HYDANTOIN DERIVATIVES USEFUL AS KV3 INHIBITORS

Technical field

This invention relates to novel compounds, pharmaceutical compositions containing them and their use in therapy, in particular in the prophylaxis or treatment of hearing disorders, including hearing loss and tinnitus, as well as schizophrenia, bipolar disorder, epilepsy and sleep disorders.

Background to the invention

The Kv3 voltage-gated potassium channel family includes four members, Kv3.1, Kv3.2, Kv3.3, and Kv3.4. Genes for each of these subtypes can generate multiple isoforms by alternative splicing, producing versions with different C-terminal domains. Thirteen isoforms have been identified in mammals to date, but the currents expressed by these variants appear similar (Rudy and McBain, 2001, Trends in Neurosciences 24, 517-526). Kv3 channels are activated by depolarisation of the plasma membrane to voltages more positive than -20mV; furthermore, the channels deactivate rapidly upon repolarisation of the membrane. These biophysical properties ensure that the channels open towards the peak of the depolarising phase of the neuronal action potential to initiate repolarisation. Rapid termination of the action potential mediated by Kv3 channels allows the neuron to recover more quickly to reach sub-threshold membrane potentials from which further action potentials can be triggered. As a result, the presence of Kv3 channels in certain neurons contributes to their ability to fire at high frequencies (Rudy and McBain, 2001, Trends in Neurosciences 24, 517-526). Kv3.1-3 subtypes are predominant in the CNS, whereas Kv3.4 channels are found predominantly in skeletal muscle and sympathetic neurons (Weiser et al., 1994, J.Neurosci. 14, 949-972). Kv3.1-3 channel subtypes are differentially expressed by sub-classes of interneurons in cortical and hippocampal brain areas (e.g. Chow et al., 1999, J.Neurosci. 19, 9332-9345; Martina et al., 1998, J.Neurosci. 18, 8111-8125; McDonald and Mascagni, 2006, Neurosci. 138, 537-547, Chang et al., 2007, J. Comp. Neurol. 502, 953-972), in the thalamus (e.g. Kasten et al., 2007, J.Physiol. 584, 565-582), cerebellum (e.g. Sacco et al., 2006, Mol. Cell. Neurosci. 33, 170-179), and auditory brain stem nuclei (Li et al., 2001, J. Comp. Neurol. 437, 196-218).

Characterisation of mice in which one or more of the Kv3 subtypes has been deleted shows that the absence of Kv3.1 gives rise to increased locomotor activity, altered electroencephalographic activity, and a fragmented sleep pattern (Joho et al., 1999, J.Neurophysiol. 82, 1855-1864). The deletion of Kv3.2 leads to a reduction in seizure threshold and altered cortical electroencephalographic activity (Lau et al., 2000, J.Neurosci. 20, 9071-9085). Deletion of Kv3.3 is associated with mild ataxia and motor deficits (McMahon et al., 2004, Eur. J.Neurosci. 19, 3317-3327). Double deletion of Kv3.1 and Kv3.3
gives rise to a severe phenotype characterised by spontaneous seizures, ataxia, and an increased sensitivity to the effects of ethanol (Espinosa et al., 2001, J. Neurosci. 21, 6657-6665; Espinosa et al., 2008, J. Neurosci. 28, 5570-5581).

The known pharmacology of Kv3 channels is limited. Tetraethylammonium (TEA) has been shown to inhibit the channels at low millimolar concentrations (Rudy and McBain, 2001, Trends in Neurosci. 24, 517-526), and blood-depressing substance (BDS) toxins from the sea anemone, Anemónia sulcata (Diochot et al., 1998, J. Biol. Chem. 273, 6744-6749), have been shown to selectively inhibit Kv3 channels with high affinity (Yeung et al., 2005, J. Neurosci. 25, 8735-8745). In addition to compounds acting directly on Kv3 channels, agonists of receptors that activate protein kinase A (PKA) and protein kinase C (PKC) have been shown to modulate Kv3-mediated currents in specific brain areas, leading to a reduction in the ability of the neurons to fire at high frequency (Atzori et al., 2000, Nat. Neurosci. 3, 791-798; Song et al., 2005, Nat Neurosci. 8, 1335-1342); these studies suggest that PKA and PKC can specifically phosphorylate Kv3 channels in a neuron-specific manner, causing a reduction in Kv3-mediated currents.

Bipolar disorder, schizophrenia, anxiety, and epilepsy are serious disorders of the central nervous system that have been associated with reduced function of inhibitory interneurons and gamma-amino butyric acid (GABA) transmission (Reynolds et al., 2004, Neurotox. Res. 6, 57-61; Benes et al., 2008, PNAS, 105, 20935-20940; Brambilla et al., 2003, Mol. Psychiatry. 8, 721-37, 715; Aroniadou-Anderjaska et al., 2007, Amino Acids 32, 305-315; Ben-Ari, 2006, Crit. Rev. Neurobiol. 18, 135-144).

Parvalbumin positive basket cells that express Kv3 channels in the cortex and hippocampus play a key role in generating feedback inhibition within local circuits (Markram et al., 2004, Nat.Rev.Neurosci. 5, 793-807). Given the relative dominance of excitatory synaptic input over inhibitory input to glutamatergic pyramidal neurons in these circuits, fast-firing of interneurons supplying inhibitory input is essential to ensure balanced inhibition. Furthermore, accurate timing of inhibitory input is necessary to sustain network synchronisation, for example, in the generation of gamma frequency field potential oscillations that have been associated with cognitive function (Fisahn et al., 2005, J.Physiol 562, 65-72; Engel et al., 2001, Nat.Rev.Neurosci. 2, 704-716). Notably, a reduction in gamma oscillations has been observed in patients with schizophrenia (Spencer et al., 2004, PNAS 101, 17288-17293). Consequently, positive modulators of Kv3 channels might be expected to enhance the firing capabilities of specific groups of fast-firing neurons in the brain. These effects may be beneficial in disorders associated with abnormal activity of these neuronal groups.
In addition, Kv3.2 channels have been shown to be expressed by neurons of the superchiasmatic nucleus (SCN) the main circadian pacemaker in the CNS (Schulz and Steimer, 2009, CNS Drugs 23 Suppl 2, 3-13).

Hearing loss represents an epidemic that affects approximately 16% of the population in Europe and the US (Goldman and Holme, 2010, Drug Discovery Today 15, 253-255), with a prevalence estimated at 250 million people worldwide (B.Shield, 2006, Evaluation of the social and economic costs of hearing impairment. A report for Hear-It AISBL: www.hear-it.org/multimedia/Hear_It_Report_October_2006.pdf). As life expectancy continues to increase, so too will the number of people suffering from hearing disorders. Furthermore, it is believed that modern lifestyles may exacerbate this burden as the younger generation ages. Hearing conditions, including tinnitus have a profound effect on the quality of life, causing social isolation, depression, work and relationship difficulties, low self-esteem, and prejudice. Voltage-gated ion channels of the Kv3 family are expressed at high levels in auditory brainstem nuclei (Li et al., 2001, J. Comp. Neurol. 437, 196-218) where they permit the fast firing of neurons that transmit auditory information from the cochlear to higher brain regions. Loss of Kv3.1 channel expression in central auditory neurons is observed in hearing impaired mice (von Hehn et al., 2004, J. Neurosci. 24, 1936-1940), and a decline in Kv3.1 expression may be associated with loss of hearing in aged mice (Jung et al. 2005 Neurol. Res. 27, 436-440). Furthermore, pathological plasticity of auditory brainstem networks is likely to contribute to symptoms that are experienced by many people suffering from hearing loss of different types. Recent studies have shown that regulation of Kv3.1 channel function and expression has a major role in controlling auditory neuron excitability (Kaczmarek et al., 2005, Hearing Res. 206, 133-145), suggesting that this mechanism could account for some of the plastic changes that give rise to tinnitus. More specifically, a reduction in Kv3-like potassium currents in neurons of the dorsal cochlear nucleus has now been observed following acoustic trauma in rats, suggesting that reduced Kv3 function could contribute to the pathological process that is triggered by damaging noise (Pilati et al., 2011, Hearing Res., doi:10.1016/j.hearing.2011.10.008), and supporting the hypothesis that positive modulation of Kv3 channels in auditory brainstem nuclei could have a therapeutic benefit in patients suffering from noise-induced hearing loss. Finally, Fragile X syndrome and autism are frequently associated with hypersensitivity to sensory input, including auditory stimuli. Recent findings suggest that the protein coded by the FMR-I gene, whose mutation or absence gives rise to Fragile X syndrome, may directly regulate the expression of Kv3.1 channels in the auditory brainstem nuclei (Strumbos et al., 2010, J.Neuroscience, in press), suggesting that mis-regulation of Kv3.1 channels could give rise to hyperacusis in patients suffering from Fragile X or autism. Consequently, we propose that small molecule
modulators of Kv3 channels in auditory brainstem nuclei could have a benefit in the treatment of disorders of hearing, including tinnitus and auditory hyper-acuity associated with Fragile X syndrome and autism.

**Summary of the invention**

The present invention provides compounds of formula (I):

![Chemical Structure](image)

wherein:

- $R_1$ is H, or $C_{1-4}$alkyl, halo, halo$C_{1-4}$alkyl, CN, $Cl_{1-4}$alkoxy, halo$Cl_{1-4}$alkoxy;
- $R_2$ is H, $Cl_{1-4}$alkyl, $C_{3-4}$ spiro carbocycly, halo$Cl_{1-4}$alkyl or halo;
- $R_3$ is H, $Cl_{1-4}$alkyl, halo$Cl_{1-4}$alkyl, halo; or $R_3$ is absent;
- $R_{13}$ is H, $Cl_{1-4}$alkyl, halo$Cl_{1-4}$alkyl, halo; or $R_{13}$ is absent;
- $A$ is a 5 or 6 membered saturated or unsaturated heterocycle, with at least one O atom; which heterocycle is optionally fused with a cyclopropyl group to form a tricycle when considered together with the phenyl;
- $X$ is Cor N;
- $Y$ is Cor N;
- $R_5$ is $Cl_{1-4}$ alkyl;
- $R_5$ is H, Deuterium, $Cl_{1-4}$ alkyl;

or $R_5$ and $R_3$ can be fused to form $C_{3-4}$ spiro carbocycly;
Compounds of formula (I) may be provided in the form of a pharmaceutically acceptable salt and/or solvate. In one embodiment of the invention a compound of formula (I) is provided in the form of a pharmaceutically acceptable salt.

