PYRIDINE AND PYRAZINE DERIVATIVES -083

The invention concerns certain novel pyridine and pyrazine derivatives, or pharmaceutically-acceptable salts thereof, which possess anti-cancer activity and are accordingly useful in methods of treatment of the human or animal body. The invention also concerns processes for the manufacture of said pyridine and pyrazine derivatives, pharmaceutical compositions containing them and their use in therapeutic methods, for example in the manufacture of medicaments for use in the prevention or treatment of cancers in a warm-blooded animal such as man, including use in the prevention or treatment of solid tumour disease.

Receptor tyrosine kinases (RTKs) are cell surface receptors that transmit signals from the extracellular environment to control growth, differentiation and survival of cells. All RTKs contain an extracellular ligand binding domain and a conserved protein tyrosine kinase cytoplasmic domain. RTKs are activated by growth factors, which promote receptor dimerisation and autophosphorylation of tyrosine residues in the kinase domain (Schlessinger, Cell, 2000, 103, 211).

RTKs can be classified into distinct subfamilies on the basis of sequence similarities. The AxI receptor subfamily is one of these subfamilies and includes AxI (also called Ark, Ufo and Tyro7), Tyro3 (also called Rse, Brt, Sky and Dtk) and Mer (also called Nyk and Tyro12). This RTK family is characterized by an extracellular domain consisting of two immunoglobulin-like and two fibronectin type 3-like domains. The AxI family RTKs are activated by the vitamin K-dependent protein known as growth arrest specific gene 6 (Gas6). The affinity of Gas6 for these receptors is AxI>Tyro3>Mer (Nagata et al, J. Biol. Chem., 1996, 271, 30022).

Gas6/Axl signalling has been shown to have roles in proliferation, protection from apoptosis, angiogenesis and invasion. The gene encoding for Axl has been shown to transform both NIH-3T3 fibroblasts, enabling them to grow as xenografts in nude mice (O’Brien et al, Mol Cell Biol, 1991, 11, 5031), and IL-3 dependent hematopoietic 32D cells, enabling IL-3 independent growth (McCloskey et al, Cell Growth Differ., 1994, 5, 1105).

The anti-apoptotic effects of Gas6/Axl signalling have been demonstrated in NIH-3T3 cells (Bellosta et al, Oncogene, 1997, 15, 2387), human oligodendrocytes (Shankar et al, J. Neurosci., 2006, 26, 5638) and in the uveal melanoma cell line Mel 290 (Van Ginkel et al, Cancer Res., 2004, 64, 128). Gas6/Axl signalling has also been shown to have a weak mitogenic effect in mouse NIH-3T3 fibroblasts (Goruppi et al, Oncogene, 1996, 12, 471), human C57MG mammary carcinoma cells (Goruppi et al, Mol Cell Biol, 2001, 21, 902) and human DU145 and PC3 prostate carcinoma cells (Sainaghi et al, J. Cell. Physiol, 2005, 204, 36).

The depletion of Axl protein has been shown to disrupt CL 1-5 human lung adenocarcinoma cell invasion (Shieh et al, Neoplasia, 2005, 7, 1058) and primary human umbilical vein endothelial cells (HUVEC) cell migration and tube formation (Holland et al, Cancer Res., 2005, 65, 9294). Furthermore, inhibition of the Axl protein by either knockdown of protein levels (Holland et al, Cancer Res., 2005, 65, 9294) or transfection of a dominant negative Axl mutant gene (Vajkoczy et al, Proc. Natl. Acad. Sci. USA, 2006, 103, 5799) has been shown to suppress xenograft growth in vivo.

Accordingly, antagonism of the activity of Axl receptor kinases is expected to be beneficial in the treatment of a number of cell proliferative disorders such as cancer
(comprising solid tumours such as carcinomas, sarcomas and the leukaemia and lymphoid malignancies), as well as vascular disease (including but not limited to thrombosis, atherosclerosis and restenosis), kidney disease (including but not limited to acute and chronic glomerulonephritis, diabetic nephropathy and transplant rejection), and diseases where deregulated angiogenesis is important (including but not limited to diabetic retinopathy, retinopathy, psoriasis, rheumatoid arthritis, atheroma, Kaposi’s sarcoma and haemangioma).

c-Met is also a receptor tyrosine kinase which acts as the cellular receptor for hepatocyte growth factor (HGF/ scatter factor), a dimeric glycoprotein that is synthesized as a single-chain precursor called pro-HGF and comprises a 50 kDa α-chain and a 145 kDa β-chain. When HGF non-covalently binds to the extracellular domain of c-Met, receptor oligomerisation occurs. This results in phosphorylation of a number of sites within c-Met such as tyrosine residue γ 1234/5 that lies within the c-Met activation loop (a flexible region of amino acids whose conformation controls kinase activity) and tyrosine residue γ 1349/50 which forms part of a structurally unique protein docking site. Phosphorylation within the activation loop causes an increase in c-Met kinase activity, whilst phosphorylation of the docking site is essential for binding and subsequent activation of classical intracellular tyrosine kinase effector proteins such as p85, Gabl and Grb2 (Ponzetto, C., et al. (1994), Cell 77, 261-271).

c-Met and HGF are expressed in numerous tissues. c-Met expression is normally restricted to cells of endothelial and epithelial origin. HGF is usually expressed in cells of mesenchymal origin and is therefore considered to be a paracrine acting growth factor which induces proliferative, morphogenic and motile responses in proximal target cells (*Birchmeier, C., et al. (2003), Nature Rev. Mol. Cell. Biol. 4, 915-925*).

A significant number of clinical studies have shown that both c-Met and HGF are frequently aberrantly expressed in aggressive carcinomas, in other types of human solid tumours, and in their metastases (*reviewed in Truslino et al.; Birchmeier et al.; Maulik, G., et al. (2002), Cytokine & Growth Factor Rev. 13, 41-59; and Danilkovitch-Miagkova, A. & Zbar, B. (2002) J. Clin. Invest. 109, 863-867*). Further, the presence of c-Met or HGF in clinical samples often correlates with poor patient prognosis (*reviewed in Truslino et al.*) suggesting that c-Met activation promotes tumour growth and metastatic spread.

Activation of c-Met in cancer cells is most commonly driven by ligand-dependent mechanisms, for example, tumour carcinoma or tumour endothelial cells express c-Met but not HGF, which is produced by the surrounding stroma. However, in other tumours, cells may express c-Met and HGF resulting in autocrine c-Met activation. Ligand independent activation is also possible and is observed in cells that express very high levels of c-Met or which harbour activating mutations (*Birchmeier et al.*). Activating mutations of c-Met have been discovered in sporadic and inherited forms of human renal papillary carcinoma (*reviewed in Maulik et al. and Danilkovitch-Miagkova et al.*) and, at present, 21 mutations have been described. The majority are localised within the kinase domain and are believed to convert c-Met into a constitutively active form. More recently, a number of additional mutations have been found in other types of primary cancer and metastatic lesions (*Lorenzato, A., et al. (2002), Cane. Res. 62, 7025-7030*).

Consequently, a considerable body of evidence supports the theory that primary cancer growth, angiogenesis, local tumour invasion and distant metastasis formation are driven or enhanced by inappropriate c-Met activation. The role of c-Met in angiogenesis has been demonstrated by experiments involving HGF stimulation of new blood vessel growth in rat corneal and mouse matrigel models (*Rosen, E.m et al. (1997) Ciba Found. Symp. 212, 215-9 and Rosen, E. & Goldberg, I. (1995) Adv. Cancer Res. 67, 257-279*). Mouse and human cell lines that ectopically overexpress either HGF or c-Met, or both, have been observed to become tumorigenic in nude mice and frequently such cells acquire an invasive phenotype
that enables them to form metastases in distant organs (reviewed in Truslino, L. and Comoglio, P. (2002), Nature Rev. Cane. 2, 289-300 and Birchmeier et al). Downregulation of c-Met/HGF signalling in human tumour cells (either by biological or small molecule approaches) has also been shown to substantially decrease the cells' tumorigenic potential through a decrease in proliferation, angiogenesis and invasion (Abounader, R., et al. (2002), FASEB J. 16, 108-110 and Christensen, J., et al. (2003), Can. Res. 63, 7345-7355). Finally, it has also been reported that mouse models expressing c-Met or HGF as a transgene in specific tissues ultimately develop a broad array of aggressively invasive tumours and metastatic lesions (Wang, R., et al. (2001), J. Cell Biol. 153, 1023-1034; Gallego, M., et al. (2003), Oncogene 22, 8498-8508; and Takayama, K., et al. (1997), Proc. Natl. Acad. ScL USA 94, 701-706) indicating that activation of c-Met is sufficient to initiate tumour formation and promote angiogenesis and invasion (Rosen et al.).

C-Met therefore represents an attractive target in the pursuit of therapies for the treatment of cancer, and an inhibitor of c-Met activity would be expected to have anti-tumour activity and in particular anti-proliferative, anti-angiogenic and anti-invasive properties. Additionally, the role of c-Met and HGF in tissue remodelling, particularly in the lungs and liver has also been demonstrated (Michalopoulos, G. & DeFrances, M. (1997) Science 276, 60-6621), and elevated levels of c-Met or HGF have been observed in patients suffering from liver cirrhosis, chronic hepatitis and pulmonary fibrosis. It is therefore further expected that inhibitors of c-Met will be of therapeutic use in the treatment of a number of inflammatory diseases (Funakoshi, H. & Nakamura, T. (2003) Clin. Chim. Acta 327, 1-23).

We have now found that surprisingly certain novel pyridine and pyrazine derivatives possess potent activity against cell proliferative disorders. Without wishing to imply that the compounds disclosed in the present invention possess pharmacological activity only by virtue of an effect on one or two biological processes, it is believed that the compounds provide a useful treatment of cell proliferative disorders, for example to provide an anti-tumour effect, by way of a contribution from inhibition of AxI and/or c-Met receptor tyrosine kinases.

International Patent Application WO 2008/025820 is concerned with certain aminopyridine derivatives that possess inhibitory kinase activity, in particular against the tyrosine kinase Itk. The compounds in WO 2008/025820 are stated to be useful in the treatment or prophylaxis of immunological, inflammatory or allergic disorders or other diseases or disorders associated with Itk kinase.
International Patent Application WO 2008/074997 is concerned with certain pyridine and pyrazine benzamide compounds which, *inter alia*, possess inhibitory kinase activity against the serine/threonine kinase Protein Kinase D (PKD). The compounds in WO 2008/074997 are stated to be useful in the treatment of diseases mediated by PKD, including proliferative conditions such as cancer.

There is no mention of AxI or c-Met receptor tyrosine kinases in either WO 2008/025820 or WO 2008/074997. Furthermore, it is believed that, in general, the compounds now being claimed exhibit improved potency against AxI and/or c-Met receptor tyrosine kinases over compounds disclosed in WO 2008/025820.

