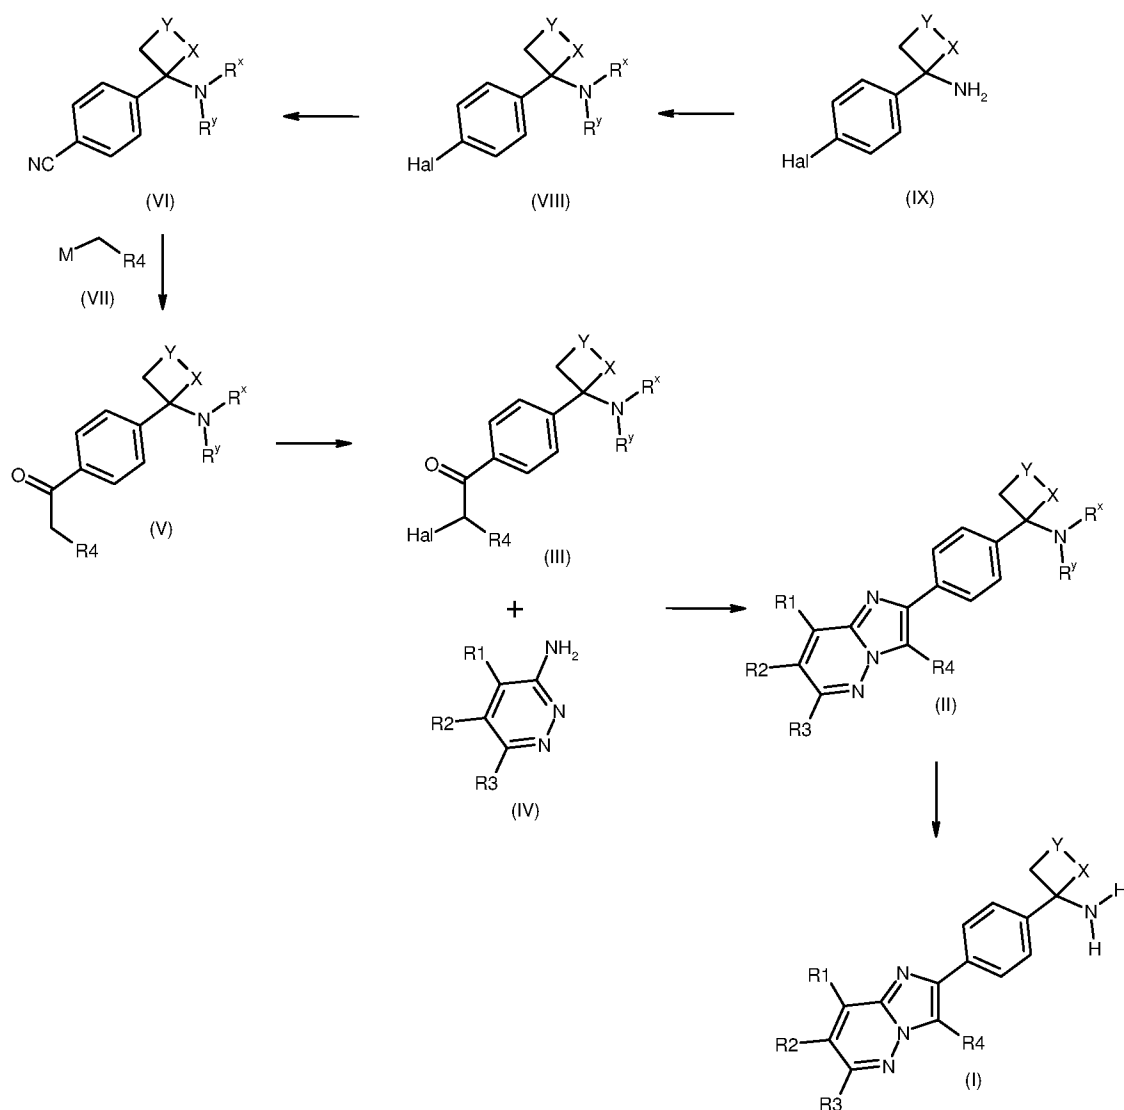

30

The intermediates used for the synthesis of the compounds of claims 1-5 as described below, as well as their use for the synthesis of the compounds of claims 1-5, are one further aspect of the present invention. Preferred intermediates are the Intermediate Examples as disclosed below.

**The compounds according to the invention can be prepared as follows.**

The compounds according to the invention can be prepared according to the following scheme,

5 **Scheme 1:**

wherein X, Y, R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub> and R<sub>4</sub> have the meanings defined above, whereby R<sub>x</sub> R<sub>y</sub> is R<sub>6</sub>, or a protecting group,; Hal is halogen, preferably M is Mg-Hal, Zn-Hal, or Li.

Compounds of general formula (I) may be prepared from compounds of general formula (II). Rx may optionally be R6, or a protecting group, or other such precursor which requires further manipulation.

The use of amine protecting groups in organic synthesis is well known to persons practiced in the art. Amine protecting groups include, but are not limited to:

- carbamate protecting groups, including, but not limited to methyl carbamate, ethyl carbamate, 9-fluorenylmethyl carbamate, (Fmoc), tert-butyl carbamate (BOC), allyl carbamate, and benzyl carbamate (CBZ) including benzyl carbamates substituted on the phenyl ring,
- amide protecting groups, including, but not limited to N-formyl amide, and N-acetyl amide,
- N-benzyl amine protecting groups, including N-benzyl amines substituted on the phenyl ring.

When Rx and Ry of the compound of formula (I) are both hydrogen, Rx of the compound of formula (II) may be a protecting group and Ry of the compound of formula (II) may be hydrogen, the same protecting group as Rx, or a different protecting group, or Rx and Ry may combine to make a cyclic imide protecting group, such as an N-phthaloyl protecting group.