The compounds of formula (I) may be used as medicaments, in particular for the prophylaxis or treatment of hearing disorders, including hearing loss and tinnitus, as well as schizophrenia, bipolar disorder, epilepsy and sleep disorders.

Further, there is provided a method for the prophylaxis or treatment of hearing disorders, including hearing loss and tinnitus, as well as schizophrenia, bipolar disorder, epilepsy and sleep disorders by administering to a subject a compound of formula (I).

Compounds of formula (I) may be used in the manufacture of a medicament for the prophylaxis or treatment of hearing disorders, including hearing loss and tinnitus, as well as schizophrenia, bipolar disorder, epilepsy and sleep disorders.

Also provided are pharmaceuticual compositions containing a compound of formula (I) and a pharmaceutically acceptable carrier or excipient.

**Detailed description of the invention**

The present invention provides compounds of formula (I):

![Chemical Structure](image)

wherein:

- $R_1$ is H, or C$_{1-4}$alkyl, halo, haloC$_{1-4}$alkyl, CN, C$_{1-4}$alkoxy, haloC$_{1-4}$alkoxy;
- $R_2$ and $R_3$ may be attached to the same or a different ring atom; and wherein $R_2$ may be attached to a fused ring atom.
R₂ is H, C₃₋₄ alkyl, C₅₋₆ spiro carbocycly, haloC₅₋₆ alkyl or halo;

R₃ is H, C₃₋₄ alkyl, haloC₅₋₆ alkyl, halo;

R₄ is H, C₅₋₆ alkyl, haloC₅₋₆ alkyl, halo;

A is a 5 or 6 membered saturated or unsaturated heterocycle, with at least one O atom; which heterocycle is optionally fused with a cyclopropyl group to form a tricycle when considered together with the phenyl;

X is C or N;

Y is C or N;

R₁ is C₂₋₄ alkyl;

R₂ is H, Deuterium, C₂₋₄ alkyl;

or R₁ and R₂ can be fused to form C₅₋₆ spiro carbocycly;

wherein R₂ and R₃ may be attached to the same or a different ring atom; and wherein R₂ may be attached to a fused ring atom.

Suitably R₁ is H or methyl. In one embodiment of the invention R₁ is H. In a second embodiment the invention R₁ is C₂₋₄ alkyl, in particular R₁ is methyl.

Suitably R₂ is H, F, methyl, ethyl, isopropyl or a C₅ spiro group. In one embodiment of the invention R₂ is H. In a second embodiment of the invention R₂ is C₂₋₄ alkyl, in a particular example of this embodiment R₂ is methyl, in a further example of this embodiment R₂ is ethyl and in another example of this embodiment R₂ is propyl (e.g. isopropyl). In a third embodiment of the invention R₂ is a C₅ spiro group.

In a fourth embodiment of the invention R₂ is a C₅ spiro group. In a fifth embodiment of the invention R₂ is halo, in particular fluoro.

Suitably R₂ is H, F, methyl or ethyl. In one embodiment of the invention R₂ is H. In a second embodiment of the invention R₂ is C₂₋₄ alkyl, in a particular example of this embodiment R₂ is methyl, in a further example of this embodiment R₂ is ethyl. In a third embodiment of the invention R₂ is halo, in particular fluoro. The skilled person will appreciate that, depending on the size, presence of heteroatoms and the degree of unsaturation of the A ring, R₃ may be absent. Consequently, in another embodiment of the invention R₃ is absent.
Suitably, R₃ may be H, F, methyl or ethyl and R₂ may be H, F, methyl, ethyl, isopropyl or C₃₄ spiro carbocycly. In particular, R₃ may be H, F, methyl or ethyl and R₂ may be H, F, methyl, ethyl, isopropyl or C₃ spiro carbocycly. In certain embodiments R₃ is H and R₂ is H, methyl, ethyl, isopropyl or C₃₄ spiro carbocycly. In other embodiments, R₃ is methyl or ethyl and R₂ is methyl or ethyl, in one example of this embodiment R₃ and R₂ are both methyl (such as attached to the same ring carbon atom), in a second example of this embodiment R₃ and R₂ are both ethyl (such as attached to the same ring carbon atom). In further embodiments R₃ and R₂ are both fluoro (such as attached to the same ring carbon atom).

Suitably R₃ is may be H. For methyl in one embodiment of the invention R₃ is H. In a second embodiment of the invention R₃ is C₃₄ alkyl, in a particular example of this embodiment R₃ is methyl. In a third embodiment of the invention R₃ is halo, in particular fluoro. The skilled person will appreciate that, depending on the size, presence of heteroatoms and the degree of unsaturation of the A ring, R₃ may be absent. Consequently, in another embodiment of the invention R₃ is absent. In one embodiment of the invention A is a 5 membered saturated or unsaturated heterocycle, with at least one O atom; which heterocycle is optionally fused with a cyclopropyl group to form a tricycle when considered together with the phenyl. In a second embodiment of the invention A is a 6 membered saturated or unsaturated heterocycle, with at least one O atom; which heterocycle is optionally fused with a cyclopropyl group to form a tricycle when considered together with the phenyl.

In certain embodiments the ring A contains one heteroatom. In other embodiments the ring A contains two heteroatoms (e.g., two oxygen atoms, alternatively one oxygen atom and one nitrogen atom).

Suitably, A is dihydrofuran, isoxazole, dihydropyran, 1,3-dioxolane, 1,3-oxazine or dihydropyran fused with a cyclopropyl group. In one embodiment of the invention A is dihydrofuran. In a second embodiment of the invention A is dihydropyran. In a third embodiment the invention A is dihydrofuran fused with a cyclopropyl group. In a fourth embodiment the invention A is dihydropyran fused with a cyclopropyl group. In a fifth embodiment of the invention A is dihydrofuran, isoxazole or dihydropyran. In a sixth embodiment of the invention A is dihydrofuran, isoxazole or dihydropyran, fused with a cyclopropyl group. In a seventh embodiment of the invention A is 1,3-oxazine. In an eighth embodiment of the invention A is 1,3-dioxolane.

When A contains a 5 membered heterocycle containing one heteroatom, suitably the oxygen atom is located in the meta position relative to the phenyl ring.
When A contains a 5 membered heterocycle containing one heteroatom, suitably the heterocycle is dihydrofuran.

When A contains a 6 membered heterocycle containing one heteroatom, suitably the oxygen atom is located in the meta position relative to the phenyl ring.

When A contains a 6 membered heterocycle containing one heteroatom, suitably the heterocycle is dihydropyran.

When A is a five membered ring, in particular embodiments of the invention one of $R_2, R_3$ and $R_5$ is H and the others are both methyl, for example one of $R_2, R_3$ and $R_5$ is H and the others are both methyl attached to the same ring carbon. Alternatively when A is a five membered ring, $R_2$ is a $C_3$ spiro group and $R_3$ and $R_5$ are both H.

When A is a five membered ring fused with a cyclopropyl group, suitably $R_2, R_3$ and $R_5$ are all H.

When A is a six membered ring, in particular embodiments of the invention one of $R_2, R_3$ and $R_5$ is methyl and the others are both H. Alternatively when A is a six membered ring, $R_2$ is a $C_3$ spiro group and $R_3$ and $R_5$ are both H.

When A is a five membered ring fused with a cyclopropyl group, suitably $R_2, R_3$ and $R_5$ are all H.

When A is a six membered ring fused with a cyclopropyl group, suitably $R_2, R_3$ and $R_5$ are all H.

In one embodiment of the invention $X$ is C and $Y$ is C. In a second embodiment of the invention $X$ is N and $Y$ is C. In a third embodiment of the invention $X$ is N and $Y$ is N.

Suitably, $R_5$ is methyl, ethyl, isopropyl or t-butyl. In one embodiment of the invention $R_5$ is methyl. In another embodiment of the invention $R_5$ is ethyl. In a further embodiment of the invention $R_5$ is propyl, such is isopropyl. In a yet further embodiment of the invention $R_5$ is butyl, such as t-butyl.

Suitably, $R_5$ is H or methyl. In one embodiment of the invention $R_5$ is H. In a second embodiment of the invention $R_5$ is $C_1-4$ alkyl, in particular $R_5$ is methyl.

In one embodiment of the invention $R_5$ and $R_5$ together form a $C_3$ spiro carbocycle. In a second embodiment of the invention $R_5$ and $R_5$ together form a $C_3$ spiro carbocycle. In a further embodiment of the invention $R_5$ is methyl and $R_5$ is methyl. In an embodiment of particular interest, $R_5$ is ethyl and $R_5$ is methyl.

Suitably, $R_5$ and $R_5$ have the stereochemical arrangement:
In one embodiment of the invention, \( R_5 \) is H and the \( R \) substituents is in the S configuration.

In one embodiment of the invention \( R_4 \) is methyl, \( R_5 \) is methyl, \( X \) is N and \( Y \) is C, such as where \( A \) is dihydrofuran, in particular where \( A \) is dihydrofuran and \( R_1 \) is H, especially where \( A \) is dihydrofuran, \( R_4 \) is H and \( R_2 \) is a \( C_3 \) spiro group.

Compounds of formula (I), or any subset thereof including compounds of formula (lb) and compounds of formula (lc) may optionally be provided in the form of a pharmaceutically acceptable salt and/or solvate. In one embodiment of the invention a compound of formula (I) is provided in the form of a pharmaceutically acceptable salt. In a second embodiment of the invention a compound of formula (I) is provided in the form of a pharmaceutically acceptable solvate. In a third embodiment of the invention a compound of formula (I) is not in the form of a salt or solvate.