It is to be understood that, insofar as certain of the compounds of Formula I defined above may exist in optically active or racemic forms by virtue of one or more asymmetric carbon atoms, the invention includes in its definition any such optically active or racemic form which possesses the above-mentioned activity. The synthesis of optically active forms may be carried out by standard techniques of organic chemistry well known in the art, for example by synthesis from optically active starting materials or by resolution of a racemic form. Similarly, the above-mentioned activity may be evaluated using the standard laboratory techniques.

It is to be understood that certain compounds of Formula I defined above may exhibit the phenomenon of tautomerism. It is to be understood that the present invention includes in its definition any such tautomeric form, or a mixture thereof, which possesses the above-mentioned activity and is not to be limited merely to any one tautomeric form utilised within the formulae drawings or named in the Examples. In general, just one of any such tautomeric forms is named in the Examples that follow hereinafter or is presented in any relevant formulae drawings that follow hereinafter.

For the avoidance of doubt, it will be appreciated that when any of G1, G2, G3 and G4 is CH and an R3 group is present, the G1, G2, G3 and G4 groups that are CH can be substituted by the R3 group to give C(R3).

In structural Formula I, it is to be understood that any CH, CH2, or CH3 in any alkyl group present in the definition of R4 that is connected to X1 or present in the definition of Q1 that is connected to X2, optionally bears a hydroxy or cyano group and optionally bears up to three halogeno groups, preferably fluoro groups. For example, where Q1 is heterocyclyl-propyl-, any CH2 within the propyl group can be substituted, to give, for example, heterocyclyl-CH2CH(OH)CH2- or heterocyclyl-CH2C(F)2CH2- and where Q1 is heterocyclyl-butyI-, any CH, CH2, or CH3 within the butyl group can be substituted, to give, for example, heterocyclyl-CH2CH(CF3)CH2-. A further example would be where R4 is hydroxy-propyl-, in which case any CH2 in the propyl group can be substituted, to give, for example, hydroxy-CH2C(F)2CH2-. 
In structural Formula I, it is to be understood that any CH, CH₂, or CH₃ in any alkyl group present in the definition of R⁴ that is connected to X¹ or present in the definition of Q¹ that is connected to X², optionally can be replaced by an atom selected from O, S or N or a group such as SO₂. For example, where Q¹ is heterocyclyl-butyl-, any CH₂ within the butyl group can be replaced, to give, for example, heterocyclyl-CH₂OCH₂CH₂-, heterocyclyl-OCH₂CH₂CH₂- or 1eleTOCyClYl-SO₂CH₂CH₂CH₂-. A further example would be where R⁴ is hydroxy-butyl-, in which case any CH₂ in the butyl group can be replaced, to give for example hydroxy-CH₂OCH₂CH₂-. It is also to be understood that adjacent carbon atoms in any alkyl group present in the definition of R⁴ that is connected to X¹ or present in the definition of Q¹ that is connected to X², optionally may be separated by the insertion into the chain of a group such as C≡C. For example, insertion of a C≡C group into the ethylene chain within a heterocyclyl-ethyl- group would give rise to a group such as heterocyclyl-but-2-ynyl.

Suitable process variants include, for example, the following:

(a) The reaction of a carboxylic acid of the Formula II

\[
\begin{align*}
\text{II} & \quad \text{NH}_2 \\
 & \quad \text{O} \\
 & \quad \text{OH}
\end{align*}
\]

or a reactive derivative thereof, wherein W and Ring A have any of the meanings defined hereinbefore except that any functional group present on Ring A is protected if necessary, with a compound of the Formula III

\[
\begin{align*}
\text{III} & \quad \text{H}_2\text{N} \\
 & \quad \text{G}_1 \quad \text{G}_2 \quad \text{G}_3 \\
 & \quad \text{G}_4 \quad \text{J} \\
 & \quad \text{H} \\
 & \quad (\text{R}^3)_n
\end{align*}
\]

wherein \(G_1, G_2, G_3, G_4, J, n\) and \(R^3\) have any of the meanings defined hereinbefore except that any functional group is protected if necessary, in the presence of a suitable acid, to form a compound of the Formula I, whereafter any protecting group that is present is removed.

A suitable reactive derivative of a carboxylic acid of the Formula II is, for example an acyl halide, for example an acyl chloride formed by the reaction of the acid with an inorganic acid chloride, for example thionyl chloride; a mixed anhydride, for example an anhydride formed by the reaction of the acid with a chloroformate such as isobutyl chloroformate; an active ester, for example an ester formed by the reaction of the acid with a phenol such as pentafluorophenol, with an ester such as pentafluorophenyl trifluoroacetate or with an alcohol such as methanol, ethanol, isopropanol, butanol or 7V-hydroxybenzotriazole; an acyl azide, for example an azide formed by the reaction of the acid with an azide such as diphenylphosphoryl azide; an acyl cyanide, for example a cyanide formed by the reaction of an acid with a cyanide such as diethylphosphoryl cyanide; or the product of the reaction of the acid with a
carbodiimide such as dicyclohexylcarbodiimide or with a uronium compound such as 2-(1-
azabenzotriazol-1-yl)-1,1,3,3-tetramethyluronium hexafluorophosphate(V) or with 1-
hydroxybenzotriazole.

A suitable acid for the reaction is, for example, an inorganic acid such as, for example,
hydrochloric acid, hydrobromic acid or polyphosphoric acid or, for example, an organic acid
such as, for example, acetic acid or trifluoroacetic acid. Conveniently, the acid used in the
reaction is polyphosphoric acid and the reaction is conveniently carried out at a temperature in
the range, for example, 50 to 250°C, conveniently at or near 200°C.

Carboxylic acid compounds of the Formula II, including reactive derivatives thereof such
as an ester thereof, may, for example, be prepared by the cross coupling reaction,
conveniently in the presence of a suitable catalyst, of a compound of the Formula IV

\[
\begin{array}{c}
A \\
\text{IV}
\end{array}
\]

wherein Ring A has any of the meanings defined hereinbefore except that any functional
group present on Ring A is protected if necessary and Y is Sn(L^0)_3, ZnI or B(L^1XL^2), wherein
L^0 is a suitable ligand for the tin atom and wherein each of L^1 and L^2, which may be the same
or different, is a suitable ligand for the boron atom, with a pyridine or pyrazine compound of
the Formula V

\[
\begin{array}{c}
\text{V}
\end{array}
\]

wherein L is a displaceable group, L^3 is hydrogen or a protecting group such as methyl and W
has any of the meanings defined hereinbefore, whereafter any protecting group that is present
is removed.

A suitable value for the ligand L^0 which is present on the Sn atom of the tin reagent

A suitable value for the ligands L^1 and L^2 which are present on the boron atom of the
organoboron reagent include, for example, a hydroxyl or a (1-4C)alkoxy, for example a
methoxy, ethoxy, propoxy, isoproxy or butoxy ligand. Alternatively the ligands L^1 and L^2
may be linked such that, together with the boron atom to which they are attached, they form a ring. For example, L\textsuperscript{1} and L\textsuperscript{2} together may define an oxy-(2-4C)alkylene-oxy group, for example an oxyethyleneoxy, oxytrimethyleneoxy group or \( \text{-}O-C(\text{CH}_3)_2\text{-}O^- \) group such that, together with the boron atom to which they are attached, they form a cyclic boronic acid ester group. Particularly suitable organoboron reagents include, for example, compounds wherein each of L\textsuperscript{1} and L\textsuperscript{2} is a hydroxy, a isopropoxy or an ethyl group or L\textsuperscript{1} and L\textsuperscript{2} together define a group of formula \( \text{-}O-C(\text{CH}_3)_2\text{-}C(\text{CH}_3)_2\text{-}O^- \).

A suitable displaceable group L is, for example, a halogeno group such as a chloro, bromo, iodo group or a trifluoromethanesulphonyl group.

A suitable catalyst for the cross coupling reaction includes, for example, a metallic catalyst such as a palladium(0), palladium(II), nickel(0) or nickel(II) catalyst, for example tetrakis(triphenylphosphine)palladium(0), palladium(II) chloride, palladium(II) bromide, bis(triphenylphosphine)palladium(II) chloride, tetrakis(triphenylphosphine)nickedl(0), nickel(II) chloride, nickel(II) bromide, bis(triphenylphosphine)nickedl(II) chloride, [1,1'-bis(diphenylphosphino)ferrocene)dichloropalladium(II) or tris(dibenzilideneacetone)dipalladium. Optionally, the catalyst can be formed \textit{in-situ} by the reaction of one or more of the above catalysts with a trialkylphosphine, such as, for example, tri-7V-butylphosphine or tricyclohexylphosphine.

Conveniently, the reaction is conducted in the presence of a suitable base such as an alkali or alkaline earth metal carbonate or hydroxide, for example sodium carbonate, caesium carbonate or potassium carbonate, caesium fluoride, or an organic base such as pyridine, 4-dimethylaminopyridine, triethylamine or \( N \)-methylmorpholine.

The reaction is conveniently carried out in the presence of a suitable solvent or diluent, for example \( N,N \)-dimethylformamide, water, tetrahydrofuran, 1,4-dioxane, 1,2-dimethoxyethane, benzene, toluene, xylene, methanol or ethanol and at a temperature in the range, for example 10 to 250\textdegree{}C, preferably in the range 60 to 180\textdegree{}C.

The cross-coupling reaction can also be conducted where the Y group of compound IV is hydrogen. Such a reaction is conveniently carried out in the presence of a suitable catalyst as defined herein-before. Conveniently, a suitable base is also present for such a reaction such as an alkali or alkaline earth metal carbonate or hydroxide, for example sodium carbonate, caesium carbonate or potassium carbonate, caesium fluoride, or an organic base such as pyridine, 4-dimethylaminopyridine, triethylamine or \( N \)-methylmorpholine.

Typical conditions for such a reaction are described in Organic Letters, 2003, 5, 4835.

Carboxylic acids of the Formula II can also be prepared using an inverse coupling process to that described above, wherein the compound of Formula IV would have an L group (which is a displacable group as defined hereinbefore) in place of the Y group and the compound of Formula V would have a Y group (being Sn(L°)₃, ZnI or B(L¹X₁L²) as defined hereinbefore) present in place of the L group. Suitable conditions for the reaction would be those described above.

Compounds of the Formulae III, IV and V may be obtained by conventional procedures or are commercially available, known in the literature, or they can be prepared by standard processes known in the art.

which is cyclized in the presence of a suitable reducing agent to form a compound of the Formula I, whereafter any protecting group that is present is removed.

This type of reaction is described in *J. Chem. Soc.* (section D), 1969, 12, 680 or *Pakistan J. of Scientific and Industrial Research* 1980, 23, 166.