An amine protecting group may be reacted with a suitable reagent to remove the protecting group and replace it with a hydrogen. Such suitable reagents include, but are not limited to:

- acid reagents, include, but are not limited to hydrochloric acid, acetic acid, trifluoroacetic acid, methanesulfonic acid, trifluoromethanesulfonic acid, sulfuric acid, boron tribromide; acid reagents may be used for the removal of tert-butyl carbamate, N-formyl amide, or N-acetyl amide or protecting groups.
- base reagents, include, but are not limited to lithium hydroxide, potassium hydroxide, sodium hydroxide, caesium carbonate, ammonium hydroxide; base reagents may be used for the removal of methyl carbamate, 9-fluorenyl carbamate, ethyl carbamate, N-formyl amide, or N-acetyl amide protecting groups.

- nucleophilic reagents, include, but are not limited to lithium iodide, sodium iodide, potassium iodide, trimethylsilyl iodide, hydrazine, nucleophilic reagents may be used for the removal of benzyl carbamate, N-formyl amide, N-acetyl amide, or N-phthaloyl protecting groups.
- 5 • metal-mediated reagents, including, but are not limited to nickel reagents, palladium reagents, platinum reagents may be used for the removal of allyl carbamate protecting groups.
- reduction reagents, include, but are not limited to sodium in ammonia, or the combination of a hydrogen source, such as, but not limited to  
10 hydrogen gas, formic acid, or a salt of formic acid and a metal reagent, including, but not limited to a nickel reagent, palladium reagent, platinum reagent; reduction reagents may be used for the removal of 9-fluorenylmethyl carbamate, benzyl carbamate, or N-benzyl amine protecting groups.

15

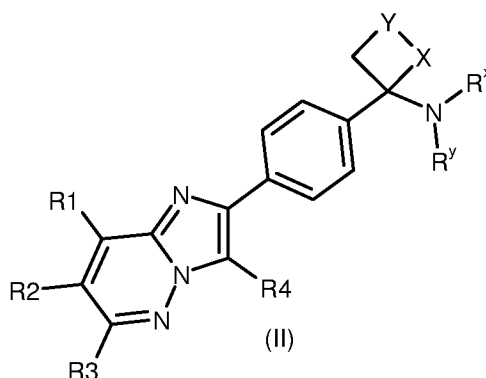

For example, Rx in compounds of general formula (II) may be a protecting group such as the Boc group,  $-\text{CO}(\text{OtBu})$ . Preparation of compounds of general formula (I) may thus be accomplished by use of an appropriate deprotection reaction, such as in the case of a Boc group, acidic reaction conditions, for  
20 example, with a solution of 4M hydrochloric acid in dioxane or trifluoromethanesulfonic acid, in an appropriate solvent, such as for example DCM and methanol, at ambient temperature. Further conditions to deprotect the Boc group, or further protecting groups that may be suitable for use in blocking the amino functionality in compounds of general formula (II), including their  
25 synthesis and deprotection, are found, for example, in T. W. Greene, Protective Groups in Organic Synthesis, John Wiley & Sons, 1999, 3rd Ed., or in P. Kocienski, Protecting Groups, Thieme Medical Publishers, 2000. Similarly, when Ry is not H, then Ry is a protecting group, such as for example when Rx and Ry together form a cyclic protecting group such as for example a phthalamide.

30

Furthermore, compounds of general formula (II) may contain functionality that may itself be further modified, thus allowing introduction of the desired functionality in the R1, R2 or R3 groups. Such transformations include

oxidations, reductions, nucleophilic substitutions, electrophilic substitutions, radical reactions, or metal promoted reactions such as metal assisted cross-coupling reactions, such as for example Suzuki, Stille, or Heck reactions, or the like. Similarly, compounds of general formula (I) may also be modified in this way to provide further compounds according to the invention, providing the transformations do not cause unwanted side reactions at the  $-NHR_6$  group.

Thus a further aspect of the invention is a process for the manufacture of compounds of general formula (I) according to claim 1 by reacting a compound of general formula (II)

wherein  
 R<sub>1</sub>-R<sub>4</sub> have the meaning as stated in claim 1 and  
 R<sub>x</sub>, R<sub>y</sub> are R<sub>6</sub>, or a protecting group,  
 wherein transformation to a compound of general formula (I) is accomplished by use of an appropriate deprotection reaction, whereby the protecting groups as discussed above can be used.

Another aspect of the invention is a process as disclosed above whereby subsequently of before the deprotection step, further modifications allowing introduction of the desired functionality in the R<sub>1</sub>, R<sub>2</sub> or R<sub>3</sub> groups can be performed.

Compounds of general formula (II) may be prepared from an intermediate ketone of general formula (III) and a heterocyclic amine of general formula (IV), by use of an appropriate cyclisation reaction. For example, compounds of

general formula (II) may be prepared by reacting (III) and (IV) in an appropriate solvent, such as for example DMF or ethanol, at elevated temperatures from 50 °C to 150 °C. The use of basic additives such as a tertiary amine, for example triethylamine, may be beneficial.

5

Compounds of general formula (IV) are either commercially available, may be prepared using the methods described in the examples, may be prepared using known methods, or may be prepared by analogous methods to those known by the person skilled in the art.

10

Compounds of general formula (III) may be prepared from a ketone of general formula (V) by use of an appropriate halogenation reaction. For example in the case of halogen is Br, a suitable bromination reaction, such as for example by reacting a ketone of general formula (V) with pyridinium hydrobromide perbromide in a suitable solvent, such as THF, at suitable temperatures, such as for example from 0 °C to ambient temperature.

15

Compounds of general formula (V) may be prepared from a compound of general formula (VI) using known methods, such as by addition of a suitable organometallic reagent (VII), in a suitable solvent, such as ethereal solvents, for example THF, at low temperatures, for example from -78 °C to -10 °C, preferably from -30 °C to -10 °C. Preferred organometallic reagents are for example organomagnesium reagents in which M is -MgCl or -MgBr, more preferably -MgCl.