In a further aspect, the invention provides a compound of formula (lb):

wherein:

\[ R_1 \] is H, or \( C_{1-4} \) alkyl, halo, halo\( C_{1-4} \) alkyl, CN, \( C_{1-4} \) alkoxy, halo\( C_{1-4} \) alkoxy;

\[ R_2 \] is H, \( C_{1-4} \) alkyl, \( C_{3-4} \) spiro carbocycle, halo\( C_{1-4} \) alkyl or halo;

\[ R_3 \] is H, \( C_{1-4} \) alkyl, halo\( C_{1-4} \) alkyl, halo;
A is a 5 or 6 membered saturated or unsaturated heterocycle, with at least one O atom; which heterocycle is optionally fused with a cyclopropyl group to form a tricycle when considered together with the phenyl;

X is C or N;

Y is C or N;

R₁ is C₃₋₄ alkyl;

R₅ is H, Deuterium, C₁₋₄ alkyl;

or R₆ and R₅ can be fused to form C₃₋₄ spiro carbocycl;

wherein R₂ and R₃ may be attached to the same or a different ring atom; and wherein R₂ may be attached to a fused ring atom;

or a pharmaceutically acceptable salt thereof.

Also provided is a compound of formula (lc)

\[
\begin{align*}
\text{wherein:} \\
R₁ & \text{ is H, or C}_1\text{-}_4 \text{ alkyl;} \\
R₂ & \text{ is H, C}_1\text{-}_4 \text{ alkyl, C}_3\text{-}_4 \text{ spiro carbocycl, haloC}_1\text{-}_4 \text{ alkyl or halo;} \\
R₃ & \text{ is H, C}_1\text{-}_4 \text{ alkyl, haloC}_1\text{-}_4 \text{ alkyl, halo;} \\
\end{align*}
\]
A is a 5 or 6 membered saturated or unsaturated heterocycle, with at least one O atom; which heterocycle is optionally fused with a cyclopropyl group to form a tricycle when considered together with the phenyl;

X is C or N;

Y is C or N;

$R_3$ is C$_{1-4}$ alkyl;

$R_5$ is H, Deuterium, C$_{1-4}$ alkyl;

or $R_6$ and $R_5$ can be fused to form C$_{3-4}$ spiro carbocycle;

wherein $R_2$ and $R_3$ may be attached to the same or a different ring atom;

and wherein $R_2$ may be attached to a fused ring atom;

or a pharmaceutically acceptable salt thereof.

In respect of the compounds of formula (1b) and (1c):

In one embodiment of the invention $R_1$ is H.

In one embodiment of the invention $R_1$ is C$_{1-4}$ alkyl. In another embodiment of the invention $R_1$ is methyl.

In one embodiment of the invention $R_2$ is H.

In one embodiment of the invention $R_2$ is C$_{1-4}$ alkyl. In another embodiment $R_2$ is methyl. In a further embodiment $R_2$ is ethyl. In a yet further embodiment $R_2$ is propyl.

In one embodiment of the invention $R_2$ is a C$_3$ spiro group.

In one embodiment of the invention $R_3$ is H.

In one embodiment of the invention $R_3$ is C$_{1-4}$ alkyl. In another embodiment of the invention $R_3$ is methyl.

In one embodiment of the invention $A$ is tetrahydrofuran, isoxazole or tetrahydropyran.

In one embodiment of the invention $A$ is tetrahydrofuran, isoxazole or tetrahydropyran, fused with a cyclopropyl group.
In one embodiment of the invention X is C and Y is C.

In one embodiment of the invention X is N and Y is C.

In one embodiment of the invention X is N and Y is N.

In one embodiment of the invention R is methyl. In another embodiment of the invention R is ethyl. In a further embodiment of the invention R is propyl. In a yet further embodiment of the invention R is butyl.

In one embodiment of the invention R is H.

In one embodiment of the invention R is C-alkyl. In another embodiment of the invention R is methyl.

In one embodiment of the invention R and R together form a C spiro carbocycle.

In one embodiment of the invention R and R together form a C spiro carbocycle.

In one embodiment of the invention, R is H and the R substituent is in the Sconfiguration.

In one embodiment of the invention R is methyl and R is methyl.

In one embodiment of the invention R is methyl, R is methyl, X is N and Y is C.

In one embodiment of the invention R is methyl, R is methyl, X is N, Y is C and A is tetrahydrofuran.

In one embodiment of the invention R is methyl, R is methyl, X is N, Y is C, A is tetrahydrofuran and R is H.

In one embodiment of the invention R is methyl, R is methyl, X is N, Y is C, A is tetrahydrofuran, R is H and R is a C spiro group.

In one embodiment of the invention the compound is selected from the group consisting of:

(5/)-3-[4-(l,3-dihydro-2-benzofuran-4-yloxy)phenyl]-5-methyl-2,4-imidazolidinedione;

(5/)-5-methyl-3-{4-[3-methyl-l,2-benzisoxazol-4-yl]oxy}phenyl]-2,4-imidazolidinedione;

(5/)-3-{4-[3,6-dimethyl-l,2-benzisoxazol-4-yl]oxy}phenyl]-5-methyl-2,4-imidazolidinedione;

5,5-dimethyl-3-{4-[3-methyl-l,2-benzisoxazol-4-yl]oxy}phenyl]-2,4-imidazolidinedione;
(5/?)-5-ethyl-346-{[3-ethyl-l,2-benzisoxazol-4-yl]oxy}-3-pyridinyl}-2,4-imidazolidinedione;

For the avoidance of doubt, the embodiments of any one feature of the compounds of the invention may be combined with any embodiment of another feature of compounds of the invention to create a further embodiment.
The term 'halo' or 'halogen' as used herein, refers to a fluorine, chlorine, bromine or iodine atom. Particular examples of halo are fluorine and chlorine, especially fluorine.

When the compound contains a C₄₋₄alkyl group, whether alone or forming part of a larger group, e.g. C₁₋₄alkoxy, the alkyl group may be straight chain, branched, cyclic, or a combination thereof.

Examples of C₁₋₄alkyl are methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, tert-butyl, cyclopropyl and cyclobutyl. A particular group of exemplary C₁₋₄alkyl groups are methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, tert-butyl. An example of C₁₋₄alkoxy is methoxy.

The term 'haloC₁₋₄alkyl' as used herein, includes straight chain, branched chain or cyclic alkyl groups containing 1 to 4 carbon atoms substituted by one or more halo atoms, for example fluromethyl, difluoromethyl and trifluoromethyl. A particular group of exemplary haloC₁₋₄alkyl include methyl and ethyl groups substituted with one to three halo atoms, in particular one to three fluoro atoms.

The term 'haloC₁₋₄alkoxy' as used herein, includes straight chain, branched chain or cyclic alkoxy groups containing 1 to 4 carbon atoms substituted by one or more halo atoms, for example fluormethoxy, difluormethoxy and trifluormethoxy. A particular group of exemplary haloC₁₋₄alkyl include methoxy and ethoxy groups substituted with one to three halo atoms, in particular one to three fluoro atoms.

The term '5 or 6 membered saturated or unsaturated heterocycle, with at least one O atom' includes for example furan, oxazole, isoxazole, oxadiazole, terahydrofuran, pyran, tetrahydropyran, dioxolane, dioxan, morpholine, and oxazoline.

It will be appreciated that for use in medicine the salts of the compounds of formula (I) should be pharmaceutically acceptable. Suitable pharmaceutically acceptable salts will be apparent to those skilled in the art. Pharmaceutically acceptable salts include those described by Berge, Bighley and Monkhouse J.Pharm.Sci. (1977) 66, pp 1-19. Such pharmaceutically acceptable salts include acid addition salts formed with inorganic acids e.g. hydrochloric, hydrobromic, sulphuric, nitric or phosphoric acid and organic acids e.g. succinic, maleic, acetic, fumaric, citric, tartaric, benzoic, p-toluensulfonic, methanesulfonic or naphthalenesulfonic acid. Other salts e.g. oxalates or formates, may be used, for example in the isolation of compounds of formula (I) and are included within the scope of this invention.

Certain of the compounds of formula (I) may form acid addition salts with one or more equivalents of the acid. The present invention includes within its scope all possible stoichiometric and non-stoichiometric forms.
The compounds of formula (I) may be prepared in crystalline or non-crystalline form and, if crystalline, may optionally be solvated, e.g. as the hydrate. This invention includes within its scope stoichiometric solvates (e.g. hydrates) as well as compounds containing variable amounts of solvent (e.g. water).

It will be understood that the invention includes pharmaceutically acceptable derivatives of compounds of formula (I) and that these are included within the scope of the invention.

As used herein "pharmaceutically acceptable derivative" includes any pharmaceutically acceptable ester or salt of such ester of a compound of formula (I) which, upon administration to the recipient is capable of providing (directly or indirectly) a compound of formula (I) or an active metabolite or residue thereof.

It is to be understood that the present invention encompasses all isomers of formula (I) and their pharmaceutically acceptable derivatives, including all geometric, tautomeric and optical forms, and mixtures thereof (e.g. racemic mixtures). Where additional chiral centres are present in compounds of formula (I), the present invention includes within its scope all possible diastereoisomers, including mixtures thereof. The different isomeric forms may be separated or resolved one from the other by conventional methods, or any given isomer may be obtained by conventional synthetic methods or by stereospecific or asymmetric syntheses.

The subject invention also includes isotopically-labeled compounds which are identical to those recited in formula (I) but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number most commonly found in nature. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, fluorine, iodine and chlorine such as $^3$H, $^{11}$C, $^{14}$C, $^{18}$F, $^{123}$I or $^{125}$I. Another isotope of interest is $^{13}$C.

Compounds of the present invention and pharmaceutically acceptable salts of said compounds that contain the aforementioned isotopes and/or other isotopes of other atoms are within the scope of the present invention. Isotopically labeled compounds of the present invention, for example those into which radioactive isotopes such as $^3$H or $^{14}$C have been incorporated, are useful in drug and/or substrate tissue distribution assays. Tritiated, i.e. $^3$H, and carbon-14, i.e. $^{14}$C, isotopes are particularly preferred for their ease of preparation and detectability. $^{11}$C and $^{18}$F isotopes are particularly useful in PET (positron emission tomography).
Since the compounds of formula (I) are intended for use in pharmaceutical compositions it will readily be understood that they are each preferably provided in substantially pure form, for example at least 60% pure, more suitably at least 75% pure and preferably at least 85%, especially at least 98% pure (% are on a weight for weight basis). Impure preparations of the compounds may be used for preparing the more pure forms used in the pharmaceutical compositions.

