Title: COMPOSITIONS AND METHODS OF USING ISLET NEOGENESIS PEPTIDES AND ANALOGS THEREOF

Abstract: The invention provides peptides and analogs of INGAP and HIP peptides. The peptides and analogs can be used in methods for treating various diseases and conditions. Such diseases and conditions can include impaired pancreatic function, treating a metabolic disease, for example, diabetes, both type 1 and type 2 diabetes, islets induction, expansion and proliferation for transplantation, promoting neuroprotection or nerve regeneration, promoting liver regeneration or inhibiting inflammation.
COMPOSITIONS AND METHODS OF USING ISLET NEOGENESIS PEPTIDES AND ANALOGS THEREOF

BACKGROUND OF THE INVENTION

[0001] The present invention relates generally to the field of medicine and pharmaceuticals, and more specifically to peptide therapies for treating diabetes and other diseases.

[0002] Diabetes mellitus (DM) afflicts over 300 million people worldwide. There are two main types of DM: type 1 DM (T1D) and type 2 DM (T2D). T1D results from the body's failure to produce insulin, and requires the patient to administer insulin daily. T2D results from insulin resistance, a condition in which cells fail to use insulin properly. There are many approved non-insulin therapies for T2D. However, there is a large portion of late stage T2D patients requiring insulin administration due to the loss of β-cell function as the disease progresses.

[0003] Development of diabetes is associated with substantial losses in pancreatic islet mass. At the time of diagnosis, over 90% of islet mass has been lost in T1D patients, and approximately 50% has been lost in T2D patients. Many attempts have been made in quest of a potential stimulus for islet neogenesis, which is considered as the optimal treatment for both T1D and T2D.

[0004] Recently, investigators have shown that islet neogenesis-associated protein (INGAP), human prolslet peptide (HIP), glucagon like peptide-1 (GLP-1), islet endocrine neuropeptide vasoactive intestinal peptide (VIP), epidermal growth factor and gastrin, and others, are capable of inducing pancreatic progenitor cells, located in the nonendocrine fraction of the pancreas, to differentiate into fully functional islets in various animal models. Among these compounds, INGAP peptide (INGAP-PP), a 15-mer peptide derived from the sequence of INGAP at amino acids 104-118, has been shown to induce islet neogenesis in multiple animal models, reverse streptozotocin (STZ) induced diabetes in mice, increase C-peptide secretion in T1D patients, and improve glycemic control in T2D patients. Additional biological effects of INGAP-PP have been reported, including dose dependent stimulation of expansion of β-cell mass and increased insulin secretion and β-cell size. In proof of concept human studies, there was an effect with an improvement of glucose homeostasis, confirmed by HbA1c reduction at 90 days in patients with T2D, and by a significant increase in C-
peptide secretion in patients with T1D. However, the short plasma half-life of INGAP-PP and the need for administration in a high dose have significantly limited clinical applications of this peptide.

[0005] HIP, the bioactive peptide encoded by a portion of the human REG3A gene, is the human homolog of the INGAP peptide. Previous studies have shown that treatment of human pancreatic ductal tissues with HIP stimulated the production of insulin. Administration of HIP improved glycemic control and increased islet number in diabetic mice. The stabilized form of HIP is currently being tested in a single ascending dose clinical trial with the goal of exploring the tolerability, safety and pharmacokinetics. It is of note that total daily doses of 60, 120, 240, 480, and 720 mg are planned. Although there is a lack of data on the efficacious dose of HIP, the planned clinical trial doses infer the peptide’s low potency.

[0006] Thus, there exists a need to develop additional drugs for treatment of diabetes or other diseases associated with impaired pancreatic function. The present invention satisfies this need, and provides related advantages as well.

SUMMARY OF INVENTION

[0007] The invention provides peptides and analogs of INGAP and HIP peptides. The peptides and analogs can be used in methods for treating various disease and conditions. Such diseases and conditions can include impaired pancreatic function, treating a metabolic disease, for example, diabetes, both type 1 and type 2 diabetes, islets induction, expansion and proliferation for transplantation, promoting neuroprotection or nerve regeneration, promoting liver regeneration or inhibiting inflammation.

BRIEF DESCRIPTION OF THE DRAWINGS

[0008] Figure 1 shows the comparison of ARIP cell (a rat pancreatic ductal cell line) proliferation in the presence of 100 nM of INGAP Scrambled PP 1 (Peptide 3), INGAP-PP (Peptide 1), and a selected peptide analog, Peptide 7 (see Table 2).

[0009] Figure 2 shows a stability comparison in culture medium of INGAP-PP (Peptide 1) and selected peptide analogs, Peptide 7 and Peptide 8 (see Table 2).
[0010] Figure 3 shows a stability comparison in mouse plasma of INGAP-PP (Peptide 1) and selected peptide analogs, Peptide 12, Peptide 16 and Peptide 29 (see Table 2).

[0011] Figure 4 shows a stability comparison in human plasma of INGAP-PP (Peptide 1) and selected peptide analogs, Peptide 12 and Peptide 16 (see Table 2).

[0012] Figure 5 shows a stability comparison in mouse plasma of HIP (Peptide 2) and selected peptide analogs, Peptide 52 and Peptide 54 (see Table 3).

[0013] Figures 6A-6C show the efficacy comparison of INGAP-PP (Peptide 1), INGAP Scrambled PP 1 (Peptide 3) and a selected peptide analog, Peptide 7 (see Table 2) in STZ induced diabetic mice model. Figure 6A: Blood glucose (BG) after 21 day treatment; Figure 6B: Fasting insulin levels after 21 day treatment; Figure 6C: Area under curve (AUC) of glucose measured in oral glucose tolerance test (OGTT) after 21 day treatment.

[0014] Figure 7 shows the number of islets defined by area ranges (arbitrary morphometric units) for equal randomly selected fields \( n \geq 7 \) for animals treated with naive and Peptide 3, Peptide 1 or Peptide 7.

[0015] Figure 8 shows the increase of glucose-stimulated insulin secretion of islets with or without the co-incubation of selected peptides \( (10 \mu g/mL) \), Peptide 12, Peptide 16 and Peptide 1 (see Table 2). Co-incubation with 100nM Glucagon like peptide – 1 (GLP-1) was included as a positive control.

**DETAILED DESCRIPTION OF THE INVENTION**

[0016] The present invention provides compounds, in particular peptide or peptide analogs, that exhibit properties useful for treating a variety of diseases and conditions, particularly diseases and conditions relating to diabetes. The peptides and analogs of the invention are additionally useful for treating impaired pancreatic function, treating a metabolic disease, \textit{ex vivo} islet induction, expansion and proliferation for transplantation, increasing the survival of transplanted islets \textit{in vivo}, promoting neuroprotection or nerve regeneration, promoting liver regeneration or inhibiting inflammation.

[0017] As disclosed herein, the present invention provides a series of INGAP-PP and HIP analogs with comparable or improved stability and activities compared to the wild-type peptides (see Tables 2 and 3). The improved pharmaceutical properties of these peptide
analogs make them particularly suitable for clinical development. The present invention also provides pharmaceutical compositions comprising a compound according to the present invention and the use of compounds according to the present invention for preparing medicaments for treating metabolic diseases, including but not limited to type 1 diabetes (T1D) and type 2 diabetes (T2D). The invention further provides the compositions of the invention in suitable formulations, including sustained release formulations.

[0019] As used herein, the term “peptide” refers to a polymer of two or more amino acids. The peptide can be modified to include analogs, derivatives, functional mimetics, pseudopeptides, and the like, so long as the peptide comprises a polymer of at least two amino acids. The meaning of the term “peptide” is well known to those skilled in the art. In general, a peptide includes two or more amino acids joined by an amide bond between the carboxyl group of one amino acid residue and the amino group of the adjacent amino acid residue. As described herein, a peptide can comprise naturally occurring amino acids or non-naturally occurring amino acids.
[0020] As used herein, the term “analog” refers to a variant of a parent molecule, for example, a parent peptide. For example, an analog of a parent peptide can include a variant, where one or more amino acids are substituted relative to the parent peptide. An analog can also include a modification of a parent peptide, including but not limited to, non-naturally occurring amino acids, D amino acids, modified amino- and/or carboxy-terminal (N- or C-terminal) amino acids, in particular modifications of the amino group on the N-terminus and/or modification of the carboxyl group in the C-terminus, fatty acid modifications, peptidomimetics, pseudopeptides, and the like, as disclosed herein. Exemplary modifications are described in more detail below.

[0021] As used herein, the phrase “impaired pancreatic function” refers to a disease or condition associated with the pancreas, where the pancreas exhibits a decreased function compared to that of a normal or healthy individual. Exemplary diseases or conditions associated with impaired pancreatic function include, but are not limited to, type 1 diabetes, type 2 diabetes, latent autoimmune diabetes in adults (LADA), impaired fasting glucose, impaired glucose tolerance, insulin deficiency, fasting hyperinsulinemia, insulin resistance, or impaired fasting insulin levels, or a combination thereof. Such diseases and conditions are discussed in more detail below.

[0022] As described herein, the invention provides peptide analogs of INGAP-PP and HIP peptides. Table 1 shows the sequence of INGAP-PP and HIP peptides, as well as various scrambled versions of the peptides that are used as negative controls in experiments described herein or can be used as negative controls in comparative studies with INGAP-PP, HIP or the peptides analogs of the invention.

Table 3. Exemplary HIP Analogs.
The invention provides peptides or analogs thereof that are analogs of INGAP-PP. In one embodiment, the invention provides a peptide or analog thereof comprising a sequence selected from the group consisting of IGLHDPSHGTLPGS (SEQ ID NO:7); and IGLHDPSHGTLPG (SEQ ID NO:73). For example, the peptide or analog can comprise a peptide or analog selected from: IGLHDPSHGTLPGS (SEQ ID NO:7); IGLHDPSHGTLPG (SEQ ID NO:73); IGLHDPSHGTLPGSK (SEQ ID NO:9); IGLHDPSHGTLPL(Aib)GS (SEQ ID NO:10); IGLHDPSHGTLPN-methyl-L-Ala)GS (SEQ ID NO:11); Ac-IGLHDPSHGTLPGS (SEQ ID NO:12); (D-Ile)GLHDPSHGTLPGS (SEQ ID NO:13); (L-NorVal)GLHDPSHGTLPGS (SEQ ID NO:14); (L-NorLeu)GLHDPSHGTLPGS (SEQ ID NO:15); IGLHDPSHGTLPG-NH2 (SEQ ID NO:28); Ac-IGLHDPSHGTLPGS-NH2 (SEQ ID NO:29); Ac-IGLHDPSHGTLPG-NH2 (SEQ ID NO:30); IGLHDPSHGTLPGS-NH2 (SEQ ID NO:41); IGLHDPSHGTLPGSC (SEQ ID NO:42); Ac-IGLHDPSHGTLPGSC (SEQ ID NO:43); IGLHDPSHGTLPGSC-NH2 (SEQ ID NO:44); Ac-IGLHDPSHGTLPGSC-NH2 (SEQ ID NO:45); IGLHDPSHGTLPGC (SEQ ID NO:46); Ac-IGLHDPSHGTLPGC (SEQ ID NO:47); IGLHDPSHGTLPGC-NH2 (SEQ ID NO:48); and Ac-IGLHDPSHGTLPGC-NH2 (SEQ ID NO:49).

In a particular embodiment of the invention, the peptide or analog thereof can consist of: IGLHDPSHGTLPGS (SEQ ID NO:7); IGLHDPSHGTLPG (SEQ ID NO:73); IGLHDPSHGTLPGSK (SEQ ID NO:9); IGLHDPSHGTLPL(Aib)GS (SEQ ID NO:10); IGLHDPSHGTLPN-methyl-L-Ala)GS (SEQ ID NO:11); Ac-IGLHDPSHGTLPGS (SEQ ID NO:12); (D-Ile)GLHDPSHGTLPGS (SEQ ID NO:13); (L-NorVal)GLHDPSHGTLPGS (SEQ ID NO:14); (L-NorLeu)GLHDPSHGTLPGS (SEQ ID NO:15); IGLHDPSHGTLPG-NH2 (SEQ ID NO:28); Ac-IGLHDPSHGTLPGS-NH2 (SEQ ID NO:29); Ac-IGLHDPSHGTLPG-NH2 (SEQ ID NO:30); IGLHDPSHGTLPGS-NH2 (SEQ ID NO:41); IGLHDPSHGTLPGSC (SEQ ID NO:42); Ac-IGLHDPSHGTLPGSC (SEQ ID NO:43); IGLHDPSHGTLPGSC-NH2 (SEQ ID NO:44); Ac-IGLHDPSHGTLPGSC-NH2 (SEQ ID NO:45); IGLHDPSHGTLPGC (SEQ ID NO:46); Ac-IGLHDPSHGTLPGC (SEQ ID NO:47); IGLHDPSHGTLPGC-NH2 (SEQ ID NO:48); and Ac-IGLHDPSHGTLPGC-NH2 (SEQ ID NO:49).
[0027] In another embodiment of the invention, additional INGAP-PP analogs are provided. An embodiment of the invention provided herein includes a peptide or analog thereof comprising a peptide or analog selected from the group consisting of: Ac-IGLHDPSHGTLPNGS (SEQ ID NO:16); (D-Ile)GLHDPSHGTLPNGS (SEQ ID NO:17); Ac-IGLHDPSHGTLPNGS-NH2 (SEQ ID NO:31); IGLHDPSHGTLPNGS-NH2 (SEQ ID NO:32); IGLHDPSHGTLPNGSC (SEQ ID NO:33); Ac-IGLHDPSHGTLPNGSC (SEQ ID NO:34); IGLHDPSHGTLPNGSC-NH2 (SEQ ID NO:35); Ac-IGLHDPSHGTLPNGSC-NH2 (SEQ ID NO:36); IGLHDPSHGTLPNGC (SEQ ID NO:37); Ac-IGLHDPSHGTLPNGC (SEQ ID NO:38); IGLHDPSHGTLPNGC-NH2 (SEQ ID NO:39); Ac-IGLHDPSHGTLPNGC-NH2 (SEQ ID NO:40); IGLHDPSHGTLPNG (SEQ ID NO:74); Ac-IGLHDPSHGTLPNG (75); IGLHDPSHGTLPNG-NH2 (76); and Ac-IGLHDPSHGTLPNG-NH2 (77).

[0028] In a particular embodiment of the invention, the peptide or analog thereof consists of: Ac-IGLHDPSHGTLPNGS (SEQ ID NO:16); (D-Ile)GLHDPSHGTLPNGS (SEQ ID NO:17); Ac-IGLHDPSHGTLPNGS-NH2 (SEQ ID NO:31); IGLHDPSHGTLPNGS-NH2 (SEQ ID NO:32); IGLHDPSHGTLPNGSC (SEQ ID NO:33); Ac-IGLHDPSHGTLPNGSC (SEQ ID NO:34); IGLHDPSHGTLPNGSC-NH2 (SEQ ID NO:35); Ac-IGLHDPSHGTLPNGSC-NH2 (SEQ ID NO:36); IGLHDPSHGTLPNGC (SEQ ID NO:37); Ac-IGLHDPSHGTLPNGC (SEQ ID NO:38); IGLHDPSHGTLPNGC-NH2 (SEQ ID NO:39); Ac-IGLHDPSHGTLPNGC-NH2 (SEQ ID NO:40); IGLHDPSHGTLPNG (SEQ ID NO:74); Ac-IGLHDPSHGTLPNG (75); IGLHDPSHGTLPNG-NH2 (76); or Ac-IGLHDPSHGTLPNG-NH2 (77).