The ester formation reaction is conveniently carried out in the presence of a suitable base, such as for example, an organic amine base such as, for example, pyridine, 2,6-lutidine, collidine, 4-dimethylaminopyridine, triethylamine, morpholine, 7V-methylmorpholine or diazabicyclo[5.4.0]undec-7-ene or, for example, an alkali or alkaline earth metal carbonate or...
hydroxide, for example sodium carbonate, potassium carbonate, calcium carbonate, sodium hydroxide or potassium hydroxide. The reaction is conveniently carried out in the presence of a suitable inert solvent or diluent, for example an ester such as ethyl acetate, a halogenated solvent such as methylene chloride, chloroform or carbon tetrachloride, an ether such as tetrahydrofuran or 1,4-dioxane, an aromatic solvent such as toluene. Conveniently, the reaction is carried out in the presence of a dipolar aprotic solvent such as N,N-dimethylformamide, 7V,7V-dimethylacetamide, N-methylpyrrolidin-2-one or dimethyl sulfoxide. The reaction is conveniently carried out at a temperature in the range, for example, 0 to 120°C, conveniently at or near ambient temperature.

A suitable reducing agent for the reaction is, for example, iron, tin or zinc in a suitable inorganic or organic acid such as acetic acid and at a temperature in the range, for example, 20 to 110°C. A suitable reducing agent for the reaction is also, for example, hydrogenation in the presence of a suitable metallic catalyst such as palladium on charcoal. Conveniently, the reaction is carried out in a suitable inert solvent or diluent, for example, ethanol under hydrogen pressure. An alternative suitable reducing agent for the reaction is also, for example, triethylphosphite. Conveniently, the reaction is carried out in a suitable inert solvent or diluent, for example, tert-butylbenzene at a temperature in the range, for example 100 to 200°C.

It is to be understood that any compound of Formula I obtained by any of the processes described hereinbefore can be converted into another compound of the Formula I if required. For example, a reductive amination reaction can be carried out to couple a compound of Formula I obtained by any of the processes described hereinbefore having a nitrogen containing heterocyclyl ring such as, for example, piperidin-4-yl as an R1 group with a suitable aldehyde or ketone to obtain another compound of the Formula I, for example, if formaldehyde, or a equivalent thereof, is used, a compound of Formula I having a 1-methylpiperidin-4-yl R1 group may be obtained. A suitable reducing agent for such a reductive amination reaction is, for example, a hydride reducting agent, for example an alkali metal aluminium hydride such as lithium aluminium hydride or, preferably, an alkali metal borohydride such as sodium borohydride, sodium cyanoborohydride, sodium triethylborohydride, sodium trimethoxyborohydride and sodium triacetoxyborohydride. The reaction is conveniently performed in a suitable inert solvent or diluent, for example tetrahydrofuran and diethyl ether for the more powerful reducing agents such as lithium
aluminium hydride, and, for example, methylene chloride or a protic solvent such as methanol and ethanol for the less powerful reducing agents such as sodium triacetoxyborohydride and sodium cyanoborohydride. The reaction is performed at a temperature in the range, for example, 10 to 80°C, conveniently at or near ambient temperature.

A further conversion reaction is where a compound of Formula I obtained by any of the processes described hereinbefore bearing a hydroxyalkyl substitutent on Ring A is activated and then reacted with with an appropriate optionally substituted nitrogen containing heterocyclyl ring such as for example 1-methylpiperazine or azetidine, to obtain another compound of the Formula I. For example, if, a compound of Formula I having a 2-hydroxyethyl substituent on Ring A is activated and reacted with 1-methylpiperazine, a compound with a 2-(1-methylpiperazin-4-yl)ethyl \( R^1 \) group may be obtained. A suitable activating agent for such a reaction is, for example, methanesulphonyl chloride. The reaction is conveniently performed in a suitable inert solvent or diluent, for example tetrahydrofuran, dimethyformide or N-methyl-pyrrolidin-2-one. The reaction is performed at a temperature in the range, for example, 10 to 150°C.

When a pharmaceutically-acceptable salt of a pyridine or pyrazine derivative of the Formula I is required, for example an acid-addition salt, it may be obtained by, for example, reaction of said pyridine or pyrazine derivative with a suitable acid.

When a pharmaceutically-acceptable pro-drug of a pyridine or pyrazine derivative of the Formula I is required, it may be obtained using a conventional procedure. For example, an \textit{in vivo} cleavable ester of a pyridine or pyrazine derivative of the Formula I may be obtained by, for example, reaction of a compound of the Formula I containing a carboxy group with a pharmaceutically-acceptable alcohol or by reaction of a compound of the Formula I containing a hydroxy group with a pharmaceutically-acceptable carboxylic acid.

For example, an \textit{in vivo} cleavable amide of a pyridine or pyrazine derivative of the Formula I may be obtained by, for example, reaction of a compound of the Formula I containing a carboxy group with a pharmaceutically-acceptable amine or by reaction of a compound of the Formula I containing an amino group with a pharmaceutically-acceptable carboxylic acid.

It will also be appreciated by the person skilled in the organic synthetic arts that certain of the ring substituents in the compounds of the present invention may be introduced by standard aromatic substitution reactions or generated by conventional functional group modifications either prior to or immediately following the processes mentioned above, and as
such are included in the process aspect of the invention. Such reactions and modifications include, for example, introduction of a substituent by means of an aromatic substitution reaction, reduction of substituents, alkylation of substituents, acylation of substituents, amidation of substituents and oxidation of substituents. The reagents and reaction conditions for such procedures are well known in the chemical art. Particular examples of aromatic substitution reactions include the introduction of a nitro group using concentrated nitric acid, the introduction of an acyl group using, for example, an acyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; the introduction of an alkyl group using an alkyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; and the introduction of a halogeno group. Particular examples of modifications include the reduction of a nitro group to an amino group by for example, catalytic hydrogenation with a nickel catalyst or treatment with iron in the presence of hydrochloric acid with heating; oxidation of alkylthio to alkylsulphinyl or alkylsulphonyl.

It will also be appreciated that, in some of the reactions mentioned hereinbefore, it may be necessary or desirable to protect any sensitive groups in the compounds. The instances where protection is necessary or desirable and suitable methods for protection are known to those skilled in the art. Conventional protecting groups may be used in accordance with standard practice (for illustration see T.W. Green, Protective Groups in Organic Synthesis, John Wiley and Sons, 1991). Thus, if reactants include groups such as amino, carboxy or hydroxy, it may be desirable to protect the group in some of the reactions mentioned herein.

A suitable protecting group for an amino or alkylamino group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an alkoxyacarbonyl group, for example a methoxycarbonyl, ethoxycarbonyl or tert-butoxycarbonyl group, an arylmethoxycarbonyl group, for example benzoxycarbonyl, or an aroyl group, for example benzoyl. The deprotection conditions for the above protecting groups necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or alkoxyacarbonyl group or an aroyl group may be removed for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an acyl group such as a tert-butoxycarbonyl group may be removed, for example, by treatment with a suitable acid as hydrochloric, sulphuric or phosphoric acid or trifluoroacetic acid and an arylmethoxycarbonyl group such as a benzoxycarbonyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon, or by treatment with
a Lewis acid for example boron tris(trifluoroacetate). A suitable alternative protecting group for a primary amino group is, for example, a phthaloyl group which may be removed by treatment with an alkylamine, for example dimethylaminopropylamine, or with hydrazine. Thus, for example, an acyl group such as an alkanoyl or an aroyl group may be removed, for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide.

Alternatively an arylmethyl group such as a benzyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

A suitable protecting group for a carboxy group is, for example, an esterifying group, for example a methyl or an ethyl group which may be removed, for example, by hydrolysis with a base such as sodium hydroxide, or for example a t-butyl group which may be removed, for example, by treatment with an acid, for example an organic acid such as trifluoroacetic acid, or for example a benzyl group which may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

The protecting groups may be removed at any convenient stage in the synthesis using conventional techniques well known in the chemical art.

Certain of the intermediates defined herein are novel and these are provided as a further feature of the invention. For example, many compounds of the Formulae XI, IV, XXI and XXIII are novel compounds. Many compounds of the Formulae X, XIII, XVI, XVIII, XXII, XXVI, XXIX, XXX and XXXII are also novel compounds. Many compounds of the Formulae II, XXI, XXIII, XXV are also novel compounds.

The following assays can be used to measure the effects of the compounds of the present invention as inhibitors of AxI and cMet tyrosine kinase enzymes, as inhibitors \textit{in vitro} of the phosphorylation of AxI expressed on NCI H1299 lung large cell carcinoma cells and as inhibitors \textit{in vitro} of the phosphorylation of cMet expressed on MKN45 cells.

(a) \textit{In Vitro} AxI Kinase Assay
The assay used AlphaScreen technology (Gray et al, Analytical Biochemistry, 2003, 313: 234-245) to determine the ability of test compounds to inhibit phosphorylation by recombinant Axl tyrosine kinase.

N-terminal GST-Axl kinase domain encompassing amino acids 473 to 894 of Axl (GenBank Accession No NM_021913) was expressed in SF126 insect cells and purified using the GST epitope tag, using standard purification techniques.

Test compounds were prepared as 10mM stock solutions in dimethylsulphoxide (DMSO) and diluted in DMSO as required. Aliquots (120nl) of compound dilutions were filled into the wells of a Greiner 384-well low volume (LV) white polystyrene plate (Greiner Bio-one) using acoustic dispensing (Labcyte Echo 550). A 10 µl mixture of recombinant purified Axl enzyme, biotinylated peptide substrate (Biotin poly-GAT; CisBio, Catalogue No. 61GATBLB), 0.2 µM adenosine triphosphate (ATP) and a buffer solution [comprising 20 mM Tris-HCl pH 7.5 buffer, 0.01% v/v Tween, 5 mM dithiothreitol (DTT) and 10 mM manganese chloride] was incubated with the compounds at room temperature for 20 minutes.

Control wells that produced a maximum signal corresponding to maximum enzyme activity were created by using 100% DMSO instead of test compound. Control wells that produced a minimum signal corresponding to 100% inhibited enzyme were created by adding 10 µM of Staurosporine.

Each reaction was stopped by the addition of 5 µl of a mixture of 500mM EDTA, 3mg/ml bovine serum albumin (BSA) and 20 mM Tris-HCl pH 7.4 buffer containing 40ng/µl AlphaScreen Streptavidin donor and anti-p-Tyr-100 acceptor beads (Perkin Elmer, Catalogue No. 6760620M). The resultant signals arising from laser light excitation at 680 nm were read using a Packard Envision instrument. The mean data values for each test compound concentration, 100% DMSO control wells and 100% inhibition control wells were used to generate a dose response curve from which the test compound's IC50 value and percentage kinase inhibition value at 1µM concentration were calculated. The IC50 value is the concentration of test compound that inhibited 50% of kinase activity. The percentage kinase inhibition value is the percentage of Axl tyrosine kinase activity inhibited by the test compound at a concentration of 1µM.

(b) Cellular phoshop-Axl ELISA Assay

This assay uses a conventional ELISA method to determine the ability of test compounds to inhibit phosphorylation of tyrosine residues in Axl.
AnNCI H1299 lung large cell carcinoma cell line [American Type Culture Collection (ATCC) CRL 5803] was routinely maintained at 37°C with 5% CO₂ in RPMI containing 10% foetal calf serum (FCS) and 2mM L-glutamine. For the assay, the cells were detached from the culture flask with 'Accutase' (Innovative Cell Technologies Inc., San Diego, CA, USA; Catalogue No. AT104) using standard tissue culture methods and re-suspended in media to give 0.9x10⁵ cells per ml. 100µl Aliquots were seeded into each of the wells of a clear 96 well tissue culture plate and the plates were incubated overnight at 37°C with 5% CO₂ to allow the cells to adhere to the wells.