According to a further aspect of the present invention there is provided a process for the preparation of compounds of formula (I) and derivatives thereof. The following schemes detail some synthetic routes to compounds of the invention. In the following schemes reactive groups can be protected with protecting groups and deprotected according to well established techniques.

In general, the compounds of formula (I) may be made according to the organic synthesis techniques known to those skilled in this field, as well as by the representative methods set forth below, those in the Examples and modifications thereof.

Compounds of formula (I), and salts and solvates thereof, may be prepared by the general methods outlined hereinafter. In the following description, the groups A, R1, R2, X, Y, R3, R4 and R5 have the meanings as previously defined for compounds of formula (I) unless otherwise stated.

Scheme Ia

**step (i):** Compounds of formula (I) can be prepared by cyclization of compounds of formula (II) in a solvent e.g. dichloromethane with a carbonylating agent e.g. triphosgene preferentially prediluted in the same solvent and added in a second time at 0°C in presence of a base e.g. triethylamine. In some cases, ethyl acetate could be used as a solvent. Optionally a catalytic amount of DMAP can be added.

**step (ii):** Compounds of formula (II) can be prepared from compounds of formula (II) by removal of the BOC protective group in acidic conditions e.g. TFA in a solvent e.g. dichloromethane at approximately 0°C or RT.
Compounds of formula (I), wherein $X=Y=N$ or $(X=C, Y=N)$ or $(X=N, Y=C)$ and $R$ and $R_5$ are not $H$, can be prepared by nucleophilic aromatic substitution. In this reaction a halo-pyridyl or halo-pyrimidyl derivative of formula (VI) wherein typically $Z=Cl$ and a phenol of formula (IX) are reacted in the presence of a base such as potassium carbonate in a suitable solvent, e.g. in N,N-dimethylformamide or in acetonitrile, with conventional heating or microwave heating.

Scheme I c

step (iii): Compounds of formula (I) wherein $R_1$ and $R_2$ are not $H$ can be prepared by reaction of a urea of the type produced by step (ii) as shown above and a base such as sodium methoxide in a suitable solvent, e.g. in N,N-dimethylformamide.

step (ii): The urea product of step (ii) as shown above can be prepared by reaction of anilines of formula (IV) and amino esters (hydrochloride salt) of formula (XII) in a suitable solvent, e.g. dichloromethane or ethyl acetate, with a carbonylating agent, e.g. triphosgene, preferentially prediluted in the same solvent in presence of a base, e.g. triethylamine or diisopropylethylamine, at temperature ranging from 0°C to 60°C, optionally adding a catalytic or stoichiometric amount of DMAP.

step (i): Amino esters (hydrochloride salt) of formula (XIII) (if not commercially available) can be prepared from commercially available amino acids (hydrochloride salt) of formula (XI) by reaction with methanol in presence of a catalytic or stoichiometric amount of thyonyl chloride at temperature ranging from r.t. to reflux.
Scheme 2a

Step (i): Compounds of formula (II) can be prepared from anilines of formula (IV) and amino acids (as free base or hydrochloride salt) of formula (VI) by amidic coupling in the presence of a coupling agent e.g. T3P in a solvent such as ethyl acetate, acetonitrile or a mixture of them.

Scheme 2b

Step (ii): Compounds of formula (III) can be prepared from anilines of formula (IV) and N-protected amino acids of formula (V) by amidic coupling in the presence of a base e.g. DIPEA and of a coupling agent e.g. HATU, TBTU in a solvent such as N,N-dimethylformamide.

Step (i): Some N-Boc protected amino acids of formula (V) are commercially available e.g. N-[(1,1-dimethylethyl)oxy]carbonyl]-2-methylalanine from example Aldrich, N-[(1,1-dimethylethyl)oxy]carbonyl]-D-alanine from example Aldrich, (2R,2S)-2-[[[(1,1-dimethylethyl)oxy]carbonyl]amino]butanoic acid from example Bachem UK Ltd, N-[(1,1-dimethylethyl)oxy]carbonyl]-D-isovaline from example Nagase & Co Ltd.

N-protected amino acids of formula (V) can also be prepared from compounds of formula (VI) for example with Boc-anhydride in presence of a base e.g. aqueous NaHCO₃, aqueous sodium hydroxide in a solvent such as THF, methanol, dioxane. Many descriptions are available in the literature (for example Tetrahedron, 2006, 62(42), 9966-9972)
Anilines of formula (IV) can be prepared from the nitro compounds (VII). Suitable reactions conditions to transform (VII) into (IV) are for example:

- reduction in presence of Fe powder and ammonium chloride in a solvent such as a mixture THF/water for example at room temperature
- reduction with tin chloride hydrate in a solvent such as ethanol with heating for example at reflux.

Anilines of formula (IVa), wherein R₂ is H, C₁₋₄ alkyl, C₃₋₄ spiro carbocycly and R₃ is H, C₁₋₄ alkyl and (X,Y) is not (N,N) can be prepared from the nitro compounds (Vila) with the conditions described on Scheme 3 or also with the following conditions:
- reduction with hydrazine hydrate and a catalytic amount of Pd/C in a solvent such as ethanol with heating for example at reflux.

Compounds of formula (VIIb) wherein X=Y=C or (X=C, Y=N) or (X=N, Y=C) can be prepared by nucleophilic aromatic substitution. In this reaction are used a nitro derivative of formula (VIIb) wherein Z=F (usually when [X=C, Y=C]) or Z=Cl (usually when [X=N, Y=C] or [X=C, Y=N]) and a phenol of formula (IX) in
presence of a base such as potassium carbonate in a solvent e.g. in N,N-dimethylformamide or in acetonitrile with regular heating or microwave one.

Compounds of formula (VIlc) wherein X=Y=N can be prepared by nucleophilic aromatic substitution from phenol (IX) and nitro compound (VIIlc) wherein usually Z=Cl at room temperature using a base such as potassium carbonate in a solvent such as N,N-dimethylformamide. A further suitable solvent is acetonitrile.

Scheme 6

step (iii): Phenol of formula (IXa) corresponding to compound of formula (IX) wherein R₂ is H and A is the heterocycle depicted on Scheme 6 can be prepared by an intramolecular reaction from compounds of formula (X) in presence of a catalytic amount of AuCl₃ in acetonitrile at room temperature or a catalytic amount of PtCl₂ in acetone with heating (as described for that one in the Journal of the American Chemical Society 2003, 125, 5757-5766)

step (ii): Compound of formula (X) can be prepared from compound of formula (XI) with a similar method to the one described in the Journal of the American Chemical Society 2003, 125, 5757-5766 by nucleophilic substitution in presence of a base such as sodium hydride in a solvent e.g. DMF, with addition in a second time of an electrophile e.g. 3-bromo-l-propyne.

Scheme 7

step (ii): Phenols of formula (IXb), corresponding to compounds of formula (IX) wherein R₁ is H and A the heterocycles depicted on Scheme 7 (R₂ being Me or Et), can be prepared using the corresponding compounds of formula (XII) in presence of acidic conditions such as aqueous HCl in a solvent such as methanol.
**step (i):** Compounds of formula (XII) can be prepared by cyclization of compounds of formula (XI) using a base such as nBuLi in a solvent such as THF e.g. at 0°C, adding in a second time 4-methylbenzenesulfonyl chloride e.g. at 0°C, then a second equivalent of a base such as nBuLi e.g. from 0°C to room temperature and stopping the reaction with a diluted protic acid such as HCl.

Optionally the two steps (i) and (ii) can be carried out in a one pot fashion.

**Scheme 8a**

**step (i):** Compound of formula (XIia) wherein $R_6 = \text{Me}$ can be prepared directly from compound of formula (XV)

- by lithiation using for example nBuLi in a solvent such as hexane in presence of TMEDA from room temperature to 60°C
- adding in a second time acetaldehyde for example at -78°C and warming up the reaction mixture for example to room temperature.

**step (iii):** Compound of formula (XIib) wherein $R_6 = \text{Et}$ can be prepared from protected compound (XIV)

- by lithiation using for example nBuLi in a solvent such as hexane at room temperature
- adding in a second time propanal for example at 0°C and warming up the reaction mixture for example to room temperature.

**step (ii):** Compound of formula (XIV) can be prepared from compound of formula (XV) by silylation, using for example chloro(1,l-dimethylethyl)dimethylsilane, 1H imidazole in a solvent such as dichloromethane at room temperature.
**step (iii):** phenol of the type produced by step (iii) as shown above can be obtained from alcohol of the type produced by step (ii) as shown above after treatment with a suitable acid such as H$_2$SO$_4$ or p-tolysolphonic acid in a suitable solvent such as ethyl acetate, methanol or ethanol.

**step (ii):** The product of step (ii) as shown above can be prepared from the protected compound of the type produced by step (ii) as shown above
- by lithiation using for example nBuLi in a solvent such as hexane at room temperature (optionally adding CeCl$_3$ previously stirred in dry THF at room temperature under argon or hydrogen atmosphere)
- adding in a second stage cyclobutanone for example at 0°C and warming up the reaction mixture for example to room temperature.

**step (i):** The product of step (i) as shown above can be prepared from the starting alcohol by silylation, using for example chloro(l,l-dimethylethyl)dimethylsilane, 1H imidazole in a solvent such as dichloromethane at room temperature.

**Scheme 9a**

**step (ii):** Compounds of formula (XV) can be prepared from esters of formula (XVI) using a suitable reducing agent typically LiAlH$_4$ in a solvent such as tetrahydrofuran at a temperature such as 0°C.

**step (i):** Compounds of formula (XVI) can be prepared from phenols of formula (XVI) using chloro(methyloxy)methane, a base such as DIPEA in a solvent such as dichloromethane for example from 0°C to room temperature.

**Scheme 9b**
**step (ii):** The product of step (ii) as shown above can be prepared from esters of the type produced by step (i) as shown above using a suitable reducing agent typically LiAlH₄ in a solvent such as tetrahydrofuran at a temperature such as 0°C or room temperature.