[0029] Further INGAP-PP peptide analogs are provided herein. In still another embodiment, the invention provides a peptide or analog thereof comprising a sequence selected from the group consisting of: IGLHAPSHGTLPNGS (SEQ ID NO:6); IGLHAPSHGTLPAGS (SEQ ID NO:8); IGLHDPSHGTEPNSGS (SEQ ID NO:18); IGLHDPSQGTLPNGS (SEQ ID NO:19); IGLHDPSQGTLPNGS (SEQ ID NO:20); IGLHDPSQGTLPNGE (SEQ ID NO:21); IGLHDPSQGTLPNGK (SEQ ID NO:22); IGLHDPSQGTLPAGK (SEQ ID NO:23); IGLHDPSQGTLPAGS (SEQ ID NO:25); and IGLHDPSQGTLPAGE (SEQ ID NO:27).
For example, the invention provides a peptide or analog thereof comprising a peptide or analog selected from: IGLHAPSHGTLPNGS (SEQ ID NO:6); IGLHAPSHGTLPG (SEQ ID NO:8); IGLHDSHPTQGTEPAGS (SEQ ID NO:18); IGLHDSQGTLPAGS (SEQ ID NO:19); IGLHDSHPTQGTEPAGS (SEQ ID NO:20); IGLHDSHPTQGTEPAGS (SEQ ID NO:21); IGLHDSHPTQGTEPAGS (SEQ ID NO:22); IGLHDSHPTQGTEPAGS (SEQ ID NO:23); IGLHDSHPTQGTEPAGS (SEQ ID NO:24); IGLHDSHPTQGTEPAGS (SEQ ID NO:25); IGLHDSHPTQGTEPAGS (SEQ ID NO:26); and IGLHDSHPTQGTEPAGS (SEQ ID NO:27). In another embodiment, the invention provides a peptide or analog thereof consisting of: IGLHAPSHGTLPNGS (SEQ ID NO:6); IGLHAPSHGTLPG (SEQ ID NO:8); IGLHDSHPTQGTEPAGS (SEQ ID NO:18); IGLHDSQGTLPAGS (SEQ ID NO:19); IGLHDSHPTQGTEPAGS (SEQ ID NO:20); IGLHDSHPTQGTEPAGS (SEQ ID NO:21); IGLHDSHPTQGTEPAGS (SEQ ID NO:22); IGLHDSHPTQGTEPAGS (SEQ ID NO:23); IGLHDSHPTQGTEPAGS (SEQ ID NO:24); IGLHDSQGTLPAGS (SEQ ID NO:25); IGLHDSHPTQGTEPAGS (SEQ ID NO:26); and IGLHDSHPTQGTEPAGS (SEQ ID NO:27).

The invention additionally provides HIP analogs. In an embodiment of the invention, the invention provides a peptide or analog thereof comprising the sequence IGLHDPQTQGTEPAGS (SEQ ID NO:50). In an embodiment of the invention, the peptide or analog can comprise a peptide or analog selected from: IGLHDPQTQGTEPAGS (SEQ ID NO:50); IGLHDPQTQGTEP(Aib)GE (SEQ ID NO:51); Ac-IGLHDPQTQGTEPAGS (SEQ ID NO:52); (D-Ile)GLHDPQTQGTEPAGS (SEQ ID NO:53); Ac-IGLHDPQTQGTEPAGS-NH2 (SEQ ID NO:60); Ac-IGLHD PTQGT EPAGE-NH2 (SEQ ID NO:62); IGLHDPQTQGTEPAGS-NH2 (SEQ ID NO:68); IGLHDPQTQGTEPAGS (SEQ ID NO:69); Ac-IGLHDPQTQGTEPAGS (SEQ ID NO:70); IGLHDPQTQGTEPAGS-NH2 (SEQ ID NO:71); and Ac-IGLHDPQTQGTEPAGS-NH2 (SEQ ID NO:72). In a particular embodiment, the peptide or analog thereof consists of: IGLHDPQTQGTEPAGS (SEQ ID NO:50); IGLHDPQTQGTEP(Aib)GE (SEQ ID NO:51); Ac-IGLHDPQTQGTEPAGS (SEQ ID NO:52); (D-Ile)GLHDPQTQGTEPAGS (SEQ ID NO:53); and Ac-IGLHDPQTQGTEPAGS-NH2 (SEQ ID NO:60); Ac-IGLHD PTQGT EPAGE-NH2 (SEQ ID NO:62); IGLHDPQTQGTEPAGS-NH2 (SEQ ID NO:68); IGLHDPQTQGTEPAGS (SEQ ID NO:69); Ac-IGLHD PTQGT EPAGC (SEQ ID NO:70); IGLHD PTQGT EPAGC-NH2 (SEQ ID NO:71); or Ac-IGLHD PTQGT EPAGC-NH2 (SEQ ID NO:72).
[0032] In another embodiment, the invention provides additional HIP peptide analogs. For example, the invention provides a peptide or analog thereof comprising a peptide or analog selected from the group consisting of: Ac-IGLHDPTQGTEPNGE (SEQ ID NO:54); (D-Ile)GLHDPTQGTEPNGE (SEQ ID NO:55); Ac-IGLHDPTQGTEPNGE-NH2 (SEQ ID NO:61); IGLHDPTQGTEPNGE-NH2 (SEQ ID NO:63); IGLHDPTQGTEPNGC (SEQ ID NO:64); Ac-IGLHDPTQGTEPNGC (SEQ ID NO:65); IGLHDPTQGTEPNGC-NH2 (SEQ ID NO:66); and Ac-IGLHDPTQGTEPNGC-NH2 (SEQ ID NO:67). In a particular embodiment, the peptide or analog thereof can consist of: Ac-IGLHDPTQGTEPNGE (SEQ ID NO:54); (D-Ile)GLHDPTQGTEPNGE (SEQ ID NO:55); Ac-IGLHDPTQGTEPNGE-NH2 (SEQ ID NO:61); IGLHDPTQGTEPNGE-NH2 (SEQ ID NO:63); IGLHDPTQGTEPNGC (SEQ ID NO:64); Ac-IGLHDPTQGTEPNGC (SEQ ID NO:65); IGLHDPTQGTEPNGC-NH2 (SEQ ID NO:66); or Ac-IGLHDPTQGTEPNGC-NH2 (SEQ ID NO:67).

[0033] In another embodiment of the invention, a peptide or analog thereof can comprise a sequence selected from the group consisting of: IGLHDPTQGTEPNGS (SEQ ID NO:56); IGLHDPTQGTEPAGS (SEQ ID NO:57); IGLHDPTQGTLPNGE (SEQ ID NO:58); and IGLHDPTQGTLPAGE (SEQ ID NO:59). For example, the peptide or analog thereof can comprise a peptide or analog selected from: IGLHDPTQGTEPNGS (SEQ ID NO:56); IGLHDPTQGTEPAGS (SEQ ID NO:57); IGLHDPTQGTLPNGE (SEQ ID NO:58); and IGLHDPTQGTLPAGE (SEQ ID NO:59). In a particular embodiment, peptide or analog thereof can consist of: IGLHDPTQGTEPNGS (SEQ ID NO:56); IGLHDPTQGTEPAGS (SEQ ID NO:57); IGLHDPTQGTLPNGE (SEQ ID NO:58); or IGLHDPTQGTLPAGE (SEQ ID NO:59).

[0034] As described herein, the peptides or analogs of the invention include analogs of INGAP-PP and HIP that can be peptides having the standard 20 naturally occurring amino acids, as well as other naturally and/or non-naturally occurring amino acids. The peptides as described herein generally use conventional nomenclature. For example, some peptides are designated H-XXX-OH, and it is understood by those skilled in the art that these can designate unmodified amino- (H-) or carboxy- (-OH) termini. The amino acid sequence can also be represented without an indication of a modification on the amino- or carboxy-terminus. It is understood by those skilled in the art that peptides described herein, unless a specific modification is indicated on the N- or C-terminus, can include unmodified and
modified amino- and/or carboxy-termini on a peptide comprising a specified amino acid sequence or peptide analog. Thus, a peptide or analog comprising a designated amino acid sequence can include additional amino acids on the N- and/or C-terminus as well as modified amino acids of the designated sequence. A peptide or analog comprising a designated peptide or analog similarly can include modified amino acids and/or additional amino acids, unless the N- and/or C-terminus comprises a modification that precludes the addition of an amino acid, for example through a peptide bond. Such modifications can include, for example, an acetylated N-terminus and/or amidated C-terminus.

[0035] As described herein, the peptides or analogs of the invention can comprise a modification. It is understood by those skilled in the art that a number of modifications can be made to a peptide or analog. Exemplary modifications include, but are not limited to, an acetylated N-terminus, an amidated C-terminus, a D amino acid, a modified amino acid, a fatty acid modification, or a combination thereof. Any of a number of well known modifications of a peptide or amino acid can be included in a peptide or analog of the invention. For example, derivatives can include chemical modifications of the polypeptide such as alkylation, acylation, carbamylation, iodination, or any modification which derivatizes the polypeptide. Modifications of a peptide or analog can include modified amino acids, for example, hydroxyproline or carboxyglutamate, and can include amino acids that are not linked by peptide bonds.

[0036] It is understood by those skilled in the art that any of a number of well known methods can be employed to produce peptides or analogs of the invention (see, for example, Protein Engineering: A practical approach (IRL Press 1992); Bodanszky, Principles of Peptide Synthesis (Springer-Verlag 1984), Lloyd-Williams et al., Tetrahedron 49:11065-11133 (1993); Kent, Ann. Rev. Biochem. 57:957-989 (1988); Merrifield, J. Am. Chem. Soc., 85:2149–2154 (1963); Merrifield, Methods Enzymol. 289:3-13 (1997)). A particularly useful method to produce peptides or analogs of the invention is via chemical synthesis using well known methods of peptide synthesis. Chemical synthesis is particularly useful for introducing non-naturally occurring amino acids, modified amino acids and/or a modified N- and/or C-terminus. For example, an advantage of using chemical synthesis to prepare a peptide or analog of the invention is that (D)-amino acids can be substituted for (L)-amino acids, if desired. The incorporation of one or more (D)-amino acids can confer, for example, additional stability of the peptide in vitro or, particularly, in vivo, since endogenous
endoproteases generally are ineffective against peptides containing (D)-amino acids. Peptides having D amino acids can also be designated herein using the well known nomenclature of a small letter for the corresponding single letter code for an amino acid.

[0037] If desired, the reactive side group of one or more amino acids in a peptide or analog of the invention can be modified or amino acid derivatives can be incorporated into the peptide. Selective modification of a reactive group of a peptide or analog can impart desirable characteristics upon a peptide or analog. The choice of including such a modification is determined, in part, by the characteristics required of the peptide. For example, a peptide or analog can have a free carboxyl terminus or can be modified so that the C-terminus is amidated (see Tables 2 and 3). Similarly, a peptide or analog can have a free amino terminus or can be modified so that the N-terminus is acetylated (Tables 2 and 3). In addition, the peptides or analogs of the invention can optionally be amidated on the C-terminus and acetylated on the N-terminus. Other modifications of the N- and/or C-terminus of a peptide or analog can also be included within the meaning of a modification.

[0038] Other modifications of a peptide or analog of the invention can include, but are not limited to, 2-Aminoacidic acid (Aad); 3-Aminoadipic acid (bAad); beta-Alanine, beta-Aminopropionic acid (bAla); 2-Aminobutyric acid (Abu); 4-Aminobutyric acid, piperidinic acid (4Abu); 6-Aminocaproic acid (Acp); 2-Aminoheptanoic acid (Ahe); 2-Aminoisobutyric acid (Aib); 3-Aminoisobutyric acid (bAib); 2-Aminopimelic acid (Apm); 2,4 Diaminobutyric acid (Dbu); Desmosine (Des); 2,2'-Diaminopimelic acid (Dpm); 2,3-Diaminopropionic acid (Dpr); N-Ethylglycine (EtGly); N-Ethylasparagine (EtAsn); Hydroxyllysine (Hyl); allo-Hydroxylysine (aHyl); 3-Hydroxyproline (3Hyp); 4-Hydroxyproline (4Hyp); Isodesmosine (Ide); allo-Isoleucine (alle); N-Methylglycine (MeGly; sarcosine), N-Methylisoleucine (MeIle); 6-N-Methyllysine (MeLys); N-Methylvaline (MeVal); Norvaline (Nva); Norleucine (Nle); and Ornithine (Orn). It is understood that all modified alpha-amino acids can be substituted with the corresponding beta-, gamma- or omega- amino acids.

[0039] Another modification of a peptide or analog of the invention includes fatty acid modification. Thus, a peptide or analog of the invention can be modified by acylation with aliphatic groups, including C2, C4, C6, C8, C10, C12, C14, C16, C18, C20 or longer chains. The peptide or analog can also be modified by isoprenylation and/or phosphatidylinositol (PI). Other amino acid, peptide or protein modifications are well known to those skilled in the art.
(see, for example, Glazer et al., *Chemical modification of proteins: Selected methods and analytical procedures*, Elsevier Biomedical Press, Amsterdam (1975)).

[0040] The invention also includes mimetics of the peptides or analogs disclosed herein, also referred to as peptidomimetics. Mimetics encompass chemicals containing chemical moieties that mimic the function of the peptide. For example, if a peptide contains two charged chemical moieties having functional activity, a mimetic places two charged chemical moieties in a spatial orientation and constrained structure so that the charged chemical function is maintained in three-dimensional space. Thus, a mimetic orients functional groups of a peptide or analog of the invention such that the functional activity of a peptide or analog is retained.

[0041] Mimetics or peptidomimetics can include chemically modified peptides, peptide-like molecules containing non-naturally occurring amino acids, peptoids and the like, and have the functional activity of the peptide or analog upon which the peptidomimetic is derived (see, for example, *Burger’s Medicinal Chemistry and Drug Discovery* 5th ed., vols. 1 to 3 (ed. M. E. Wolff, Wiley Interscience 1995)). Methods for identifying a peptidomimetic are well known in the art and include, for example, the screening of databases that contain libraries of potential peptidomimetics (Allen et al., *Acta Crystallogr.* Section B, 35:2331 (1979)) or using molecular modeling (Rusinko et al., *J. Chem. Inf. Comput. Sci.* 29:251 (1989)). Mimetics or peptidomimetics can provide desirable properties such as greater stability, for example, when administered to a subject, such as during passage through the digestive tract and, therefore, can be useful for oral administration.

[0042] A variety of mimetics or peptidomimetics are known in the art including, but not limited to, peptide-like molecules which contain a constrained amino acid, a non-peptide component that mimics peptide secondary structure, or an amide bond isostere. A mimetic or peptidomimetic that contains a constrained, non-naturally occurring amino acid can include, without limitation, an α-methylated amino acid; α-, α-dialkylglycine or α-aminocycloalkane carboxylic acid; an \( \overset{N=}{\alpha} \)-α-cyclized amino acid; an \( \overset{N=}{\alpha} \)-methylated amino acid; a β- or γ-amino cycloalkane carboxylic acid; an α,β-unsaturated amino acid; a β,β-dimethyl or β-methyl amino acid; a β-substituted-2,3-methano amino acid; an N-C\( \overset{\delta}{\delta} \) or C\( \overset{\delta}{\delta} \) cycloalkane amino acid; a substituted proline or another amino acid mimic. A mimetic or peptidomimetic which mimics peptide secondary structure can contain, without limitation, a
nonpeptidic β-turn mimic; γ-turn mimic; or mimic of helical structure, each of which is well known in the art. As non-limiting examples, a peptidomimetic also can be a peptide-like molecule which contains an amide bond isostere such as a retro-inerso modification; reduced amide bond; methylenethioether or methylene-sulfoxide bond; methylene ether bond; ethylene bond; thioamide bond; trans-olefin or fluoroolefin bond; 1,5-disubstituted tetrazole ring; ketomethylene or fluoroketomethylene bond or another amide isostere. One skilled in the art understands that these and other mimetics or peptidomimetics of a peptide or analog of the invention can be used.

[0043] The invention also provides pseudopeptide derivatives of peptides or analogs of the invention. Pseudopeptides are known in the art as peptides in which a peptide bond (amide bond) in a peptide is modified to an amide bond surrogate (see, for example, Cudic and Stawikowski, *Mini-Rev Organic Chem.* 4:268-280 (2007); Anderson, in *Neuropeptide Protocols*, Brent and Carvell, eds. 73:49-60 (1996)). Exemplary amide bond surrogates include, but are not limited to, peptidosulfonamides, phosphonopeptides, depsides and depsipeptides, oligoureas, azapeptides and peptoids (see Cudic and Stawikowski, *supra*, 2007) as well as as methylene amino, thioether and hydroxyethylene derivatives, and the like (Anderson, *supra*, 1996).