Test compounds were prepared as 10 mM stock solutions in DMSO and serially diluted as required in DMSO to give a range of concentrations. Aliquots of each compound concentration were added to the cells in each well using the Echo 550 (Labcyte Inc., Sunnyvale, California, US). Control cells received DMSO only. The cells were incubated for 2 hours at 37°C with 5% CO₂.

The resultant cells were stimulated with 100 ng/ml recombinant mouse GAS6 (R&D Systems Europe Ltd, Abingdon, Oxfordshire, UK; Catalogue No. 986-GS) for 10 minutes at 37°C with 5% CO₂. Cells were lysed by the addition of 50 µl/well of lysis buffer comprising 20mM Tris-HCl pH 8.0, 137 mM sodium chloride, 2 mM EDTA, 10% v/v glycerol, 1% v/v Igepal CA-630 (Sigma-Aldrich Company Ltd, Gillingham, Dorset, UK; Catalogue No. 13021), 0.5mM sodium orthovanadate, 1 mM sodium pyrophosphate, 10 mM sodium pyrophosphate, 10 mM glycerophosphate and IX protease inhibitor tablets (Roche; catalogue number 11836153001). The resultant tissue culture plates were incubated on ice for 30 minutes to ensure full lysis.

High-binding ELISA plates (Corning B.V. Life Sciences, Schiphol-Rijk, The Netherlands; Catalogue No. #3925) were coated with an anti-Axl antibody (R&D Systems; Catalogue No. AF154) at room temperature for 16 hours. The wells were washed 3 times with 250 µl per well of PBS containing 0.05% v/v Tween (PBS/T). The wells were treated with 3% w/v BSA in PBS at ambient temperature for 2 hours and subsequently washed 3 times with 250 µl per well of PBS/T.

50 µl Aliquots of the NCI H1299 cell lysates were added to the ELISA plates. The ELISA plates were incubated for 16 hours at 4°C and then washed 3 times with 250 µl per well of PBS/T. The cells were incubated for 1 hour at room temperature with a mouse anti-Phospho tyrosine antibody (Upstate, Catalogue No 05-321) diluted in 1% w/v BSA in PBS.
Plates were washed three times with 250 µl per well of PBS/T. Subsequently, plates were incubated for 1 hour at room temperature with an anti-mouse horseradish peroxidase conjugated secondary antibody diluted in 1% w/v BSA in PBS.

The plates were washed 3 times with 250 µl per well of PBS/T. Fluorogenic substrate was made up according to manufacturers instructions (Pierce Biotechnology Inc., Rockford IL, USA; Catalogue No. 15169). 100 µl Aliquots of substrate solution were added to each of the wells and fluorescence was read on a Tecan Ultra plate reader (Tecan UK Ltd., Reading, Berkshire, UK). Fluorescence dose response data obtained with each compound were analysed and the degree of inhibition of phospho-Axl was calculated and expressed as an IC50 value and/or a percentage kinase inhibition value at 1 µM concentration. The IC50 value is the concentration of test compound that inhibited 50% of kinase activity. The percentage kinase inhibition value is the percentage of kinase activity inhibited by the test compound at a concentration of 1 µM.

(c) In Vitro c-Met Kinase Assay

The assay used AlphaScreen technology (Gray et al, Analytical Biochemistry, 2003, 313: 234-245) to determine the ability of test compounds to prevent the activation of c-Met, in which wild type activated c-Met phosphorylates a mutant form of c-Met lacking catalytic activity but retaining the ability to be phosphorylated on the activating residues.

Kinase activity assays were performed in 384-well low-volume white plates (Greiner, 784075) with a total volume of 12 µL in each well. Each kinase reaction contained 40pg (100OpM) pY^{1234,1235}_{c-Met(1074-1366)} kinase domain, 44ng (100nM) cMyc-[D1204N,R1208Q]c-Met(1069-1366)-biotin, 25mM HEPES (pH7.4), 0.1mM sodium orthovanadate, 1mM DTT, 0.01% (v/v) Tween-20, 10mM magnesium chloride, 0.1% BSA, 50µM ATP.

Various concentrations of test compounds were each added in 6% (v/v) DMSO to yield a final assay DMSO concentration of 1% (v/v). The kinase reactions were incubated at room temperature for 60 minutes and stopped by adding 5 µL containing 0.5ng anti-pY^{1234,1235}_{c-Met} rabbit polyclonal antibody (generated as described below) with 200ng rabbit IgG Protein A Alphascreen acceptor beads (Perkin Elmer 67606 17R) & 200ng streptavidin donor beads (Perkin Elmer 67606 17R) in 25 mM HEPES (pH 7.4), 84.5mM EDTA, 0.3% BSA under low-level light conditions. Plates were sealed under low-level light conditions & incubated in the dark for 20 hours. Plates were read using an Envision (Perkin
Elmer) with excitation at 680 nM, emission 520-620 nM. The mean data values for each test compound concentration, untreated control wells and 100% inhibition control wells were used to determine the test compound’s IC50 value. The IC50 value is the concentration of test compound that inhibits 50% of c-Met kinase activity.

The anti-pYpY<sup>1234/1235</sup>c-Met rabbit polyclonal antibody used in the above assay, was generated by the immunisation of rabbits. Rabbits were immunised 4 times over a 3 month period with Ac-RDMYDKEY(p)Y(p)SVHN(Ahx)C-amide peptide conjugated to BSA (Harlan Sera Labs). Serum was taken at a terminal bleed and this was purified by an ammonium sulphate precipitation followed by affinity purification on dual phosphorylated peptide and non-phosphorylated peptide affinity columns.

(d) **Cellular c-Met Inhibition Assay**

These and other assays can be used to indicate the ability of a test compound to inhibit c-Met mediated cellular signalling in mammalian cell lines, for example the human tumour cell line MKN45. This is achieved by measuring the amount of phosphorylated c-Met within a cell following compound treatment.

MKN45 cells were routinely passaged in DMEM (Gibco BRL, product number 41966-029) plus 10% foetal calf serum (FCS), 1% L-glutamine (Gibco BRL, product number 25030024), to a confluence not greater than 85%. To undertake the assay, MKN45 cells were seeded at 2x10<sup>4</sup> cells/well in DMEM plus 0.5% foetal calf serum, 1% L-glutamine in 96 well plates (Costar, product number 3904) and incubated at 37°C (+5% CO<sub>2</sub>) in a humidified incubator. Once the cells had fully adhered (typically following overnight incubation) plates were dosed with 25µl compound (diluted from 10 mM stock in DMSO using serum free DMEM) and the plates were returned to a humidified 37°C (+5% CO<sub>2</sub>) incubator for one hour. Following incubation the cells were fixed by adding formaldehyde (4% final concentration) and incubating at room temperature for 20 minutes. The fixative solution was removed and the wells were washed three times with 100 µl phosphate buffered saline (PBS) before permeabilising the cells by the addition of 50 µl/well 0.1% triton/ PBS for 20 minutes at room temperature. The permeabilisation solution was removed and the cells were washed twice more with 100µl/ well PBS before the addition of 40µl/well anti-phospho-pYpY<sup>1230/4/5</sup>c-Met (Biosource, product number 44-888G-CS2), diluted 1/500 with PBS plus 10% FCS. Following incubation at room temperature for 1 hour, the antibody solution
was removed and the wells were washed twice with 100 µl/ well PBS. 50 µl/ well 1/400 goat anti-rabbit Alexa Fluor 594 secondary antibody (Molecular Probes, product number A11012) and 1/10000 Hoescht (Molecular Probes, product number H-3570) diluted with PBS plus 10% FCS was added and the plate incubated in the dark at room temperature for one hour. Finally, the plates were washed three times with 100 µl/ well PBS, leaving the final wash in the wells before sealing the plates. The plates were read using an Arrayscan II (Cellomics). The mean average intensity fluorescence values for each test compound concentration, untreated control wells and 100% inhibition control wells were used to determine the test compound's IC50 value. The IC50 value is the concentration of test compound that inhibits 50% of c-Met phosphorylation.

According to a further aspect of the invention there is provided a pharmaceutical composition, which comprises a pyridine or pyrazine derivative of the Formula I, or a pharmaceutically-acceptable salt thereof, as defined hereinbefore in association with a pharmaceutically-acceptable diluent or carrier.
The compositions of the invention may be in a form suitable for oral use (for example as tablets, lozenges, hard or soft capsules, aqueous or oily suspensions, emulsions, dispersions, powders or granules, syrups or elixirs), for topical use (for example as creams, ointments, gels, or aqueous or oily solutions or suspensions), for administration by inhalation (for example as a finely divided powder or a liquid aerosol), for administration by insufflation (for example as a finely divided powder) or for parenteral administration (for example as a sterile aqueous or oily solution for intravenous, subcutaneous, intraperitoneal or intramuscular dosing) or as a suppository for rectal dosing.

The compositions of the invention may be obtained by conventional procedures using conventional pharmaceutical excipients, well known in the art. Thus, compositions intended for oral use may contain, for example, one or more colouring, sweetening, flavouring and/or preservative agents.

The amount of active ingredient that is combined with one or more excipients to produce a single dosage form will necessarily vary depending upon the host treated and the particular route of administration. For example, a formulation intended for oral administration to humans will generally contain, for example, from 1 mg to 1 g of active agent (more suitably from 1 to 250 mg, for example from 1 to 100 mg) compounded with an appropriate and convenient amount of excipients which may vary from about 5 to about 98 percent by weight of the total composition.

The size of the dose for therapeutic or prophylactic purposes of a compound of the Formula I will naturally vary according to the nature and severity of the disease state, the age and sex of the animal or patient and the route of administration, according to well known principles of medicine.

In using a compound of the Formula I for therapeutic or prophylactic purposes it will generally be administered so that a daily dose in the range, for example, 1 mg/kg to 100 mg/kg body weight is received, given if required in divided doses. In general, lower doses will be administered when a parenteral route is employed. Thus, for example, for intravenous administration, a dose in the range, for example, 1 mg/kg to 25 mg/kg body weight will generally be used. Similarly, for administration by inhalation, a dose in the range, for example, 1 mg/kg to 25 mg/kg body weight will be used. Oral administration is however preferred, particularly in tablet form. Typically, unit dosage forms will contain about 10 mg to 0.5 g of a compound of this invention.
As stated above, antagonism of the activity of AxI and/or c-Met receptor kinases, is expected to be beneficial in the treatment of a number of cell proliferative disorders such as cancer.

We have now found that the novel pyridine or pyrazine derivatives described herein possess potent activity against cell proliferative disorders. It is believed that the compounds provide a useful treatment of cell proliferative disorders, for example to provide an anti-tumour effect, by way of a contribution from inhibition of AxI and/or c-Met receptor tyrosine kinases. In addition, as stated hereinbefore, AxI and c-Met are involved in angiogenesis, the process of forming new blood vessels that is critical for continuing tumour growth. It is therefore believed that the compounds of the present invention are expected to be beneficial in the treatment of a number of disease states that are associated with angiogenesis and/or increased vascular permeability such as cancer, especially in inhibiting the development of tumours.