**step (i):** The product of step (i) as shown above can be prepared from the starting phenol using chloro(methyloxy)methane, a base such as NaH in a solvent such as DMF or THF for example from 0°C to room temperature.

 Optionally the two steps (i) and (ii) can be carried out in a one pot fashion.

*Scheme 10*

**step (ii):** Compounds of formula (XIX) can be prepared from compounds of formula (XX) with hydroxylamine hydrochloride using a base such as sodium acetate heating e.g. at reflux in a solvent such as a mixture ethanol/water or using pyridine as solvent and base.

**step (i):** Compounds of formula (XIX) can be prepared from compounds of formula (XVII) by cyclization in presence of an excess of a base such as pyridine with heating e.g. at reflux.

**step (ii):** Compounds of formula (XVI II) can be prepared from compounds of formula (XIX) by acylation for example with acetic anhydride at room temperature.

**Scheme 11**
Amongst the ketones of formula (XX), l-(2,6-dihydroxyphenyl)ethanone is commercially available e.g. from Aldrich. Ketones of formula (XXa) corresponding to ketones of formula (XX) wherein \( R_7 = \text{Me} \) can be prepared from compounds of formula (XXI). Compounds of formula (XXI) undergoes first a bis-acylation using e.g. acetic anhydride in presence of a base e.g. triethylamine in a solvent e.g. dichloromethane followed by a Friedel Crafts acylation with intramolecular acyl transfer in presence of a Lewis acid such as AICl3 in a solvent such as chlorobenzene with heating e.g. at 90°C.

**Scheme 12**

step (i): Compound of formula (XXIa) can be prepared from compound of formula (XXI) corresponding to compound of formula (XXI) wherein \( R_7 = \text{Et} \) or iPr and \( R_1 = \text{H} \) using a base such as sodium hydride in a solvent such as DMF adding in a second time the suitable anhydride or acyl chloride for example at -78°C.

step (ii): Compounds of formula (XXII) can be prepared from compounds of formula (XXII) by -lithiation with for example BuLi in a solvent such as tetrahydrofuran at e.g. room temperature adding in a second time the suitable anhydride or acyl chloride for example at -78°C.

step (iii): Ketones of formula (XXb) corresponding to ketones of formula (XX) wherein \( R_7' = \text{Et} \) or iPr and \( R_1 = \text{H} \) can be prepared from compounds of formula (XXII) by removal of the two protective groups under acidic conditions such as aqueous HCl solution, with heating e.g. at reflux, in a solvent such as methanol.

**Scheme 13a**
Step (iii): Phenol of formula (IX) corresponding to compound of formula (IX) wherein R₁ is H and A is the heterocycle depicted on Scheme 13a, can be prepared from the O-methoxy precursor (XXIV) using a reaction of demethylation using for example BBr₃ in a solvent such as dichloromethane at 0°C.

Step (ii): Compound of formula (XXIV) can be prepared by cyclization from compound of formula (XXV) using for example tributylstannane and AIBN in a solvent such as toluene e.g. at reflux.

Step (i): Compound of formula (XXV) can be prepared from compound of formula (XXVI) in presence of a base such as sodium hydride in a solvent such as DMF adding in a second time the compound of formula (XXVI) wherein Z=Cl or Br e.g. at room temperature.

Scheme 13b

Step (iv): Phenol of the type produced by step (iv) as shown above can be prepared from TiPS protected compounds of the type produced by step (iii) as shown above removing the protective group in presence of a Fluoride source such as tetrabutylammonium fluoride in a suitable solvent such as THF at room temperature.

Step (iii): the compound of the type produced by step (iii) as shown above can be prepared by metal-halogen exchange using butyllithium or sec-butyllithium or tert-butyllithium in a suitable solvent such as THF or Et₂O or n-hexane at temperature ranging from -78°C to room temperature and adding in a second stage a methylating agent such as iodomethane at temperature ranging from -78°C to room temperature.

Step (ii): the compound of the type produced by step (ii) as shown above can be prepared from a protected phenol of the type produced by step (i) as shown above by using a brominating agent such as NBS in a suitable solvent such as DMF or acetonitrile or THF at room temperature.
**Step (i):** The compound of the type produced by step (i) as shown above can be prepared from the starting phenol by silylation, using for example chloro triisopropylsilane in presence of a base such as butyllithium in a solvent such as THF at temperature ranging from 0°C and room temperature.

**Scheme 14**

```
  (XXIX)  (XXVIII)  (XXVII)  (XXVI)
```

**step (iii):** Compound of formula (XXVI) can be prepared from compound of formula (XXVII) by removal of the protective group under acidic conditions using for example HCl gas in a solvent such as dichloromethane.

**step (ii):** Compound of formula (XXVI) can be prepared from compound of formula (XXVII) by reaction with e.g. BuLi in a solvent such as tetrahydrofuran at e.g. -78°C and adding in a second time a solution of iodine for example at -70°C and leaving the reaction at room temperature.

**step (i):** Compound of formula (XXVI) can be prepared from compound of formula (XXIX) by protection of the phenol using a base e.g. sodium hydride, in a solvent e.g. tetrahydrofuran, adding in a second time bromomethyl methyl ether e.g. at room temperature.

**Scheme 15**

```
(XXXIII)  (XXXII)  (XXXI)  (XXX)  (IXd)
```

**step (iv):** Alternatively phenol of formula (IXd) corresponding to compound of formula (IX) wherein R₂ is H and A is the heterocycle depicted on Scheme 15 can be prepared from compound of formula (XXX) using an hydroxide base for example sodium hydroxide, in a solvent such as methanol, e.g. at room temperature.

**step (iii):** Compound of formula (XXX) can be prepared from compound of formula (XXXI) by cyclization with conditions presented on Scheme 13a in step (ii)
**step (ii):** Compound of formula (XXXI) can be prepared from compound of formula (XXXII) using a base such as potassium carbonate and an electrophile such as 3-bromo-2-methyl-1-propene, in a solvent such as acetonitrile e.g. at room temperature.

**step (i):** Compound of formula (XXXI) can be prepared from compound of formula (XXXII) by acetylation using for example acetic anhydride, a base e.g. triethylamine in a solvent e.g. dichloromethane e.g. at room temperature.

**Scheme 16**

**step (vi):** Phenol of formula (IXe) corresponding to compound of formula (IX) wherein $R_1$ is H or methyl and $A$ is the heterocycle depicted on Scheme 16 can be prepared from compound of formula (XXXIV) by removal of the MOM protective group under acidic conditions using for example aqueous HCl in a solvent such as methanol heating e.g. at 50°C.

**step (v):** Compound of formula (XXXIV) can be prepared from compound of formula (XXXV) by a Mitsonobu reaction using triphenylphosphine in a solvent such as tetrahydrofuran and adding diisopropyl azodicarboxylate at room temperature.

**step (iv):** Compound of formula (XXXV) can be prepared from compound of formula (XXXVI) in a sequential mode - deprotection in acidic conditions such as HCl 2N in water in ethanol - evaporation of the solvent and use of a strong base such as NaH in a solvent such as THF at 0°C - addition of MOMCl at 0°C - reduction with lithium aluminium hydride at 0°C.
step (iii): Compound of formula (XXXVI) can be prepared from compound of formula (XXXVII) using a Corey-Chaykovsky cyclopropanation reaction carried out at room temperature. To pre-form the dimethyloxosulfonium methylium, trimethylsulfoxonium iodide can be used in presence of a base such as NaN₃ in a solvent such as DMSO, the compound of formula (XXXVII), (prediluted in DMSO) being added in a second time.

step (ii): Compound of formula (XXXVI) can be prepared from compound of formula (XXXVII) using a Wittig reaction. In order to pre-form the ylide, a phosphonium salt such as methyltriphenylphosphonium bromide and a strong base such as KHMS can be used in a solvent such as THF from 0°C to room temperature. The compound of formula (XXXVII) prediluted in a solvent such as THF can be added in a second time at 0°C.

step (i): Compound of formula (XXXVI) can be prepared from compound (XXII) by lithiation using BuLi in a solvent such as hexane at room temperature, this solution being added in a second time fn at -78°C to the electrophile e.g. ethyl chloro(oxo)acetate (prediluted e.g. in THF).

Compounds of formula (XXII) can be prepared in a similar fashion as described in Scheme 12 (step i).

Scheme 17a

step (vii): Phenol of formula (IXf) corresponding to compound of formula (IX) wherein R₂ is H and A is the heterocycle depicted on Scheme 17a can be prepared from compound of formula (XXXIX) by removal of the MOM protective group under acidic conditions using for example aqueous HCl in a solvent such as methanol heating e.g. at 60°C.

step (vi): Compound of formula (XXXIX) can be prepared by cyclization of compounds of formula (XL) using a base such as triethylamine in a solvent such as THF e.g. at 0°C, adding in a second time methanesulfonyl chloride and in a third time a strong base such as potassium 2-methyl-2-propanolate.
**step (v):** Compound of formula (XL) can be prepared by hydrogenation of the mixture of compounds of formula (XLI) and (XL) in presence of a catalyst such as Pd/C at room temperature.

**step (iv):** The mixture of compounds of formula (XLI) and (XL) can be prepared from compound of formula (XLII) by reaction with a reducing agent such as lithium aluminium hydride in a solvent such as THF at 0°C.

**step (iii):** Compound of formula (XLI) can be prepared from phenol of formula (XLI1) using a base such as NaH and chloro(methyloxy)methane in a solvent such as DMF for example from 0°C to room temperature. Alternatively the solvent used may be DCM and with a base such as DIPEA or TEA.

**step (ii):** Phenol of formula (XLI1) can be prepared from compound of formula (XLIV) by demethylation using for example boron tribromide in a solvent such as dichloromethane from 0°C to room temperature.

**step (i):** Compound of formula (XLIV) can be prepared from compound of formula (XLV) by reaction with propanoic anhydride in presence of a base such as potassium carbonate heating e.g. at 70°C in a solvent such as DMF followed by addition of water and heating e.g. at 120°C.