25

Compounds of general formula (VI) may be prepared from compounds of general formula (VIII) using known methods, such as by way of a palladium catalysed cyanation reaction, using a suitable catalyst such as tetrakis(triphenylphosphine)palladium(0)[Pd(PPh<sub>3</sub>)<sub>4</sub>], a suitable cyano source, such as zinc dicyanide, a suitable solvent, such as DMF, whereby dry DMF may be beneficial, and elevated temperatures, such as up to the boiling point of the solvent, preferably at 80 °C.

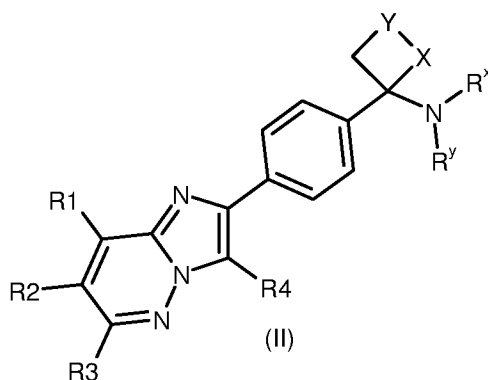

30

Compounds of general formula (VIII) and (IX) are either commercially available, may be prepared using the methods described below, may be prepared using known methods, or may be prepared by analogous methods to those known by the person skilled in the art.

5

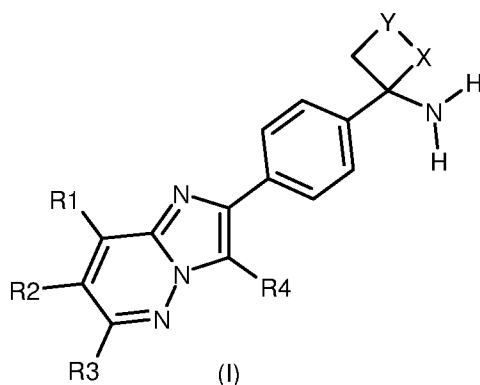

One aspect of the invention are compounds of formula (II), especially wherein Rx is the Boc group,  $-\text{CO}(\text{OtBu})$  and Ry is hydrogen.

Another aspect of the invention is the process for the manufacture of  
10 compounds of general formula (I), characterized in that a compound of formula (II)

15 whereby R1-R4, X and Y have the meaning according to claim 1 and Rx is R6 or a protecting group; Ry is hydrogen or a protecting group, or Rx and Ry together, or Y and Rx together, may form a cyclic protecting group, Hal is halogen,

is reacted with a solution of 4M hydrochloric acid in dioxane or  
20 trifluoromethanesulfonic acid, in an appropriate solvent, such as for example DCM and methanol, at ambient temperature forming a compound of formula (I)

Thus another aspect of the invention is the use of intermediate of formula (II) for the preparation of compounds of formula (I).

5

One preferred aspect of the invention is the process for the preparation of the compounds of claims 1-5 according to the Examples.

It is known to the person skilled in the art that, if there are a number of reactive  
10 centers on a starting or intermediate compound, it may be necessary to block one or more reactive centers temporarily by protective groups in order to allow a reaction to proceed specifically at the desired reaction center. A detailed description for the use of a large number of proven protective groups is found, for example, in T. W. Greene, *Protective Groups in Organic Synthesis*, John  
15 Wiley & Sons, 1999, 3rd Ed., or in P. Kocienski, *Protecting Groups*, Thieme Medical Publishers, 2000.

The compounds according to the invention are isolated and purified in a manner known per se, e.g. by distilling off the solvent in vacuo and recrystallizing the  
20 residue obtained from a suitable solvent or subjecting it to one of the customary purification methods, such as chromatography on a suitable support material. Furthermore, reverse phase preparative HPLC of compounds of the present invention which possess a sufficiently basic or acidic functionality, may result in the formation of a salt, such as, in the case of a compound of the present  
25 invention which is sufficiently basic, a trifluoroacetate or formate salt for example, or, in the case of a compound of the present invention which is sufficiently acidic, an ammonium salt for example. Salts of this type can either

be transformed into its free base or free acid form, respectively, by various methods known to the person skilled in the art, or be used as salts in subsequent biological assays. Additionally, the drying process during the isolation of compounds of the present invention may not fully remove traces of  
5 cosolvents, especially such as formic acid or trifluoroacetic acid, to give solvates or inclusion complexes. The person skilled in the art will recognise which solvates or inclusion complexes are acceptable to be used in subsequent biological assays. It is to be understood that the specific form (e.g. salt, free base, solvate, inclusion complex) of a compound of the present invention as  
10 isolated as described herein is not necessarily the only form in which said compound can be applied to a biological assay in order to quantify the specific biological activity.

Salts of the compounds of formula (I) according to the invention can be obtained  
15 by dissolving the free compound in a suitable solvent (for example a ketone such as acetone, methylethylketone or methylisobutylketone, an ether such as diethyl ether, tetrahydrofuran or dioxane, a chlorinated hydrocarbon such as methylene chloride or chloroform, or a low molecular weight aliphatic alcohol such as methanol, ethanol or isopropanol) which contains the desired acid or  
20 base, or to which the desired acid or base is then added. The acid or base can be employed in salt preparation, depending on whether a mono- or polybasic acid or base is concerned and depending on which salt is desired, in an equimolar quantitative ratio or one differing therefrom. The salts are obtained by filtering, reprecipitating, precipitating with a non-solvent for the salt or by  
25 evaporating the solvent. Salts obtained can be converted into the free compounds which, in turn, can be converted into salts. In this manner, pharmaceutically unacceptable salts, which can be obtained, for example, as process products in the manufacturing on an industrial scale, can be converted  
30 into pharmaceutically acceptable salts by processes known to the person skilled in the art.

Pure diastereomers and pure enantiomers of the compounds and salts according to the invention can be obtained e.g. by asymmetric synthesis, by

using chiral starting compounds in synthesis and by splitting up enantiomeric and diasteriomic mixtures obtained in synthesis.

