Abstract:

Title: PLATINUM CATALYZED HYDROSILYLATION REACTIONS UTILIZING CYCLODIENE ADDITIVES

A process for the hydroxylation of an unsaturated compound comprising reacting (a) a silyl hydride with (b) an unsaturated compound in the presence of (c) a platinum compound and (d) a cyclodiene, with the provisos that (i) when the unsaturated compound is a terminal alkyne, the silyl hydride is other than a halosilane, and (ii) when the platinum compound is a Pt(II)-based compound, the ratio of total moles of cyclodiene to moles of platinum is less than 3:1.
PLATINUM CATALYZED HYDROSILYLATION REACTIONS UTILIZING CYCLODIENE ADDITIVES

CROSS REFERENCE TO RELATED APPLICATIONS

The present application claims priority to and the benefit of U.S. Provisional Application No. 62/011,825 titled “Platinum Catalyzed Hydrosilylation Reactions Utilizing Cyclodiene Additives” filed on June 13, 2014, which is incorporated herein by reference in its entirety.

FIELD OF THE INVENTION

The present invention relates generally to the use of cyclodiene additives for improved catalyst performance in platinum catalyzed hydrosilylation reactions.

BACKGROUND

Hydrosilylation chemistry, involving the reaction between a silylhydride and an unsaturated organic group, is the basis for synthetic routes to produce commercial silicone products such as silicone surfactants, silicone fluids and organosilanes. Conventionally, hydrosilylation reactions have been catalyzed by precious metal catalysts, such as platinum or rhodium metal complexes.

Various precious metal complex catalysts are known in the art. For example, U.S. Patent No. 3,775,452 discloses a platinum complex containing unsaturated siloxanes as ligands. This type of catalyst is known as Karstedt’s catalyst. Other exemplary platinum-based hydrosilylation catalysts that have been described in the literature include Ashby’s catalyst as disclosed in U.S. Patent No. 3,159,601, Lamoreaux’s catalyst as disclosed in U.S. Patent No. 3,220,972, and Speier’s catalyst as disclosed in Speier, J.L., Webster J.A. and Barnes G.H., J. Am. Chem. Soc. 79, 974 (1957).

Although these precious metal compounds and complexes are widely employed commercially as catalysts for hydrosilylation reactions, they have several distinct disadvantages. One disadvantage of the current catalyst systems is the undesired color imparted to the final product. This yellow coloration or Pt precipitation in crude products often necessitates additional and costly purification steps. Another distinct disadvantage of the current systems is the progressive deactivation of the platinum catalysts during the course of the reaction which necessitates higher loadings of this costly metal. Yet another disadvantage encountered with Pt-catalyzed hydrosilylation of unsaturated and COH-terminated oligo- or polyethers is the
undesired reaction of SiH with the alcohol OH, which produces SiOC linkages that waste SiH groups, leave unreacted C=C bonds, and can cause performance problems.

Due to the high price of precious metals, catalysts derived from these platinum metals can constitute a significant proportion of the cost of organosilane and silicone products. Over the last two decades, global demand for precious metals, including platinum, has sharply increased, driving prices several hundred folds higher, thereby precipitating the need for effective, yet lower catalyst loadings. There is a need in the silicone industry for platinum catalysts of improved stability. This improved stability would enable the lowering of Pt catalyst loadings and decreasing cycle time in reactors and improving yield for many hydrosilylations.

The use of pre-formed Pt-COD complexes (COD = 1,5-cyclooctadiene) in hydrosilylation reactions has been previously reported, e.g., JP 54076530A, JP 54076529A, L. Lewis et al., Organometallics, 1991, 10, 3750-3759, and P. Pregosin et al., Organometallics, 1988, 7, 1373-1380. PtCODCl₂, PtCODMe₂, and PtCODPh₂ are commercially available and their use as catalysts for hydrosilylation has been known for many years. Roy et al. have reported the preparation of a series of PtCOD(SiR₃)₂ compounds from PtCODCl₂ (Roy, Aroop K.; Taylor, Richard B. J. Am Chem. Soc., 2012, 124, 9510-9524; and U.S. Patent No. 6,605,734). Notably, the preparation of these CODPtSi₂ complexes strictly requires the use of at least three equivalents of COD per equivalent of Pt, even when prepared in situ for hydrosilylation catalysis, as COD is lost to both hydrogenation and isomerization (1,4-COD and 1,3-COD) reactions. This critical stoichiometry of COD/Pt is delineated both in the above patent and the JACS publication. Further, the use of only one COD per Pt led to no identifiable COD-Pt species, as reported in the JACS publication.

The use of COD as an additive has been shown to reduce the amount of bis-silylated product in hydrosilylation of only alkynes with hydrochlorosilanes in U.S. Patent No. 5,563,287. Other cyclooctadiene complexes of platinum are also known and commercially available, such as (norbornadiene)PtCl₂ and (dicyclopentadiene)PtCl₂, but again, these latter diene complexes are not known to provide any particular benefit over catalysts such as Speier’s or Karstedt’s.

SUMMARY

The present invention describes the use of cyclooctadiene additives to stabilize the platinum catalysts in hydrosilylation reactions. It has been found that cyclooctadiene additives are suitable for use in hydrosilylation reactions with a variety of unsaturated compounds and silanes. The stabilization can be achieved using a relatively low amount of cyclooctadiene additive. The use of cyclooctadiene additives may also allow for decreasing the platinum loading in hydrosilylation reactions. It has now been surprisingly found that cyclooctadiene additives, such as cyclooctadienes,
can be used to stabilize platinum catalyst in hydrosilylation reactions. The stabilization can be observed, for example, by the ability to use lower platinum loadings in hydrosilylation reactions, improved color of the hydrosilylation products, and/or reduction of side reactions occurring during the process. The cyclodiene additives used may include 1,5-cyclooctadiene.

The present inventors have now unexpectedly discovered that the use of cyclodienes such as COD as additives, even at cyclodiene:Pt ratio as low as 1:1 and 2:1, and in conjunction with common Pt catalysts such as Speier’s or Karstedt’s helps stabilize active platinum catalysts in hydrosilylation reactions and leads to highly desirable catalysis improvements such as reduced level of Pt use, color reduction, reduction in by-products and shorter reaction time.

In one aspect, the present invention provides a process for the hydrosilylation of an unsaturated compound comprising reacting (a) a silyl hydride with (b) an unsaturated compound in the presence of (c) a platinum compound and (d) a cyclodiene, with the provisos that (i) when the unsaturated compound is a terminal alkyne, the silyl hydride is other than a halosilane, and (ii) when the platinum compound is a Pt(II)-based compound, the ratio of total moles of cyclodiene to moles of platinum is less than 3:1.

In an embodiment, the cyclodiene is chosen from a compound of the formula:

\[
\begin{align*}
R_1 & \quad R_2 \\
R_3 & \quad R_4 \\
R_5 & \quad R_6 \\
R_7 & \quad R_8
\end{align*}
\]

wherein \( R^1 - R^8, R^{1'} - R^{8'}, R^{1''} - R^{8''}, \) and \( R^{1'''} - R^{8'''} \) are independently hydrogen; an substituted or unsubstituted alkyl or aryl group optionally containing at least one heteroatom; an alkoxy; and a halogen radical; optionally \( R^1 - R^2 \) and/or \( R^5 - R^6 \) taken together may form a ring structure.

In one embodiment, the cyclodiene comprises 1,5-cyclooctadiene; 1,5-dimethyl-1,5-cyclooctadiene; 1,6-dimethyl-1,5-cyclooctadiene, or a combination of two or more thereof.