[0044] The peptides or analogs of the invention can be produced using methods well known to those skilled in the art, including chemical synthesis of the peptides or analogs using well known methods of peptide synthesis, as described herein. Thus, when the peptides or analogs include one or more non-standard amino acids, it is more likely that they will be produced by a chemical synthetic method. In addition to using chemical synthesis of peptides or analogs, the peptides or analogs can be produced by expression from encoding nucleic acids. This is particularly useful for peptides or analogs that include only naturally occurring amino acids. In such a case, a nucleic acid encoding the peptide sequence can be prepared using well known methods (see Sambrook et al., *Molecular Cloning: A Laboratory Manual*, Third Ed., Cold Spring Harbor Laboratory, New York (2001); Ausubel et al., *Current Protocols in Molecular Biology*, John Wiley and Sons, Baltimore, MD (1999)). Generally such a nucleic acid will be expressed recombinantly in a suitable host organism such as a bacterium, yeast, mammalian or insect cell, and the like. Production in bacteria can be particularly useful for large scale production of a peptide or analog of the invention. The
peptide can be expressed in the organism and purified using well known purification techniques.

[0045] A nucleic acid molecule encoding the peptide or analog of the invention can be cloned into an appropriate vector, particularly an expression vector, and the encoded peptide or analog can be expressed in a host cell or using an in vitro transcription/translation reaction, thereby providing a means to obtain large amounts of the peptide or analog. Optionally, the recombinant peptide can be produced as a fusion with a tag, such as a His tag, to facilitate identification and purification. Suitable vectors, host cells, in vitro transcription/translation systems, and tag sequences are well known in the art and commercially available.

[0046] The peptide or analog can be expressed as a single copy, in a polycistronic expression vector, or optionally can be expressed as a single open reading frame with multiple copies of the peptide sequence. In such a case, the peptide can be obtained by expressing an open reading frame containing multiple copies of the peptide sequence, resulting in expression of a polypeptide with multiple copies of the peptide. The polypeptide can be post-translationally processed into a peptide or analog of the invention, for example, by engineering appropriate proteolytic cleavage sites between the copies of the peptide and cleaving the polypeptide into the peptide or analog of the invention. Although such a recombinant method will generally be used when the peptide or analog of the invention is a peptide containing only naturally occurring amino acids, it is also understood that such a method can be employed with expression hosts suitably engineered to express non-naturally occurring amino acids. Additionally, it is understood that a peptide or analog expressed recombinantly can optionally be chemically modified to introduce a desired amino acid modification or N- and/or C-terminal modification using well known chemical modification methods (see Glazer et al., supra, 1975).

[0047] Thus, the invention additionally provides nucleic acids encoding peptides or analogs of the invention. Such nucleic acids include, for example, nucleic acids encoding any of the amino acid sequences of SEQ ID NOS:6-73. Thus, when the analogs include only one or more substitutions with standard amino acids, the analogs can be expressed from an expression vector using well known methods, as disclosed herein.

[0048] The peptides or analogs of the invention can comprise a sequence or peptide or analog as disclosed herein. In the case of a peptide or analog comprising an amino acid
sequence or peptide, the peptide will generally have a length of 20 amino acids or less. For example, the peptide or analog can have a length of 19 amino acids or less, 18 amino acids or less, 17 amino acids or less. Thus, a peptide or analog of the invention, as disclosed herein, can have a length of 10 amino acids, 11 amino acids, 12 amino acids, 13 amino acids 14 amino acids (see Peptide 73, Peptide 74), 15 amino acids, 16 amino acids, 17 amino acids, 18 amino acids, 19 amino acids, or 20 amino acids. In the case of shorter peptides, it is understood by those skilled in the art that the shorter peptide includes a fragment of a disclosed peptide or analog, for example, by deletion of one or more amino acids on the N- and/or C-terminus of a disclosed peptide or analog, that retains functional activity, including but not limited to one or more of the biological activities of peptides and analogs of the invention, as disclosed herein. Nevertheless, it is understood that a peptide can also comprise longer amino acid lengths, so long as the functional activity of the peptide or analog is retained. Thus, a peptide or analog can have a length of less than 150 residues, less than 130 residues, less than 120 residues, less than 110 residues, less than 100 residues, less than 90 residues, less than 80 residues, less than 70 residues, less than 60 residues, less than 50 residues, less than 45 residues, less than 40 residues, less than 35 residues, less than 30 residues, less than 25 residues, less than 24 residues, less than 23 residues, less than 22 residues, less than 21 residues, less than 20 residues, less than 19 residues, less than 18 residues, or less than 17 residues. It is understood by those skilled in the art that, where a peptide or analog of the invention comprises a sequence found within a known longer sequence such as a wild type full length protein, the peptide or analog of the invention specifically excludes such a full length sequence.

[0049] The invention also provides peptides and analogs of the invention in a pharmaceutically acceptable salt form that is well known to those skilled in the art. A particularly useful salt form is acetate or hydrochloride salt form. Nevertheless, it is understood by those skilled in the art that any of a number of suitable salt forms are available. When the peptide or analog of the invention contains an acidic or basic moiety, it can be provided as a pharmaceutically acceptable salt (see, for example, Berge et al., J. Pharm. Sci. 1977, 66, 1-19; and Handbook of Pharmaceutical Salts, Properties, and Use; Stahl and Wermuth, Ed.; Wiley-VCH and VHCA: Zurich, Switzerland, 2002).

[0050] Suitable acids for use in the preparation of pharmaceutically acceptable salts include, but are not limited to, acetic acid, 2,2-dichloroacetic acid, acylated amino acids,
adipic acid, alginic acid, ascorbic acid, L-aspartic acid, benzenesulfonic acid, benzoic acid, 4-acetamidobenzoic acid, boric acid, (+)-camphoric acid, camphorsulfonic acid, (+)-(1S)-camphor-10-sulfonic acid, capric acid, caproic acid, caprylic acid, cinnamic acid, citric acid, cyclamic acid, cyclohexanesulfamic acid, dodecysulfuric acid, ethane-1,2-disulfonic acid, ethanesulfonic acid, 2-hydroxy-ethanesulfonic acid, formic acid, fumaric acid, galactaric acid, gentisic acid, glucoheptonic acid, D-gluconic acid, D-glucuronic acid, L-glutamic acid, α-oxoglutaric acid, glycolic acid, hippuric acid, hydrobromic acid, hydrochloric acid, hydroiodic acid, (+)-L-lactic acid, (±)-DL-lactic acid, lactobionic acid, lauric acid, maleic acid, (-)-L-malic acid, malonic acid, (±)-DL-mandelic acid, methanesulfonic acid, naphthalene-2-sulfonic acid, naphthalene-1,5-disulfonic acid, 1-hydroxy-2-naphthoic acid, nicotinic acid, nitric acid, oleic acid, orotic acid, oxalic acid, palmitic acid, pamoic acid, perchloric acid, phosphoric acid, L-pyroglutamic acid, saccharic acid, salicylic acid, 4-amino-salicylic acid, sebacic acid, stearic acid, succinic acid, sulfuric acid, tannic acid, (+)-L-tartaric acid, thiocyanic acid, p-toluenesulfonic acid, undecylenic acid, and valeric acid.

[0051] Suitable bases for use in the preparation of pharmaceutically acceptable salts, including, but not limited to, inorganic bases, such as magnesium hydroxide, calcium hydroxide, potassium hydroxide, zinc hydroxide, or sodium hydroxide; and organic bases, such as primary, secondary, tertiary, and quaternary, aliphatic and aromatic amines, including L-arginine, benethamine, benzathine, choline, deanol, diethanolamine, diethylamine, dimethylamine, dipropylamine, diisopropylamine, 2-(diethylamino)-ethanol, ethanolamine, ethylamine, ethylenediamine, isopropylamine, N-methyl-glucamine, hydrabamine, 1H-imidazole, L-lysine, morpholine, 4-(2-hydroxyethyl)-morpholine, methylamine, piperidine, piperazine, propylamine, pyrrolidine, 1-(2-hydroxyethyl)-pyrrolidine, pyridine, quinuclidine, quinoline, isoquinoline, secondary amines, triethanolamine, trimethylamine, triethylamine, N-methyl-D-glucamine, 2-amino-2-(hydroxymethyl)-1,3-propanediol, and tromethamine.

[0052] The invention also provides peptides and analogs of the invention in a composition. The composition can optionally be formulated with a pharmaceutically acceptable carrier to produce a pharmaceutical composition, which can be administered to the individual, which can be a human or other mammal. A pharmaceutically acceptable carrier can be, for example, water, sodium phosphate buffer, phosphate buffered saline, normal saline or Ringer's solution or other physiologically buffered saline, or other solvent or vehicle such as a glycol, glycerol, an oil such as olive oil or an injectable organic ester.
[0053] A pharmaceutically acceptable carrier can contain physiologically acceptable compounds that act, for example, to stabilize or increase the absorption of the peptide or analog of the invention. Such physiologically acceptable compounds include, for example, carbohydrates such as glucose, sucrose or dextrins; antioxidants such as ascorbic acid or glutathione; chelating agents such as ethylenediamine tetraacetic acid (EDTA), which disrupts microbial membranes; divalent metal ions such as calcium or magnesium; low molecular weight proteins; or other stabilizers or excipients. One skilled in the art would know that the choice of a pharmaceutically acceptable carrier, including a physiologically acceptable compound, depends, for example, on the route of administration of the composition. Suitable carriers and their formulations are well known in the art (see, for example, Remington: The Science and Practice of Pharmacy, 19th ed., ed. A. R. Gennaro, Mack Publishing Company, Easton, PA (1995); and Remington’s Pharmaceutical Sciences, 18th ed., Mack Publishing Company, Easton PA (1990)). Typically, an appropriate amount of a pharmaceutically-acceptable salt is used in the formulation to render the formulation isotonic. The pH of the solution is generally from about 5 to about 8, for example, from about 7 to about 7.5.

[0054] Pharmaceutical carriers are known to those skilled in the art. These most typically would be standard carriers for administration of drugs to humans, including solutions such as sterile water, saline, and buffered solutions at physiological pH, as described above. Pharmaceutical compositions can include carriers, thickeners, diluents, buffers, preservatives, surface active agents and the like in addition to the molecule of choice such as the peptides or analogs of the invention. Pharmaceutical compositions can also include one or more active ingredients such as antimicrobial agents, anti-inflammatory agents, anesthetics, and the like.

[0055] Further carriers include sustained or controlled release preparations such as semipermeable matrices of solid hydrophobic polymers covalently or non-covalently bound to the peptide or analog, which matrices are in the form of shaped articles, for example, films, liposomes, non-liposome lipid complex or microparticles, and the like, or other biocompatible polymers well known to those skilled in the art (see, for example, U.S. Patent No. 6,824,822 and 8,329,648). Liposomes, which consist of phospholipids or other lipids, are nontoxic, physiologically acceptable and metabolizable carriers that are relatively simple to make and administer (Gregoriadis, Liposome Technology, Vol. 1 (CRC Press, Boca Raton Fla., 1984). Various drug delivery methods are well known to those skilled in the art (Langer,
Nature 392(Suppl):5-10 (1998); Langer et al., Nature 428:487-492 (2004)). It will be apparent to those persons skilled in the art that certain carriers can be selected depending upon, for instance, the route of administration and concentration of composition being administered.

[0056] The pharmaceutical composition can be administered in a number of ways depending on whether local or systemic treatment is desired, and on the area to be treated. It is understood that a variety of routes of administration are useful for the peptides, analogs and methods of the invention. Such routes encompass systemic and local administration and include, without limitation, intravenous injection, intraperitoneal injection, intramuscular injection, subcutaneous injection, transdermal delivery, transdermal diffusion or electrophoresis, inhalable administration, oral administration, local injection, intracavity, and extended release delivery devices including locally implanted extended release devices such as bioerodible or reservoir-based implants. Administration can be topically (including ophthalmically, vaginally, rectally, intranasally), orally, by inhalation, or parenterally, for example by intravenous drip, subcutaneous, intraperitoneal or intramuscular injection.

[0057] Preparations for parenteral administration include sterile aqueous or non-aqueous solutions, suspensions, and emulsions. Examples of non-aqueous solvents are propylene glycol, polyethylene glycol, vegetable oils such as olive oil, and injectable organic esters such as ethyl oleate. Aqueous carriers include water, alcoholic/aqueous solutions, emulsions or suspensions, including saline and buffered media. Parenteral vehicles include sodium chloride solution, Ringer's dextrose, dextrose and sodium chloride, lactated Ringer's, or fixed oils. Intravenous vehicles include fluid and nutrient replenishers, electrolyte replenishers (such as those based on Ringer's dextrose), and the like. Preservatives and other additives can also be present such as, for example, antimicrobials, anti-oxidants, chelating agents, and inert gases and the like. Insulin is a well known peptide therapeutic, so methods used for delivery of insulin are particularly amenable as a delivery method for peptides or analogs of the invention, including but not limited to syringes, pens, infusion pumps, inhalers, mouth sprays, pills, and the like.

[0058] Guidance on appropriate doses for the peptides or analogs of the invention is provided in Dungan et al., Diabetes Metab. Res. Rev., 25:558-565 (2009). In particular, human clinical trials with INGAP peptide provide an indication of suitable possible doses for the peptides or analogs of the invention. Since the peptides or analogs of the invention
exhibit improved efficacy over the parent INGAP peptide (see Examples), the peptides or analogs of the invention can be administered at effective doses that are lower than that used for INGAP.

[0059] As described herein, the peptides and analogs of the invention are particularly useful for treating certain diseases and disorders. For example, the peptides or analogs of the invention can be used for treating impaired pancreatic function, treating a metabolic disease, promoting neuroprotection or nerve regeneration, promoting liver regeneration or inhibiting inflammation. Thus, the invention additionally provides compositions of the invention for treating impaired pancreatic function, treating a metabolic disease, promoting neuroprotection or nerve regeneration, promoting liver regeneration or inhibiting inflammation. The use of the peptides and analogs of the invention in such therapeutic applications are described below in more detail.

[0060] If desired, the peptides or analogs of the invention can be administered in combination. For example, a combination of two or more peptides or analogs of the invention, including those disclosed herein and shown in Tables 2 and 3, can be administered for a method of treatment as disclosed herein. Such a combination can be administered concurrently, either in separate formulations or combined into the same formulation, depending on the peptides being administered and the compatibility of the formulations for the peptides or analogs of the invention. Alternatively, the two or more peptides or analogs of the invention can be administered sequentially, including on the same day or staggered on separate days.

[0061] Furthermore, it is understood by those skilled in the art that the peptide and analogs of the invention can optionally be administered with drugs or therapeutic agents for treating a condition. For example, in the case of treating diabetes or related conditions, other anti-diabetic drugs can be administered with the peptides or analogs of the invention. It is understood that such a co-administration can occur concurrently, either in separate formulations or combined into the same formulation, depending on the drugs being administered and the compatibility of the formulations for the peptides or analogs of the invention. Alternatively, the co-administration can occur sequentially, including on the same day or staggered on separate days. One skilled in the art will understand appropriate administration regimens suitable for effective deliver of a peptide or analog of the invention with another drug or therapeutic agent.
[0062] In the case of treating insulin or related disorders, suitable anti-diabetic drugs include, but are not limited to, insulin, pramlintide, GLP-1 receptor agonists, oral anti-diabetic agents, and the like. Exemplary anti-diabetic drugs include, but are not limited to, insulin, meglitinides, for example, repaglinide (Prandin™) and nateglinide (Starlix™); sulfonylureas, for example, glipizide (Glucotrol™), glimepiride (Amaryl™), and glyburide (DiaBeta™, Glynase™); dipeptidyl peptidase-4 (DPP-4) inhibitors, for example, saxagliptin (Onglyza™), sitagliptin (Januvia™), and linagliptin (Tradjenta™); biguanides, for example, metformin (Fortamet™, Glucophage™); thiazolidinediones, for example, rosiglitazone (Avandia™) and pioglitazone (Actos™); alpha-glucosidase inhibitors, for example, acarbose (Precose™) and miglitol (Glyset™); amylin mimetics, for example, pramlintide (Symlin™); and incretin mimetics, for example, exenatide (Byetta™) and liraglutide (Victoza™). Thus, in methods and uses of the invention for treating diabetes or related conditions, an anti-diabetic drug can be administered with a peptide or analog of the invention.