Scheme 17b

**step (vii):** Phenol of the type produced by step (vii) as shown above wherein R₁ is H and A is the heterocycle depicted on Scheme 17b can be prepared from a compound of of the type produced by step (vi) as shown above by removal of the MOM protective group under acidic conditions using for example aqueous HCl in a solvent such as methanol heating e.g. at 60°C.

**step (vi):** Compound of the type produced by step (vi) as shown above can be prepared by cyclization of compounds of the type produced by step (v) as shown above using a base such as triethylamine in a
solvent such as THF e.g. at 0°C, adding in a second time methanesulfonyl chloride and in a third time a strong base such as potassium 2-methyl-2-propanolate.

Alternatively Mitsunobu conditions can be used.

**step (v):** Compound of the type produced by step (v) as shown above can be prepared by hydrogenation of the mixture of compounds of the type produced by step (iv) as shown above in presence of a catalyst such as Pd/C at room temperature.

**step (iv):** The mixture of compounds of the type produced by step (iv) as shown above can be prepared from compound of the type produced by step (iii) as shown above by reaction with a reducing agent such as lithium aluminium hydride in a solvent such as THF at 0°C.

**step (iii):** Compound of the type produced by step (iii) as shown above can be prepared from phenol of the type produced by step (ii) as shown above using a base such as NaH and chloro(methyloxy)methane in a solvent such as DMF for THF for example from 0°C to room temperature.

**step (ii):** Phenol of the type produced by step (ii) as shown above can be prepared from compound of the type produced by step (i) as shown above by demethylation using for example boron tribromide in a solvent such as dichloromethane from 0°C to reflux.

**step (i):** Compound of the type produced by step (i) as shown above can be prepared from the starting alcohol by reaction with acetic anhydride in presence of a base such as potassium carbonate heating e.g. at 70°C in a solvent such as DMF followed by addition of water and heating e.g. at 120°C.

Scheme 18a

**step (iv):** Phenol of formula (IXg) corresponding to compound of formula (IX) wherein R₁ is H and A is the heterocycle depicted on Scheme 18a can be prepared from compound (XLVI) by removal of the MOM protective group as previously described on Scheme 16 (step vi).
**step (iii):** Compound of formula (XLVI) can be prepared from compound of formula (XLVIi) by a Mitsonobu reaction using triphenylphosine in a solvent such as tetrahydrofuran and adding bis(l-methylethyl) (E)-1,2-diazenedicarboxylate at room temperature.

**step (ii):** Compound of formula (XLVIi) can be prepared from compound of formula (XLVIIIi) by reaction with a reducing agent such as lithium aluminium hydride in a solvent such as THF at 0°C.

**step (i):** Compound of formula (XLVIi) can be prepared from compound of formula (XLVI) by a Corey-Chaykovsky cyclopropanation reaction, carried out at room temperature as previously described on Scheme 16 (step (iii)).

**Scheme 18b**

**step (iv):** Phenol of the type produced by step (iv) as shown above can be prepared from the compound the type produced by step (iii) as shown above by removal of the MOM protective group as previously described on Scheme 16 (step vi).

**step (iii):** Compound of the type produced by step (iii) as shown above can be prepared from compound of the type produced by step (ii) as shown above by a Mitsonobu reaction using triphenylphosine in a solvent such as tetrahydrofuran and adding bis(l-methylethyl) (E)-1,2-diazenedicarboxylate at room temperature.

**step (ii):** Compound of the type produced by step (ii) as shown above can be prepared from compound of the type produced by step (i) as shown above by reaction with a reducing agent such as lithium aluminium hydride in a solvent such as THF at 0°C.

**step (i):** Compound of the type produced by step (i) as shown above can be prepared from the starting compound by a Corey-Chaykovsky cyclopropanation reaction, carried out at room temperature as previously described on Scheme 16 (step (iii)).
**step (vi):** Phenol of formula (IXh) corresponding to compound of formula (IX) wherein $R_1$ is H and A is the heterocycle depicted on Scheme 19a can be prepared from compound (XLIX) by removal of the MOM protective group as previously described on Scheme 16 (step vi).

**step (v):** Compound of formula (XLIX) can be prepared by cyclization of compound of formula (L) using a base such as BuLi in a solvent such as hexane e.g. at $0^\circ$C, adding in a second time 4-methylbenzenesulfonyl chloride e.g. at $0^\circ$C, then in a third time a second equivalent of a base such as nBuLi e.g. at $0^\circ$C.

**step (iv):** Compound of formula (L) can be prepared from compound of formula (LII) sequentially - by addition a reductive agent such as lithium aluminium hydride in a solvent such as THF e.g. at $0^\circ$C - after work up and solvent evaporation addition of a desilylating agent such as TBAF in a solvent such as THF.

**step (iii):** Compound of formula (LII) can be prepared from compound of formula (LII) by a Corey-Chaykovsky cyclopropanation reaction carried out at room temperature as previously described on Scheme 16 (step iii).

**step (ii):** Compound of formula (LII) can be prepared from compound of formula (LII) by olefination with for example a solution of dimethyl titanocene in a solvent such as toluene (e.g. 9% w/w) heating e.g. at $90^\circ$C in a solvent such as toluene. The solution of dimethyl titanocene in toluene can be prepared by the reaction of titanocene dichloride with for example a solution of methylmagnesium chloride at $-10^\circ$C.
**step (i):** Compound of formula (UN) can be prepared from compound (XIV) by lithiation using BuLi in a solvent such as hexane at room temperature, this solution being added in a second time at -78°C to the electrophile e.g. ethyl chloro(oxo)acetate (prediluted e.g. in THF).

Scheme 19b.

**step (ii):** Phenol of the type produced by step (ii) as shown above can be prepared from the starting compound by lithiation using BuLi in a solvent such as hexane at room temperature, this solution being added in a second time at -78°C to the electrophile e.g. ethyl chloroformate (prediluted e.g. in THF).

Scheme 20.
**Step (iv):** Phenol of the type produced by step (iv) as shown above can be prepared from a compound of the type produced by step (iii) as shown above by removal of the MOM protective group as previously described on Scheme 16 (step vi).

**Step (iii):** the compound of the type produced by step (iii) as shown above can be prepared by cyclopropanation (Simmons-Smith conditions) of the unsaturated compound of the type produced by step (ii) as shown above using diethylzinc and diiodomethane (optionally 2,4,6-trichlorophenol is added) in a solvent such as dichloromethane at temperature ranging from -40 °C to room temperature.

**Step (ii):** the compound of the type produced by step (ii) as shown above can be prepared using a wittig type reaction as described in Scheme 16 (step ii).

**Step (i):** Compound of the type produced by step (i) as shown above can be prepared from the starting phenol using a base such as NaH and chloromethyloxy)methane in a solvent such as DMF or THF for example from 0°C to room temperature.

**Scheme 21**

**Step (ii):** Phenol of the type produced by step (ii) as shown above can be prepared from lactone of the type produced by step (i) as shown above using Methylmagnesium bromide in a suitable solvent such as THF or diethyl ether at temperature ranging from -78°C to room temperature. Obtained compound can be treated with a suitable acid such as H2SO4 or TsOH in a suitable solvent such as ethyl acetate or acetonitrile or methanol or ethanol.
Step (i): Lacton of the type produced by step (i) as shown above can be prepared by reaction of commercially available starting anhydride with a reducing agent such as K-selectride in a solvent such as THF at 0°C; followed by MOM-protection using a base such as DIPEA and chloro(methyloxy)methane in a solvent such as DCM for example from 0°C to room temperature.

Step (ii): the boronic acid of the type produced by step (ii) as shown above can be prepared from boronic acid of the type produced by step (i) as shown above by lithiation using sec-BuLi in a solvent such as THF at a temperature ranging from -78°C to room temperature, followed by the addition in a second time of a methylating agent such as iodomethane at a temperature ranging from -78°C to room temperature.

Step (iii): Phenol of the type produced by step (iii) as shown above can be prepared from a boronic acid of the type produced by step (ii) as shown above using H₂O₂ and NaOH in a suitable solvent such as THF or a combination of solvents such as water/THF at room temperature.
Step (iv): Phenol of the type produced by step (iv) as shown above can be prepared from compounds of the type produced by step (iii) as shown above by treatment with a demethylating agent such as BBr₃ in a suitable solvent such as dichloromethane or dichloroethane at temperature ranging from room temperature to reflux.

Step (iii): Compound of the type produced by step (iii) as shown above can be prepared from compound of the type produced by step (ii) as shown above by treatment with a suitable acid such as polyphosphoric acid neat at suitable temperature such as 110°C.

Step (ii): Compound of the type produced by step (ii) as shown above can be prepared from aminoalcohol of the type produced by step (i) as shown above by treatment with an acylating agent such as acetyl chloride in presence of a base such as triethylamine in a suitable solvent such as dichloromethane at a suitable temperature for example 0°C.

Step (i): Alcohol of the type produced by step (i) as shown above can be prepared from the commercially available starting ketone by treatment with Methyl magnesium bromide in a suitable solvent such as THF or diethyl ether at temperature ranging from 0°C to room temperature.

Scheme 24

Step (ii): Alternatively to the route described on Scheme 2b (step ii), compounds of formula (II i) can be obtained by coupling between the aniline (IV) and the precursor (LIV) with heating e.g. at 150°C in a solvent such as toluene.

Step (i): Compounds of formula (LIV) can be prepared from N-protected amino acid (V) and 2,2'-dithiodipyridine (LV) in presence of triphenylphosphine at room temperature in a solvent such as THF.
Compounds of formula (VII) can be prepared by reaction of ureas of formula (XI) and a base such as sodium methoxide in a solvent such as Methanol at temperature ranging from 0°C to 60°C.

Compounds of formula (XI) can be prepared by reaction of commercially available anilines of formula (IVa), wherein Z is Cl, and amino esters (hydrochloride salt) of formula (XII) in a solvent e.g. dichloromethane or ethyl acetate with a carbonylating agent e.g. triphosgene preferentially prediluted in the same solvent in presence of a base e.g. triethylamine or diisopropylethylamine at temperature ranging from 0°C to 60°C, optionally adding a catalytic or stochiometric amount of DMAP.