Particular compounds of the invention possess better potency against AxI receptor tyrosine kinases than against c-Met receptor kinases.

- (ix) above.

Therefore in a further aspect of the invention there is provided a compound of formula (I)
or a pharmaceutically acceptable salt thereof in combination with an anti-tumour agent
selected from one listed under (i) - (ix) herein above.

Herein, where the term "combination" is used it is to be understood that this refers to
simultaneous, separate or sequential administration. In one aspect of the invention
"combination" refers to simultaneous administration. In another aspect of the invention
"combination" refers to separate administration. In a further aspect of the invention
"combination" refers to sequential administration. Where the administration is sequential or
separate, the delay in administering the second component should not be such as to lose the
beneficial effect of the combination.

According to a further aspect of the invention there is provided a pharmaceutical
composition which comprises a compound of formula (I) or a pharmaceutically acceptable
salt thereof in combination with an anti-tumour agent selected from one listed under (i) - (ix)
herein above, in association with a pharmaceutically acceptable diluent or carrier.

According to a further aspect of the invention there is provided a pharmaceutical
composition which comprises a compound of formula (I) or a pharmaceutically acceptable
salt thereof in combination with an anti-tumour agent selected from one listed under (i) - (ix)
herein above, in association with a pharmaceutically acceptable diluent or carrier for use in
treating cancer.

According to another feature of the invention there is provided the use of a compound

c) container means for containing said first and second dosage forms.

Although the compounds of the Formula I are primarily of value as therapeutic agents for use in warm-blooded animals (including man), they are also useful whenever it is required to inhibit the effects of AxI or c-Met receptor tyrosine kinase enzymes. Thus, they are useful as pharmacological standards for use in the development of new biological tests and in the search for new pharmacological agents.

The invention will now be illustrated in the following Examples in which, generally:

(i) operations were carried out at ambient temperature, i.e. in the range 17 to 25°C and under an atmosphere of an inert gas such as nitrogen unless otherwise stated;

(ii) evaporations were carried out by rotary evaporation or utilising Genevac equipment in vacuo and work-up procedures were carried out after removal of residual solids by filtration;

(iii) column chromatography (by the flash procedure) was performed on Merck Kieselgel silica (Art. 9385) obtained from E. Merck, Darmstadt, Germany or using proprietary pre-packed normal phase silica cartridges, for example SiliCycle (TM) disposable chromatography cartridges, or high pressure liquid chromatography (HPLC) was performed
on C18 reverse phase silica, for example on a X Bridge 5µm C-18 60A preparative reversed-phase column;

(iv) ion exchange chromatography was performed using pre-packed 1ST Isolute® SCX-2 columns;

(v) preparative chromatography was performed on a Gilson instrument with an X Bridge 5µm C18 column (19 x 100 mm), with a flow rate of 25 ml/min and solvent system of 1% aqueous ammonia : acetonitrile with a gradient in the range of 25-95% (this is described hereinafter as 'X Bridge preparative chromatography');

(vi) yields, where present, are not necessarily the maximum attainable;

(vii) in general, the structures of end-products of the Formula I were confirmed by nuclear magnetic resonance (NMR) spectroscopy; NMR chemical shift values were measured on the delta scale [proton magnetic resonance spectra were determined using a Bruker DPX 400 (400 MHz) or a Bruker DRX 500 (500 MHz) instrument]; measurements were taken at ambient temperature unless otherwise specified; the following abbreviations have been used: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; dd, doublet of doublets; ddd, doublet of doublet of doublet; dt, doublet of triplets; bs, broad signal;

(viii) in general, end-products of the Formula I were also characterised by mass spectroscopy following liquid chromatography (LCMS); LCMS was carried out using an Agilent 1100 or Waters Alliance HT (2790 & 2795) fitted with a Waters ZQ ESCi mass spectrometer and an X Bridge 5µm C-18 column (2.1 x 50 mm) at a flow rate of 1.1 ml/min, using a solvent system of 95% A + 5% C to 95% B + 5% C over 4 minutes, where A = water, B = acetonitrile, C = 1:1 acetonitrile:water 1% ammonia; in general, the retention time (RT) of each product under these chromatographic conditions was noted;

(ix) intermediates were not generally fully characterised and purity was assessed by thin layer chromatographic, mass spectral, HPLC and/or NMR analysis;

(x) Where HPLC retention times are quoted for Examples 40 to 72, the following conditions were used unless otherwise stated. Analytical LC-MS was carried out using a Waters Alliance HT (2695) fitted with a Waters ZQ or ZMD ESCi mass spectrometer and a Sunfire 3.5µm C-18 column (4.6 x 50 mm) at a flow rate of 2.5 ml/min, using a solvent system of 95% A + 5% C to 95% B + 5% C over 4 minutes, where A = water, B =
acetonitrile, C = 5% HCOOH in Methanol; retention time of each product is quoted in minutes;

(xi) Conventional TFA deprotection can be carried out as follows. Trifluoroacetic acid is added to a solution of the Boc protected compound in dichloromethane at room temperature. After 2 hours, the mixture is concentrated and purified. Conventional hydrogen chloride deprotection can be carried out as follows. A 4N solution of hydrogen chloride is added to the Boc protected compound at room temperature. After 2 hours of stirring, the reaction mixture is concentrated and purified;

Example 1

3-Benzoxazol-2-yl-5-[4-(dimethylaminomethyl)phenyl]pyridin-2-amine

![Chemical Structure](image)

2M Sodium carbonate solution (0.4 ml) was added to a solution of 3-(benzoxazol-2-yl)-5-bromo-pyridin-2-amine (0.10 g), [4-(dimethylaminomethyl)phenyl]boronic acid (0.075 g) and dichlorobis(triphenylphosphine)palladium (II) (0.003 g) in a mixture of 2:7:3:2 DMF:DME:water:ethanol (3 ml). The reaction mixture was heated at 160°C for 7 mins in a 1000W microwave oven. The solvent was evaporated in a Genevac and NMP (1.8 ml) was added. The mixture was filtered and purified by X bridge preparative HPLC. There was thus obtained the title compound (0.021 g); Mass Spectrum: M+H+ 344, RT 2.82 min.

The 3-(benzoxazol-2-yl)-5-bromo-pyridin-2-amine used as a starting material was prepared as follows:-

2-Aminophenol (4.02 g) was added in one portion to 2-amino-5-bromo-pyridine-3-carboxylic acid (8.0 g) in polyphosphoric acid (20 ml). The resulting mixture was stirred at 200°C for 7 hours. The mixture was allowed to cool to 150°C and poured into water (3 L) with rapid stirring. The resulting suspension was adjusted to pH 12 by addition of sodium hydroxide solution and the resulting precipitate was collected by filtration. The solid was then washed with methanol (200 ml) and dried under vacuum. There was thus obtained 3-(1,3-benzoxazol-2-yl)-5-bromo-pyridin-2-amine (4.90 g); NMR Spectrum: (DMSOδ6) 7.47 (m, 2H), 7.83 (m, 4H), 8.32 (d, IH), 8.38 (d, IH); Mass Spectrum: M+H+ 292.08, RT 2.78 min.

Example 2

5. Mass Spectrum: M+H+ 380.22; RT 2.64 min.

7. Mass Spectrum: M+H+ 387; RT 2.66 min. 4-[4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl]methyl)morpholine was used as a starting material to prepare compound [7].

8. Mass Spectrum: M+H+ 402.47; RT 2.06 min.
[10] Tert-butyl 4-[3-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl]piperazine-l-carboxylate was used as a reagent and after coupling, the Boc group was removed with trifluoroacetic acid in DCM. The resultant product gave the following characterising data: Mass Spectrum: M+H+ 372.1; RT 2.41 min; NMR Spectrum: (DMSOd6) 8.56 (IH, d), 8.47 (IH, d), 7.79 - 7.88 (2H, m), 7.76 (2H, s), 7.41 - 7.50 (2H, m), 7.31 (IH, t), 7.18 (IH, s), 7.07 (IH, d), 6.92 (IH, dd), 3.15 (4H, t), 2.87 (4H, t).

The tert-butyl 4-[3-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl]piperazine-l-carboxylate used as a reagent was prepared as follows:

Di-tert-butyl dicarbonate (4.93 g) was added slowly to a mixture of l-(3-bromophenyl)piperazine (4.95 g), triethylamine (4.2 g) and DMAP (0.25 g) in a solution of acetonitrile (50 ml) and resulting solution was stirred for 1 hour. The reaction mixture was then evaporated and diluted with DCM (200 ml), and then washed with water (100 ml). The organic layer was dried over magnesium sulfate, filtered through a silica pad and evaporated under reduced pressure. There was thus obtained tert-butyl 4-(3-bromophenyl)piperazine-l-carboxylate (7.44 g); Mass Spectrum: M+H+ 341; RT 3.01 min; NMR Spectrum: (DMSOd6) 7.11 (IH, t), 7.03 (IH, t), 6.98 (IH, ddd), 6.82 (IH, ddd), 3.56 (4H, t), 3.13 (4H, t), 1.48 (9H, s).

Dichlorobis(triphenylphosphine)palladium (II) (0.172 g), tert-butyl 4-(3-bromophenyl)piperazine-l-carboxylate (3.59 g), bis(pinacolato)diboron (3.21 g) and potassium acetate (2.06 g) were combined in a flask which was then dried in a dessicator containing phosphorus pentoxide. The flask was then flushed with nitrogen and 1,4-dioxane (100 ml) was added. The resulting suspension was stirred at 80°C for 20 hours. The mixture was allowed to cool and then the solvent was evaporated under reduced pressure. The residue was redissolved in ethyl acetate (100 ml) and washed with water (100 ml), then dried over magnesium sulfate, filtered through a silica pad and evaporated. The resultant product was purified by flash silica chromatography (elution solvent 25% ethyl acetate in isohexane). There was thus obtained tert-butyl 4-[3-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl]piperazine-l-carboxylate (3.34 g); Mass Spectrum: M+H+ = 389; RT 3.23 min; NMR Spectrum: (DMSOd6) 7.32 (3H, m), 7.02 (IH, ddd), 3.57 (4H, t), 3.15 (4H, t), 1.48 (9H, s), 1.33 (12H, s).