[0063] Type 1 diabetes and latent autoimmune diabetes in adults (LADA) are both autoimmune diseases. Therefore, in the case of a subject having type 1 diabetes or LADA, another therapeutic agent that can be administered with a peptide or analog of the invention can be, for example, an immune modulatory agent. The immunomodulatory agent can be used to block or reduce the destruction of neogenic islet or beta cells associated with autoimmunity. Exemplary immunomodulatory agents include, but are not limited to, sirolimus (rapamycin, Rapamune™), tacrolimus (FK 506, Prograf™), lisofoylline, antithymocyte globulin, basiliximab (Simulect™), DiaPep277™, and the like.

[0064] As described herein, the peptides and analogs of the invention exhibit unexpected properties over that of the parent INGAP-PP and HIP peptides, including the peptides and analogs of Tables 2 and 3 that are not the parent INGAP-PP or HIP peptides. As disclosed herein, peptides and analogs of the invention exhibit improved stability in culture medium and plasma over that of the parent peptide (see Example III). The peptide analogs of the invention also were effective at significantly improving blood glucose, fasting insulin and oral glucose tolerance (see Example IV). The peptide analogs of the invention also exhibit a significantly increased islet neogenic effect than the parent peptide (see Example V). Further, the peptide analogs of the invention exhibit a significantly increased ability to stimulate insulin secretion in primary pancreatic islet cells (see Example VI). Additionally, peptide analogs of the invention exhibited superior pharmacokinetic properties (see Example VII).
The numerous unexpected and superior properties of the peptides and analogs of the invention indicate that the peptides and analogs of the invention, including the peptides and analogs of Tables 2 and 3 that are not the parent INGAP-PP or HIP peptides, can be utilized for therapeutic applications.

[0065] In a further embodiment, the invention provides a method for ameliorating a sign or symptom associated with impaired pancreatic function comprising administering a peptide or analog of the invention. A disease or condition associated with impaired pancreatic function includes, but is not limited to, type 1 diabetes, type 2 diabetes, latent autoimmune diabetes in adults (LADA), impaired fasting glucose, impaired glucose tolerance, insulin deficiency, fasting hyperinsulinemia, insulin resistance, or impaired fasting insulin levels, or a combination thereof. The pancreas produces insulin for regulation of blood glucose. In conditions such as type 1 and type 2 diabetes and LADA, the body cannot respond normally to glucose production, leading to a number of related conditions (see Cecil Textbook of Medicine, Bennett and Plum, eds., 20th ed., W.B. Saunders, Philadelphia (1996); Harrison’s Principles of Internal Medicine, Fauci et al., eds., 14th ed., McGraw-Hill, New York (1998)). It is understood by those skilled in the art that such conditions, which are correlated with decreased function of the pancreas, are included within the meaning of impaired pancreatic function.

[0066] Diabetes mellitus is a serious metabolic disease that is defined by the presence of chronically elevated levels of blood glucose (hyperglycemia). This state of hyperglycemia is the result of a relative or absolute lack of activity of the peptide hormone, insulin. Insulin is produced and secreted by the β-cells of the pancreas. Insulin promotes glucose utilization, protein synthesis, and the formation and storage of carbohydrate energy as glycogen. Glucose is stored in the body as glycogen, a form of polymerized glucose, which may be converted back into glucose to meet metabolism requirements. Under normal conditions, insulin is secreted at both a basal rate and at enhanced rates following glucose stimulation, all to maintain metabolic homeostasis by the conversion of glucose into glycogen.

[0067] The term diabetes mellitus encompasses several different hyperglycemic states. These states include type 1 (insulin-dependent diabetes mellitus or IDDM) and type 2 (non-insulin dependent diabetes mellitus or NIDDM) diabetes. The hyperglycemia present in individuals with type 1 diabetes is associated with deficient, reduced, or nonexistent levels of insulin which are insufficient to maintain blood glucose levels within the physiological range.
Treatment of type 1 diabetes involves administration of replacement doses of insulin, generally by a parenteral route. The hyperglycemia present in individuals with type 2 diabetes is initially associated with normal or elevated levels of insulin; however, these individuals are unable to maintain metabolic homeostasis due to a state of insulin resistance in peripheral tissues and liver and, as the disease advances, due to a progressive deterioration of the pancreatic $\beta$ cells which are responsible for the secretion of insulin. Thus, initial therapy of type 2 diabetes may be based on diet and lifestyle changes augmented by therapy with oral hypoglycemic agents such as sulfonylureas. Insulin therapy is often required, however, especially in the latter states of the disease, in order to produce some control of hyperglycemia and minimize complications of the disease.

[0068] The invention additionally provides a method for ameliorating a sign or symptom associated with a metabolic disease in a subject comprising administering a peptide or analog of the invention to the subject. Such a metabolic disease includes, but is not limited to, diabetes, pre-diabetes or metabolic syndrome.

[0069] Prediabetes is a condition where blood sugar level is higher than normal but not yet high enough to be classified as type 2 diabetes. Metabolic syndrome is a name for a group of risk factors that occur together and increase the risk for coronary artery disease, stroke, and type 2 diabetes. The two most important risk factors for metabolic syndrome are extra weight around the middle and upper parts of the body (central obesity)(so-called "apple-shaped") and insulin resistance, where the body uses insulin less effectively than normal. Insulin is needed to help control the amount of sugar in the body. As a result, blood sugar and fat levels rise. Metabolic syndrome is considered to be present if a subject has three or more of the following signs: blood pressure equal to or higher than 130/85 mmHg; fasting blood sugar (glucose) equal to or higher than 100 mg/dL; large waist circumference (length around the waist)(men, 40 inches or more; women, 35 inches or more); low HDL cholesterol (men, under 40 mg/dL; women, under 50 mg/dL); triglycerides equal to or higher than 150 mg/dL.

[0070] One skilled in the art will readily understand and can readily determine appropriate indicators of the effectiveness of the peptides or analogs of the invention at ameliorating a sign or symptom associated with a condition or disease associated with impaired pancreatic function and/or metabolic disease. For example, both type 1 and type 2 diabetes are a well characterized diseases with a number of known parameters for diagnosing
and/or monitoring the progression of the disease and/or to monitor the effectiveness of a therapy. Such parameters include, but are not limited to, plasma glucose levels, fasting glucose levels, oral glucose tolerance test (OGTT), insulin levels, fasting insulin levels, glycosylated hemoglobin levels, and the like.

[0071] The peptides or analogs of the invention can therefore be used to ameliorate any one or more of the signs or symptoms associated with impaired pancreatic function and/or metabolic disease. In the case of diabetes, such signs or symptoms include, but are not limited to, impaired glucose tolerance, increased blood glucose (in particular above 200 mg/dl), increased fasting blood glucose (in particular above 140 mg/dl), increased postprandial (after eating) blood glucose, insulin deficiency, fasting hyperinsulinemia, insulin resistance, impaired fasting insulin levels, increased glycosylated hemoglobin (HbA1c), and the like. Such signs or symptoms are well known to those skilled in the art and can be routinely determined by those skilled in the art, including tests available through medical testing laboratories. In an embodiment of the invention, the invention provides a method of reducing a sign or symptom associated with a condition such as diabetes, for example, a method of reducing impaired glucose tolerance, blood glucose, in particular daily average blood glucose concentration, fasting blood glucose, postprandial (after eating) blood glucose, insulin deficiency, fasting hyperinsulinemia, insulin resistance, impaired fasting insulin levels, glycosylated hemoglobin (HbA1c), arginine-stimulated C-peptide, advanced glycation end products (AGE), or a combination thereof, by administering a peptide or analog of the invention. Methods of monitoring the effectiveness of a drug for treating diabetes are well known to those skilled in the art (see, for example, *Cecil Textbook of Medicine, supra; Harrison’s Principles of Internal Medicine supra*, Dungan et al., *Diabetes/Metabolism Res. Rev.* 25:558-565 (2009); U.S. Patent No. 8,329,648). Thus, the invention provides a method of reducing in a diabetic subject impaired glucose tolerance, blood glucose, fasting blood glucose, postprandial blood glucose, insulin deficiency, fasting hyperinsulinemia, insulin resistance, impaired fasting insulin levels, glycosylated hemoglobin (HbA1c), arginine-stimulated C-peptide, advanced glycation end products (AGE), or a combination thereof, by administering a peptide or analog of the invention to the subject.

[0072] As disclosed herein, the peptides and analogs of the invention were particularly effective at stimulating pancreatic islet cell growth and induction of β-cell clusters (see Example V). Exemplary peptides and analogs of the invention exhibited improved islet
neogenic effect over parent peptide (Example V). Thus, the invention additionally provides a method for stimulating pancreatic islet cell growth by contacting a pancreatic islet cell \textit{in vitro} with a peptide or analog of the invention, whereby proliferation of the pancreatic islet cell is stimulated. In another embodiment, the invention provides a method of producing a population of pancreatic islet cells, comprising contacting one or more pancreatic islet cells \textit{in vitro} with a peptide or analog of the invention, whereby proliferation of the one or more pancreatic islet cells is stimulated and a population of pancreatic islet cells is produced. The methods of the invention can be used for \textit{ex vivo} islet induction, expansion and proliferation for transplantation and for increasing the survival of transplanted islets \textit{in vivo}. Thus, the invention provides methods of \textit{ex vivo} islet expansion and proliferation for transplantation using the peptides or analogs of the invention by contacting islet cells \textit{in vitro}, increasing the islet cell numbers and optionally using the cells for transplantation. The invention also provides a method of increasing the survival of transplanted islets \textit{in vivo} by administering to a subject a peptide or analog of the invention, wherein the subject is the recipient of transplanted islet cells. The peptides or analogs of the invention can thus be used to generate cells for transplantation using \textit{in vitro} and \textit{ex vivo} methods as well as to increase survival of transplanted islet cells. Such transplanted cells can be obtained from the \textit{in vitro} methods using the peptides or analogs of the invention or from traditional transplant sources of islet cells such as cadavers.

[0073] In a particular embodiment, the one or more pancreatic islet cells can be obtained from a subject. The population of pancreatic islet cells produced by stimulating proliferation of the pancreatic islet cells can be used, for example, for transplantation into a subject and restoration of pancreatic islet cell function. Thus, a method of the invention can further comprise the step of transplanting the population of pancreatic islet cells into a subject. In a particular embodiment, the one or more pancreatic cells are obtained from the subject into which the population of pancreatic islet cells is to be transplanted. Alternatively, the pancreatic islet cells to be transplanted are obtained from a suitable donor having a compatible blood type.

[0074] Transplantation of pancreatic islets has been described previously (see, for example, Shapiro et al., \textit{N. Engl. J. Med.} 343:230-238 (2000)). Pancreatic islet cells can be obtained from the subject or, alternatively, from a suitable donor, including islet cells harvested from a cadaver. Generally, the transplant recipient is administered
immunosuppressive drugs to decrease rejection of the islet cells (see, for example, immunosuppressive drugs described herein). The use of suitable immunosuppressive drugs are well known in the field of organ or cell transplantation. Thus, in methods of the invention in which pancreatic islet cells are stimulated to proliferate in vitro to produce a population of pancreatic islet cells, such a population can be transplanted into a subject using well known methods of pancreatic islet cell transplantation. In addition, peptides or analogs of the invention can be used to induce differentiation of pancreatic ductal cells into islet cells, in particular beta-cells (see Yatoh et al., *Diabetes* 56:1802-1809 (2007)). Thus, the invention further provides a method of differentiating pancreatic ductal cells into islet cells by contacting a pancreatic ductal cell with a peptide or analog of the invention. When the method is performed where the pancreatic ductal cell is contacted in vitro, a population of differentiated pancreatic ductal cells can be generated and used for transplantation, as described herein.

[0075] The invention further provides a method for increasing the number of pancreatic islet cells in a subject comprising administering a peptide or analog of the invention to the subject. Such a method of therapeutic treatment using peptides or analogs of the invention can be used to increase pancreatic islet cells in an individual, without the need to harvest pancreatic cells from the individual or identify a suitable donor and without the need to put the subject through complex transplantation procedures and the frequently required use of immunosuppressive agents if using donor cells not obtained from the patient.

[0076] As described previously, INGAP peptide has been shown to improve nerve function and enhance nerve regeneration in a diabetic mouse model (Tam et al., *FASEB J.* 18:1767-1769 (2004)). INGAP peptide was also shown to enhance neurite outgrowth in dorsal root ganglia neurons (Tam et al., *Biochem. Biophys. Res. Commun.* 291:649-654 (2002; Tam et al., *NeuroReport* 17:189-193 (2006)). As described herein, the peptides and analogs of the invention are significantly more active than the INGAP parent peptide and are expected to have a similar but more potent activity than INGAP. Thus, the invention provides a method for promoting neuroprotection or nerve regeneration by contacting a nerve cell with a peptide or analog the invention, thereby stimulating neuroprotection and/or nerve regeneration. The contacting with a nerve cell can occur in vivo or in vitro. In the case where the nerve cell is contacted in vivo, the peptide or analog of the invention is administered to a subject as with other therapeutic methods disclosed herein. In the case
where the nerve cell is contacted \textit{in vitro}, the neuroprotected cell can be used in an \textit{ex vivo} application and the cell administered to the subject. Such methods of introducing nerve cells by way of transplantation are well known to those skilled in the art (see, for example, Dunnett et al., \textit{Brit. Med. Bulletin} 53:757-776 (1997)). Such transplantations have been performed to treat neurological conditions such as Parkinson’s disease and Huntington’s disease.

[0077] The HIP peptide has been described as accelerating liver regeneration (Lieu et al., \textit{Hepatol.} 42:618-626 (2005). As described herein, the peptides and analogs of the invention are significantly more active than the HIP parent peptide and are expected to have a similar but more potent activity than HIP. Thus, the invention also provides a method for promoting liver regeneration by contacting a liver cell with a peptide or analog of the invention, thereby promoting liver regeneration. The contacting with a liver cell can occur \textit{in vivo} or \textit{in vitro}. In the case where the liver cell is contacted \textit{in vivo}, the peptide or analog of the invention is administered to a subject as with other therapeutic methods disclosed herein. In the case where the liver cell is contacted \textit{in vitro}, the liver cells can be induced to proliferate, for example, to produce a population of liver cells. The population of liver cells can be used in an \textit{ex vivo} application and the cells administered to the subject. Methods for transplanting or grafting liver cells onto the liver of a subject are well known to those skilled in the art. The transplanted cells can be used to reconstitute injured, or metabolically defective, liver tissue. Liver cells can be infused into the portal vein or spleen from where cells migrate to the liver and take up permanence residence and perform the normal liver metabolic functions (see, for example, Khan et al., \textit{Cell Transplant.} 19:409-418 (2010)).

[0078] The HIP protein (also referred to as Pancreatitis-associated protein (PAP)) has been found to exhibit anti-inflammatory activity \textit{in vivo} and \textit{in vitro} (Closa et al., \textit{World J. Gastroenterol.} 13:170-174 (2007)). Therefore, the peptides and analogs of the invention are expected to exhibit anti-inflammatory activity. Therefore, the invention further provides a method for inhibiting inflammation by administering a peptide or analog of the invention.

[0079] The invention also provides the use of a peptide or analog of the invention for preparation of a medicament for treating impaired pancreatic function, treating a metabolic disease, promoting neuroprotection or nerve regeneration, promoting liver regeneration or inhibiting inflammation in a subject.
[0080] The invention additionally provides use of a peptide or analog of the invention for preparation of a medicament for treating impaired pancreatic function, treating a metabolic disease, promoting neuroprotection or nerve regeneration, promoting liver regeneration or inhibiting inflammation in a subject. Such uses can be, for example, to carry out the methods of the invention disclosed herein.

[0081] As described herein, the peptides and analogs of the invention can be used in a variety of methods. Such methods include, but not limited to, treating impaired pancreatic function, treating a metabolic disease, promoting neuroprotection or nerve regeneration, promoting liver regeneration or inhibiting inflammation. In many applications of the invention for a therapeutic application, the peptides or analogs of the invention are administered. However, it is understood that an alternative mode is to use gene therapy to express a peptide of the invention by administering a suitable gene therapy vector containing a nucleic acid encoding the peptide to a subject. Such gene therapy methods are described below in more detail and are well known to those skilled in the art (see, for example, Anderson, *Nature* 392 (Supp.):25-30 (1998)).