Enantiomeric and diastereomeric mixtures can be split up into the pure  
5 enantiomers and pure diastereomers by methods known to a person skilled in the art. Preferably, diastereomeric mixtures are separated by crystallization, in particular fractional crystallization, or chromatography. Enantiomeric mixtures can be separated e.g. by forming diastereomers with a chiral auxiliary agent, resolving the diastereomers obtained and removing the chiral auxiliary agent. As  
10 chiral auxiliary agents, for example, chiral acids can be used to separate enantiomeric bases such as e.g. mandelic acid and chiral bases can be used to separate enantiomeric acids via formation of diastereomeric salts. Furthermore, diastereomeric derivatives such as diastereomeric esters can be formed from enantiomeric mixtures of alcohols or enantiomeric mixtures of acids,  
15 respectively, using chiral acids or chiral alcohols, respectively, as chiral auxiliary agents. Additionally, diastereomeric complexes or diastereomeric clathrates may be used for separating enantiomeric mixtures. Alternatively, enantiomeric mixtures can be split up using chiral separating columns in chromatography. Another suitable method for the isolation of enantiomers is the enzymatic  
20 separation.

One preferred aspect of the invention is the process for the preparation of the compounds of claims 1-5 according to the examples.

25 Optionally, compounds of the formula (I) can be converted into their salts, or, optionally, salts of the compounds of the formula (I) can be converted into the free compounds. Corresponding processes are customary for the skilled person.

Optionally, compounds of the formula (I) can be converted into their N-oxides.

30 The N-oxide may also be introduced by way of an intermediate. N-oxides may be prepared by treating an appropriate precursor with an oxidizing agent, such as meta-chloroperoxybenzoic acid, in an appropriate solvent, such as dichloromethane, at suitable temperatures, such as from 0 °C to 40 °C, whereby

room temperature is generally preferred. Further corresponding processes for forming N-oxides are customary for the skilled person.

### Commercial utility

5

The compounds of formula (I) and the stereoisomers of the compounds of formula (I) according to the invention are hereinafter referred to as the compounds of the invention. In particular, the compounds of the invention are pharmaceutically acceptable. The compounds according to the invention have valuable pharmaceutical properties, which make them commercially utilizable. In particular, they inhibit the Pi3K/Akt pathway and exhibit cellular activity. They are expected to be commercially applicable in the therapy of diseases (e.g. diseases dependent on overactivated Pi3K/Akt). An abnormal activation of the PI3K/AKT pathway is an essential step towards the initiation and maintenance of human tumors and thus its inhibition, for example with AKT inhibitors, is understood to be a valid approach for treatment of human tumors. For a recent review see Garcia-Echeverria et al (Oncogene, 2008, 27, 551-5526).

10  
15

Cellular activity and analogous terms in the present invention is used as known to persons skilled in the art, as an example, inhibition of phosphorylation, inhibition of cellular proliferation, induction of apoptosis or chemosensitization.

20

Chemosensitization and analogous terms in the present invention is used as known to persons skilled in the art. These stimuli include, for example, effectors of death receptor and survival pathways as well as cytotoxic / chemotherapeutic and targeted agents and finally radiation therapy. Induction of apoptosis and analogous terms according to the present invention are used to identify a compound which executes programmed cell death in cells contacted with that compound or in combination with other compounds routinely used for therapy.

25

30

Apoptosis in the present invention is used as known to persons skilled in the art. Induction of apoptosis in cells contacted with the compound of this invention might not necessarily be coupled with inhibition of cell proliferation. Preferably,

the inhibition of proliferation and/or induction of apoptosis are specific to cells with aberrant cell growth.

Furthermore, the compounds according to the present invention inhibit protein  
5 kinase activity in cells and tissues, causing a shift towards dephosphorylated substrate proteins and as functional consequence, for example the induction of apoptosis, cell cycle arrest and/or sensitization towards chemotherapeutic and target-specific cancer drugs. In a preferred embodiment, inhibition of the  
10 PI3K/Akt pathway induces cellular effects as mentioned herein, alone, or in combination with standard cytotoxic or targeted anti-cancer drugs.

Compounds according to the present invention exhibit anti-proliferative and/or pro-apoptotic and/or chemosensitizing properties. Accordingly, the compounds of the present invention are useful for the treatment of hyperproliferative  
15 disorders, in particular cancer. Therefore the compounds of the present invention are useful to induce an anti-proliferative and/or pro-apoptotic and/or chemosensitizing effect in mammals, such as humans, suffering from a hyperproliferative disorders, like cancer.

20 The invention further relates to a compound according to the invention or a pharmaceutically acceptable salt thereof, for the treatment and/or prophylaxis, preferably treatment of (hyper)proliferative diseases and/or disorders responsive to induction of apoptosis, which include benign neoplasia and malignant neoplasia, especially malignant neoplasia, including cancer and the tumor types  
25 as disclosed below.

Compounds according to the present invention exhibit anti-proliferative and/or pro-apoptotic properties in mammals such as humans due to inhibition of metabolic activity of cancer cells which are able to survive despite of  
30 unfavourable growth conditions such as glucose depletion, hypoxia or other chemo stress.

Thus, the compounds according to the present invention are useful for treating, ameliorating or preventing diseases of benign or malignant behaviour as described herein, such as e.g. for inhibiting cellular neoplasia.

- 5 Neoplasia in the present invention is used as known to persons skilled in the art. A benign neoplasia is described by hyperproliferation of cells, incapable of forming an aggressive, metastasizing tumor in-vivo. In contrast, a malignant neoplasia is described by cells with multiple cellular and biochemical abnormalities, capable of forming a systemic disease, for example forming  
10 tumor metastasis in distant organs.