The present technology also provides a process according to any of the previous embodiments, where the platinum compound is a Pt(II)-based compound, and the ratio of total moles of cyclodiene additive to moles of platinum is less than 2:1.

The present technology also provides a process according to any of the previous embodiments, where the platinum compound is a Pt(II)-based compound, and the ratio of total moles of cyclodiene additive to moles of platinum is about 1:1 or lower.
The present technology also provides a process according to any of the previous embodiments, where the platinum compound is a Pt(II)-based compound, and the ratio of total moles of cycloadiene additive to moles of platinum is from about 0.1:1 to about 2:1.

The present technology also provides a process according to any of the previous embodiments, where the platinum compound is a Pt(0)-based compound.

The present technology also provides a process according to any of the previous embodiments, where the platinum compound is chosen from a vinylsiloxane-complexed Pt catalyst.

The present technology also provides a process according to any of the previous embodiments, where the ratio of cycloadiene to Pt(0) is 0.1:1 to 100:1.

The present technology also provides a process according to any of the previous embodiments, where the unsaturated compound is chosen from an unsaturated polyether; an alkyl capped allyl polyether; a methyallyl polyether; a terminally unsaturated amine; an alkyne; a C2-C45 linear or branched olefin; an unsaturated epoxide; a terminally unsaturated acrylate; a terminally unsaturated methacrylate; a terminally unsaturated diene; an aliphatically unsaturated aryl ether; an aliphatically unsaturated aromatic hydrocarbon; an unsaturated cycloalkane; a vinyl-functionalized polymer or oligomer; a vinyl-functionalized and/or terminally unsaturated allyl-functionalized or alkenyl-functionalized silane or siloxane; an unsaturated fatty acid; an unsaturated fatty ester; an aliphatically unsaturated synthetic or natural mineral; or a combination of two or more thereof.

The present technology also provides a process according to any of the previous embodiments, where the unsaturated compound is chosen from polyoxyalkylenes having the general formula:

\[
R^{25} \left(OCH_2CH_2\right)_n \left(OCH_2CHR^{27}\right)_s OR^{36};
\]

\[
R^{36}O(CHR^{27}CH_2O)_m(CH_2=CHR^{28})_n CR^{28}=CH_2
\]

wherein \(R^{25}\) is independently an unsaturated organic group containing from 2 to 10 carbon atoms; \(R^{26}\) is independently hydrogen, an acyl group, or an alkyl group having from 1 to 8 carbon atoms; \(R^{27}\) is independently hydrogen, an acyl group, or an alkyl group having from 1 to 8 carbon atoms; \(R^{28}\) is independently hydrogen, an acyl group, or an alkyl group having from 1 to 8 carbon atoms; and each occurrence of \(n\) is 0 to 100 inclusive; and each occurrence of \(s\) is 0 to 100 inclusive.

The present technology also provides a process according to any of the previous embodiments, where the silylhydride is chosen from a compound of the formula \(R^9_m SiH_p X_{4(m-p)}\) and/or \(M_1 M^H_1 D_c E_d T^H_1 E^H_0 Q_8\), where each \(R^9\) is independently a substituted or unsubstituted aliphatic or aromatic hydrocarbyl group, \(X\) is alkoxy, acyloxy, halogen, or silazane, \(m\) is 1-3, \(p\) is
1-3 the subscripts a, b, c, d, e, f, and g are such that the molar mass of the silylhydride is between 100 and 100,000 Dalton; \( \mathbf{M} \) represents a monofunctional group of formula \( \mathbf{R}^{10} \), \( \mathbf{S}i\mathbf{O}_{1/2} \); a \( \mathbf{D} \) represents a difunctional group of formula \( \mathbf{R}^{11} _2 \mathbf{Si}_{2/2} \mathbf{O} \); a \( \mathbf{T} \) represents a trifunctional group of formula \( \mathbf{R}^{12} _2 \mathbf{Si}_{3/2} \); Q represents a tetrafunctional group of formula \( \mathbf{R}^{12} _4 \mathbf{Si}_{4/2} \); \( \mathbf{M}^{\mathbf{H}} \) represents HR\(^{13} \mathbf{Si}_{1/2} \mathbf{O} \); \( \mathbf{T}^{\mathbf{H}} \) represents HSi\(^{14} \mathbf{O}_{3/2} \), and \( \mathbf{D}^{\mathbf{H}} \) represents R\(^{15} \mathbf{HSi}_{2/2} \); each occurrence of \( \mathbf{R}^{10-14} \) is independently C1-C18, alkyl, C1-C18 substituted alkyl, C6-C14 aryl or substituted aryl, wherein \( \mathbf{R}^{10-14} \) optionally contains at least one heteroatom.

The present technology also provides a process according to any of the previous embodiments, where the silylhydride is a chlorosilane.

The present technology also provides a process according to any of the previous embodiments, where the silylhydride is a compound of the formula \( \mathbf{R}^{15} \mathbf{R}^{16} \mathbf{R}^{17} \mathbf{Si} (\mathbf{CH}^{18} \mathbf{R}) \mathbf{SiOSiR}^{19} \mathbf{R}^{20} (\mathbf{OSiR}^{21} \mathbf{R})^{22} \mathbf{OSiR}^{23} \mathbf{R}^{24} \mathbf{H} \), where \( \mathbf{R}^{15} \mathbf{R}^{24} \) are independently chosen from hydrogen, a monovalent alkyl group, a cycloalkyl group, and an aryl group; \( \chi \) has a value of 1-8, and \( \mathbf{y} \) has a value from zero to 10.

The present technology also provides a process according to any of the previous embodiments, where the ratio of cyclodiene to platinum is about 1:1.

The present technology also provides a process according to any of the previous embodiments, where the platinum compound is chosen from platinum halides, platinum siloxane complexes, cycloalkadiene-platinum complexes, or a combination of two or more thereof.

The present technology also provides a process according to any of the previous embodiments, where the platinum compound is chloroplatinic acid.

The present technology also provides a process according to any of the previous embodiments, where the unsaturated compound is allyl methacrylate.

The present technology also provides a process according to any of the previous embodiments, where the unsaturated compound is allyl glycidyl ether.

The present technology also provides a process according to any of the previous embodiments, where the unsaturated compound is an allyl or methallyl polyether.

The present technology also provides a process according to any of the previous embodiments, where the reaction is carried out at a temperature of -50 °C to 250 °C.

The present technology also provides a process according to any of the previous embodiments, where the reaction is conducted in the presence of a solvent chosen from a hydrocarbon, a halogenated hydrocarbon, an ether, an alcohol, or a combination of two or more thereof.
The present technology also provides a process according to any of the previous embodiments, where the platinum concentration is from about 100 parts per billion to about 100 parts per million.

In another aspect, the present invention provides a silylated product produced from the process according to any of the previous embodiments.

Figure 4 is a graph showing the analyses of product mixtures for reactions of allylglycidyl ether and Si(OEt)₃H run without COD and with 2 different ratios of COD to Pt.

**DETAILED DESCRIPTION**

The present invention provides a process for the hydrosilylation of a composition containing a silylhydride and a compound containing at least one unsaturated group in the presence of a platinum catalyst and cyclohexene compound.

As used herein, the term “alkyl” includes straight, branched, and/or cyclic alkyl groups. Specific and non-limiting examples of alkyls include, but are not limited to, methyl, ethyl, propyl, isobutyl, cyclopentyl, cyclohexyl, etc. Still other examples of alkyls include alkyls substituted with a heteroatom, including cyclic groups with a heteroatom in the ring.