The (4-hydroxypiperidin-1-yl)-[4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl]methanone used as a reagent was prepared as follows:

1-Ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride (1.15 g) was added to a solution of 4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)benzoic acid (1.25 g) and HOBT (0.82 g) in DMF (12 ml) under an atmosphere of argon. The mixture was stirred for four hours. The mixture was then added slowly to a solution of piperidin-4-ol (0.61 g) in DMF (6 ml). The mixture was stirred overnight, then concentrated under reduced pressure and dichloromethane (50 ml) was added. The resultant mixture was washed with water (20 ml), saturated sodium hydrogen carbonate solution twice (2 x 20 ml) and water (50 ml). The solution was the dried over magnesium sulfate and evaporated to give an oil. Diethylether (20 ml) was added to this oil and the mixture was stirred for 30 min. The resultant mixture was filtered and concentrated under reduced pressure. There was thus obtained (4-hydroxypiperidin-1-yl)-[4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl]methanone (2.10 g); Mass Spectrum: M+H+ 332; NMR Spectrum: (DMSOd6 at 100°C) 7.70 (d, 2H), 7.33 (2, 2H), 4.42 (d, IH), 3.80-3.68 (m, 2H), 3.22-3.10 (m, 2H), 1.80-1.67 (m, 2H), 1.5-1.3 (m, 2H), 1.30 (s, 12H).

[14] Tert-butyl 4-(4-(4,4,5 ,5-tetramethyl- 1,3,2-dioxaborolan-2-yl)phenyl)piperazine-1-carboxylate was used as a reagent and after coupling, the Boc group was removed with trifluoroacetic acid in DCM. The resultant product gave the following characterising data: Mass Spectrum: M+H+ 372.11; RT 2.36 min; NMR Spectrum: (DMSOd6) 8.53 (IH, d), 8.43 (IH, d), 7.79 - 7.87 (2H, m), 7.66 (2H, s), 7.56 (2H, d), 7.41 - 7.49 (2H, m), 7.02 (2H, d), 3.10 (4H, t), 2.86 (4H, t).

[18] Tert-butyl 4-((4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl)piperidine-1-carboxylate was used as a reagent and after coupling, the Boc group was removed with trifluoroacetic acid in DCM. The resultant product gave the following characterising data: Mass Spectrum: M+H+ 371.33; RT 1.89 min; NMR Spectrum: (DMSOd6) 8.57 (IH, d), 8.48
(IH, d), 7.79 (2H, s), 7.79 - 7.88 (2H, m), 7.63 (2H, d), 7.40 - 7.49 (2H, m), 7.32 (2H, d), 3.04 (2H, d), 2.55 - 2.66 (3H, m), 1.71 (2H, d), 1.54 (2H, qd).

The tert-butyl 4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl)piperidine-1-carboxylate used as a reagent was prepared as follows:

The residue was purified by SCX ion exchange chromatography (elution with 7M methanolic ammonia) and pure fractions were evaporated to dryness. The crude product was purified by flash silica chromatography (elution gradient 0 to 10% 7M methanolic ammonia in DCM). There was thus obtained methyl 2-amino-5-\{1-(1-methyl-4-piperidyl)pyrazol-4-yl\}pyridine-3-carboxylate (1.990 g); Mass Spectrum: M+H+ 316.2; RT 0.64 min; NMR Spectrum: (DMSOd6) 8.43 (d, 1H), 8.14 (d, IH), 8.12 (d, IH), 7.75 (d, IH), 7.03 (br s, 2H), 4.02 (m, IH), 3.78 (s, 3H), 2.79 (br m, 2H), 2.14 (s, 3H), 1.93 (m, 6H).

The title compound can also be prepared by the following process: 37% aqueous formaldehyde (0.015 ml) at 0°C, was added to a stirred solution of 3-(4-fluoro-l,3-benzoxazol-2-yl)-5-\{1-(4-piperidyl)pyrazol-4-yl\}pyridin-2-amine dissolved in dichloromethane (6 ml) and methanol (6 ml) over a period of 5 minutes. The resulting mixture was stirred at 0°C for 10 minutes. Sodium triacetoxyhydroborate (233 mg) was added at 0°C to the mixture and stirred at 0°C for 1 hour. A solution of 7N ammonia in methanol (20 ml) was added to the mixture and adsorbed on silica gel. The crude product was purified by
flash chromatography on silica gel eluting with 2 to 6% methanolic ammonia (7 N) in dichloromethane. The solvent was evaporated to dryness and tritured in hot acetonitrile, filtered and dried under reduce pressure to afford 3-(4-fluoro-1,3-benzoxazol-2-yl)-5-[1-(1-methyl-4-piperidyl)pyrazol-4-yl]pyridin-2-amine (268 mg) as a solid.

**Example 7**

Using analogous procedures to those described in Example 6, the appropriate 2-bromoaniline was reacted with the appropriate pyridine-3-carboxylate to give the compounds described in Table III. Unless otherwise stated, the required 2-bromoanilines that were used were commercially available.

Example 8

3-Oxazolo[4,5-c]pyridin-2-yl-5-[l-(4-piperidyl)pyrazol-4-yl] pyridin-2-amine

2M Sodium carbonate solution (0.206 ml) was added in one portion to a stirred suspension of 5-bromo-3-oxazolo[4,5-c]pyridin-2-yl-pyridin-2-amine (0.100 g), tert-butyl 4-(4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-1H-pyrazol-1-yl)piperidine-1-carboxylate (0.143 g) and bis(triphenylphosphine)palladium(II) chloride (0.012 g) in a mixture of 2:7:3:2 DMF:DME:water:ethanol (3 ml). The reaction was heated to 140°C for 20 minutes in a 100W microwave reactor. The mixture was concentrated to dryness and redisolved in DCM (3 ml). Trifluoroacetic acid (3 ml) was then added dropwise over a period of 1 minute. The resulting solution was stirred for 10 minutes and then evaporated to dryness. The resultant solid was purified by SCX ion exchange chromatography (elution with 7M methanolic ammonia). The solution was then evaporated to dryness and purified by preparative HPLC (Waters XBridge Prep C18 OBD column, 5µ silica, 21 mm diameter, 150 mm length), using decreasingly polar
mixtures of water (containing 1% formic acid) and acetonitrile as eluents. Fractions containing the desired compound were purified again by SCX ion-exchange chromatography, eluted from the column using 7N methanolic ammonia followed by DCM, then evaporated to dryness. There was thus obtained 3-oxazolo[4,5-c]pyridin-2-yl-5-[l-(4-piperidyl)pyrazol-4-yl]pyridin-2-amine (0.024 g); Mass Spectrum: M+H+ 362.40; RT 0.94 min; NMR Spectrum: (DMSOd6) 9.14 (IH, s), 8.62 (IH, d), 8.58 (IH, d), 8.45 (IH, d), 8.30 (IH, s), 7.92 (IH, s), 7.89 (IH, dd), 7.64 (2H, s), 4.17 - 4.28 (IH, m), 3.09 (2H, d), 2.65 (2H, t), 2.02 (2H, d), 1.84 (2H, qd).

The 5-bromo-3-oxazolo[4,5-c]pyridin-2-yl-pyridin-2-amine used as a reagent was prepared as follows:

3-Aminopyridin-4-ol (2.90 g) and 2-amino-5-bromo-pyridine-3-carboxylic acid (5.72 g) were added to polyphosphoric acid (100 ml) and stirred at 200°C for 5 hours. The reaction mixture was quenched with water (100 ml) and the mixture was basified with 10N sodium hydroxide until pH was 12.5. The resulting precipitate was collected by filtration, washed with water then methanol and dried under vacuum. There was thus obtained 5-bromo-3-(oxazolo[4,5-c]pyridin-2-yl)pyridin-2-amine (6.06 g);

**Example 8A**

Using an analogous procedure to that described in Example 8, the appropriate bromopyridine was reacted with the appropriate boronic acid or, where stated, an appropriate boronate ester, to give the compounds described in Table IV. Unless otherwise stated, Boc protected reagents were not used in the procedure for these compounds.

The [3-[(tert-butoxycarbonyl)piperidine-4-carbonyl]amino]phenyl]boronic acid used as a reagent was synthesised as follows:

Diisopropylethylamine (14.93 ml) was added to a solution of 1-tert-butoxycarbonyl piperidine-4-carboxylic acid (15.69 g) and HATU (20.06 g) in DMA (400 ml) and the solution was stirred for 20 minutes. 3-Aminophenylboronic acid (7.97 g) was then added and the solution stirred for a further 30 minutes. 3-Oxazolo[4,5-b]pyridin-2-yl-5-[l-(4-piperidyl)pyrazol-4-yl]pyridin-2-amine

2M Sodium carbonate solution (0.206 ml) was added in one portion to a stirred
suspension of 5-bromo-3-oxazolo[4,5-b]pyridin-2-yl-pyridin-2-amine (0.100 g), tert-butyl 4-
[4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)pyrazol-1-yl]piperidine-1-carboxylate (0.143
g) and bis(triphenylphosphine)palladium(II) chloride (0.012 g) in a mixture of 2:7:3:2
DMF:DME:water:ethanol (3 ml). The reaction was heated to 160°C for 20 minutes in a IOOW microwave reactor. The mixture was then concentrated to dryness and redissolved in DCM (3 ml). Trifluoroacetic acid (3 ml) was added dropwise over a period of 1 minute. The resulting solution was stirred for 10 minutes and then evaporated to dryness. The crude product was purified by SCX ion exchange chromatography. The crude material was purified by preparative HPLC (Waters XBridge Prep C18 OBD column, 5µ silica, 21 mm diameter, 150 mm length), using decreasingly polar mixtures of water (containing 1% formic acid) and acetonitrile as eluents. Fractions containing the desired compound were purified by SCX chromatography, eluted from the column using 7M ammonia in methanol then DCM. There was thus obtained 3-oxazolo[4,5-b]pyridin-2-yl-5-[l-(4-piperidyl)pyrazol-4-yl]pyridin-2-amine (0.028 g); Mass Spectrum: M+H+ 362.33; RT 1.13 min; NMR Spectrum: (DMSOd₆) 8.59 (IH, d), 8.56 (IH, dd), 8.46 (IH, d), 8.30 (IH, s), 8.22 (IH, dd), 7.91 (IH, s), 7.65 (2H, s), 7.49 (IH, dd), 4.15 - 4.25 (IH, m), 3.07 (2H, d), 2.62 (2H, t), 2.01 (2H, d), 1.82 (2H, qd).

The 5-bromo-3-oxazolo[4,5-b]pyridin-2-yl-pyridin-2-amine used as a reagent was prepared as follows:

2-Aminopyridin-3-ol (0.20 g) and 2-amino-5-bromo-pyridine-3-carboxylic acid (0.394 g) were stirred in polyphosphoric acid (10 ml) at 200°C for 5 hours. The reaction mixture was quenched with water (10 ml) and the mixture was basified to pH 11.6 by addition of ION sodium hydroxide solution. The precipitate was collected by filtration, washed with water (10 ml) then methanol (10 ml) and dried under vacuum. There was thus obtained 5-bromo-3-oxazolo[4,5-b]pyridin-2-yl-pyridin-2-amine (0.250 g); Mass Spectrum: M+H+ 291.14; RT 1.91 min; NMR Spectrum: (DMSOd₆) 8.56 (IH, dd), 8.40 (IH, d), 8.36 (IH, d), 8.23 (IH, dd), 7.84 (2H, s), 7.50 (IH, dd).