[0082] A gene delivery vehicle refers to a molecule that can carry inserted polynucleotides into a host cell. Examples of gene delivery vehicles are liposomes, micelles biocompatible polymers, including natural polymers and synthetic polymers; lipoproteins; polypeptides; polysaccharides; lipopolysaccharides; artificial viral envelopes; metal particles; and bacteria, or viruses, such as baculovirus, adenovirus and retrovirus, bacteriophage, cosmid, plasmid, fungal vectors and other recombination vehicles typically used in the art which have been described for expression in a variety of eukaryotic and prokaryotic hosts, and may be used for gene therapy as well as for simple protein expression.

[0083] A peptide or analog of the invention can be delivered to a cell or tissue using a gene delivery vehicle. Gene delivery, gene transfer, transducing, and the like as used herein, are terms referring to the introduction of an exogenous polynucleotide (sometimes referred to as a transgene) into a host cell, irrespective of the method used for the introduction. Such methods include a variety of well-known techniques such as vector-mediated gene transfer (by, e.g., viral infection/transfection, or various other protein-based or lipid-based gene delivery complexes) as well as techniques facilitating the delivery of "naked" polynucleotides (such as electroporation, "gene gun" delivery and various other techniques used for the introduction of polynucleotides). The introduced polynucleotide can be stably or transiently
maintained in the host cell. Stable maintenance typically requires that the introduced polynucleotide either contains an origin of replication compatible with the host cell or integrates into a replicon of the host cell such as an extrachromosomal replicon (e.g., a plasmid) or a nuclear or mitochondrial chromosome. A number of vectors are known to be capable of mediating transfer of genes to mammalian cells, as is known in the art.

[0084] A viral vector refers to a recombinantly produced virus or viral particle that comprises a polynucleotide to be delivered into a host cell, either in vivo, ex vivo or in vitro. Examples of viral vectors include retroviral vectors, adenovirus vectors, adeno-associated virus vectors, alphavirus vectors and the like. Alphavirus vectors, such as Semliki Forest virus-based vectors and Sindbis virus-based vectors, have also been developed for use in gene therapy and immunotherapy (see Schlesinger and Dubensky Curr. Opin. Biotechnol. 5:434-439 (1999) and Ying, et al. Nat. Med. 5(7):823-827 (1999)).

[0085] In aspects where gene transfer is mediated by a retroviral vector, a vector construct refers to the polynucleotide comprising the retroviral genome or part thereof, and a therapeutic gene. As used herein, retroviral mediated gene transfer or retroviral transduction carries the same meaning and refers to the process by which a gene or nucleic acid sequences are stably transferred into the host cell by virtue of the virus entering the cell and integrating its genome into the host cell genome. The virus can enter the host cell via its normal mechanism of infection or be modified such that it binds to a different host cell surface receptor or ligand to enter the cell. As used herein, retroviral vector refers to a viral particle capable of introducing exogenous nucleic acid into a cell through a viral or viral-like entry mechanism. Retroviruses carry their genetic information in the form of RNA; however, once the virus infects a cell, the RNA is reverse-transcribed into the DNA form which integrates into the genomic DNA of the infected cell. The integrated DNA form is called a provirus.

[0086] In aspects where gene transfer is mediated by a DNA viral vector, such as an adenovirus (Ad) or adeno-associated virus (AAV), a vector construct refers to the polynucleotide comprising the viral genome or part thereof, and a transgene. Adenoviruses (Ads) are a relatively well characterized, homogenous group of viruses, including over 50 serotypes (see, for example, WO 95/27071). Ads do not require integration into the host cell genome. Recombinant Ad derived vectors, particularly those that reduce the potential for recombination and generation of wild-type virus, have also been constructed (see, for example, WO 95/00655 and WO 95/11984). Wild-type AAV has high infectivity and

[0087] Vectors that contain both a promoter and a cloning site into which a polynucleotide can be operatively linked are well known in the art. Such vectors are capable of transcribing RNA *in vitro* or *in vivo*, and are commercially available from sources such as Stratagene (La Jolla, CA) and Promega Biotech (Madison, WI). In order to optimize expression and/or *in vitro* transcription, it may be necessary to remove, add or alter 5' and/or 3' untranslated portions of the clones to eliminate extra, potential inappropriate alternative translation initiation codons or other sequences that may interfere with or reduce expression, either at the level of transcription or translation. Alternatively, consensus ribosome binding sites can be inserted immediately 5' of the start codon to enhance expression.

[0088] Gene delivery vehicles also include DNA/liposome complexes, micelles and targeted viral protein-DNA complexes. Liposomes that also comprise a targeting antibody or fragment thereof can be used in the methods of this invention. To enhance delivery to a cell, the nucleic acid or proteins of this invention can be conjugated to antibodies or binding fragments thereof which bind cell surface antigens, for example, a cell surface marker found on pancreatic islet cells.

[0089] In yet another embodiment, the invention provides a method of introducing a peptide or analog of the invention into a subject by contacting a cell with a nucleic acid encoding a peptide or analog of the invention. The contacting of a cell with the nucleic acid can occur *in vitro*, for *ex vivo* applications, or *in vivo*. Such methods are often referred to as gene therapy methods. When the cell is contacted *in vitro*, the cells expressing the polynucleotide can be administered to the subject. Such methods permit the expression of a therapeutic protein or peptide, such as the peptides or analogs of the invention, for therapeutic applications. Such therapeutic applications can be used for treating various diseases and conditions, including but not limited to treating impaired pancreatic function, treating a metabolic disease, promoting neuroprotection or nerve regeneration, promoting liver regeneration or inhibiting inflammation, as disclosed herein.

[0090] It is understood that modifications which do not substantially affect the activity of the various embodiments of this invention are also provided within the definition of the
invention provided herein. Accordingly, the following examples are intended to illustrate but not limit the present invention.

**EXAMPLE I**
**Production of Peptides and Peptide Analogs**

[0091] This example describes the production of peptides and peptide analogs.

[0092] All the peptides used in the studies were synthesized by solid phase peptide synthesis using 9-fluorenlymethoxy carbonyl (Fmoc) chemistry. In brief, a pre-weighed amount of 2-chlorotrityl chloride resin (1.6 mmol/g) was swelled in dichloromethane (DCM). For peptides with an amidated C-terminus, Rink amide resin was used instead of 2-chlorotrityl chloride resin. Fmoc-preactivated amino acids were used for the coupling reactions in the presence of hydroxybenzotriazole (Sigma Chemical Co., St. Louis, MO, USA) in dimethylformamide (DMF). Excess amino acids were used throughout the synthesis. Chain elongation reaction was performed followed by Fmoc deprotection in 20% piperidine in DMF. When the chain elongation reaction was finished, the Fmoc protecting groups were removed from the N terminus of the peptides by 25% piperidine in DMF followed by washing with DMF for four times. For peptides with an acetylated N-terminus, before trifluoroacetic acid (TFA) cleavage, a solution of 20% acetic anhydride dissolved in DMF was added at a ratio of 7 mL/g resin, reacted for 30 mins, followed by 4 times washes with DMF and DCM. Following washing for four times with DMF and DCM, the resin was dried under vacuum. Subsequently, the prepared peptides were cleaved from the resin using standard TFA cleavage procedures in TFA with 5% H₂O followed by multiple ether extractions. All synthetic peptides were purified to >95% by reverse-phase high-pressure liquid chromatography performed with a liquid chromatograph. Peptides were analyzed by mass spectrometry to confirm the identity and purity.

[0093] For *in vitro* and *ex-vivo* studies, the above prepared peptides were dissolved in double distilled water to make a stock solution, and in the *in vivo* efficacy study they were reconstituted in sterile normal saline to reach the desired concentration. The final peptide solution was filtered through a 0.22 μm membrane to make it sterile.

[0094] The peptides and analogs can also be produced using other well known methods, including manufacturing the peptides using a method of peptide synthesis or expressing nucleic acids that code for the desired peptides or peptide analogs. Thus, when the analogs
include one or more non-standard amino acids, it is more likely that they will be produced by a chemical synthetic method. When the peptides include only one or more substitutions with standard amino acids, the peptides can be expressed from an expression vector using well known expression methods.

[0095] The particular peptides used in the experiments below can be found in Tables 1-3.

EXAMPLE II
Stimulatory Effect of Peptides on Cell Proliferation

[0096] This example describes the effect of peptides and analogs on pancreatic cell growth.

[0097] To measure cell proliferation, a bromodeoxyuridine (BrdU) ELISA assay was performed. Briefly, ARIP cells (ATCC (American Type Culture Collection), Manassas VA USA), a rat pancreatic ductal cell line, were cultured in F-12K medium (Gibco-BRL, Gaithersburg, MD, USA) containing 10% fetal bovine serum (FBS; HyClone, Thermo Fisher Scientific Inc.; Waltham MA USA), 100 μg/ml streptomycin and 100 μg/ml penicillin in a cell incubator. ARIP cells were seeded into 96-well culture plates at 8000 or 0 (as blank control) cells/well in a volume of 50 μl cell culture medium and incubated overnight for the following experiments. On the second day, after replacing the medium with medium without serum, 50 μl serum-free cell culture medium containing test peptides at a series concentrations (final concentrations were 10 μM, 5 μM, 1 μM, 500 nM, 100 nM, 50 nM, 10 nM and 1nM) were added to seeded cells. Medium without compound was added to negative control and background control wells. The medium was replaced at 24 h and 48 h respectively with fresh medium. At 69 hours, the medium was supplemented with 10 μl bromodeoxyuridine (BrdU) labeling solution (except the background control wells) from a BrdU cell proliferation ELISA kit (Roche Applied Science; Indianapolis IN USA), and incubated for an additional 3 hours. At 72 hours, labeling medium was removed, and 200 μl/well of FixDenat solution was added. After 30 minutes of incubation time, FixDenat solution was removed thoroughly and 100 μl/well of anti-BrdU antibody working solution was added and incubated at room temperature (RT) for 90 minutes. Antibody conjugate was removed and wells were rinsed three times with 250 μl/well Washing solution (1X PBS). After removing washing solution, 100 μl/well of Substrate solution was added and incubated at RT for 15 min, then 25 μl/well of 1 M H2SO4 was added, and the plate was incubated for about 1 min on the shaker to mix thoroughly. The absorbance at 450 nm (reference
wavelength 690 nm) on an EnVision™ plate reader (Perkin Elmer, Boston MA) within 5 min after adding the stop solution was measured.

[0098]  To test for cell viability, a CellTiter-Glo™ (CTG) assay (Promega, Madison WI) was performed. Briefly, ARIP cells (ATCC, cat# CRL-1674) were cultured in F-12K medium (Gibco-BRL) containing 10% fetal bovine serum (FBS; HyClone), 100 µg/ml streptomycin and 100 µg/ml penicillin in a cell incubator. ARIP cells were seeded into 96-well culture plates at 8000 and 0 (as blank control) cells/well in the volume of 50 µl cell culture medium and incubated overnight for the following experiments. On the second day, after replacing the medium with medium without serum, 50 µl serum-free cell culture medium containing test peptides at a series of concentrations (final concentrations were 10 µM, 5 µM, 1 µM, 500 nM, 100 nM, 50 nM, 10 nM and 1nM) were added to seeded cells. Medium without compound was added to negative control and background control wells. The medium was replaced at 24h and 48h respectively with fresh medium. At 72 hours, 25µl of CellTiter-Glo® reagent was added to each well and mixed on an orbital shaker for 2 mins. Luminescence signal was quantified on an EnVision™ plate reader after a 10 minute incubation at room temperature.

[0099]  Figure 1 shows the comparison of ARIP cell proliferation in the presence of 100 nM of INGAP Scrambled PP 1 (Peptide 3), INGAP-PP (Peptide 1), and Peptide 7 (peptides shown in Table 2). Figure 1 shows that there was an increase in cell number at a peptide concentration of 100 nM. Peptide 7 showed a significantly higher percentage increase in cell number compared to the INGAP scrambled peptide, a negative control, and INGAP-PP peptide.

EXAMPLE III
Peptide Stability Studies

[00100]  This example describes stability studies of peptides in various conditions.

[00101]  To determine the stability of peptides in culture medium, a certain amount of selected peptides was accurately weighed and dissolved in distilled water to 5 mg/mL as a stock solution. The stock solution was diluted to 0.25 mg/mL with F-12K medium (Gibco-BRL, Gaithersburg, MD, USA) as working solution. A volume of 100 µL of each working solution was transferred into individual sample vials. The sample vials were incubated in a 37 °C incubator for 0, 24, 48 and 72 hours before being analyzed and quantitated by HPLC.
Figure 2 shows the stability of compounds in culture medium. In particular, Figure 2 shows a stability comparison in culture medium of INGAP-PP (Peptide 1) and selected peptide analogs, Peptide 7 and Peptide 8 (see Table 2). As shown in Figure 2, peptide analogs Peptide 7 and Peptide 8 were significantly more stable than INGAP-PP peptide in culture medium.

The stability of peptides was also tested in mouse and human plasma. Briefly, a certain amount of peptides and eucatropine powder (positive control) was accurately weighed. Test compounds were dissolved in 50% methanol-water solution and diluted to 20 mg/mL, and eucatropine was dissolved in dimethylsulfoxide (DMSO) and diluted to 10 mM, as a stock solution. Eucatropine stock solution was diluted to 0.2 mM with DMSO as a working solution. A stop reagent was prepared containing 200 ng/mL midazolam and tolbutamide in acetonitrile. A volume of 300 μL of stop solution was added to each well of a 96-well deep-well plate placed on ice beforehand.

For the stability studies, peptides and eucatropine were spiked into plasma respectively, mixed well, and then 100 μL of each mixture solution was transferred into the pre-cooled stop reagent as 0 time point sample. The remaining mixtures were incubated in a 37 °C water bath with shaking at 100 rpm (n = 2). The final incubation concentration was 1 μM for eucatropine and 100 μg/mL for all test compounds.

At desired time points, 100 μL of incubation mixture was transferred to the stop reagent to precipitate proteins. Samples were vortexed and centrifuged at RCF 5000×g for 10 minutes, and supernatant was transferred to a test plate. The samples were analyzed by LC-MS/MS.

Slope was calculated by plotting the natural logarithm of the percentage of remaining amount of test compounds and time, and $T_{1/2}$ was calculated in accordance with the following formula.

$$T_{1/2} = \frac{0.693}{-slope}$$

For stability in mouse plasma, the incubation time was 0, 5, 15, 30 and 60 min for Peptide 1 and eucatropine; 0, 15, 30, 60, 120, 240 and 480 min for Peptide 12, Peptide 16
and Peptide 29. Figure 3 shows stability of compounds in mouse plasma. In particular, Figure 3 shows a stability comparison in mouse plasma of INGAP-PP (Peptide 1) and selected peptide analogs, Peptide 12, Peptide 16 and Peptide 29 (see Table 2). As shown in Figure 3, peptide analogs Peptide 12, Peptide 16 and Peptide 29 exhibited good stability in mouse plasma and were more stable than INGAP-PP (Peptide 1).

[00108] In another stability study in mouse plasma, the incubation time was 0, 30, 60 and 120 min for Peptide 2 and eucapotropin; 0, 30, 60, 120, 240 and 960 min for Peptide 52 and Peptide 54. Figure 5 shows stability of compounds in mouse plasma. In particular, Figure 5 shows a stability comparison in mouse plasma of HIP (Peptide 2) and selected peptide analogs, Peptide 52 and Peptide 54 (see Table 3). As shown in Figure 5, peptide analogs Peptide 52 and Peptide 54 exhibited good stability in mouse plasma and were significantly more stable than HIP (Peptide 2).