As used herein, the term “substituted alkyl” includes an alkyl group that contains one or more substituent groups that are inert under the process conditions to which the compound containing these groups is subjected. The substituent groups also do not substantially or deleteriously interfere with the process. The alkyl and substituted alkyl groups can include one or more heteroatoms. In one embodiment, a substituted alkyl may comprise an alkylsilyl group.

Examples of alkylsilyl groups include, but are not limited to alkylsilyl groups having 3-20 carbon atoms such as a trimethylsilyl group, a triethyldisilyl group, a triisopropylsilyl group, etc. Optionally, the silyl moiety of the alkylsilyl group may also be represented by phenyldimethylsilyl, diphenylmethylsilyl, or triphenylsilyl.
As used herein, the term “alkoxy” refers to a monovalent group of the formula –OR, where R is an alkyl group. Non-limiting examples of alkoxy groups include, for example, methoxy, ethoxy, propoxy, butoxy, benzyloxy, etc.

As used herein, the term “aryl” refers to a non-limiting group of any aromatic hydrocarbon from which one hydrogen atom has been removed. An aryl may have one or more aromatic rings, which may be fused, connected by single bonds or other groups. Examples of suitable aryls include, but are not limited to, tolyl, xylyl, phenyl, and naphthalenyl.

As used herein, the term “substituted aryl” refers to an aromatic group substituted as set forth in the above definition of “substituted alkyl.” Similar to an aryl, a substituted aryl may have one or more aromatic rings, which may be fused, connected by single bonds or other groups; however, when the substituted aryl has a heteroaromatic ring, the attachment can be through a heteroatom (such as nitrogen) of the heteroaromatic ring instead of a carbon. In one embodiment, the substituted aryl groups herein contain 6 to about 30 carbon atoms.

As used herein, the term “alkenyl” refers to any straight, branched, or cyclic alkenyl group containing one or more carbon-carbon double bonds, where the point of substitution can be either a carbon-carbon double bond or elsewhere in the group. Examples of suitable alkenyls include, but are not limited to, vinyl, propenyl, allyl, methallyl, ethylidenyl norbornyl, etc.

As used herein, the term “alkynyl” refers to any straight, branched, or cyclic alkynyl group containing one or more carbon-carbon triple bonds, where the point of substitution can be either at a carbon-carbon triple bond or elsewhere in the group.

As used herein, the term “unsaturated” refers to one or more double or triple bonds. In one embodiment, it refers to carbon-carbon double or triple bonds.

As used herein, the term “inert substituent” refers to a group other than hydrocarbyl or substituted hydrocarbyl, which is inert under the process conditions to which the compound containing the group is subjected. The inert substituents also do not substantially or deleteriously interfere with any process described herein that the compound in which they are present may take part in. Examples of inert substituents include, but are not limited to, halo (fluoro, chloro, bromo, and iodo), and ether such as –OR, wherein R is hydrocarbyl or substituted hydrocarbyl.

As used herein, the term “hetero atoms” refers to any of the Group 13-17 elements except carbon, and can include, for example, oxygen, nitrogen, silicon, sulfur, phosphorus, fluorine, chlorine, bromine, and iodine.

As used herein, the term “olefin” refers to any aliphatic or aromatic hydrocarbon also containing one or more aliphatic carbon-carbon unsaturations. Such olefins may be linear, branched, or cyclic and may be substituted with heteroatoms as described above, with the
proviso that the substituents do not interfere substantially or deleteriously with the course of the
desired reaction to produce the dehydrogenatively silylated product.

The cyclodiene of this invention is represented by Formula I:

![Formula I](image)

wherein R₁⁻R₈, R'_₁⁻R'_₈, R₄⁺⁻R₄⁻, and R₈⁺⁻ are independently a H or substituted or unsubstituted alkyl
or aryl group optionally containing at least one heteroatom. R₁⁺R₈ may also independently
represent a halide or alkoxy group. Furthermore, R₂⁻R₈ and R₅⁻R₈ taken together, or

independently, may form a ring. In embodiments, R₁⁺R₈, R₃⁺⁻R₄⁻, R₇⁺⁻ and R₈⁺⁻ are independently
chosen from H, a C₁-C₁₈ alkyl, a C₁-C₁₈ substituted alkyl, a C₆-C₁₄ aryl, and a substituted aryl. In embodiments, R₁⁺R₈, R₃⁺⁻R₄⁻, R₇⁺⁻ and R₈⁺⁻ are independently chosen from H, a C₁-C₁₆ alkyl, a C₁-C₁₆ substituted alkyl, a C₆-C₁₀ aryl, and a substituted aryl. Examples of suitable compounds of Formula I, include but are not limited to, 1,5-cyclooctadiene, 1,5-dimethyl-1,5-cyclooctadiene, 1,6-dimethyl-1,5-cyclooctadiene, and mixtures of two or more thereof.

The cyclodiene additive may be provided based on the valence state of the platinum in
the platinum compound. In embodiments, the platinum compound is a Pt(II) compounds, and the
cyclodiene additive is provided such that the molar equivalent ratio of cyclodiene additive to
platinum is less than 3:1. In one embodiment, the ratio of cyclodiene to Pt(II) is 2:1, 1.5:1 1:1;
0.5:1; even 0.1:1. In one embodiment, the cyclodiene to platinum (Pt(II)) ratio is from about
0.1:1 to about 2:1; from about 0.25:1 to about 1.5:1; even from about 0.5:1 to about 1:1. It will
be appreciated that the ratio of cyclodiene to platinum includes all fractional ratios within the
particular ranges. In embodiments when the platinum compound is a Pt(0) compound, the ratio
of total moles of cyclodiene additive to moles of platinum may be from about 0.1:1 to about
100:1; from about 0.5:1 to about 50:1; even from about 1:1 to about 5:1. The practical ratio of
cyclodiene to platinum (0) is determined by any deleterious effect of the cyclodiene at the higher
cyclodiene:Pt ratios.

The total moles of cyclodiene provided to the process include the cyclodiene-platinum
complex plus any additional non-complexed cyclodiene present in the process. Thus, where the
process employs a cyclodiene-platinum complex as the catalyst, the additional non-complexed cyclodiene may be added to the process separate from the cyclodiene-platinum complex or may be provided to the process as a mixture with the cyclodiene-platinum complex. When the catalyst is a cyclodiene-platinum complex, it is desirable that the non-complexed cyclodiene be the same as that already complexed with the platinum although this is not a strict requirement.

The silyl hydride and/or hydrosiloxane employed in the reactions is not particularly limited. It can be, for example, any compound chosen from hydroxylsila or hydrosiloxanes including those compounds of the formulas $R_9^{\text{i}}\text{SiH}_p\frac{X}{s}^{-\text{(mop)}}$ or $M_n\text{SiH}_4\text{D}_a\text{D}_b\text{H}_c\text{H}_d\text{I}_e\text{I}_f\text{Q}_g$, where each $R_9^{\text{i}}$ is independently a substituted or unsubstituted aliphatic or aromatic hydrocarbyl group, $X$ is halide, alkoxy, acyloxy, or silazane, $m$ is 1-3, $p$ is 1-3, and $M$, $D$, $T$, and $Q$ have their usual meaning in siloxane nomenclature, with the proviso that when $X$ is halide, the unsaturated substrate is not an alkyn. The subscripts $a$, $b$, $c$, $d$, $e$, $f$, and $g$ are such that the molar mass of the siloxane-type reactant is between 100 and 100,000 Dalton. In one embodiment, an “$M$” group represents a monofunctional group of formula $R_{10}^{\text{i}}\text{SiO}_{2\text{j}}$, a “$D$” group represents a difunctional group of formula $R_{11}^{\text{i}}\text{SiO}_{2\text{j}}$, a “$T$” group represents a trifunctional group of formula $R_{17}^{\text{i}}\text{SiO}_{4\text{j}}$, and a “$Q$” group represents a tetrafunctional group of formula $R_{22}^{\text{i}}\text{SiO}_{4\text{j}}$, an “$M^\text{r}$” group represents $HR_{13}^{\text{i}}\text{SiO}_{1\text{j}}$, a “$D^\text{r}$” represents $\text{HSiO}_{3\text{j}}$, and a “$T^\text{r}$” group represents $R_{14}^{\text{i}}\text{HSiO}_{2\text{j}}$. Each occurrence of $R_{10-14}^{\text{i}}$ is independently C1-C18 alkyl, C1-C18 substituted alkyl, C6-C14 aryl or substituted aryl, wherein $R_{10-14}^{\text{i}}$ optionally contains at least one heteroatom.