The tert-butyl 4-[4-(5-amino-6-formyl-pyrazin-2-yl)pyrazol-1-yl]piperidin-1-carboxylate used as starting material was made as follows:

1,1'-Bis(diphenylphosphino)ferrocenedichloropalladium(II) (2.245 g) was added to a mixture of caesium fluoride (18.85 g), methyl 3-amino-6-bromopyrazine-2-carboxylate (14.4 g) and tert-butyl 4-(4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-1H-pyrazol-1-yl)piperidine-1-carboxylate (30.4 g) in methanol (450 ml). The resulting mixture was stirred at 60°C for 1 hour at which time a further portion of tert-butyl 4-(4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-1H-pyrazol-1-yl)piperidine-1-carboxylate (15.0 g) was added. The resultant mixture was stirred for a further 3 hours at 60°C. The reaction mixture was concentrated under reduced pressure and redissolved in ethyl acetate (500 ml), then washed twice with water (2 x 250 ml). The organic extract was dried with magnesium sulfate, filtered and concentrated under reduced pressure. The material so obtained was purified by flash silica chromatography on Flash 75 equipment, elution gradient 0 to 4% methanol in dichloromethane. There was thus obtained methyl 3-amino-6-(1-(1-tert-butoxycarbonyl)piperidin-4-yl)-1H-pyrazol-4-yl)pyrazine-2-carboxylate (24.98 g); Mass Spectrum: M-H+ 401; RT 2.09 min; NMR Spectrum: (DMSO-d6) 8.44 (s, 1H), 7.95 (s, 1H), 7.92 (s, 1H), 6.37 (brs, 2H), 4.30 (m, 1H), 3.98 (s, 3H), 2.93 (t, 2H), 2.18 (d, 2H), 1.98 (m, 2H), 1.66 (s, 2H), 1.50 (s, 9H).

The resulting solution was stirred at -30°C to 0°C for 5 hours. Solid sodium sulfate decahydrate was added and the mixture was stirred for 30 minutes. The suspension was filtered and the filtrate was evaporated under reduced pressure. The crude product was purified by flash
chromatography on silica gel (eluting with 2 to 5% methanol in DCM). There was thus obtained tert-butyl 4-(4-(5-amino-6-(hydroxymethyl)pyrazin-2-yl)-1H-pyrazol-1-yl)piperidine-1-carboxylate (0.326 g); Mass spectrum: M+H+ 373.

The resulting solution was stirred for 2 hours, then the mixture was filtered. The crude product was purified by flash chromatography on silica gel (eluting with 50 to 70% ethyl acetate in petroleum ether). There was thus obtained tert-butyl 4-(4-(5-amino-6-formylpyrazin-2-yl)-1H-pyrazol-1-yl)piperidine-1-carboxylate (0.224 g);

3-oxazolo[5,4-b]pyridin-2-yl-5-[4-(3-pyrrolidin-1-ylpropoxy)phenyl] pyridin-2-amine

A solution of di-tert-butyl azodicarboxylate (DTAD) (227 mg) in dichloromethane (1 ml) was added to a stirred solution of 4-(6-amino-5-oxazolo[5,4-b]pyridin-2-yl-3-pyridyl)phenol (100 mg), polystyrene bound triphenylphosphine (330 mg, 3 mmol/g) and 3-pyrrolidin-1-ylpropan-1-ol (64 mg) in DMF (2 ml) at room temperature under argon. The resulting suspension was stirred at room temperature for 2 hours. The mixture was filtered and the resulting solid was washed with methanol. The filtrates were combined, concentrated to dryness and diluted with DCM/TFA (1 ml:1 ml). The mixture was stirred for 30 min and concentrated. The reaction mixture was purified by preparative HPLC using a Waters X-Bridge reverse-phase column (C-18, 5 micron silica, 19 mm diameter, 100 mm length, flow rate of 40 ml/minute) and decreasingly polar mixtures of water (containing 1% acetic acid) and Methanol as eluent. The fractions containing the desired compound were evaporated to dryness to afford 3-oxazolo[5,4-b]pyridin-2-yl-5-[4-(3-pyrrolidin-1-ylpropoxy)phenyl]pyridin-2-amine (36 mg) as a solid. **NMR Spectrum**: (DMSO-d6) 1.86 (bs, 4H), 2.03-2.15 (m, 2H), 3.02-3.33 (m partially hidden by H2O, 6H), 4.11 (t, 2H), 7.06 (d, 2H), 7.53 (dd, 1H), 7.68 (d, 2H), 7.77 (bs, 2H), 8.30 (dd, 1H), 8.40 (dd, 1H), 8.46 (d, 1H), 8.58 (d, 1H); **Mass spectrum**: M+H+ 416.

The 4-(6-amino-5-oxazolo[5,4-b]pyridin-2-yl-3-pyridyl)phenol used as starting material was made as follows:

A mixture of 5-bromo-3-oxazolo[5,4-b]pyridin-2-yl-pyridin-2-amine (1 g, Example 9 starting material), 4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenol (0.794 g),
bis(triphenylphosphine) palladium(II) chloride (0.121 g) and caesium fluoride (1.56 g) in methanol (17 ml) was heated at 120 °C for 20 min in a microwave oven. The reaction was repeated and the reaction mixtures were combined. The resulting mixture was concentrated, then diluted with water (400 ml) and stirred for 30 min. The resulting solid was filtered, washed with water (4x 150 ml), dried, washed with diethyl ether (4x 150ml) and dried overnight to give 4-(6-amino-5-oxazolo[5,4-b]pyridin-2-yl-3-pyridyl)phenol (12.3 g) as a solid. 

**NMR Spectrum**: (DMSOdø) 6.88 (d, 2H), 7.50-7.57 (m, 3H), 7.72 (bs, 2H), 8.28 (dd, IH), 8.37-8.42 (m, 2H), 8.53 (d, IH), 8.55 (bs, IH); **Mass spectrum**: M+H+ 355

**Example 43A**

Using an analogous procedure to that described in Example 42, the following examples were prepared by reacting 4-(6-amino-5-oxazolo[5,4-b]pyridin-2-yl-3-pyridyl)phenol with an appropriate alcohol:

**Example 43B**

The following examples were prepared by reacting 4-(6-amino-5-oxazolo[4,5-b]pyridin-2-yl-3-pyridyl)phenol with the appropriate alcohol using the following procedure:
di-tert-butyl azodicarboxylate (DTAD) (227 mg) in dichloromethane (2 ml) was added to a stirred suspension of the appropriate alcohol (0.66 mol), 4-(6-amino-5-oxazolo[4,5-b]pyridin-2-yl-3-pyridyl)phenol (100 mg) and polystyrene bound triphenylphosphine (329 mg, 3 mmol/g) dissolved in THF (3 ml) at room temperature. The resulting suspension was stirred at room temperature for 18 hours. The mixture was filtered. The resulting solution was concentrated to dryness. TFA / DCM (2 ml, 1:1) was added. The mixture was stirred at room temperature for 2 hours and concentrated to dryness. The residue was dissolved in DMF (1.5 ml) and purified by preparative HPLC using a Waters X-Bridge reverse-phase column (C-18, 5 microns silica, 19 mm diameter, 100 mm length, flow rate of 40 ml / minute) and decreasingly polar mixtures of water (containing 1% acetic acid) and acetonitrile as eluent. The fractions containing the desired compound were evaporated to dryness. The residue was dissolved in a mixture of methanol (10 ml), water (10 ml) and 30% aqueous ammonia (1 ml) and concentrated to dryness to give the title compound.

The 4-(6-amino-5-oxazolo[4,5-b]pyridin-2-yl-3-pyridyl)phenol used as starting material was made from 5-bromo-3-(oxazolo[4,5-b]pyridin-2-yl)pyridin-2-amine (Example 10, starting material) and 4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenol in several batches (using about 1 g of 5-bromo-3-(oxazolo[4,5-b]pyridin-2-yl)pyridin-2-amine each time) according to the starting material portion of the procedure described in Example 42. The different batches were combined. The reaction mixture was concentrated, diluted with water (400 ml) and stirred for 30 min. The resulting solid was filtered, washed with water, dried, washed with diethyl ether and dried overnight. The resulting solid was suspended in THF and heated at 70°C during 10 minutes. The mixture was filtered and washed with THF. The solid was triturated in diethyl ether, filtered and dried to give 4-(6-amino-5-(oxazolo[4,5-b]pyridin-2-yl)pyridin-3-yl)phenol (10.34 g) as a solid. NMR Spectrum (DMSOd6): 6.87 (d, 2H), 7.49 (dd, IH), 7.52 (d, 2H), 7.71 (bs, 2H), 8.24 (dd, IH), 8.43 (d, IH), 8.53-8.58 (m, 2H), 9.55 (s, IH); Mass spectrum: M+H+ 305.

A solution of di-tert-butyl azodicarboxylate (37.9 mg) in dichloromethane (1 ml) was added to a stirred suspension of 4-(6-amino-5-(oxazolo[5,4-b]pyridin-2-yl)pyridin-3-yl)-2-methoxyphenol (50 mg), triphenylphosphine (43 mg) and 2-(pyrrolidin-1-yl)ethanol (19 mg) dissolved in dichloromethane (4 ml) under nitrogen. The resulting suspension was stirred at room temperature for 1 hour. Triphenylphosphine (43 mg) and a solution of DTAD (37.9 mg) in dichloromethane (1 ml) were added. The resulting mixture was stirred at room temperature for 20 minutes. After evaporation of the solvents, the residue was purified by flash chromatography on silica gel eluting with 5% methanol in dichloromethane and methanolic ammonia (7 N) in dichloromethane. After collection of the desired fractions and evaporation of the solvents, the resulting solid was triturated with acetonitrile to give 5-[3-methoxy-4-(2-pyrrolidin-1-yloxy)phenyl]-3-oxazolo[5,4-b]pyridin-2-yl-pyridin-2-amine (20 mg) as a solid. [C2] A solution of di-tert-butyl azodicarboxylate (241 mg) in dichloromethane (1 ml), was
added dropwise to a stirred suspension of 4-(6-amino-5-(oxazolo[4,5-b]pyridin-2-yl)pyridin-
3-yl)-2-methoxyphenol (130 mg), 2-morpholinoethanol (0.054 ml) and triphenylphosphine

suspension was stirred at room temperature for 2 hours. The mixture was filtered, washed with
dichloromethane (1 ml) and methanol (1 ml). The solvent was evaporated. The resulting
residue was diluted with Iml of dichloromethane and 1 ml of TFA; the mixture was stirred
overnight and concentrated. The reaction mixture was purified by preparative HPLC using a
Waters X-Bridge reverse-phase column (C-18, 5 microns silica, 19 mm diameter, 100 mm

0.2% ammonium carbonate) and acetonitrile as eluent. The fractions containing the desired
compound were evaporated to dryness to afford 5-[3-methoxy-4-(2-
morpholinoethoxy)phenyl]-3-oxazolo[4,5-b]pyridin-2-yl-pyridin-2-amine (70 mg) as a solid.