The compounds according to the present invention can be preferably used for the treatment of malignant neoplasia. Examples of malignant neoplasia treatable with the compounds according to the present invention include solid  
15 and hematological tumors. Solid tumors can be exemplified by tumors of the breast, bladder, bone, brain, central and peripheral nervous system, colon, endocrine glands (e.g. thyroid and adrenal cortex), esophagus, endometrium, germ cells, head and neck, kidney, liver, lung, larynx and hypopharynx, mesothelioma, ovary, pancreas, prostate, rectum, renal, small intestine, soft  
20 tissue, testis, stomach, skin, ureter, vagina and vulva. Malignant neoplasias include inherited cancers exemplified by Retinoblastoma and Wilms tumor. In addition, malignant neoplasias include primary tumors in said organs and corresponding secondary tumors in distant organs ("tumor metastases"). Hematological tumors can be exemplified by aggressive and indolent forms of  
25 leukemia and lymphoma, namely non-Hodgkins disease, chronic and acute myeloid leukemia (CML / AML), acute lymphoblastic leukemia (ALL), Hodgkins disease, multiple myeloma and T-cell lymphoma. Also included are myelodysplastic syndrome, plasma cell neoplasia, paraneoplastic syndromes, and cancers of unknown primary site as well as AIDS related malignancies.

30

In another aspect of the invention the compounds according to the present invention can be preferably used for the treatment of breast cancer.

It is noted that a malignant neoplasia does not necessarily require the formation of metastases in distant organs. Certain tumors exert devastating effects on the primary organ itself through their aggressive growth properties. These can lead to the destruction of the tissue and organ structure finally resulting in failure of  
5 the assigned organ function and death.

Drug resistance is of particular importance for the frequent failure of standard cancer therapeutics. This drug resistance is caused by various cellular and molecular mechanisms. One aspect of drug resistance is caused by constitutive  
10 activation of anti-apoptotic survival signals with PKB/Akt as a key signalling kinase. Inhibition of the Pi3K/Akt pathway leads to a resensitization towards standard chemotherapeutic or target specific cancer therapeutics. As a consequence, the commercial applicability of the compounds according to the present invention is not limited to 1<sup>st</sup> line treatment of cancer patients. In a  
15 preferred embodiment, cancer patients with resistance to cancer chemotherapeutics or target specific anti-cancer drugs are also amenable for treatment with these compounds for e.g. 2<sup>nd</sup> or 3<sup>rd</sup> line treatment cycles. In particular, the compounds according to the present invention might be used in combination with standard chemotherapeutic or targeted drugs to resensitize  
20 tumors towards these agents.

Compounds according to the present invention are suitable for treatment, prevention or amelioration of the diseases of benign and malignant behavior as described above, such as e.g. benign or malignant neoplasia, particularly  
25 cancer, especially a cancer that is sensitive to Pi3K/Akt pathway inhibition.

The present invention further includes a method for treating, preventing or ameliorating diseases, preferably treating mammals, including humans, which are suffering from one of the abovementioned conditions, illnesses, disorders or

The present invention further includes a method for inhibiting cellular hyperproliferation or arresting aberrant cell growth in a mammal, comprising  
25 administering a pharmacologically active and therapeutically effective and tolerable amount of one or more of the compounds according to the present invention to said mammal.

30 therapy of benign or malignant neoplasia, particularly cancer, comprising administering a pharmacologically active and therapeutically effective and tolerable amount of one or more of the compounds according to the present invention to a subject in need of such therapy.

The present invention further includes a method for treating benign and/or malignant neoplasia, especially malignant neoplasia, particularly cancer, in a mammal, including human, comprising administering a pharmacologically active and therapeutically effective and tolerable amount of one or more of the compounds according to the present invention to said mammal.

The present invention further includes a method for treating solid and hematological tumors, whereby solid tumors can be exemplified by tumors of the breast, bladder, bone, brain, central and peripheral nervous system, colon, endocrine glands (e.g. thyroid and adrenal cortex), esophagus, endometrium, germ cells, head and neck, kidney, liver, lung, larynx and hypopharynx, mesothelioma, ovary, pancreas, prostate, rectum, renal, small intestine, soft tissue, testis, stomach, skin, ureter, vagina and vulva. #### Methods of treating angiogenic disorders

25 The present invention also provides methods of treating disorders and diseases associated with excessive and/or abnormal angiogenesis.

Inappropriate and ectopic expression of angiogenesis can be deleterious to an organism. A number of pathological conditions are associated with the growth of extraneous blood vessels. These include, e.g., diabetic retinopathy, ischemic retinal-vein occlusion, and retinopathy of prematurity (Aiello et al. *New Engl. J. Med.* 1994, 331, 1480; Peer et al. *Lab. Invest.* 1995, 72, 638), age-related macular degeneration (AMD; see, Lopez et al. *Invest. Ophthalmol. Vis. Sci.*

30

1996, 37, 855), neovascular glaucoma, psoriasis, retrolental fibroplasias, angiofibroma, inflammation, rheumatoid arthritis (RA), restenosis, in-stent restenosis, vascular graft restenosis, etc. In addition, the increased blood supply associated with cancerous and neoplastic tissue, encourages growth, leading to rapid tumor enlargement and metastasis. Moreover, the growth of new blood and lymph vessels in a tumor provides an escape route for renegade cells, encouraging metastasis and the consequence spread of the cancer. Thus, compounds of the present invention can be utilized to treat and/or prevent any of the aforementioned angiogenesis disorders, e.g., by inhibiting and/or reducing blood vessel formation; by inhibiting, blocking, reducing, decreasing, etc. endothelial cell proliferation or other types involved in angiogenesis, as well as causing cell death or apoptosis of such cell types.

**Biological investigations**

The following assays can be used to illustrate the commercial utility of the compounds according to the present invention.

5 Examples were tested in selected biological assays one or more times. When tested more than once, data are reported as either average values or as median values, wherein

- the average value, also referred to as the arithmetic mean value, represents the sum of the values obtained divided by the number of times  
10 tested, and
- the median value represents the middle number of the group of values when ranked in ascending or descending order. If the number of values in the data set is odd, the median is the middle value. If the number of values in the data set is even, the median is the arithmetic mean of the  
15 two middle values.

Examples were synthesized one or more times. When synthesized more than once, data from biological assays represent average values or median values calculated utilizing data sets obtained from testing of one or more synthetic  
20 batch.