The instant invention also provides hydrosilylation with hydridosiloxanes comprising carbosiloxane linkages (for example, Si-CH$_2$-Si-O-SiH, Si-CH$_2$-CH$_2$-Si-O-SiH or Si-arylene-Si-O-SiH). Carbosiloxanes contain both of the –Si-(hydrocarbylene)–Si- and –Si-O-Si- functionalities, where hydrocarbylene represents a substituted or unsubstituted, divalent alkyne, cycloalkylene or arylene group. The synthesis of carbosiloxanes is disclosed in U.S. Patent No. 7,259,220; U.S. Patent No. 7,326,761 and U.S. Patent No. 7,507,775 all of which are incorporated herein in their entirety by reference. An exemplary formula for hydridosiloxanes with carbosiloxane linkages is $R_{15}^{\text{i}}$Si$^{16}$Si$^{17}$(CH$_2$)$^{18}$_{\text{i}}$SiOSi$^{19}$R$^{20}$(OSi$^{21}$R$^{22}$_{\text{j}})$\text{OSi}$^{23}$H, wherein $R_{15}^{\text{i}}$ – $R_{24}^{\text{j}}$ is independently a monovalent alkyl, cycloalkyl or aryl group such as methyl, ethyl, cyclohexyl or phenyl. Additionally, $R_{15-24}^{\text{i}}$ independently may also be H. The subscript $x$ has a value of 1-8, $y$ has a value from zero to 10 and, in embodiments, is zero to 4. A specific example of a hydridocarbosiloxane is (CH$_3$)$_{3}$SiCH$_2$CH$_2$Si(CH$_3$)$_{3}$OSi(CH$_3$)$_{2}$H.

As used herein, “unsaturated” refers to a compound comprising one or more double or triple bonds. In one embodiment, unsaturated refers to a compound comprising carbon-carbon double or triple bonds. The unsaturated compound containing at least one unsaturated functional group employed in the hydrosilylation reaction is generally not limited and can be chosen from
an unsaturated compound as desired for a particular purpose or intended application. The unsaturated compound can be a mono-unsaturated compound or it can comprise two or more unsaturated functional groups. In one embodiment, the unsaturated group can be an aliphatically unsaturated functional group. Examples of suitable compounds containing an unsaturated group include, but are not limited to, unsaturated polyethers such as alkyl-capped allyl polyethers, vinyl functionalized alkyl capped allyl or methallyl polyethers; terminally unsaturated amines; alkynes (except with hydrochlorosilanes); C2-C45 linear or branched olefins, in one embodiment alpha olefins; terminally unsaturated dienes; unsaturated epoxides such as allyl glycidyl ether and vinyl cyclohexene-oxide; terminally unsaturated acrylates or methacrylates; unsaturated aryl ethers; aliphatically unsaturated aromatic hydrocarbons; unsaturated cycloalkanes such as trivinyl cyclohexane; vinyl-functionalized polymer or oligomer; vinyl-functionalized and/or terminally unsaturated allyl-functionalized silane and/or vinyl-functionalized silicones; unsaturated fatty acids; unsaturated fatty esters; or combinations of two or more thereof.

Illustrative examples of such unsaturated substrates include, but are not limited to, ethylene, propylene, isobutylene, 1-hexene, 1-octene, 1-octadecene, styrene, alpha-methylstyrene, cyclopentene, norbornene, 1,5-hexadiene, norbornadiene, vinylcyclohexene, allyl alcohol, allyl-terminated polyethylene glycol, allylacrylate, allyl methacrylate, allyl glycidyl ether, allyl-terminated isocyanate-or acrylate prepolymers, polybutadiene, allylamine, methallyl amine, methyl undecenoate, acetylene, phenylacetylene, vinyl-pendent or vinyl-terminal polysiloxanes, vinylcyclosiloxanes, vinylsiloxane resins, other terminally-unsaturated alkenyl silanes or siloxanes, vinyl-functional synthetic or natural minerals, etc.

Unsaturated polyethers suitable for the hydrosilylation reaction include polyoxyalkylenes having the general formula:

\[ R^{25}(OCH_2CH_2)_n(OCH_2CHR^{27})_m-OR^{26} \] (Formula III); or

\[ R^{26}O(CHR^{27}CH_2O)_n(CH_2CH_2O)_m-C=CHR^{28}_n(C-CHR^{28}_n(OCH_2CH_2)_m(OCH_2CHR^{27})_mOR^{26} \] (Formula IV); or

\[ H_2C=CR^{28}CH_2O(CH_2CH_2O)_n(CH_2CHR^{27}O)_mCH_2CR^{28}=CH_2 \] (Formula V)

wherein \( R^{25} \) denotes an unsaturated organic group containing from 2 to 10 carbon atoms such as vinyl, allyl, methallyl, propargyl or 3-pentynyl. When the unsaturation is olefinic, it is desirable to terminal to facilitate smooth hydrosilylation. However, when the unsaturation is a triple bond, it may be internal. \( R^{26} \) is independently hydrogen, an alkyl group, e.g., from 1 to 8 carbon atoms such as the alkyl groups CH₃, n-C₄H₉, t-C₄H₉, or i-C₄H₉, and an acyl group, e.g., CH₃COO, t-C₄H₄COO, the beta-ketoester group such as CH₃C(O)CH₂C(O)O, or a trialkylsilyl group. \( R^{27} \) and \( R^{28} \) are monovalent hydrocarbon groups such as the C1-C20 alkyl groups, for example, methyl, ethyl, isopropyl, 2-ethylhexyl, dodecyl and stearyl, or the aryl groups, for example, phenyl and naphthyl, or the alkaryl groups, for example, benzyl, phenylethyl and nonylphenyl, or
the cycloalkyl groups, for example, cyclohexyl and cyclooctyl. $R_{28}$ may also be hydrogen. In embodiments, $R_{27}$ and $R_{28}$ are methyl groups. Each occurrence of $z$ is 0 to 100 inclusive and each occurrence of $w$ is 0 to 100 inclusive. In embodiments, $z$ and $w$ are 1 to 50 inclusive.

In accordance with aspects of the present technology, when the unsaturated compound is a terminal alkyne, the silylhydride is a silylhydride other than a halosilane.

The present process can also be used, for example, for preparing a silylated polyurethane. This may include the step of contacting a terminally-unsaturated polyurethane with a silylhydride in the present of a platinum catalyst and the cycloalkadiene additive.

The hydrosilylation process is conducted in the presence of a platinum catalyst. The platinum catalyst employed in the process is not particularly limited and can be chosen from a variety of platinum compounds including, but not limited to, platinum halides, platinum siloxane complexes such as Ashby’s or Karstedt’s catalyst, cycloalkadiene-platinum complexes, or various other common platinum compounds or complexes known in the art.