[00109] For stability in human plasma, the incubation time was 0, 30, 60 and 120 min for Peptide 1, Peptide 12, Peptide 16 and eucapotropin. Figure 4 shows the stability of compounds in human plasma. In particular, Figure 4 shows a stability comparison in human plasma of INGAP-PP (Peptide 1) and selected peptide analogs, Peptide 12 and Peptide 16 (see Table 2). As shown in Figure 4, peptide analogs Peptide 12 and Peptide 16 exhibited good stability in human plasma and were significantly more stable than INGAP-PP (Peptide 1).

[00110] These results demonstrate that various peptide analogs exhibit good stability under various conditions, including culture medium and mouse and human plasma, and exhibit superior stability over INGAP-PP and HIP peptides.

EXAMPLE IV
Efficacy of Peptide Analog in a Diabetic Mouse Model

[00111] This example describes an in vivo efficacy study using a streptozotocin (STZ) induced diabetic mice model.

[00112] After acclimatization in the animal facility for one week, 6-8 weeks old C57BL/6J mice were administered low dose STZ at 40 mg/kg in citrate buffer for 5 consecutive days to establish a T1D animal model. Mice with blood glucose greater than 16.7 mmol/L at 5 days post last STZ injection were included in the study. These mice were then treated with INGAP-PP (Peptide 1) or Peptide 7 at the doses of 5 mg/kg (2.5 mg/kg, bid (twice a day)) or
25 mg/kg (12.5 mg/kg, bid) for 20 days before sacrifices. Two additional groups of diabetic mice were administered either saline or a peptide (Peptide 3) composed of a scrambled sequence of amino acids from Peptide 1 as control groups. Blood glucose and insulin levels were measured, and 20 days post the last dosing of test agents, an oral glucose tolerance test (OGTT) was performed in 6 hour fasted animals to determine the effect of Peptide 1 and Peptide 7. Blood samples obtained from the tail cut for glucose determination were detected with an ACCU-CHEK™ glucometer (Roche, ACCU-CHEK® Active), and insulin levels were determined with Rat/Mouse Insulin Elisa kit (Millipore, Billerica, MA USA). For the OGTT, after the measurement of the basal glucose concentration ($T = -30\,\text{min}$), mice received an oral glucose challenge at 2 g/kg and glucose values were determined by glucometer at 0, 15, 30, 60, 90 and 120 min.

[00113] Figure 6 shows the efficacy comparison of INGAP-PP (Peptide 1), INGAP Scrambled PP 1 (Peptide 3) and Peptide 7 in STZ induced diabetic mice model. Figure 6A shows the blood glucose (BG, mM) on day 21 of treatment. Figure 6B shows the fasting insulin levels (ng/ml) on day 21 of treatment. Figure 6C shows the area under curve (AUC) of glucose ($T_{0-120\text{min}}$) measured in an oral glucose tolerance test (OGTT) on day 21 of treatment.

[00114] Administration of Peptide 1 and Peptide 7 (either 5mg/kg or 25mg/kg) for 20 days did not affect body weight or pancreas weight. Significant differences in blood glucose levels were demonstrated between the mouse group administered Peptide 7 and the saline control group (Figure 6A). Moreover, one of the most striking results was that plasma insulin levels of the Peptide 7 treated animals (25 mg/kg dose group) at the end of the 20-day period were significantly different from saline controls and almost restored to the level of the naive group (Figure 6B). In addition, the Peptide 7 treated groups also demonstrated improved glucose tolerance (Figure 6C).

[00115] These results demonstrate that a representative peptide analog, peptide 7, was effective at ameliorating signs and symptoms of diabetes in a diabetic mouse model.

**EXAMPLE V**

The Effect of Peptides on Induction of Small $\beta$-cell Clusters

[00116] This example describes the effects of peptides on the induction of small $\beta$-cell clusters in normal C57BL/6J mice.
After a 1-week acclimation, C57BL/6J female mice were randomly divided into 4 groups. The two control groups received either 10mL/kg sterile normal saline (n=4) or scrambled peptide (Peptide 3, 25mg/kg) (n=5) via subcutaneous injection for 10 days. The other two groups received INGAP-PP (Peptide 1) or INGAP-PP analog Peptide 7 at a dose of 25 mg/kg per day respectively (n=7 per group) for the same period. Body weight and 6 hour fasting blood glucose were measured before treatment and after the last dosing of treatment. Plasma and pancreatic insulin were also measured at the end of the study. On day 11, the pancreas was removed from each animal, cleared of fat and lymph nodes, weighed, and fixed in 10% neutral buffered formalin (NBF) for no longer than 24 hours before processing for morphometric analysis.

Compared to the saline group, administration of Peptide 3, Peptide 1, or Peptide 7 to normal mice for 10 days did not affect body weight, blood glucose, plasma insulin, pancreas insulin, or pancreas weight. Immunohistochemistry analysis was used to determine pancreatic islet size distribution. Figure 7 shows pancreatic islet size distribution in female C57BL/6J mice at 10 days of peptide treatment. For the islet size (expressed as Log [μm²]) ranging from 4.9 to 2.3, there was no difference for each group, whereas for the islet size ranging from 2.1 to 0.7, the numbers increased significantly in the mice treated with Peptide 7 (p<0.05 or 0.01 versus the naive/control group)(Figure 7). The increase in the Peptide 1 treated mice was only observed in islet size of 2.1 (p<0.05 versus the naive/control group).

These results indicated the improved islet neogenic effect of designed INGAP-PP analogs. It is of note that among all parameters measured, there was no difference for mice treated with normal saline or scrambled peptide.

**EXAMPLE VI**

The Effect of Peptides on Glucose-stimulated Insulin Secretion

This example describes the effect of peptides on glucose-stimulated insulin secretion (GSIS).

The pancreases were procured from male adult Sprague-Dawley (SD) rats. After 7 days acclimation, the animals were sacrificed by cervical dislocation and the entire pancreas was removed and digested with collagenase to isolate islets. After digestion, islets were maintained at 37 °C in RPMI 1640 (Carlsbad CA, USA) pH 7.4, containing 10% (v/v) fetal calf serum, 1% penicillin/streptomycin, and 10 mM glucose in a humid atmosphere (5%
CO₂/95% O₂, without the addition of any compound (control), or with the addition of 100 nM glucagon like peptide-1 (GLP-1); 10μg/mL Peptide 1, Peptide 12, or Peptide 16, as summarized in Table 4 below.

[00122] Cultured islets were rinsed in Krebs–Ringer bicarbonate buffer (KRB), pH 7.4, previously gassed with a mixture of CO₂/O₂ (5/95%), and pre-incubated in 1.0 ml of KRB containing 0.5% (w/v) BSA and 1.5 mM glucose at 37 °C for 45 min. After this period, groups of 5 islets were incubated in 0.6 ml KRB with the addition of 1.5 or 12.0 mM glucose, with or without the addition of peptides for 60 min. At the end of the incubation period, aliquots of the medium were collected for insulin quantitation.

[00123] The results of the insulin quantitation are shown in Figure 8. Figure 8 shows the increase of glucose-stimulated insulin secretion of islets with or without the co-incubation of
selected peptides (10 μg/mL), Peptide 12, Peptide 16 and Peptide 1. Co-incubation with 100nM Glucagon like peptide – 1 (GLP-1) was included as a positive control. At 12.0 mM glucose concentration, pancreatic islets cultured with peptides GLP-1, Peptide 12 and Peptide 16 released significantly more insulin than those cultured without the addition of peptides. In particular, INGAP-PP analogs Peptide 12 and Peptide 16 showed 2-3 fold higher stimulation of insulin secretion than GLP-1. In contrast, no stimulation was observed with the addition of INGAP-PP (Peptide 1) (Figure 8).

[00124] These results demonstrate that INGAP-PP analogs stimulated insulin secretion from pancreatic islet cells.

EXAMPLE VII
Pharmacokinetic Properties of Peptides in Rat and Mouse

[00125] This example describes in vivo pharmacokinetic (PK) properties of peptides in rat and mouse.

[00126] After 7 days acclimation, male Sprague-Dawley (SD) rats weighing 210–250 g, or male C57BL/6 mice, weighing 19–24 g, in good health were used in the study. Peptide 1, Peptide 12 and Peptide 16 were dissolved in sterile normal saline and then they were injected via subcutaneous (sc) bolus or intravenous (iv) bolus at the dose level of 25mg/kg. Three animals in each group were used for blood collection at the time point of 5 min, 15 min, 30 min, 1 h, 2 h, 4 h, 6h, 8h and 24 h post-dose. Blood samples (approximately 400 μL) were collected and placed into tubes containing EDTA-K2 and centrifuged at 8000 rpm for 6 minutes at 4°C to separate plasma from the samples. The resulting plasma was stored frozen at -80°C until being analyzed.

[00127] Plasma concentrations of peptides were determined using tandem mass spectrometry (LC-MS/MS) analysis. A non-compartmental module of WinNonlin® Professional 5.2 (Pharsight; St. Louis MO), was used to calculate PK parameters. Selected PK parameters are presented in Table 5 below. The abbreviation AUC_{(0-t)} represents area under the curve from the time of dosing to the time of the last observation, the AUC_{(0-∞)} represents area under the curve from the time of dosing to infinity, and the C_{max} represents maximum concentration detected.

[00128] Compared to INGAP-PP (Peptide 1), the peptide analogs Peptide 12 and Peptide 16 showed marked improved PK properties evidenced by the significant increase in the area under the plasma concentration-time curves (AUC) and the maximum concentration (Cmax) in mouse and rat.

[00129] These results demonstrate that the INGAP-PP peptide analogs exhibited significantly improved pharmacokinetic properties over INGAP-PP.

[00130] Throughout this application various publications have been referenced. The disclosures of these publications in their entireties are hereby incorporated by reference in this application in order to more fully describe the state of the art to which this invention pertains. Although the invention has been described with reference to the examples provided above, it should be understood that various modifications can be made without departing from the spirit of the invention.
What is claimed is:

1. A peptide or analog thereof comprising a sequence selected from the group consisting of:

   IGLHDPSHGTLPAGS (SEQ ID NO:7); and

   IGLHDPSHGTLPAG (SEQ ID NO:73).

2. The peptide or analog of claim 1, wherein the peptide or analog comprises a peptide or analog selected from:

   IGLHDPSHGTLPAGS (SEQ ID NO:7);

   IGLHDPSHGTLPAG (SEQ ID NO:73);

   IGLHDPSHGTLPAGSK (SEQ ID NO:9);

   IGLHDPSHGTLP(Aib)GS (SEQ ID NO:10);

   IGLHDPSHGTLP(N-methyl-L-Ala)GS (SEQ ID NO:11);

   Ac-IGLHDPSHGTLPAGS (SEQ ID NO:12);

   (D-Ile)GLHDPSHGTLPAGS (SEQ ID NO:13);

   (L-NorVal)GLHDPSHGTLPAGS (SEQ ID NO:14);

   (L-NorLeu)GLHDPSHGTLPAGS (SEQ ID NO:15);

   IGLHDPSHGTLPAG-NH2 (SEQ ID NO:28);

   Ac-IGLHDPSHGTLPAGS-NH2 (SEQ ID NO:29);

   Ac-IGLHDPSHGTLPAG-NH2 (SEQ ID NO:30);

   IGLHDPSHGTLPAGS-NH2 (SEQ ID NO:41);

   IGLHDPSHGTLPAGSC (SEQ ID NO:42);

   Ac-IGLHDPSHGTLPAGSC (SEQ ID NO:43);
IGLHDPSHGTLPGSC-NH2 (SEQ ID NO:44);

Ac-IGLHDPSHGTLPGSC-NH2 (SEQ ID NO:45);

IGLHDPSHGTLPGC (SEQ ID NO:46);

Ac-IGLHDPSHGTLPGC (SEQ ID NO:47);

IGLHDPSHGTLPGC-NH2 (SEQ ID NO:48); and

Ac-IGLHDPSHGTLPGC-NH2 (SEQ ID NO:49).

3. The peptide or analog thereof of any one of claims 1 or 2, wherein the peptide or analog thereof consists of:

IGLHDPSHGTLPGS (SEQ ID NO:7);

IGLHDPSHGTLPG (SEQ ID NO:73);

IGLHDPSHGTLPGSK (SEQ ID NO:9);

IGLHDPSHGTLP(Aib)GS (SEQ ID NO:10);

IGLHDPSHGTLP(N-methyl-L-Ala)GS (SEQ ID NO:11);

Ac-IGLHDPSHGTLPGS (SEQ ID NO:12);

(D-Ile)GLHDPSHGTLPGS (SEQ ID NO:13);

(L-NorVal)GLHDPSHGTLPGS (SEQ ID NO:14);

(L-NorLeu)GLHDPSHGTLPGS (SEQ ID NO:15);

IGLHDPSHGTLPG-NH2 (SEQ ID NO:28);

Ac-IGLHDPSHGTLPGS-NH2 (SEQ ID NO:29);

Ac-IGLHDPSHGTLPG-NH2 (SEQ ID NO:30);

IGLHDPSHGTLPGS-NH2 (SEQ ID NO:41);

IGLHDPSHGTLPGSC (SEQ ID NO:42);
Ac-IGLHDPSHGTLPAGSC (SEQ ID NO:43);

IGLHDPSHGTLPAGSC-NH2 (SEQ ID NO:44);

Ac-IGLHDPSHGTLPAGSC-NH2 (SEQ ID NO:45);

IGLHDPSHGTLPAGC (SEQ ID NO:46);

Ac-IGLHDPSHGTLPAGC (SEQ ID NO:47);

IGLHDPSHGTLPAGC-NH2 (SEQ ID NO:48); or

Ac-IGLHDPSHGTLPAGC-NH2 (SEQ ID NO:49).

4. A peptide or analog thereof comprising the sequence:

IGLHDPTQGTEPAGE (SEQ ID NO:50).

5. The peptide or analog of claim 4, wherein the peptide or analog comprises a peptide or analog selected from:

IGLHDPTQGTEPAGE (SEQ ID NO:50);

IGLHDPTQGTEP(Aib)GE (SEQ ID NO:51);

Ac-IGLHDPTQGTEPAGE (SEQ ID NO:52);

(D-Ile)GLHDPTQGTEPAGE (SEQ ID NO:53);

Ac-IGLHDPTQGTEPAG-NH2 (SEQ ID NO:60);

Ac-IGLHD PTQGT EPAGE-NH2 (SEQ ID NO:62);

IGLHDPTQGTEPAGE-NH2 (SEQ ID NO:68);

IGLHDPTQGTEPAGC (SEQ ID NO:69);

Ac-IGLHDPTQGTEPAGC (SEQ ID NO:70);

IGLHDPTQGTEPAGC-NH2 (SEQ ID NO:71); and

Ac-IGLHD PTQGT EPAGC-NH2 (SEQ ID NO:72).
6. The peptide or analog thereof of any one of claims claim 4 or 5, wherein the peptide or analog thereof consists of:

IGLHDPTQGTEPAG (SEQ ID NO:50);
IGLHDPTQGTEP(Aib)GE (SEQ ID NO:51);
Ac-IGLHDPTQGTEPAG (SEQ ID NO:52);
(D-Ile)GLHDPTQGTEPAG (SEQ ID NO:53);
Ac-IGLHDPTQGTEPAG-NH2 (SEQ ID NO:60);
Ac-IGLHD PTQGT EPAGE-NH2 (SEQ ID NO:62);
IGLHDPTQGTEPAG-NH2 (SEQ ID NO:68);
IGLHDPTQGTEPAGC (SEQ ID NO.69);
Ac-IGLHDPTQGTEPAGC (SEQ ID NO:70);
IGLHDPTQGTEPAGC-NH2 (SEQ ID NO:71); or
Ac-IGLHDPTQGTEPAGC-NH2 (SEQ ID NO:72).