**Biological Assay 1.0: Akt1 kinase assay**

Akt1 inhibitory activity of compounds of the present invention was quantified employing the Akt1 TR-FRET assay as described in the following paragraphs.

- 25 His-tagged human recombinant kinase full-length Akt1 expressed in insect cells was purchased from Invitrogen (part number PV 3599). As substrate for the kinase reaction the biotinylated peptide biotin-Ahx-KKLNRTLSEFAEPG (C-terminus in amide form) was used which can be purchased e.g. from the company Biosynthan GmbH (Berlin-Buch, Germany).
- 30 For the assay 50 nl of a 100fold concentrated solution of the test compound in DMSO was pipetted into a black low volume 384well microtiter plate (Greiner Bio-One, Frickenhausen, Germany), 2 µl of a solution of Akt1 in assay buffer [50 mM TRIS/HCl pH 7.5, 5 mM MgCl<sub>2</sub>, 1 mM dithiothreitol, 0.02% (v/v) Triton X-

100 (Sigma)] were added and the mixture was incubated for 15 min at 22 °C to allow pre-binding of the test compounds to the enzyme before the start of the kinase reaction. Then the kinase reaction was started by the addition of 3 µl of a solution of adenosine-tri-phosphate (ATP, 16.7 µM => final conc. in the 5 µl assay volume is 10 µM) and substrate (1.67 µM => final conc. in the 5 µl assay volume is 1 µM) in assay buffer and the resulting mixture was incubated for a reaction time of 60 min at 22 °C. The concentration of Akt1 in the assay was adjusted depending of the activity of the enzyme lot and was chosen appropriate to have the assay in the linear range, typical enzyme concentrations were in the range of about 0.05 ng/µl (final conc. in the 5 µl assay volume). The reaction was stopped by the addition of 5 µl of a solution of HTRF detection reagents (200 nM streptavidine-XL665 [Cisbio] and 1.5 nM anti-phospho-Serine antibody [Millipore, cat. # 35-001] and 0.75 nM LANCE Eu-W 1024 labeled anti-mouse IgG antibody [Perkin Elmer]) in an aqueous EDTA-solution (100 mM EDTA, 0.1 % (w/v) bovine serum albumin in 50 mM HEPES/NaOH pH 7.5). The resulting mixture was incubated 1 h at 22 °C to allow the binding of the biotinylated phosphorylated peptide to the streptavidine-XL665 and the antibodies. Subsequently the amount of phosphorylated substrate was evaluated by measurement of the resonance energy transfer from the anti-mouse-IgG-Eu-Chelate to the streptavidine-XL665. Therefore, the fluorescence emissions at 620 nm and 665 nm after excitation at 350 nm was measured in a HTRF reader, e.g. a Rubystar (BMG Labtechnologies, Offenburg, Germany) or a Viewlux (Perkin-Elmer). The ratio of the emissions at 665 nm and at 622 nm was taken as the measure for the amount of phosphorylated substrate. The data were normalised (enzyme reaction without inhibitor = 0 % inhibition, all other assay components but no enzyme = 100 % inhibition). Normally test compound were tested on the same microtiter plate at 10 different concentrations in the range of 20 µM to 1 nM (20 µM, 6.7 µM, 2.2 µM, 0.74 µM, 0.25 µM, 82 nM, 27 nM, 9.2 nM, 3.1 nM and 1 nM, dilution series prepared before the assay at the level of the 100fold conc. stock solutions by serial 1:3 dilutions) in duplicate values for each concentration and IC<sub>50</sub> values were calculated by a 4 parameter fit using an in-house software.

**Biological Assay 2.0: Akt2 kinase assay**

Akt2 inhibitory activity of compounds of the present invention was quantified employing the Akt2 TR-FRET assay as described in the following paragraphs.

- 5 His-tagged human recombinant kinase full-length Akt2 expressed in insect cells and activated by PDK1 was purchased from Invitrogen (part number PV 3975). As substrate for the kinase reaction the biotinylated peptide biotin-Ahx-KKLNRTLSEFAEPG (C-terminus in amide form) was used which can be purchased e.g. from the company Biosynthan GmbH (Berlin-Buch, Germany).

The concentration of Akt2 in the assay was adjusted depending of the activity of the enzyme lot and was chosen appropriate to have the assay in the linear range, typical enzyme concentrations were in the range of about 0.2 ng/µl (final conc. in the 5 µl assay volume). The resulting mixture was incubated 1 h at 22 °C to allow the binding of the
- 30 biotinylated phosphorylated peptide to the streptavidine-XL665 and the antibodies. Subsequently the amount of phosphorylated substrate was evaluated by measurement of the resonance energy transfer from the anti-mouse-IgG-Eu-Chelate to the streptavidine-XL665. Therefore, the fluorescence

Preferred compounds of the present invention show in either the Akt1 or Akt2 kinase assay: median IC<sub>50</sub> < 5  $\mu$ M or greater than 50% inhibition at 5  $\mu$ M, more preferably, median IC<sub>50</sub> < 0.5  $\mu$ M or greater than 50% inhibition at 0.5  $\mu$ M, even more preferably, median IC<sub>50</sub>  $\leq$  0.1  $\mu$ M or greater than 50% inhibition at 0.1  $\mu$ M.

### Cellular Assays 3.0: p-AKT1/2/3-S473, -T308, and p-4E-BP1-T70 assays

The molecular mechanism of action was investigated in a set of experiments to assess the inhibition of the PI3K-AKT-mTOR pathway in responsive cell lines such as KPL-4 breast tumour cell line (PIK3CA<sup>H1047R</sup>, HER2<sup>O/E</sup> and hormone independent). The phospho-substrates of PI3K-AKT-mTOR axis were used as the read-outs to reflect pathway inhibition. Cells were seeded at 60-80% confluency per well in 96-well cell culture plates. After overnight incubation at 37°C 5% CO<sub>2</sub>, cells were treated with compounds and vehicle at 37°C for 2 hours. Thereafter, cells were lysed in 150µl lysis buffer and the levels of phospho-AKT at T308 and S473 and p-4E-BP1 at T70 sites were determined with the corresponding AlphaScreen® SureFire® assay kits (Perkin Elmer: 4E-BP1 Assay Kit Cat # TRG4E2S10K; Akt 1/2/3 p-Ser 473 #TGRA4S500 and Akt 1/2/3 p-Thr 308 #TGRA3S500 as well as IgG detection Kit #6760617M) as described in the manuals. All measurements were at least done in duplicates and confirmed by independent repetition.