In one embodiment, the platinum catalyst comprises a platinum halide, a reaction product of a platinum halide and organosilicon compound having terminal aliphatic unsaturation, or combinations of two or more thereof. Suitable platinum halides include, but are not limited to, platinum dichloride, platinum dibromide, platinum tetrachloride, chloroplatinic acid (i.e. $\text{H}_2\text{PtCl}_6, 6\text{H}_2\text{O}$), dipotassium tetrachloroplatinate (i.e. $\text{K}_2\text{PtCl}_4$), etc. A particularly suitable platinum halide is chloroplatinic acid. Platinum catalysts useful in the present invention also include the reaction product of a platinum halide with an organosilicon compound having terminal aliphatic unsaturation. Such catalysts are described, for example, in Willing, U.S. Patent No. 3,419,593, which is incorporated by reference for its teaching of platinum catalysts useful in the present process. The platinum catalyst can be, for example, the reaction product of a solution of chloroplatinic acid in ethanol or 2-propanol optionally in combination with an ethereal solvent at various ratios, or the reaction products of platinum dichloride or chloroplatinic acid with 1,3-divinyl-1,1,3,3-tetramethyldisiloxane.

In one embodiment, the platinum catalyst comprises a cycloalkadiene-platinum complex described by formula or $\text{Pt}(R_{30})X_2$, where $R_{30}$ is a cycloalkadiene comprising about six to 20 carbon atoms and each $X$ can be an independently selected halogen atom. In one embodiment, the cycloalkadiene comprises about 6 to 10 carbon atoms. Suitable cycloalkadienes for the cycloalkadiene-platinum complexes include, but are not limited to, cyclohexadiene, cycloheptadiene, cyclooctadiene, cyclodecadiene, and norbornadiene. 1,5-cyclooctadiene is a particularly suitable cycloalkadiene for the cycloalkadiene-platinum complexes. In one embodiment, the platinum catalyst is described by formula $\text{Pt}(R_{30})\text{Cl}_2$, where $R_{30}$ is 1,5-cyclooctadiene.
The concentration of platinum catalyst used in the present process can be varied. In one embodiment, the concentration of platinum is from about 100 parts per billion (ppb) to about 100 ppm; from about 500 ppb to about 70 ppm; from about 1 ppm to about 50 ppm; even from about 10 ppm to about 30 ppm. Here as elsewhere in the specification and claims, numerical values can be combined to form new and alternative ranges.

The platinum catalyst may be dissolved in solvent to improve ease of handling. The solvent is not limited and can be either polar or non-polar. Any solvent can be used in the method of the invention, as long as it facilitates the dissolution of the platinum catalyst, without deleterious effects.

The temperature range for the process of the hydrosilylation is from -50 °C to 250 °C, preferably from 0 °C to 150 °C. A variety of reactors can be used in the process of this invention. The process can be run as a batch reaction or a continuous reaction at ambient, sub-ambient, or supra-ambient pressures. In one embodiment, the reaction is carried out under an inert atmosphere. Selection is determined by factors such as the volatility of the reagents and products. Continuously stirred batch reactors are conveniently used when the reagents are liquid at ambient and reaction temperature. These reactors can also be operated with a continuous input of reagents and continuous withdrawal of dehydrogenatively silylated or hydrosilylated reaction product. With gaseous or volatile olefins and silanes, fluidized-bed reactors, fixed-bed reactors and autoclave reactors can be more appropriate.

The reaction may be conducted in the presence of a solvent. The solvent is not particularly limited. In embodiments, the solvent is chosen from a hydrocarbon, a halogenated hydrocarbon, an ether, an alcohol, or a combination of two or more thereof.

Accordingly, in some embodiments, the present invention is also directed to the compositions produced from the above described methods. These compositions contain the hydrosilylated products of the silylhydride and the compound having at least one unsaturated group. The hydrosilylated products that are produced by the process of the present invention have uses in the synthesis of silicone materials such as organosilanes for coupling agents, adhesives, products for agricultural and personal care applications, and silicone surfactant for stabilizing polyurethane foams.

The following examples are intended to illustrate, but in no way limit the scope of the present invention. All parts and percentages are by weight and all temperatures are in Celsius unless explicitly stated otherwise. All patents, other publications, and U.S. patent applications referred to in the instant application are incorporated herein by reference in their entireties.
EXAMPLES

Reactions and manipulations were performed under nitrogen, using standard Schlenk-line techniques. The chloroplatinic acid was employed as an alcoholic solution of hexachloroplatinic acid. COD was used either directly or as an alcoholic or toluene solution. The allylpolyether and MD\textsuperscript{H}M were obtained internally. All other starting materials were purchased from a commercial source and used as received without further purification. Olefin:SiH molar ratio used for the reactions was between 1:1:1 and 1:1.

Example 1: Hydrosilylation of allyl methacrylate (AMA) with SiMeCl\textsubscript{2}H using diene additives.

A 4-neck round bottomed flask was fitted with an addition funnel, a syringe port, an alcohol thermometer, a magnetic stir bar, and a straight water-condenser fitted on top with a dry ice condenser. The addition funnel was equipped with a N\textsubscript{2} inlet and the N\textsubscript{2} line was split with a t-piece attached to a bubbler before the reaction. The system was flushed with N\textsubscript{2} and was charged with the appropriate inhibitors. The SiMeCl\textsubscript{2}H (16.5 g, 0.140 mol) was charged to the addition funnel. The round bottomed flask was charged with allyl methacrylate (19.7 g, 0.16 mol), chloroplatinic acid (2 ppm Pt), and cyclooctadiene (COD) solution in ethanol (0.39 \mu mol, equimolar to Pt), where COD was used as an additive. The reaction mixture was heated to 80 °C. Approximately 1 mL of the chlorosilane was added and the reaction was monitored for an exotherm. Once an exothermic reaction was detected, the chlorosilane was slowly added as to maintain a reaction temperature between 80 °C and 90 °C. After chlorosilane addition was complete, the reaction was heated to 80 °C for 90 min. After 90 min the heat was removed and the product at ambient temperature was decanted into a brown bottle and stored under a N\textsubscript{2} blanket, The material was analyzed by GC and NMR spectroscopy.

Comparative Example 1: Hydrosilylation of allyl methacrylate with SiMeCl\textsubscript{2}H without the use of diene additives.

A reaction was run similarly to Example 1 except that COD solution was not added to the reaction. Figure 1 shows the product yield evaluated by GC analysis for reactions of allyl methacrylate and SiMeCl\textsubscript{2}H run with and without COD additives at 2 ppm of platinum. Figure 2 shows the product the product yield over time with and without COD additives. The product yield was determined by GC analysis for reactions of allyl methacrylate and SiMeCl\textsubscript{2}H run with and without COD additives at 2 ppm Pt. Aliquots were taken and analyzed by GC immediately after chlorosilane addition was complete (t initial), 15 minutes after chlorosilane addition was complete (t 15), and 90 minutes after chlorosilane addition was complete (t final).
Example 2: Hydrosilylation of allyl methacrylate with SiMeCl₂H using diene additives run to evaluate the color of the reaction product.

The reactions were run at a 5 ppm Pt loading similar to those discussed above, except the inhibitors which impart color were not added to the reaction. The color of the product was evaluated for reactions of allyl methacrylate and SiMeCl₂H run with various amount of COD equivalents.

Example 3: Hydrosilylation of allyl methacrylate with Si(OEt)₃H using diene additives.