Amino esters (hydrochloride salt) of formula (XI) can be prepared from commercially available amino acids (hydrochloride salt) of formula (XIII) by reaction with methanol in presence of a catalytic or stochiometric amount of thyonyl chloride at temperature ranging from r.t. to reflux.

The present invention provides compounds of formula (I) or a pharmaceutically acceptable salt thereof for use in therapy.

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of a disease or disorder where a modulator of the Kv3.1 or Kv3.2 or Kv3.1 and Kv3.2 channels is required. As used herein, a modulator of Kv3.1 or Kv3.2 or Kv3.1 and Kv3.2 is a compound which alters the properties of these channels, either positively or negatively. The altered property of the channel may be the scale of response observed or the temporal behaviour of the channel.

Compounds of the invention may be tested in the assay of Biological Example 1 to determine their modulatory properties.

Diseases or conditions that may be mediated by modulation of Kv3.1 and/or Kv3.2 channels may be selected from the list below. The numbers in brackets after the listed diseases below refer to the classification code in Diagnostic and Statistical Manual of Mental Disorders, 4th Edition, published by
the American Psychiatric Association (DSM-IV) and/or the International Classification of Diseases, 10th Edition (ICD-10).

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of depression and mood disorders including Major Depressive Episode, Manic Episode, Mixed Episode and Hypomanic Episode; Depressive Disorders including Major Depressive Disorder, Dysthymic Disorder (300.4), Depressive Disorder Not Otherwise Specified (311); Bipolar Disorders including Bipolar I Disorder, Bipolar II Disorder (Recurrent Major Depressive Episodes with Hypomanic Episodes) (296.89), Cyclothymic Disorder (301.13) and Bipolar Disorder Not Otherwise Specified (296.80); Other Mood Disorders including Mood Disorder Due to a General Medical Condition (293.83) which includes the subtypes With Depressive Features, With Major Depressive-like Episode, With Manic Features and With Mixed Features), Substance-Induced Mood Disorder (including the subtypes With Depressive Features, With Manic Features and With Mixed Features) and Mood Disorder Not Otherwise Specified (296.90); Seasonal affective disorder.

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of schizophrenia including the subtypes Paranoid Type (295.30), Disorganised Type (295.10), Catatonic Type (295.20), Undifferentiated Type (295.90) and Residual Type (295.60); Schizophreniform Disorder (295.40); Schizoaffective Disorder (295.70) including the subtypes Bipolar Type and Depressive Type; Delusional Disorder (297.1) including the subtypes Erotomanic Type, Grandiose Type, Jealous Type, Persecutory Type, Somatic Type, Mixed Type and Unspecified Type; Brief Psychotic Disorder (298.8); Shared Psychotic Disorder (297.3); Psychotic Disorder Due to a General Medical Condition including the subtypes With Delusions and With Hallucinations; Substance-Induced Psychotic Disorder including the subtypes With Delusions (293.81) and With Hallucinations (293.82); and Psychotic Disorder Not Otherwise Specified (298.9).

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of anxiety disorders including Panic Attack; Panic Disorder including Panic Disorder without Agoraphobia (300.01) and Panic Disorder with Agoraphobia (300.21); Agoraphobia; Agoraphobia Without History of Panic Disorder (300.22), Specific Phobia (300.29, formerly Simple Phobia) including the subtypes Animal Type, Natural Environment Type, Blood-Injection-Injury Type, Situational Type and Other Type), Social Phobia (Social Anxiety Disorder, 300.23), Obsessive-Compulsive Disorder (300.3), Posttraumatic Stress Disorder (309.81), Acute Stress Disorder (308.3), Generalized Anxiety Disorder (300.02), Anxiety Disorder Due to a General Medical Condition (293.84), Substance-
Induced Anxiety Disorder, Separation Anxiety Disorder (309.21), Adjustment Disorders with Anxiety (309.24) and Anxiety Disorder Not Otherwise Specified (300.00).

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of substance-related disorders including Substance Use Disorders such as Substance Dependence, Substance Craving and Substance Abuse; Substance-Induced Disorders such as Substance Intoxication, Substance Withdrawal, Substance-Induced Delirium, Substance-Induced Persisting Dementia, Substance-Induced Persisting Amnestic Disorder, Substance-Induced Psychotic Disorder, Substance-Induced Mood Disorder, Substance-Induced Anxiety Disorder, Substance-Induced Sexual Dysfunction, Substance-Induced Sleep Disorder and Hallucinogen Persisting Perception Disorder (Flashbacks); Alcohol-Related Disorders such as Alcohol Dependence (303.90), Alcohol Abuse (305.00), Alcohol Intoxication (303.00), Alcohol Withdrawal (291.81), Alcohol Intoxication Delirium, Alcohol Withdrawal Delirium, Alcohol-Induced Persisting Dementia, Alcohol-Induced Persisting Amnestic Disorder, Alcohol-Induced Psychotic Disorder, Alcohol-Induced Mood Disorder, Alcohol-Induced Anxiety Disorder, Alcohol-Induced Sexual Dysfunction, Alcohol-Induced Sleep Disorder and Alcohol-Related Disorder Not Otherwise Specified (291.9); Amphetamine (or Amphetamine-Like)-Related Disorders such as Amphetamine Dependence (304.40), Amphetamine Abuse (305.70), Amphetamine Intoxication (292.89), Amphetamine Withdrawal (292.0), Amphetamine Intoxication Delirium, Amphetamine Induced Psychotic Disorder, Amphetamine-Induced Mood Disorder, Amphetamine-Induced Anxiety Disorder, Amphetamine-Induced Sexual Dysfunction, Amphetamine-Induced Sleep Disorder and Amphetamine-Related Disorder Not Otherwise Specified (292.9); Caffeine Related Disorders such as Caffeine Intoxication (305.90), Caffeine-Induced Anxiety Disorder, Caffeine-Induced Sleep Disorder and Caffeine-Related Disorder Not Otherwise Specified (292.9); Cannabis-Related Disorders such as Cannabis Dependence (304.30), Cannabis Abuse (305.20), Cannabis Intoxication (292.89), Cannabis Intoxication Delirium, Cannabis-Induced Psychotic Disorder, Cannabis-Induced Anxiety Disorder and Cannabis-Related Disorder Not Otherwise Specified (292.9); Cocaine-Related Disorders such as Cocaine Dependence (304.20), Cocaine Abuse (305.60), Cocaine Intoxication (292.89), Cocaine Withdrawal (292.0), Cocaine Intoxication Delirium, Cocaine-Induced Psychotic Disorder, Cocaine-Induced Mood Disorder, Cocaine-Induced Anxiety Disorder, Cocaine-Induced Sexual Dysfunction, Cocaine-Induced Sleep Disorder and Cocaine-Related Disorder Not Otherwise Specified (292.9); Hallucinogen-Related Disorders such as Hallucinogen Dependence (304.50), Hallucinogen Abuse (305.30), Hallucinogen Intoxication (292.89), Hallucinogen Persisting Perception Disorder (Flashbacks) (292.89), Hallucinogen Intoxication Delirium, Hallucinogen-Induced Psychotic Disorder, Hallucinogen-Induced Mood Disorder, Hallucinogen-Induced Anxiety Disorder and Hallucinogen-Related Disorder Not Otherwise Specified.
Inhalant-Related Disorders such as Inhalant Dependence (304.60), Inhalant Abuse (305.90), Inhalant Intoxication (292.89), Inhalant Intoxication Delirium, Inhalant-Induced Persisting Dementia, Inhalant-Induced Psychotic Disorder, Inhalant-Induced Mood Disorder, Inhalant-Induced Anxiety Disorder and Inhalant-Related Disorder Not Otherwise Specified (292.9); Nicotine-Related Disorders such as Nicotine Dependence (305.1), Nicotine Withdrawal (292.0) and Nicotine-Related Disorder Not Otherwise Specified (292.9); Opioid-Related Disorders such as Opioid Dependence (304.00), Opioid Abuse (305.50), Opioid Intoxication (292.89), Opioid Withdrawal (292.0), Opioid Intoxication Delirium, Opioid-Induced Psychotic Disorder, Opioid-induced Mood Disorder, Opioid-Induced Sexual Dysfunction, Opioid-Induced Sleep Disorder and Opioid-Related Disorder Not Otherwise Specified (292.9); Phencyclidine (or Phencyclidine-Like)-Related Disorders such as Phencyclidine Dependence (304.60), Phencyclidine Abuse (305.90), Phencyclidine Intoxication (292.89), Phencyclidine Intoxication Delirium, Phencyclidine-Induced Psychotic Disorder, Phencyclidine-Induced Mood Disorder, Phencyclidine-Induced Anxiety Disorder and Phencyclidine-Related Disorder Not Otherwise Specified (292.9); Sedative-, Hypnotic-, or Anxiolytic-Related Disorders such as Sedative, Hypnotic, or Anxiolytic Dependence (304.10), Sedative, Hypnotic, or Anxiolytic Abuse (305.40), Sedative, Hypnotic, or Anxiolytic Intoxication (292.89), Sedative, Hypnotic, or Anxiolytic Withdrawal (292.0), Sedative, Hypnotic, or Anxiolytic Intoxication Delirium, Sedative, Hypnotic, or Anxiolytic Withdrawal Delirium, Sedative-, Hypnotic-, or Anxiolytic-Persisting Dementia, Sedative-, Hypnotic-, or Anxiolytic-Persisting Amnestic Disorder, Sedative-, Hypnotic-, or Anxiolytic-Induced Psychotic Disorder, Sedative-, Hypnotic-, or Anxiolytic-Induced Mood Disorder, Sedative-, Hypnotic-, or Anxiolytic-Induced Anxiety Disorder Sedative-, Hypnotic-, or Anxiolytic-Induced Sexual Dysfunction, Sedative-, Hypnotic-, or Anxiolytic-Induced Sleep Disorder and Sedative-, Hypnotic-, or Anxiolytic-Related Disorder Not Otherwise Specified (292.9); Polysubstance-Related Disorder such as Polysubstance Dependence (304.80); and Other (or Unknown) Substance-Related Disorders such as Anabolic Steroids, Nitrate Inhalants and Nitrous Oxide.