Alternatively pAKT-S473 was measured using the “Akt Duplex” of the MULTI-SPOT® Assay System (Fa. Meso Scale Discovery, Cat# N41100B-1) following manufacturers instructions. Each assay used 20µg of protein extract and measured total AKT and p-AKT content simultaneously in one well. All measurements were at least done in duplicates and confirmed by independent repetition. Values for P-AKT are expressed as percentage of P-AKT level compared to total-AKT content of the extracts.

#### Biological Assay 4.0: Tumor cell proliferation assays

Compounds were tested in a cell-based assay that measures the capacity of the compounds to inhibit tumour cell proliferation following a 72h drug exposure.

5 Cell viability is determined using CellTiter-Glow® (CTG, Promega, cat# G7571/2/3). The CellTiter-Glo® Luminescent Cell Viability Assay is a homogeneous method to determine the number of viable cells in culture.

Detection is based on using the luciferase reaction to measure the amount of ATP from viable cells. The amount of ATP in cells correlates with cell viability. Within minutes after a loss of membrane integrity, cells lose the ability to synthesize ATP, and endogenous ATPases destroy any remaining ATP; thus  
 5 the levels of ATP fall precipitously.

Cells were plated at 3000-5000 cells/well (depending on the cell lines) in 90  $\mu$ L growth medium on MTPs (Corning; #3603, black plate, clear flat bottom). For each cell line assayed, cells were plated onto a separate plate for determination of fluorescence at  $t = 0$  hour and  $t = 72$  hour time points. Following overnight  
 10 incubation at 37 °C, chemiluminescence values for the  $t = 0$  samples were determined after adding 10 $\mu$ L medium and 100 $\mu$ L CTG solution according to manufacture protocol. Plates for the  $t = 72$  hour time points were treated with compounds diluted into growth medium at ten times final concentration added in 10 $\mu$ L to the cell culture plate. Cells were then incubated for 72 hours at 37 °C.  
 15 Chemiluminescence values for the  $t = 72$  hour samples were determined. For data analysis, briefly, data from 24h plate were used to reflect 100% inhibition of growth ("Ci") and DMSO control for uninhibited growth ("C0") and analyzed using MTS software package for IC<sub>50</sub> and Hill coefficient. Experiments were controlled using a reference compound as standard.

20

#### Example 5.0 – Caco2 permeability assay

Caco-2 cells (purchased from DSMZ Braunschweig, Germany) were seeded at a density of  $4.5 \times 10^4$  cell per well on 24 well insert plates, 0.4  $\mu$ m pore size, and  
5 grown for 15 days in DMEM medium supplemented with 10% fetal bovine serum, 1% GlutaMAX (100x, GIBCO), 100 U/ml penicillin, 100 $\mu$ g/ml streptomycin (GIBCO) and 1% non essential amino acids (100 x). Cells were maintained at 37°C in a humified 5% CO<sub>2</sub> atmosphere. Medium was changed every 2-3 day. Before running the permeation assay, the culture medium was  
10 replaced by a FCS-free hepes-carbonate transport puffer (pH 7.2) For assessment of monolayer integrity the transepithelial electrical resistance (TEER) was measured. Test compounds were predissolved in DMSO and

added either to the apical or basolateral compartment in final concentration of 2  $\mu$ M. Before and after 2h incubation at 37 °C samples were taken from both compartments. Analysis of compound content was done after precipitation with methanol by LC/MS/MS analysis. Permeability ( $P_{app}$ ) was calculated in the  
5 apical to basolateral ( $A \rightarrow B$ ) and basolateral to apical ( $B \rightarrow A$ ) directions. The apparent permeability was calculated using following equation:

$$P_{app} = (V_r/P_o)(1/S)(P_2/t)$$

Where  $V_r$  is the volume of medium in the receiver chamber,  $P_o$  is the measured peak area of the test drug in the donor chamber at  $t=0$ ,  $S$  the surface area of the  
10 monolayer,  $P_2$  is the measured peak area of the test drug in the acceptor chamber after 2h of incubation, and  $t$  is the incubation time. The efflux ratio basolateral (B) to apical (A) was calculated by dividing the  $P_{app}$  B-A by the  $P_{app}$  A-B. In addition the compound recovery was calculated. As assay control reference compounds were analyzed in parallel.

### Example 6.0 – in vivo rat pharmacokinetics

For in vivo pharmacokinetic experiments test compounds were administered to male Wistar rats intravenously at doses of 0.5 to 1 mg/kg and intragastral at doses of 1 to 10 mg/kg formulated as solutions using solubilizers such as  
20 PEG400 in well-tolerated amounts.

For pharmacokinetics after intravenous administration test compounds were given as i.v. bolus and blood samples were taken at 2 min, 8 min, 15 min, 30 min, 45 min, 1 h, 2 h, 4 h, 6 h, 8 h and 24 h after dosing. Depending on the  
25 expected half-life additional samples were taken at later time points (e.g. 48 h, 72 h). For pharmacokinetics after intragastral administration test compounds were given intragastral to fasted rats and blood samples were taken at 5 min, 15 min, 30 min, 45 min, 1 h, 2 h, 4 h, 6 h, 8 h and 24 h after dosing. Depending on the expected half-life additional samples were taken at later time points (e.g. 48  
30 h, 72 h). Blood was collected into Lithium-Heparintubes (Monovetten<sup>®</sup>, Sarstedt) and centrifuged for 15 min at 3000 rpm. An aliquot of 100  $\mu$ L from the supernatant (plasma) was taken and precipitated by addition of 400  $\mu$ L cold acetonitrile and frozen at -20 °C over night. Samples were subsequently thawed

and centrifuged at 3000 rpm, 4°C for 20 minutes. Aliquots of the supernatants were taken for analytical testing using an Agilent 1200 HPLC-system with LCMS/MS detection. PK parameters were calculated by non-compartmental analysis using a PK calculation software.