The 4-(6-amino-5-oxazolo[4,5-b]pyridin-2-yl-3-pyridyl)-2-methoxy-phenol used as starting
material was made as follows:

A mixture of 2-methoxy-4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenol (90 mg), 5-
bromo-3-oxazolo[4,5-b]pyridin-2-yl-pyridin-2-amine (100 mg), caesium fluoride (0.038 g)
and bis(triphenylphosphine) palladium chloride (12.06 mg) were suspended in methanol (2
ml) and sealed into a microwave tube. The reaction was degassed, purged with nitrogen and
heated to 120°C over a period of 20 minutes in the microwave reactor. The solvent was
removed; the residue was diluted with water (20 ml) and stirred for 30 min. The mixture was
filtered, washed with water (3 X 10 ml), dried; and washed with diethyl ether (4 X 15 ml) and
dichloromethane / diethyl ether (10 ml) and dried overnight to give 4-(6-amino-5-

[C36] The tert-butyl (2R,4R)-4-hydroxy-2-(methoxymethyl)pyrrolidine-1-carboxylate used as
starting material was prepared as follows:
Iodomethane (4.17 ml) was added to (2R,4R)-l-tert-butoxycarbonyl-4-hydroxy-pyrrolidine-2-carboxylic acid (15.00 g) in DMF (100 ml) at 0°C. Caesium carbonate (25.4 g) was added in one portion and the resulting mixture stirred at 20°C for 16 hours. The reaction mixture was diluted with water (150 ml) and extracted with dichloromethane (2 x 150 ml). The combined organics were washed with brine (100 ml), dried over Magnesium sulphate, filtered and evaporated to dryness to give Ol-tert-butyl O2-methyl (2R,4R)-4-hydroxypyrrolidine-1,2-dicarboxylate (13.83 g) as a yellow oil. 1H NMR Spectrum: (DMSOd6) 1.32 (9H, s); 1.77 - 1.85 (IH, m); 2.24 - 2.38 (IH, m); 3.07 - 3.15 (IH, m); 3.47 (IH, q); 3.63 (3H, t); 4.16 - 4.23 (2H, m); 4.92 - 4.98 (IH, m).

Tert-Butyldimethylsilylchloride (9.36 g) was added to a mixture of Ol-tert-butyl O2-methyl (2R,4R)-4-hydroxypyrrolidine-1,2-dicarboxylate (13.83 g) and imidazole (9.61 g) in DMF (100 ml). The reaction was stirred at 20°C for 19 hours and then evaporated to dryness. The residues were slurried in diethyl ether and filtered. The filtrate was evaporated to dryness and the residues purified by flash chromatography on silica eluting with increasingly polar mixtures of methanol / dichloromethane (0/100-5/95). Fractions containing the desired product were combined and evaporated to dryness to give Ol-tert-butyl O2-methyl (2R,4R) 4-(tert-butyl-dimethyl-silyl)oxy-pyrrolidine-1,2-dicarboxylate (10.35 g) as a colourless oil. 1H NMR Spectrum: (DMSOd6) 0.00 (6H, s); 0.80 (9H, s); 1.32 - 1.38 (9H, m); 1.84 - 1.89 (IH, m); 2.30 - 2.35 (IH, m); 3.06 - 3.10 (IH, m); 3.49 (IH, q); 3.59 (3H, d); 4.22 - 4.26 (IH, m); 4.37 (IH, d).

2M Lithium borohydride in THF (15.06 ml) was added slowly to a stirred solution of Ol-tert-butyl O2-methyl (2R,4R) 4-(tert-butyl-dimethyl-silyl)oxy-pyrrolidine-1,2-dicarboxylate (10.35 g) in THF (100 ml) at 0°C. The resulting mixture was allowed to warm to 20°C and stirred for a further 18 hours. The reaction mixture was quenched with water and evaporated to remove THF. The aqueous residues were extracted with DCM (250 ml). The organic phase was washed sequentially with water (250 ml) and saturated brine (250 ml), dried over Magnesium sulphate, filtered and evaporated to give tert-butyl (2R,4R) 4-(tert-butyl-dimethyl-silyl)oxy-2-(hydroxymethyl)pyrrrolidine-1-carboxylate (9.32 g). 1H NMR Spectrum: (DMSOd6) 0.01 (6H, s); 0.80 - 0.82 (9H, m); 1.34 (9H, s); 1.84 - 1.89 (IH, m); 1.99 (IH, m); 3.00 (IH, m); 3.53 - 3.57 (4H, m); 4.28 (IH, s); 4.48 - 4.49 (IH, m).

A solution of tert-butyl (2R,4R) 4-(tert-butyl-dimethyl-silyl)oxy-2-(hydroxymethyl)pyrrrolidine-1-carboxylate (9.32 g) in DMF (15 ml) was added to a stirred
suspension of sodium hydride (60% dispersion) (1.37 g) in DMF 100 ml) at -10 °C.
Iodomethane (2.13 ml) was added and the reaction allowed to warm to 20°C. The reaction mixture was quenched carefully with water and evaporated to dryness. The crude material was partitioned between ethyl acetate (250 ml) and water (100 ml). The organic layer was washed with brine (100 ml), dried over Magnesium sulphate, filtered and evaporated to give tert-butyl (2R,4R) 4-(tert-butyl-dimethyl-silyl)oxy-2-(methoxymethyl)pyrrolidine-1-carboxylate (6.68 g) as a colourless oil. NMR Spectrum: (DMSOd6) 0.02 (6H, s); 0.83 - 0.84 (9H, s); 1.36 (9H, s); 1.78 (IH, d); 1.99 (IH, s); 2.99 (IH, d); 3.19 (3H, d); 3.23 - 3.48 (3H, m); 3.80 (IH, s); 4.33 (IH, s).

Tetrabutyl ammonium fluoride (21.3 ml) was added to a stirred solution of tert-butyl (2R,4R) 4-(tert-butyl-dimethyl-silyl)oxy-2-(methoxymethyl)pyrrolidine-1-carboxylate (6.68 g) in THF (150 ml). The resulting mixture was stirred at 20°C for 18 hours. The reaction mixture was evaporated to dryness and the residue was purified by flash chromatography on silica eluting with increasingly polar mixtures of methanol / dichloromethane (0/100 - 5/95). Fractions containing the desired product were combined and evaporated to give tert-butyl (2R,4R) 4-hydroxy-2-(methoxymethyl)pyrrolidine-1-carboxylate (3.32 g) as a solid. NMR Spectrum: (DMSOd6) 1.44 (9H, s); 1.81 - 1.86 (IH, m); 2.05 (IH, d); 3.09 (IH, d); 3.43 - 3.49 (3H, s); 3.52 (3H, m); 3.83 (IH, d); 4.20 - 4.25 (IH, m); 4.94 (IH, d).

[C37] Tert-butyl N-[(3S,4S)-4-hydroxytetrahydropyran-3-yl]-N-methyl-carbamate was used as a starting material.

[C38] Tert-butyl 4-hydroxyazepane-1-carboxylate was used as starting material.

**Example 44**

4-(6-amino-5-(oxazolo [5,4-b]pyridin-2-yl)pyridin-3-yl)-N-(2-(dimethylamino)ethyl)benzamide
A mixture of 4-(6-amino-5-oxazolo[5,4-b]pyridin-2-yl-3-pyridyl)benzoic acid (100 mg) N,N-dimethylethane-1,2-diamine (0.036 ml), 2-(1H-benzo[d][1,2,3]triazol-1-yl)-1,3,3-tetramethylisouronium tetrafluoroborate (145 mg) and 4-methylmorpholine (0.066 ml) in NMP (1 ml) was stirred at room temperature for 15 hours. The reaction mixture was purified by preparative HPLC using a Waters X-Bridge reverse-phase column (5 microns silica, 30 mm diameter, 150 mm length) and decreasingly polar mixtures of water (containing 0.2% ammonium carbonate) and acetonitrile as eluent. The fractions were evaporated to dryness to afford the title compound (38 mg) as a solid; NMR Spectrum: (DMSOd$_6$) 2.19 (s, 6H), 2.42 (t, 2H), 3.35-3.42 (m, 2H), 7.54 (dd, IH), 7.86 (d, 2H), 7.93 (bs, 2H), 7.95 (d, 2H), 8.30 (dd, IH), 8.41 (dd, IH), 8.45 (t, IH), 8.59 (d, IH), 8.71 (d, IH); Mass spectrum: M+H$: 403.

RT: 1.73

The 4-(6-amino-5-oxazolo[5,4-b]pyridin-2-yl-3-pyridyl)benzoic acid used as starting material was prepared as follows:

Bis(triphenylphosphine) palladium (II) chloride (0.121 g) and caesium fluoride (1.56 g) were added to a degassed solution of 5-bromo-3-oxazolo[5,4-b]pyridin-2-yl-pyridin-2-amine (1 g) and 4-boronobenzoic acid (0.570 g) in methanol (15 ml) under nitrogen atmosphere. The suspension was stirred at 120 °C for 20 min in a 300W microwave reactor. The reaction mixture was then stirred at 130°C for 20 minutes in a 300W microwave reactor. The mixture was diluted with water (25ml) and stirred for 30min. The yellow suspension was filtered, washed with water (4 x 15ml), washed with diethyl ether (4 x 15ml) and dried overnight to give 4-(6-amino-5-oxazolo[5,4-b]pyridin-2-yl-3-pyridyl)benzoic acid (1.090 g, 95%). NMR Spectrum: (DMSOd$_6$) 7.54 (dd, IH), 7.89 (d, 2H), 7.95 (bs, 2H), 8.03 (d, 2H), 8.30 (dd, IH), 8.41 (dd, IH), 8.60 (d, IH), 8.71 (d, IH); Mass spectrum: M+H$: 333

**Example 45A**

Using an analogous procedure to that described in Example 44, the following examples were prepared by reacting 4-(6-amino-5-(oxazolo[5,4-b]pyridin-2-yl)pyridin-3-yl)benzoic acid with an appropriate amine.

The 4-(6-amino-5-oxazolo[4,5-b]pyridin-2-yl-3-pyridyl)benzoic acid used as starting material was prepared as follows:
A mixture of 5-bromo-3-(oxazolo[4,5-b]pyridin-2-yl)pyridin-2-amine, 4-boronobenzoic acid (0.57 g), bistriphenylphosphine palladium chloride (0.121 g) and caesium fluoride (0.380 g) in MeOH (15 ml) were stirred at 120°C for 20 mins under microwaves in a 300 W microwave oven.

The mixture was then concentrated under reduced pressure and the residue dissolved in DCM (150 ml) and washed with saturated ammonium chloride (2 x 100 ml). The resultant mixture was then dried over magnesium sulfate and evaporated under reduced pressure.

The residue was redissolved in DCM (200 ml) and cooled to 0 °C. Small portions of chloroperbenzoic acid (11.8 g) added slowly over a 10 minute period and the mixture was stirred at ambient temperature for 3 hours. The resultant mixture was stirred at 80 °C for 18 hours. The reaction mixture was evaporated to dryness, then DCM (500 ml) was added. The mixture was stirred for 15 minutes, then filtered, and the filtrate was concentrated under reduced pressure. The crude product was purified by flash silica chromatography (elution gradient 8 to 20% ethyl acetate in isohexane).