7. A peptide or analog thereof comprising a peptide or analog selected from the group consisting of:

Ac-IGLHDPSHGTLPNGS (SEQ ID NO:16);
(D-Ile)GLHDPSHGTLPNGS (SEQ ID NO:17);
Ac-IGLHD PSHT LPNGS-NH2 (SEQ ID NO:31);
IGLHDPSHGTLPNGS-NH2 (SEQ ID NO:32);
IGLHDPSHGTLPNGSC (SEQ ID NO:33);
Ac-IGLHDPSHGTLPNGSC (SEQ ID NO:34);
IGLHDPSHGTLPNGSC-NH2 (SEQ ID NO:35);
Ac-IGLHDPSHGTLPNGC-NH2 (SEQ ID NO:36);

IGLHDPSHGTLPNGC (SEQ ID NO:37);

Ac-IGLHDPSHGTLPNGC (SEQ ID NO:38);

IGLHDPSHGTLPNGC-NH2 (SEQ ID NO:39);

Ac-IGLHDPSHGTLPNGC-NH2 (SEQ ID NO:40);

IGLHDPSHGTLPNG (SEQ ID NO:74);

Ac-IGLHDPSHGTLPNG (75);

IGLHDPSHGTLPNG-NH2 (76); and

Ac-IGLHDPSHGTLPNG-NH2 (77).

8. The peptide or analog of claim 7, wherein the peptide or analog thereof consists of:

Ac-IGLHDPSHGTLPNGS (SEQ ID NO:16);

(D-Ile)GLHDPSHGTLPNGS (SEQ ID NO:17);

Ac-IGLHDPSHGTLPNGS-NH2 (SEQ ID NO:31);

IGLHDPSHGTLPNGS-NH2 (SEQ ID NO:32);

IGLHDPSHGTLPNGSC (SEQ ID NO:33);

Ac-IGLHDPSHGTLPNGSC (SEQ ID NO:34);

IGLHDPSHGTLPNGSC-NH2 (SEQ ID NO:35);

Ac-IGLHDPSHGTLPNGSC-NH2 (SEQ ID NO:36);

IGLHDPSHGTLPNGC (SEQ ID NO:37);

Ac-IGLHDPSHGTLPNGC (SEQ ID NO:38);

IGLHDPSHGTLPNGC-NH2 (SEQ ID NO:39);
Ac-IGLHDPSHGTLPNGC-NH2 (SEQ ID NO:40);

IGLHDPSHGTLPNG (SEQ ID NO:74);

Ac-IGLHDPSHGTLPNG (75);

IGLHDPSHGTLPNG-NH2 (76); or

Ac-IGLHDPSHGTLPNG-NH2 (77).

9. A peptide or analog thereof comprising a peptide or analog selected from the group consisting of:

Ac-IGLHDPTQGTEPNGE (SEQ ID NO:54);

(D-Ile)GLHDPTQGTEPNGE (SEQ ID NO:55);

Ac-IGLHDPTQGTEPNGE-NH2 (SEQ ID NO:61);

IGLHDPTQGTEPNGE-NH2 (SEQ ID NO:63);

IGLHDPTQGTEPNGC (SEQ ID NO:64);

Ac-IGLHDPTQGTEPNGC (SEQ ID NO:65);

IGLHDPTQGTEPNGC-NH2 (SEQ ID NO:66); and

Ac-IGLHDPTQGTEPNGC-NH2 (SEQ ID NO:67).

10. The peptide or analog of claim 1D, wherein the peptide or analog thereof consists of:

Ac-IGLHDPTQGTEPNGE (SEQ ID NO:54);

(D-Ile)GLHDPTQGTEPNGE (SEQ ID NO:55);

Ac-IGLHDPTQGTEPNGE-NH2 (SEQ ID NO:61);

IGLHDPTQGTEPNGE-NH2 (SEQ ID NO:63);

IGLHDPTQGTEPNGC (SEQ ID NO:64);
Ac-IGLHDPTQGTEPNGC (SEQ ID NO:65);

IGLHDPTQGTEPNGC-NH2 (SEQ ID NO:66); or

Ac-IGLHDPTQGTEPNGC-NH2 (SEQ ID NO:67).

11. A peptide or analog thereof comprising a sequence selected from the group consisting of:

IGLHAPSHGTLPNGS (SEQ ID NO:6);
IGLHAPSHGTLPAGS (SEQ ID NO:8);
IGLHDPSHGTEPNGS (SEQ ID NO:18);
IGLHDPSQGTLPNGS (SEQ ID NO:19);
IGLHDPTHGTLPNGS (SEQ ID NO:20);
IGLHDPSHGTLPNGE (SEQ ID NO:21);
IGLHDPSHGTLPNGK (SEQ ID NO:22);
IGLHDPSHGTLPGK (SEQ ID NO:23);
IGLHDPSHGTEPAGS (SEQ ID NO:24);
IGLHDPSQGTLPGS (SEQ ID NO:25);
IGLHDPTHGTLPAGS (SEQ ID NO:26);
IGLHDPSHGTLPAGE (SEQ ID NO:27);
IGLHDPTQGTEPNGS (SEQ ID NO:56);
IGLHDPTQGTEPAGS (SEQ ID NO:57);
IGLHDPTQGTLPNGE (SEQ ID NO:58); and
IGLHDPTQGTLPAGE (SEQ ID NO:59).
12. The peptide or analog of claim 11, wherein the peptide or analog thereof comprises a peptide or analog selected from:

IGLHAPSHGTLPNGS (SEQ ID NO:6);
IGLHAPSHGTLPAGS (SEQ ID NO:8);
IGLHDPSHGTEPNGS (SEQ ID NO:18);
IGLHDPSQGTLPNGS (SEQ ID NO:19);
IGLHDPTHGTLPNGS (SEQ ID NO:20);
IGLHDPSHGTLPGNE (SEQ ID NO:21);
IGLHDPSHGTLPNGK (SEQ ID NO:22);
IGLHDPSHGTLPAKG (SEQ ID NO:23);
IGLHDPSHGTEPAGS (SEQ ID NO:24);
IGLHDPSQGTLPAGS (SEQ ID NO:25);
IGLHDPTHGTLPGAS (SEQ ID NO:26);
IGLHDPSHGTLPAEG (SEQ ID NO:27);
IGLHDPTQGTEPNGS (SEQ ID NO:56);
IGLHDPTQGTEPAGS (SEQ ID NO:57);
IGLHDPTQGTLPNGE (SEQ ID NO:58); and
IGLHDPTQGTLPAEG (SEQ ID NO:59).

13. The peptide or analog thereof of any one of claims 11 or 12, wherein the peptide or analog thereof consists of:

IGLHAPSHGTLPNGS (SEQ ID NO:6);
IGLHAPSHGTLPAGS (SEQ ID NO:8);
14. The peptide or analog of any one of claims 1, 2, 4, 5, 7, 9, 11 or 12, wherein the peptide or analog thereof comprises a modification.

15. The peptide or analog of claim 14, wherein the modification is selected from an acetylated N-terminus, an amidated C-terminus, a D amino acid, a modified amino acid, a fatty acid modification, or a combination thereof.

16. The peptide or analog of any one of claims 1, 2, 4, 5, 7, 9, 11 or 12, wherein the peptide or analog thereof has a length of 20 amino acids or less.

17. A composition comprising the peptide or analog of any one of claims 1-16.
18. The composition of claim 17, further comprising a pharmaceutically acceptable carrier.

19. The composition of claim 17 or 18 for treating impaired pancreatic function, treating a metabolic disease, promoting neuroprotection or nerve regeneration, promoting liver regeneration or inhibiting inflammation.

20. A method for ameliorating a sign or symptom associated with impaired pancreatic function comprising administering the peptide or analog of any one of claims 1-16.

21. The method of claim 20, wherein the impaired pancreatic function is type 1 diabetes, type 2 diabetes, latent autoimmune diabetes in adults (LADA), impaired fasting glucose, impaired glucose tolerance, insulin deficiency, fasting hyperinsulinemia, insulin resistance, or impaired fasting insulin level, or a combination thereof.

22. The method of claim 20 or 21, wherein an anti-diabetic drug is administered.

23. A method for stimulating pancreatic islet cell growth, comprising contacting a pancreatic islet cell in vitro with the peptide or analog of any one of claims 1-16, whereby proliferation of the pancreatic islet cell is stimulated.

24. A method of producing a population of pancreatic islet cells, comprising contacting one or more pancreatic islet cells in vitro with the peptide or analog of any one of claims 1-16, whereby proliferation of the one or more pancreatic islet cells are stimulated and a population of pancreatic islet cells is produced.

25. The method of claim 24, wherein the one or more pancreatic islet cells are obtained from a subject.

26. The method of claim 24 or 25, further comprising the step of transplanting the population of pancreatic islet cells into a subject.

27. The method of claim 26, wherein the one or more pancreatic cells are obtained from the subject into which the population of pancreatic islet cells is to be transplanted.

28. A method for increasing the number of pancreatic islet cells in a subject comprising administering the peptide or analog of any one of claims 1-16.
29. A method for ameliorating a sign or symptom associated with a metabolic disease in a subject comprising administering the peptide of any one of claims 1-16.

30. The method of claim 29, wherein the metabolic disease is diabetes, pre-diabetes or metabolic syndrome.

31. A method of reducing in a diabetic subject impaired glucose tolerance, blood glucose, fasting blood glucose, postprandial blood glucose, insulin deficiency, fasting hyperinsulinemia, insulin resistance, impaired fasting insulin levels, glycosylated hemoglobin (HbA1c), arginine-stimulated C-peptide (AUC), or a combination thereof, by administering a peptide or analog of any one of claims 1-16 to the subject.

32. A method for promoting neuroprotection or nerve regeneration, comprising contacting a nerve cell with the peptide or analog of any one of claims 1-16.

33. A method for promoting liver regeneration, comprising contacting a liver cell with the peptide or analog of any one of claims 1-16.

34. The method of claim 32 or 33, wherein the contacting occurs in vitro.

35. The method of claim 32 or 33, wherein the contacting occurs in vivo.

36. A method for inhibiting inflammation, comprising administering the peptide or analog of any one of claims 1-16.

37. Use of a peptide or analog thereof of any one of claims 1-16 for preparation of a medicament for treating impaired pancreatic function, treating a metabolic disease, promoting neuroprotection or nerve regeneration, promoting liver regeneration or inhibiting inflammation in a subject.

38. The use of claim 37, wherein the impaired pancreatic function is type 1 diabetes, type 2 diabetes, latent autoimmune diabetes in adults (LADA), impaired fasting glucose, impaired glucose tolerance, insulin deficiency, fasting hyperinsulinemia, insulin resistance, or impaired fasting insulin level, or a combination thereof.

39. The use of claim 37, wherein the metabolic disease is diabetes, pre-diabetes or metabolic syndrome.
AMENDED CLAIMS
received by the International Bureau on 17 January 2014 (17.01.2014)

1. A peptide or analog thereof comprising a sequence selected from the group consisting of:

IGLHDPSHGTLPAGS (SEQ ID NO:7); and

IGLHDPSHGTLPAG (SEQ ID NO:73).

2. The peptide or analog of claim 1, wherein the peptide or analog comprises a peptide or analog selected from:

IGLHDPSHGTLPAGS (SEQ ID NO:7);

IGLHDPSHGTLPAG (SEQ ID NO:73);

IGLHDPSHGTLPAGSK (SEQ ID NO:9);

IGLHDPSHGTLP(Aib)GS (SEQ ID NO:10);

IGLHDPSHGTLP(N-methyl-L-Ala)GS (SEQ ID NO:11);

Ac-IGLHDPSHGTLPAGS (SEQ ID NO:12);

(D-Ile)GLHDPSHGTLPAGS (SEQ ID NO:13);

(L-NorVal)GLHDPSHGTLPAGS (SEQ ID NO:14);

(L-NorLeu)GLHDPSHGTLPAGS (SEQ ID NO:15);

IGLHDPSHGTLPAG-NH2 (SEQ ID NO:28);

Ac-IGLHDPSHGTLPAGS-NH2 (SEQ ID NO:29);

Ac-IGLHDPSHGTLPAG-NH2 (SEQ ID NO:30);

IGLHDPSHGTLPAGS-NH2 (SEQ ID NO:41);

IGLHDPSHGTLPAGSC (SEQ ID NO:42);

Ac-IGLHDPSHGTLPAGSC (SEQ ID NO:43);
IGLHDPSHGTLPAGSC-NH₂ (SEQ ID NO:44);
Ac-IGLHDPSHGTLPAGSC-NH₂ (SEQ ID NO:45);
IGLHDPSHGTLPAGC (SEQ ID NO:46);
Ac-IGLHDPSHGTLPAGC (SEQ ID NO:47);
IGLHDPSHGTLPAGC-NH₂ (SEQ ID NO:48); and
Ac-IGLHDPSHGTLPAGC-NH₂ (SEQ ID NO:49).

3. The peptide or analog thereof of any one of claims 1 or 2, wherein the peptide or analog thereof consists of:
IGLHDPSHGTLPGS (SEQ ID NO:7);
IGLHDPSHGTLPG (SEQ ID NO:73);
IGLHDPSHGTLPGSK (SEQ ID NO:9);
IGLHDPSHGTLPG(Aib)GS (SEQ ID NO:10);
IGLHDPSHGTLPG(N-methyl-L-Ala)GS (SEQ ID NO:11);
Ac-IGLHDPSHGTLPGS (SEQ ID NO:12);
(D-Ile)GLHDPSHGTLPGS (SEQ ID NO:13);
(L-NorVal)GLHDPSHGTLPGS (SEQ ID NO:14);
(L-NorLeu)GLHDPSHGTLPGS (SEQ ID NO:15);
IGLHDPSHGTLPG-NH₂ (SEQ ID NO:28);
Ac-IGLHDPSHGTLPGS-NH₂ (SEQ ID NO:29);
Ac-IGLHDPSHGTLPG-NH₂ (SEQ ID NO:30);
IGLHDPSHGTLPGS-NH₂ (SEQ ID NO:41);
IGLHDPSHGTLPGSC (SEQ ID NO:42).
Ac-IGLHDPSHGTLPGSC (SEQ ID NO:43);
IGLHDPSHGTLPGSC-NH2 (SEQ ID NO:44);
Ac-IGLHDPSHGTLPGSC-NH2 (SEQ ID NO:45);
IGLHDPSHGTLPGC (SEQ ID NO:46);
Ac-IGLHDPSHGTLPGC (SEQ ID NO:47);
IGLHDPSHGTLPGC-NH2 (SEQ ID NO:48); or
Ac-IGLHDPSHGTLPGC-NH2 (SEQ ID NO:49).

4. A peptide or analog thereof comprising the sequence:

IGLHDPTQGTEPAGE (SEQ ID NO:50).

5. The peptide or analog of claim 4, wherein the peptide or analog comprises a peptide or analog selected from:

IGLHDPTQGTEPAGE (SEQ ID NO:50);
IGLHDPTQGTEP(Aib)GE (SEQ ID NO:51);
Ac-IGLHDPTQGTEPAGE (SEQ ID NO:52);
(D-Ile)GLHDPTQGTEPAGE (SEQ ID NO:53);
Ac-IGLHDPTQGTEPAG-NH2 (SEQ ID NO:60);
Ac-IGLHD PTQGT EPAGE-NH2 (SEQ ID NO:62);
IGLHDPTQGTEPAGE-NH2 (SEQ ID NO:68);
IGLHDPTQGTEPAGC (SEQ ID NO:69);
Ac-IGLHDPTQGTEPAGC (SEQ ID NO:70);
IGLHDPTQGTEPAGC-NH2 (SEQ ID NO:71); and
Ac-IGLHD PTQGT EPAGC-NH2 (SEQ ID NO:72).
6. The peptide or analog thereof of any one of claims claim 4 or 5, wherein the peptide or analog thereof consists of:

   IGLHDPTQGTEPAG (SEQ ID NO:50);
   IGLHDPTQGTEP(Aib)GE (SEQ ID NO:51);
   Ac-IGLHDPTQGTEPAG (SEQ ID NO:52);
   (D-Ile)GLHDPTQGTEPAG (SEQ ID NO:53);
   Ac-IGLHDPTQGTEPAG-NH2 (SEQ ID NO:60);
   Ac-IGLHD PTQGT EPAGE-NH2 (SEQ ID NO:62);
   IGLHDPTQGTEPAG-NH2 (SEQ ID NO:68);
   IGLHDPTQGTEPAGC (SEQ ID NO:69);
   Ac-IGLHDPTQGTEPAGC (SEQ ID NO:70);
   IGLHDPTQGTEPAGC-NH2 (SEQ ID NO:71); or
   Ac-IGLHDPTQGTEPAGC-NH2 (SEQ ID NO:72).