5

PK parameters derived from concentration-time profiles after i.v.: CL<sub>plasma</sub>: Total plasma clearance of test compound (in L/kg/h); CL<sub>blood</sub>: Total blood clearance of test compound: CL<sub>plasma</sub>\*C<sub>p</sub>/C<sub>b</sub> (in L/kg/h) with C<sub>p</sub>/C<sub>b</sub> being the ratio of concentrations in plasma and blood. PK parameters calculated from concentration time profiles after i.g.: C<sub>max</sub>: Maximal plasma concentration (in mg/L); C<sub>maxnorm</sub>: C<sub>max</sub> divided by the administered dose (in kg/L); T<sub>max</sub>: Time point at which C<sub>max</sub> was observed (in h). Parameters calculated from both, i.v. and i.g. concentration-time profiles: AUC<sub>norm</sub>: Area under the concentration-time curve from t=0h to infinity (extrapolated) divided by the administered dose (in kg\*h/L); AUC(0-t<sub>last</sub>)<sub>norm</sub>: Area under the concentration-time curve from t=0h to the last time point for which plasma concentrations could be measured divided by the administered dose (in kg\*h/L); t<sub>1/2</sub>: terminal half-life (in h); F: oral bioavailability: AUC<sub>norm</sub> after intragastral administration divided by AUC<sub>norm</sub> after intravenous administration (in %).

The person skilled in the art will be aware of methods to show *in vivo* efficacy of anti-cancer compounds. By way of illustration, the following example describes methods of quantifying the *in vivo* efficacy in a mouse xenograft model. The skilled person will be able to apply such principles to derive models from alternative tumor material.

### **Example 7.0 In vivo xenograft mechanism of action study**

To demonstrate that compounds act in tumours by the anticipated mode of action phosphorylation of the AKT protein was investigated in KPL-4 breast tumours treated once with 50 mg/kg compound.

30

To this extent KPL-4 human breast tumours were xenografted onto athymic nude mice. KPL-4 tumour cells were cultivated according to ATCC protocols in recommended media contained 10% FCS and harvested for transplantation in a

subconfluent (70%) state.  $3 \times 10^6$  tumour cells suspended in 50% Matrigel were subcutaneously implantated into the inguinal region of female mice. Tumours were allowed to grow to the predetermined size of 60-80 mm<sup>2</sup>. When the tumours were approximately in size, the animals were randomized to treatment and control groups (groups size: 9 animals) and treatment was started. Animals were treated once with 50 mg/kg compound or vehicle per oral administration (p.o.) carried out via a gastric tube. Treatment of each animal was based on individual body weight. At 2, 5 and 24 hours post treatment 3 animals each were sacrificed and the KPL-4 tumours excised. Tumour samples of approximately 5x5x5 mm were lysed on ice in MSD lysis buffer in the presence of protease and phosphatase inhibitors using Tissue Lyzer (Qiagen, Germany). The levels of p-AKT S473 in extracts from tumour tissue were analysed in an ELISA based assay. This assay is based on the "Akt Duplex" of the MULTI-SPOT® Assay System (Fa. Meso Scale Discovery, Cat# N41100B-1) following manufacturers instructions. Each assay used 20µg of protein extract and measured total AKT and p-AKT content simultaneously in one well. All measurements were at least done in duplicates and confirmed by independent repetition. Values for P-AKT are expressed as percentage of P-AKT level compared to total-AKT content of the extracts. Vehicle treated tumours were analyzed to determine the basal level of P-AKT in this model and used as a normalization control to determine the % P-AKT relative to vehicle levels.

Preferred compounds of the present invention show in this assay: relative to vehicle levels P-AKT < 30 % at 2 hours post treatment, more preferably at 5 hours post treatment, even more preferably at 24 hours post treatment.

#### **Example 7.1 In vivo xenograft efficacy study**

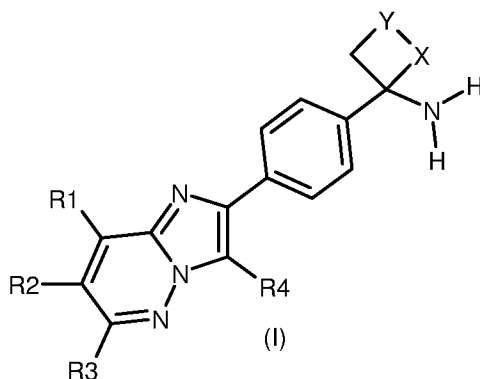

To determine the therapeutic efficacy and tolerability of compounds, tumour growth of KPL-4 breast tumours xenografted onto nude mice may be observed. Mice were treated either with vehicle or compounds. To this extent KPL-4 xenografts were established as described above. Tumours were allowed to grow to the predetermined size of 25 – 35 mm<sup>2</sup>. When the tumours were approximately in size, the animals were randomized to treatment

and control groups (groups size: 8 animals) and treatment was started. Treatment of each animal was based on individual body weight and oral administration (p.o.) was carried out via a gastric tube. The oral application volumes were 10 ml/kg for mice. Mice were treated once daily with 50 mg/kg compounds.

Tumour response was assessed by determination of the tumour area (product of the longest diameter and its perpendicular) using a calliper. The animal body weight was monitored as a measure for treatment-related toxicity. Measurement of tumour area and body weight were performed 2-3 times weekly. Statistical analysis was assessed using the SigmaStat software. A one way analysis of variance was performed, and differences to the control were compared by a pair-wise comparison procedure (Dunn's method). T/C ratios (Treatment/Control) were calculated with final tumour weights at study end.