A 4-neck round bottomed flask equipped with a magnetic stir bar, straight condenser, topped with a dry-ice condenser, syringe port, a liquid addition funnel, and a thermometer and placed under N₂. The reaction vessel was charged with inhibitors and allyl methacrylate (15 mL, 0.11 mol), the chloroplatinic acid solution (2 ppm Pt) COD solution (equimolar to Pt). The addition funnel was charged with the triethoxysilane (19 mL, 0.1 mol). The reaction was heated to 90 °C and then an aliquot of the triethoxysilane (3-5% by volume) was added and the reaction was monitored for exotherm. After exotherm was confirmed the remainder of the triethoxysilane was added via addition funnel at a rate to keep the reaction between 85 °C and 95 °C. After final addition of the triethoxysilane, the reaction was heated for 90 minutes at 90 °C. The resulting product was analyzed by GC and ¹H NMR. The average Hazen value of the product for 4 separate runs was 111 Pt/Co.

Comparative Example 2: Hydrosilylation of allyl methacrylate with Si(OEt)₃H without the use of diene additives.

A reaction was run similarly as in Example 3 except that COD solution was not added to the reaction. The average Hazen value of the product for 4 separate runs was 171 Pt/Co. Figure 3 compares the product yield as determined by GC analysis for Example 3 and Comparative Example 2 at 2 ppm of platinum.
Example 4: **Hydrosilylation of allylpolyether with MD²⁻M using diene additives.**

A 4-neck round bottomed flask was equipped with a magnetic stir bar, an addition funnel, a syringe port, an alcohol thermometer, and a straight water-condenser fitted with a t-piece to accommodate N₂ flow. The system was flushed with N₂ and was charged with the MD²⁻M (5 mL, 0.02 mol) and methoxypolyethyleneglycolallylether (39.4 g, 0.1 mol). The remaining MD²⁻M (15 mL, 0.06 mol) was charged to the addition funnel. The round bottomed flask was charged with the COD solution (1.76 µmol, equimolar to Pt). The reaction mixture was heated to 80 °C. The chloroplatinic acid solution (6 ppm Pt) was added to the mixture. The MD²⁻M was slowly added as to maintain a reaction temperature below 120 °C. After addition of the MD²⁻M was complete, the reaction was heated to 80 °C for 60 min. The material was analyzed by NMR spectroscopy. The average Hazen value of the product for 3 separate runs was 32 Pt/Co.

**Comparative Example 3: Hydrosilylation of allylpolyether with MD²⁻M without the use of diene additives.**

A reaction was run similarly to Example 4 except that COD solution was not added to the reaction. The average Hazen value of the product for 3 separate runs was 78 Pt/Co.

Example 5: **Hydrosilylation of allyl glycidyl ether (AGE) with Si(OEt)₃H using diene additives.**

A 4-neck round bottomed flask was equipped with a magnetic stir bar, a condenser, a septum, a liquid addition funnel, and a thermocouple and subsequently rendered inert with N₂. The reaction vessel was charged with AGE (44.6 g, 0.39 mol) and the liquid addition funnel was charged with triethoxysilane (53.4 g, 0.33 mol). Subsequently, 5% of the triethoxysilane volume was added to the reaction vessel and the mixture heated to 90 °C. Glacial acetic acid (44 µL) and the appropriate amount of COD solution were injected via syringe, followed by the injection of the chloroplatinic acid catalyst solution (250 ppb Pt). After confirmation of a reaction exotherm, the remainder of the triethoxysilane was added via addition funnel at a rate aimed at keeping the reaction temperature between 85 °C and 95 °C. After final addition of the triethoxysilane, the temperature was maintained at 90 °C for an additional 2 hours. The resulting product mixture was analyzed by GC for % product area.
Comparative Example 4: Hydrosilylation of allyl glycidyl ether with Si(OEt)$_3$H without the use of diene additives.

A reaction was run similarly as in Example 5 except that COD solution was not added to the reaction. Figure 4 shows the product yield for Example 5 (at 1 and 2 equivalents of COD) and Comparative Example 4.

Example 6: Hydrosilylation of allyl methacrylate with SiCl$_3$H using diene additives.

A 3-neck round bottomed flask was fitted with a syringe pump feeding across a septum, thermocouple connected to a temperature controller controlling a heating mantle, a magnetic stir bar, and a straight water-condenser fitted on top equipped with a N$_2$ inlet to a mineral oil bubbler. The system was flushed with N$_2$ and the round bottom flask was charged was charged with the allyl methacrylate (11.37 g, 0.09 mol) and appropriate inhibitors. The SiCl$_3$H was charged to the syringe pump. The syringe pump was set on a feed rate of 0.14 mL/min and total feed volume was set to 8.41 mL (11.27 g, 0.08 mol). The reaction mixture was heated to 80 °C. At 80 °C the reaction mixture was charged with chloroplatinic acid solution (3.3 ppm Pt), and COD solution in ethanol (0.38 µmol, equimolar to Pt), where COD was used as an additive. The chlorosilane feed was started and added over 1 hour. The exotherm was seen and reached a maximum temperature of 94.7 °C after 7 minutes onto the addition. After chlorosilane addition was complete the reaction mixture was cooled to ambient temperature and analyzed by GC. The composition of the reaction mixture was 75.3% product.

Comparative Example 5: Hydrosilylation of allyl methacrylate with SiCl$_3$H without the use of diene additives.

A 3-neck round bottomed flask was fitted with a syringe pump feeding across a septa, thermocouple connected to a temperature controller controlling a heating mantle, a magnetic stir bar, and a straight water-condenser fitted on top equipped with a N$_2$ inlet to a mineral oil bubbler. The system was flushed with N$_2$ and the round bottomed flask was charged was charged with the allyl methacrylate (11.37 g, 0.09 mol) and appropriate inhibitors. The SiCl$_3$H was charged to the syringe pump. The syringe pump was set on a feed rate of 0.14 mL/min and total feed volume was set to 8.41 mL (11.27 g, 0.08 mol). The reaction mixture was heated to 80 °C. At 80 °C the reaction mixture was charged with chloroplatinic acid solution (6.5 ppm Pt). The chlorosilane feed was started and added over 1 hour. The exotherm was seen and reached a maximum temperature of 90.2 °C after 5 minutes onto the addition. After chlorosilane addition was complete the reaction mixture was cooled to ambient temperature and analyzed by GC. The composition of the reaction mixture was 73.2% product.
Examples 7-8: Hydrosilylation of an OH-terminated methallylpolyether with a carbosiloxhydryde.

Examples 7 and 8 and Comparative Examples 6-7 illustrate the effective use of 1,5-cyclooctadiene (COD) in the platinum-catalyzed, solventless hydrosilylation of uncapped methallyl polyethers by the carbodisiloxane, \((\text{CH}_3)_2\text{SiCH}_2\text{Si(CH}_3)_2\text{OSi(CH}_3)_2\text{H}\). The reaction products are intermediates in the synthesis of materials useful for making contact lens (See U.S. Patent Publications 2012/0244088 and 2012/0245249)

The carbodisiloxane was synthesized as disclosed in US 7,259,220. The polyethers were the four and ten ethoxylates of methallyl alcohol. The four ethoxylate has a molecular weight of 248.32. The ten ethoxylate has a molecular weight of 512.64. Each polyether was reacted with and without addition of COD. Karstedt’s catalyst was the platinum source in each experiment.

Each reaction was conducted in a 500 mL, 4-neck round bottomed flask fitted with a temperature-controlled heating mantle, mechanical stirrer, reflux condenser and Claisen connection. A serum cap was placed over the fourth neck. A thermocouple and nitrogen inlet line were affixed to the Claisen connection.

