FOOTBALL OVERSHOE

Application filed December 24, 1929. Serial No. 416,270.

The invention relates to an accessory for the toe of all football and soccer shoes, made of some suitable material such as canvas upon which layers of rubber, rubberized or water proof materials are attached or adhered, said layers of rubber, rubberized or waterproof materials being detachable one at a time, thereby affording a dry surface as each layer is removed, and the objects of the football overshoe are, first, to provide a clean, dry surface for kicking or punting in rainy weather; second, to eliminate the usual "time out" for changing or cleaning the shoe when getting ready for a kick or punt; and, third, to eliminate the "chance" element or rather the possibility of a poor kick or punt due to a wet and muddy shoe in contact with a slippery ball.

The invention is illustrated in the accompanying drawings by Figures 1, 2, 3 and 4.

Figure 1 is a side view of the overshoe in place. The ring 1 is the loop through which the shoe strings or lacings are passed to fasten the top of the overshoe firmly to the football shoe.

Figure 2 is a bottom view of the overshoe in place. Elastic 2 holds the overshoe taut over the bottom of the football shoe. Holes 3 provide openings for the cleats 4.

Figure 3 is a top view of the overshoe in place.

Figure 4 shows overshoe in place with top layer partly removed. In Figure 4, tips 5 provide the means by which the layers 6 of rubber, rubberized or waterproof material are easily grasped and peeled off separately, thereby leaving a clean, dry kicking surface each time a layer is removed.

We claim:

A football accessory comprising a protector for covering the toe portion of the shoe to which it is to be attached, means carried by the protector for holding it in engagement with the shoe, and a plurality of easily detachable layers of waterproof material on the toe portion of the protector.

HERSCHEL CONAWAY ICE.