7. A peptide or analog thereof comprising a peptide or analog selected from the group consisting of:

   Ac-IGLHDPSHGTLPNGS (SEQ ID NO:16);
   (D-Ile)GLHDPSHGTLPNGS (SEQ ID NO:17);
   Ac-IGLHD PSHT LPNGS-NH2 (SEQ ID NO:31);
   IGLHDPSHGTLPNGS-NH2 (SEQ ID NO:32);
   IGLHDPSHGTLPNGSC (SEQ ID NO:33);
   Ac-IGLHDPSHGTLPNGSC (SEQ ID NO:34);
   IGLHDPSHGTLPNGSC-NH2 (SEQ ID NO:35);
Ac-IGLHDPSHGTLPNGSC-NH2 (SEQ ID NO:36);
IGLHDPSHGTLPNGC (SEQ ID NO:37);
Ac-IGLHDPSHGTLPNGC (SEQ ID NO:38);
IGLHDPSHGTLPNGC-NH2 (SEQ ID NO:39);
Ac-IGLHDPSHGTLPNGC-NH2 (SEQ ID NO:40);
IGLHDPSHGTLPNG (SEQ ID NO:74);
Ac-IGLHDPSHGTLPNG (75);
IGLHDPSHGTLPNG-NH2 (76); and
Ac-IGLHDPSHGTLPNG-NH2 (77).

8. The peptide or analog of claim 7, wherein the peptide or analog thereof consists of:

Ac-IGLHDPSHGTLPNGS (SEQ ID NO:16);
(D-Ile)GHDPSHGTLPNGS (SEQ ID NO:17);
Ac-IGLHDPSHGTLPNGS-NH2 (SEQ ID NO:31);
IGLHDPSHGTLPNGS-NH2 (SEQ ID NO:32);
IGLHDPSHGTLPNGSC (SEQ ID NO:33);
Ac-IGLHDPSHGTLPNGSC (SEQ ID NO:34);
IGLHDPSHGTLPNGSC-NH2 (SEQ ID NO:35);
Ac-IGLHDPSHGTLPNGSC-NH2 (SEQ ID NO:36);
IGLHDPSHGTLPNGC (SEQ ID NO:37);
Ac-IGLHDPSHGTLPNGC (SEQ ID NO:38);
IGLHDPSHGTLPNGC-NH2 (SEQ ID NO:39);
Ac-IGLHDPSHGTLPNGC-NH2 (SEQ ID NO:40);
IGLHDPSHGTLPNG (SEQ ID NO:74);
Ac-IGLHDPSHGTLPNG (75);
IGLHDPSHGTLPNG-NH2 (76); or
Ac-IGLHDPSHGTLPNG-NH2 (77).

9. A peptide or analog thereof comprising a peptide or analog selected from the group consisting of:

Ac-IGLHDPTEQGTEPNGE (SEQ ID NO:54);
(D-Ile)GLHDPTEQGTEPNGE (SEQ ID NO:55);
Ac-IGLHDPTEQGTEPNGE-NH2 (SEQ ID NO:61);
IGLHDPTQGTEPNGE-NH2 (SEQ ID NO:63);
IGLHDPTQGTEPNGC (SEQ ID NO:64);
Ac-IGLHDPTQGTEPNGC (SEQ ID NO:65);
IGLHDPTQGTEPNGC-NH2 (SEQ ID NO:66); and
Ac-IGLHDPTQGTEPNGC-NH2 (SEQ ID NO:67).

10. The peptide or analog of claim 9, wherein the peptide or analog thereof consists of:

Ac-IGLHDPTQGTEPNGE (SEQ ID NO:54);
(D-Ile)GLHDPTEQGTEPNGE (SEQ ID NO:55);
Ac-IGLHDPTQGTEPNGE-NH2 (SEQ ID NO:61);
IGLHDPTQGTEPNGE-NH2 (SEQ ID NO:63);
IGLHDPTQGTEPNGC (SEQ ID NO:64),
Ac-IGLHDPTQGTEPNGC (SEQ ID NO:65);
IGLHDPTQGTEPNGC-NH2 (SEQ ID NO:66); or
Ac-IGLHDPTQGTEPNGC-NH2 (SEQ ID NO:67).

11. A peptide or analog thereof comprising a sequence selected from the group consisting of:

  IGLHAPSHGTLPNGS (SEQ ID NO:6);
  IGLHAPSHGTLPAGS (SEQ ID NO:8);
  IGLHDPSHGTEPNSG (SEQ ID NO:18);
  IGLHDPSQGTLPNGS (SEQ ID NO:19);
  IGLHDPTGHTLPNGS (SEQ ID NO:20);
  IGLHDPSTGTLPNGE (SEQ ID NO:21);
  IGLHDPSHGTLPNGK (SEQ ID NO:22);
  IGLHDPSHGTLPAGK (SEQ ID NO:23);
  IGLHDPSHGTPEG (SEQ ID NO:24);
  IGLHDPSQGTLPAGS (SEQ ID NO:25);
  IGLHDPTHGTLPAGS (SEQ ID NO:26);
  IGLHDPSHGTLPAG (SEQ ID NO:27);
  IGLHDPTQGTEPNSG (SEQ ID NO:56);
  IGLHDPTQGTEPAGS (SEQ ID NO:57);
  IGLHDPTQGTLPNGE (SEQ ID NO:58); and
  IGLHDPTQGTLPAGE (SEQ ID NO:59).
12. The peptide or analog of claim 11, wherein comprises a peptide or analog selected from:

IGLHAPSHGTLPNGS (SEQ ID NO:6);
IGLHAPSHGTLPGS (SEQ ID NO:8);
IGLHDPSHGTEPNGS (SEQ ID NO:18);
IGLHDPSQGTLPNGS (SEQ ID NO:19);
IGLHDPTHGTLPNGS (SEQ ID NO:20);
IGLHDPSHGTLPNGE (SEQ ID NO:21);
IGLHDPSHGTLPNGK (SEQ ID NO:22);
IGLHDPSHGTLPGK (SEQ ID NO:23);
IGLHDPSHGTEPGS (SEQ ID NO:24);
IGLHDPSQGTLPGS (SEQ ID NO:25);
IGLHDPTHGTLPGS (SEQ ID NO:26);
IGLHDPSHGTLPAGE (SEQ ID NO:27);
IGLHDPTQGTEPNGS (SEQ ID NO:56);
IGLHDPTQGTEPGS (SEQ ID NO:57);
IGLHDPTQGTLPNGE (SEQ ID NO:58); and
IGLHDPTQGTLPAGE (SEQ ID NO:59).

13. The peptide or analog thereof of any one of claims 11 or 12, wherein the peptide or analog thereof consists of:

IGLHAPSHGTLPNGS (SEQ ID NO:6);
IGLHAPSHGTLPGS (SEQ ID NO:8);
14. The peptide or analog of any one of claims 1, 2, 4, 5, 7, 9, 11 or 12, wherein the peptide or analog thereof comprises a modification.

15. The peptide or analog of claim 14, wherein the modification is selected from an acetylated N-terminus, an amidated C-terminus, a D amino acid, a modified amino acid, a fatty acid modification, or a combination thereof.

16. The peptide or analog of any one of claims 1, 2, 4, 5, 7, 9, 11 or 12, wherein the peptide or analog thereof has a length of 20 amino acids or less.

17. A composition comprising the peptide or analog of any one of claims 1-16.
18. The composition of claim 17, further comprising a pharmaceutically acceptable carrier.

19. The composition of claim 17 or 18 for treating impaired pancreatic function, treating a metabolic disease, promoting neuroprotection or nerve regeneration, promoting liver regeneration or inhibiting inflammation.

20. A method for ameliorating a sign or symptom associated with impaired pancreatic function comprising administering the peptide or analog of any one of claims 1-16.

21. The method of claim 20, wherein the impaired pancreatic function is type 1 diabetes, type 2 diabetes, latent autoimmune diabetes in adults (LADA), impaired fasting glucose, impaired glucose tolerance, insulin deficiency, fasting hyperinsulinemia, insulin resistance, or impaired fasting insulin level, or a combination thereof.

22. The method of claim 20 or 21, wherein an anti-diabetic drug is administered.

23. A method for stimulating pancreatic islet cell growth, comprising contacting a pancreatic islet cell in vitro with the peptide or analog of any one of claims 1-16, whereby proliferation of the pancreatic islet cell is stimulated.

24. A method of producing a population of pancreatic islet cells, comprising contacting one or more pancreatic islet cells in vitro with the peptide or analog of any one of claims 1-16, whereby proliferation of the one or more pancreatic islet cells are stimulated and a population of pancreatic islet cells is produced.

25. The method of claim 24, wherein the one or more pancreatic islet cells are obtained from a subject.

26. The method of claim 24 or 25, further comprising the step of transplanting the population of pancreatic islet cells into a subject.

27. The method of claim 26, wherein the one or more pancreatic cells are obtained from the subject into which the population of pancreatic islet cells is to be transplanted.

28. A method for increasing the number of pancreatic islet cells in a subject comprising administering the peptide or analog of any one of claims 1-16.
29. A method for ameliorating a sign or symptom associated with a metabolic disease in a subject comprising administering the peptide of any one of claims 1-16.

30. The method of claim 29, wherein the metabolic disease is diabetes, pre-diabetes or metabolic syndrome.

31. A method of reducing in a diabetic subject impaired glucose tolerance, blood glucose, fasting blood glucose, postprandial blood glucose, insulin deficiency, fasting hyperinsulinemia, insulin resistance, impaired fasting insulin levels, glycosylated hemoglobin (HbA1c), arginine-stimulated C-peptide (AUC), or a combination thereof, by administering a peptide or analog of any one of claims 1-16 to the subject.

32. A method for promoting neuroprotection or nerve regeneration, comprising contacting a nerve cell with the peptide or analog of any one of claims 1-16.

33. A method for promoting liver regeneration, comprising contacting a liver cell with the peptide or analog of any one of claims 1-16.

34. The method of claim 32 or 33, wherein the contacting occurs in vitro.

35. The method of claim 32 or 33, wherein the contacting occurs in vivo.

36. A method for inhibiting inflammation, comprising administering the peptide or analog of any one of claims 1-16.

37. Use of a peptide or analog thereof of any one of claims 1-16 for preparation of a medicament for treating impaired pancreatic function, treating a metabolic disease, promoting neuroprotection or nerve regeneration, promoting liver regeneration or inhibiting inflammation in a subject.

38. The use of claim 37, wherein the impaired pancreatic function is type 1 diabetes, type 2 diabetes, latent autoimmune diabetes in adults (LADA), impaired fasting glucose, impaired glucose tolerance, insulin deficiency, fasting hyperinsulinemia, insulin resistance, or impaired fasting insulin level, or a combination thereof.

39. The use of claim 37, wherein the metabolic disease is diabetes, pre-diabetes or metabolic syndrome.

# INTERNATIONAL SEARCH REPORT

## A. CLASSIFICATION OF SUBJECT MATTER

See the extra sheet

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC: C07K 7/2; A61K 38/2; A61P 3/2

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

WPI, EPDOC, CNKI, CNPAT, PubMed, ISI Web of Knowledge, Google, NCBI GenBank, EBI-EMBL: peptide, INGAP, Ile-Gly-Leu-His-Asp-Pro-Ser-His-Gly-Thr-Leu-Pro-Ala-Gly-Ser, IGLHDPSHGTLPAGS, IGLHDPSHGTLP, pancreatic, diabetes, glucose, stability

* Special categories of cited documents:

- “A” document defining the general state of the art which is not considered to be of particular relevance
- “E” earlier application or patent but published on or after the international filing date
- “L” document which may throw doubts on priority claim (S) or which is cited to establish the publication date of another citation or other special reason (as specified)
- “O” document referring to an oral disclosure, use, exhibition or other means
- “P” document published prior to the international filing date but later than the priority date claimed

- “T” later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- “X” document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- “Y” document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
- “&” document member of the same patent family

### INTERNATIONAL SEARCH REPORT

**Box No. II  Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)**

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. **X** Claims Nos.: 20-22, 28-33, 35, 36
   - because they relate to subject matter not required to be searched by this Authority, namely:
     
     The subject matter of claims 20-22, 28-33, 35, 36 relates to methods of treatment for diseases, and therefore does not warrant an international search according to the criteria set out in Rule 39.1(iv). However, the search has been carried out and based on the use of the peptide or analog comprising a sequence SEQ ID NO: 7 for manufacturing of a medicament.

2. **☐** Claims Nos.:
   - because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. **☐** Claims Nos.:
   - because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box No. III  Observations where unity of invention is lacking (Continuation of item 3 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

- See the extra sheet.

1. **☐** As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. **☐** As all searchable claims could be searched without effort justifying an additional fees, this Authority did not invite payment of additional fee.

3. **☐** As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. **X** No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.: 1-3 (in part: SEQ ID NO: 7), 14-39 (in part: SEQ ID NO: 7)

**Remark on protest**

- **☐** The additional search fees were accompanied by the applicant’s protest and, where applicable, the payment of a protest fee.

- **☐** The additional search fees were accompanied by the applicant’s protest but the applicable protest fee was not paid within the time limit specified in the invitation.

- **☐** No protest accompanied the payment of additional search fees.

Form PCT/ISA/210 (continuation of first sheet (2)) (July 2009)
INTERNATIONAL SEARCH REPORT

Continuation of: Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

D1: WO2009/029847A1 (CUREDM, INC) 5 March 2009 (05.03.2009)

D2: CN102827253A (SHANGHAI FIRST PEOPLE'S HOSPITAL) 19 December 2012 (19.12.2012)

This Authority considers that there are 72 inventions covered by the claims indicated as follows:

In claims 1-16, there are 72 different sequences, which are SEQ ID NO: 6-77, so there are 72 inventions covered by the claims.

Claims 1-3, 7-8 direct to the peptide or analogy thereof comprising a sequence selected from the group of SEQ ID NO: 7, 73, 9-17, 28-40, 41-49, 74-77. Since the above-mentioned 37 sequences are involved, claims 1-3, 7-8 cover 37 inventions. Each invention relates to a sequence. The same or corresponding technical features among the inventions above are as follows: the peptide comprising GLHDPSHGTLP. However, the document D1 discloses the peptide comprising GLHDPSHGTLP (SEQ ID NO: 26) (see paragraph [0082], claim 10).

Claims 4-6, 9-10 direct to the peptide comprising a sequence selected from the group of SEQ ID NO: 50-55, 60-72. Since the above-mentioned 19 sequences are involved, claims 4-6, 9-10 cover 19 inventions. Each invention relates to a sequence. The same or corresponding technical features among the inventions above are as follows: the peptide comprising IGLHDPTQGTEP. However, the document D2 discloses the peptide comprising IGLHDPTQGTEP (see page 15, table 2, SEQUENCE LISTING, SEQ ID NO: 1).

Claims 11-13 direct to the peptide or analogy thereof comprising a sequence selected from the group of SEQ ID NO: 6, 8, 18-27, 56-59. Since the above-mentioned 16 sequences are involved, claims 11-13 cover 16 inventions. The same or corresponding technical features among the inventions above are as follows: the peptide comprising IGLHDXNGTXGPXG (X is any kind of amino acid). However, the document D1 discloses the peptide comprising IGLHDXNGTXGPXG (see page 15, SEQ ID NO: 84).

Meanwhile, the same or corresponding technical features among claims 1-13 are as follows: the peptide comprising GLHDXNGTXGPXG (X is any kind of amino acid). However, the document D1 or D2 discloses the peptide comprising IGLHDXNGTXGPXG (see D1 SEQ ID NO: 26 and 84, D2 SEQ ID NO: 1).

The additional feature of the dependent claims 14-16 is well known in the art. Claims 17-19 direct to a composition comprising the peptide or analog of any one of claims 1-16. However, a composition comprising the peptide or analog is well known in the art. Claims 20-39 direct to a method of treatment of the human body by therapy using the peptide or analog of any one of claims 1-16. However, treating of the human body using the bioactive peptide is well known in the art.

It follows that the same or corresponding technical features of claims above do not make a contribution over the prior art and can not be considered as special technical features within the meaning of Rule 13.2 PCT. The application, hence does not meet the requirement of unity of invention as defined in Rule 13.1 PCT.