Equimolar quantities of carbodisiloxane and polyether were used because of the absence of isomerization with methallyl groups. In each experiment, the carbodisiloxane and polyether were added to the reaction flask and stirred vigorously while the environment in the flask is made inert with a slow flow of nitrogen. A small sample was withdrawn by syringe and analyzed by FTIR to establish the initial absorbance of the SiH vibration at 910 cm\(^{-1}\). The
temperature was then increased to 80 °C and the platinum catalyst was injected by syringe through the serum cap. An exotherm was observed and the temperature was maintained at 100 °C overnight (19 hours total reaction time). In Examples 7 and 8, 7 microliters COD (approx. 1:1 ratio of COD:Pt) were also added by syringe at 80 °C just prior to the catalyst injection.

Both the KOH test and analysis by FTIR were done to determine whether SiH functional groups were still present in the reaction mixture at intervals and after overnight heating. At the end, hydrogen was generated when the KOH test was applied to the reaction mixtures of Comparative Examples 6 and 7. The FTIR spectrum of each sample also showed pronounced absorbance at 910 cm⁻¹ indicating that unreacted SiH was present. In contrast, the reaction mixtures of Examples 7 and 8 tested negatively for SiH in both analyses.

The reaction products were stripped of volatiles in vacuo and later characterized by ¹³C, ¹H and ²⁹Si NMR. ²⁹Si NMR showed that conversion of SiH functionality in Comparative Example 7 was not only due to the desired reaction with the methallyl group (Si-C bond formation), but also to reaction with the terminal hydroxyl group (Si-O-C bond formation) of the polyether. Si-O-C bond formation was ~20 percent in the control (Comparative Example 7) and negligible in Example 8. Thus, use of COD as an additive was effective in completing the hydrosilylation of methallyl polyethers and suppressing the formation of SiOC by-products.

Example 9: Hydrosilylation of 1-octene with Si(OEt)₃H using diene additives.

All glassware was dried in an oven at 125 °C, overnight, prior to use. A 4-neck round bottom flask was fitted with an addition funnel, two rubber septa, a magnetic stir bar, and a water condenser fitted with a dry ice condenser. The addition funnel was equipped with a N₂ inlet and the N₂ line was split with a t-piece attached to a bubbler whose exit was passed through a scrubber filled with a KOH/ethanol solution (to quench any SiH₄ formed). A J-Kem temperature probe connected to a heating mantle was introduced through one rubber septum. The set-up was purged with N₂ flow, and the 4-neck round bottom was charged with 1-octene (37.2 g, 0.32 mol), 1, 5-cyclooctadiene in toluene (0.14 mg, 1.28 Pmol) as a 1.1 molar equivalent vs Pt. The mixture was blanketed with N₂. An amount of triethoxysilane (48.7 g, 0.29 mol) was added to the addition funnel and purged with N₂. An additional amount of triethoxysilane (2.56 g, 0.016 mol) was added to the reaction mixture in the round bottom. The mixture in the round bottom was heated to 75 °C. At 75 °C the reaction mixture was charged with acetic acid (0.18 g, 0.2 wt%), after which a chloroplatinic acid solution (2.5 ppm Pt, 1.14 Pmol) was added, and the reaction was monitored for an exotherm. Upon confirmation of the exotherm (˃5 °C temperature increase), the reaction was closely monitored and kept below 85 °C with the aid of a cool air gun. The triethoxysilane was added at a rate to keep the temperature between 80 °C and 85 °C,
with assistance as needed from a heating mantle or cool air gun. After final addition of
triethoxysilane the resulting solution was allowed to stir at 80 °C for 60 minutes. At the end of
60 minutes the reaction was sampled for GC analysis, removed from heat, and was cooled to
room temperature. The composition of the crude mixture by GC was 92.1% product. The Hazen
value for the crude product was 22 Pt/Co.

Comparative Example 8: Hydrosilylation of 1-octene with Si(OEt)_3H without the use of
diene additives.

The reaction was run similarly to Example 9 except that COD solution was not added to
the reaction. The composition of the crude mixture by GC was 92.8% product with a Hazen
Value of 33 Pt/Co.

Example 11: Hydrosilylation of 1-octene with Si(OEt)_3H using diene additives.

All glassware was dried in an oven at 125 °C, overnight, prior to use. A 4-neck round
bottom flask was fitted with an addition funnel, two rubber septa, a magnetic stir bar, and a water
condenser fitted with a dry ice condenser. The addition funnel was equipped with a N₂ inlet and
the N₂ line was split with a t-piece attached to a bubbler whose exit was passed through a
scrubber filled with a KOH/ethanol solution (to quench any SiH₄ formed). A J-Kem temperature
probe connected to a heating mantle was introduced through one rubber septum. The set-up was
purged with N₂ flow, and the reaction vessel was charged with 1-octene (82.24 g, 0.72 mol), 1,
5-cyclooctadiene (0.54 mg, 4.98 Pmol, 2 molar equivalents vs Pt), and the mixture was
blanketed with N₂. An amount of triethoxysilane (105.9 g, 0.63 mol), was added to the addition
funnel and purged with N₂. An additional amount of triethoxysilane (5.34 g, 0.032 mol) was
added to the reaction via a syringe pump. The mixture in the round bottom was heated to 70 °C.
At 70 °C the reaction mixture was charged with aniline (0.136 g, 0.07 wt%). The reaction
temperature was increased to 72.5 °C at which Karstedt’s solution (2.5 ppm Pt, 2.49 Pmol), was
added and the reaction was monitored for an exotherm. Upon confirmation of the exotherm,
the triethoxysilane was added at 2 mL/min and the reaction temperature was held at 72.5 °C +/- 1.5
°C. After final addition of triethoxysilane the resulting solution was allowed to stir at 70 °C for
60 minutes. At the end of 60 minutes the reaction was sampled for GC analysis, removed from
heat, and was cooled to room temperature. The composition of the crude mixture by GC was
94.1%, product. The Hazen value for the crude product was 30 Pt/Co.
Comparative Example 9:  Hydrosilylation of 1-octene with Si(OEt)$_3$H without the use of diene additives.

The reaction was run similarly to Example 11 except that COD solution was not added to the reaction. The composition of the crude mixture by GC was 93.7% product with a Hazen Value of 43 Pt/Co.

While the above description contains many specifics, these specifics should not be construed as limitations on the scope of the invention, but merely as exemplifications of preferred embodiments thereof. Those skilled in the art may envision other possible variations that are within the scope and spirit of the invention as defined by the claims appended hereto.
CLAIMS

WHAT I CLAIMED IS:

1. A process for the hydrosilylation of an unsaturated compound comprising reacting (a) a silyl hydride with (b) an unsaturated compound in the presence of (c) a platinum compound and (d) a cyclodiene, with the provisions that (i) when the unsaturated compound is a terminal alkyne, the silyl hydride is other than a halosilane, and (ii) when the platinum compound is a Pt(II)-based compound, the ratio of total moles of cyclodiene to moles of platinum is less than 3:1.

2. The process of claim 1, wherein the cyclodiene is chosen from a compound of the formula:

\[
\begin{array}{c}
\text{R}_1 \quad \text{R}_2 \\
\text{R}_3 \quad \text{R}_4 \\
\text{R}_5 \quad \text{R}_6 \\
\text{R}_7 \quad \text{R}_8
\end{array}
\]

wherein \(\text{R}_1-\text{R}_8\), \(\text{R}_1'-\text{R}_8'\), and \(\text{R}_4'^{-}\) are independently hydrogen; an substituted or unsubstituted alkyl or aryl group optionally containing at least one heteroatom; an alkoxy; and a halogen radical; optionally \(\text{R}_1'-\text{R}_2'^{-}\) and/or \(\text{R}_4'^{-}\cdot\text{R}_6'^{-}\) taken together may form a ring structure.

3. The process of claim 1, wherein the cyclodiene comprises 1,5-cyclooctadiene; 1,5-dimethyl-1,5-cyclooctadiene; 1,6-dimethyl-1,5-cyclooctadiene, or a combination of two or more thereof.

4. The process of any of claims 1-3, wherein the platinum compound is a Pt(II)-based compound, and the ratio of total moles of cyclodiene additive to moles of platinum is less than 2:1.

5. The process of any of claims 1-3, wherein the platinum compound is a Pt(II)-based compound, and the ratio of total moles of cyclodiene additive to moles of platinum is about 1:1 or lower.
6. The process of any of claims 1-3, wherein the platinum compound is a Pt(II)-based compound, and the ratio of total moles of cyclodiene additive to moles of platinum is from about 0.1:1 to about 2:1.

7. The process of any of claims 1-6, wherein the unsaturated compound is chosen from an unsaturated polyether; an alkyl capped allyl polyether; a methylallyl polyether; a terminally unsaturated amine; an alkyne; a C2-C45 linear or branched olefin; an unsaturated epoxide; a terminally unsaturated acrylate; a terminally unsaturated methacrylate; a terminally unsaturated diene; an aliphatically unsaturated aryl ether; an aliphatically unsaturated aromatic hydrocarbon; an unsaturated cycloalkane; a vinyl-functionalized polymer or oligomer; a vinyl-functionalized and/or terminally unsaturated allyl-functionalized or alkenyl-functionalized silane or siloxane; an unsaturated fatty acid; an unsaturated fatty ester; an aliphatically unsaturated synthetic or natural mineral; or a combination of two or more thereof.

8. The process of any of claims 1-7, wherein the unsaturated compound is chosen from polyoxyalkylenes having the general formula:

$$R^{25}(OCH_2CH_2)_n(OCH_2CHR^{27})_m—OR^{26};$$

$$R^{26}(CHR^{27}CH_2O)_n(CH_2=CHR^{28})_m—CR^{29}—C—C—CR^{30}(OCH_2CH_2)_2(OCH_2CHR^{27})_mOR^{26}$$

$$H_2C=CR^{28}CH_2O(CH_2=CH_2O)_m(CH_2CHR^{27}O)_nCH_2CR^{28}=CH_2$$

wherein $R^{25}$ is independently an unsaturated organic group containing from 2 to 10 carbon atoms; $R^{26}$ is independently hydrogen, an acyl group, or an alkyl group having from 1 to 8 carbon atoms; $R^{27}$ is independently a monovalent hydrocarbon group; $R^{28}$ independently chosen from hydrogen and a monovalent hydrocarbon group; each occurrence of $z$ is 0 to 100 inclusive; and each occurrence of $w$ is 0 to 100 inclusive.

9. The process of any of claims 1-8, wherein the silylhydride is chosen from a compound of the formula $R^9 SiH X_{4(m+p)}$ and/or $M_{25}M^{H}_h D^{H}_c D^{H}_e T^{H}_d T^{H}_e Q^{g}$, where each $R^9$ is independently a substituted or unsubstituted aliphatic or aromatic hydrocarbyl group, X is alkoxy, acyloxy, halogen, or silazane, m is 1-3, p is 1-3 the subscript s a, b, c, d, e, f, and g are such that the molar mass of the silylhydride is between 100 and 100,000 Dalton; M represents a monofunctional group of formula $R^{10} SiO^{1/2}_3$, A represents a difunctional group of formula $R^{11} _2 SiO^{1/2}_2$, T represents a trifunctional group of formula $R^{12} SiO^{1/2}_2$, Q represents a tetrafunctional group of formula $SiO^{1/2}_2$, M represents HR^{13} SiO^{1/2}_2, T^{H} represents HSiO^{1/2}_2, and $D^{H}$ represents $R^{14} HSiO^{1/2}_2$; each occurrence of $R^{10-14}$ is independently C1-C18 alkyl, C1-C18.
substituted alkyl, C6-C14 aryl or substituted aryl, wherein R10-14 optionally contains at least one heteroatom.

10. The process according to any of claims 1-9, wherein the silylhydride is a chlorosilane.

11. The process of any of claims 1-10, wherein the silylhydride is a compound of the formula R15R16R17Si(CH2R18)xSiOSiR19R20(OSiR21R22)yOSiR23R24H, where R15 – R24 are independently chosen from hydrogen, a monovalent alkyl group, a cycloalkyl group, and an aryl group; x has a value of 1-8, and y has a value from zero to 10.

12. The process of claim 11, wherein the ratio of cycloadiene to platinum is about 1:1.

13. The process of any of claims 1-12, wherein the platinum compound is chosen from platinum halides, platinum siloxane complexes, cycloalkadiene-platinum complexes, or a combination of two or more thereof.

14. The process of any of claims 1-13, wherein the platinum compound is chloroplatinic acid.

15. The process of any of claims 1-14, wherein the platinum compound is a Pt(0)-based compound.

16. The process of claim 15, wherein the platinum compound is chosen from a vinylsiloxane-complexed Pt catalyst.

17. The Process of Claim 15, where the ratio of cycloadiene to Pt(0) is 0.1:1 to 100:1.

18. The process according to any of claims 1-17, where the unsaturated compound is allyl methacrylate.

19. The process of any of claims 1-17, wherein the unsaturated compound is allyl glycidyl ether.
20. The process of any of claims 1-17, where the unsaturated compound is an allyl or methallyl polyether.

21. The process of any of claims 1-20, where the reaction is carried out at a temperature of -50 °C to 250 °C.

22. The process of any of claims 1-21, where the reaction is conducted in the presence of a solvent chosen from a hydrocarbon, a halogenated hydrocarbon, an ether, an alcohol, or a combination of two or more thereof.

23. The process of any of claims 1-22, wherein the platinum concentration is from about 100 parts per billion to about 100 parts per million.

INTERNATIONAL SEARCH REPORT

A. CLASSIFICATION OF SUBJECT MATTER

INV. C07F7/12 C07F7/14 C07F7/18 C08F230/08

ADD.

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

C07F C08F

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

EPO-Internal

C. DOCUMENTS CONSIDERED TO BE RELEVANT

| X        | wo 03/050130 AI (DOW CORNING [US]; ROY AR00P [US]; TAYLOR RICHARD [US])
19 June 2003 (2003-06-19)
Example 1, page 8 in combination with [36]
di scl oses a sol uti on of a Pt-catalyst with
1-1.5 equi val ents COD: This solution is
then used in a process for
hydrosi lyl ati on: Page 9, [38] and
di scl oses:
A process for the hydrosi lyl ati on of hexene
comprising reacting (a) MeSiCl3 with (b)
hexene in the presence of (c) the plati num
compound (COD) Pt(SiMeC12)2 and (d) 1-1.5
equi v. COD (see page 9, line 16 in
combination with page 8, lines 29-30), the
ratio of total moles of cyclo diene to
moles of plati num being thus less than
3:1.
Process for hydrosi lyl ati on uses Pt(II)
-/-

* Special categories of cited documents:

**A** document defining the general state of the art which is not considered to be of particular relevance

**E** earlier application or patent but published on or after the international filing date

**L** document which may throw doubts on priority claim(s) on which the publication date of another citation or other special reason (as specified)

**O** document referring to an oral disclosure, use, exhibition or other means

**P** document published prior to the international filing date but later than the priority date claimed

**T** later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

**X** document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

**Y** document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

**A** document member of the same patent family