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the enhancement of cognition including the treatment of cognition impairment in other diseases such as schizophrenia, bipolar disorder, depression, other psychiatric disorders and psychotic conditions associated with cognitive impairment, e.g. Alzheimer's disease.

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of sleep disorders including primary sleep disorders such as Dyssomnias such as Primary Insomnia (307.42), Primary Hypersomnia (307.44), Narcolepsy (347), Breathing-Related Sleep Disorders (780.59), Circadian Rhythm Sleep Disorder (307.45) and Dyssomnia Not Otherwise Specified (307.47); primary sleep disorders such as Parasomnias such as Nightmare Disorder (307.47), Sleep
Terror Disorder (307.46), Sleepwalking Disorder (307.46) and Parasomnia Not Otherwise Specified (307.47); Sleep Disorders Related to Another Mental Disorder such as Insomnia Related to Another Mental Disorder (307.42) and Hypersomnia Related to Another Mental Disorder (307.44); Sleep Disorder Due to a General Medical Condition, in particular sleep disturbances associated with such diseases as neurological disorders, neuropathic pain, restless leg syndrome, heart and lung diseases; and Substance-Induced Sleep Disorder including the subtypes Insomnia Type, Hypersomnia Type, Parasomnia Type and Mixed Type; sleep apnea and jet-lag syndrome.

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of eating disorders such as Anorexia Nervosa (307.1) including the subtypes Restricting Type and Binge-Eating/Purging Type; Bulimia Nervosa (307.51) including the subtypes Purging Type and Nonpurging Type; Obesity; Compulsive Eating Disorder; Binge Eating Disorder; and Eating Disorder Not Otherwise Specified (307.50).

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of Autism Spectrum Disorders including Autistic Disorder (299.00), Asperger's Disorder (299.80), Rett's Disorder (299.80), Childhood Disintegrative Disorder (299.10) and Pervasive Disorder Not Otherwise Specified (299.80, including Atypical Autism).

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of Attention-Deficit/Hyperactivity Disorder including the subtypes Attention-Deficit /Hyperactivity Disorder Combined Type (314.01), Attention-Deficit /Hyperactivity Disorder Predominantly Inattentive Type (314.00), Attention-Deficit /Hyperactivity Disorder Hyperactive-Impulse Type (314.01) and Attention-Deficit /Hyperactivity Disorder Not Otherwise Specified (314.9); Hyperkinetic Disorder; Disruptive Behaviour Disorders such as Conduct Disorder including the subtypes childhood-onset type (321.81), Adolescent-Onset Type (312.82) and Unspecified Onset (312.89), Oppositional Defiant Disorder (313.81) and Disruptive Behaviour Disorder Not Otherwise Specified; and Tic Disorders such as Tourette's Disorder (307.23).

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of Personality Disorders including the subtypes Paranoid Personality Disorder (301.0), Schizoid Personality Disorder (301.20), Schizotypal Personality Disorder (301.22), Antisocial Personality Disorder (301.7), Borderline Personality Disorder (301.83), Histrionic Personality Disorder (301.50), Narcissistic Personality Disorder (301.81), Avoidant Personality Disorder (301.82), Dependent Personality Disorder (301.6), Obsessive-Compulsive Personality Disorder (301.4) and Personality Disorder Not Otherwise Specified (301.9).
The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of Sexual dysfunctions including Sexual Desire Disorders such as Hypoactive Sexual Desire Disorder (302.71), and Sexual Aversion Disorder (302.79); sexual arousal disorders such as Female Sexual Arousal Disorder (302.72) and Male Erectile Disorder (302.72); orgasmic disorders such as Female Orgasmic Disorder (302.73), Male Orgasmic Disorder (302.74) and Premature Ejaculation (302.75); sexual pain disorder such as Dyspareunia (302.76) and Vaginismus (306.51); Sexual Dysfunction Not Otherwise Specified (302.70); paraphilias such as Exhibitionism (302.4), Fetishism (302.81), Frotteurism (302.89), Pedophilia (302.2), Sexual Masochism (302.83), Sexual Sadism (302.84), Transvestic Fetishism (302.3), Voyeurism (302.82) and Paraphilia Not Otherwise Specified (302.9); gender identity disorders such as Gender Identity Disorder in Children (302.6) and Gender Identity Disorder in Adolescents or Adults (302.85); and Sexual Disorder Not Otherwise Specified (302.9).

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of Impulse control disorder including: Intermittent Explosive Disorder (312.34), Kleptomania (312.32), Pathological Gambling (312.31), Pyromania (312.33), Trichotillomania (312.39), Impulse-Control Disorders Not Otherwise Specified (312.3), Binge Eating, Compulsive Buying, Compulsive Sexual Behaviour and Compulsive Hoarding.

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of hearing disorders including auditory neuropathy, auditory processing disorder, hearing loss, which includes sudden hearing loss, noise induced hearing loss, substance-induced hearing loss, and hearing loss in adults over 60 (presbycusis), and tinnitus.

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of Meniere’s disease, disorders of balance, and disorders of the inner ear.

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of hyperacusis and disturbances of loudness perception, including Fragile-X syndrome and autism.

The compounds of formula (I) or their pharmaceutically acceptable salts may be of use for the treatment or prophylaxis of Epilepsy, (including, but not limited to, localization-related epilepsies, generalized epilepsies, epilepsies with both generalized and local seizures, and the like), seizures associated with Lennox-Gastaut syndrome, seizures as a complication of a disease or condition (such as seizures associated with encephalopathy, phenylketonuria, juvenile Gaucher’s disease, Lundborg’s progressive myoclonic epilepsy, stroke, head trauma, stress, hormonal changes, drug use or withdrawal,
alcohol use or withdrawal, sleep deprivation, fever, infection, and the like), essential tremor, restless
limb syndrome, partial and generalised seizures (including tonic, clonic, tonic-clonic, atonic, myoclonic,
absence seizures), secondarily generalized seizures, temporal lobe epilepsy, absence epilepsies
(including childhood, juvenile, myoclonic, photo- and pattern-induced), severe epileptic
encephalopathies (including hypoxia-related and Rasmussen's syndrome), febrile convulsions, epilepsy
partialis continua, progressive myoclonus epilepsies (including Unverricht-Lundborg disease and Lafora's
disease), post-traumatic seizures/epilepsy including those related to head injury, simple reflex epilepsies
(including photosensitive, somatosensory and proprioceptive, audiogenic and vestibular), metabolic
disorders commonly associated with epilepsy such as pyridoxine-dependent epilepsy, Menkes' kinky hair
disease, Krabbe's disease, epilepsy due to alcohol and drug abuse (e.g. cocaine), cortical malformations
associated with epilepsy (e.g. double cortex syndrome or subcortical band heterotopia), chromosomal
anomalies associated with seizures or epilepsy such as Partial monosomy (15Q) / Angelman syndrome
and the like.

In one embodiment of the invention, there is provided a compound of formula (I) or a
pharmaceutically acceptable salt thereof for the treatment or prophylaxis of depression and mood
disorders, hearing disorders, schizophrenia, substance abuse disorders, sleep disorders or epilepsy.

In one embodiment of the invention, there is provided a compound of formula (I) or a
pharmaceutically acceptable salt thereof for the treatment or prophylaxis of bipolar disorder or mania.

The term "treatment" or "treating" as used herein includes the control, mitigation, reduction, or
modulation of the disease state or its symptoms.

The term "prophylaxis" is used herein to mean preventing symptoms of a disease or disorder in
a subject or preventing recurrence of symptoms of a disease or disorder in an afflicted subject and is not
limited to complete prevention of an affliction.

The invention also provides a method of treating or preventing a disease or disorder where a
modulator of Kv3 is required, for example those diseases and disorders mentioned hereinabove, which
comprises administering to a subject in need thereof an effective amount of a compound of formula (I)
or a pharmaceutically acceptable salt thereof.

The invention also provides a compound of formula (I), or a pharmaceutically acceptable salt
thereof, for use in the treatment or prophylaxis of a disease or disorder where a modulator of Kv3 is
required, for example those diseases and disorders mentioned hereinabove.
The invention also provides the use of a compound of formula (I), or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for the treatment or prophylaxis of a disease or disorder where a modulator of Kv3 is required, for example those diseases and disorders mentioned hereinabove.

The invention also provides a method of treating depression and mood disorders, schizopherenia, substance abuse disorders, sleep disorders or epilepsy, for example for those indications mentioned hereinabove, which comprises administering to a subject in need thereof an effective amount of a Kv3 modulator or a pharmaceutically acceptable salt thereof.

For use in therapy the compounds of the invention are usually administered as a pharmaceutical composition. The invention also provides a pharmaceutical composition comprising a compound of formula (I), or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier.

The compounds of formula (I) or their pharmaceutically acceptable salts may be administered by any convenient method, e.g. by oral, parenteral, buccal, sublingual, nasal, rectal or transdermal administration, and the pharmaceutical compositions adapted accordingly.

The compounds of formula (I) or their pharmaceutically acceptable salts which are active when given orally can be formulated as liquids or solids, e.g. as syrups, suspensions, emulsions, tablets, capsules or lozenges.

A liquid formulation will generally consist of a suspension or solution of the active ingredient in a suitable liquid carrier(s) e.g. an aqueous solvent such as water, ethanol or glycerine, or a non-aqueous solvent, such as polyethylene glycol or an oil. The formulation may also contain a suspending agent, preservative, flavouring and/or colouring agent.

A composition in the form of a tablet can be prepared using any suitable pharmaceutical carrier(s) routinely used for preparing solid formulations, such as magnesium stearate, starch, lactose, sucrose and cellulose.

A composition in the form of a capsule can be prepared using routine encapsulation procedures, e.g. pellets containing the active ingredient can be prepared using standard carriers and then filled into a hard gelatin capsule; alternatively a dispersion or suspension can be prepared using any suitable pharmaceutical carrier(s), e.g. aqueous gums, celluloses, silicates or oils and the dispersion or suspension then filled into a soft gelatin capsule.
Typical parenteral compositions consist of a solution or suspension of the active ingredient in a sterile aqueous carrier or parenterally acceptable oil, e.g. polyethylene glycol, polyvinyl pyrrolidone, lecithin, arachis oil or sesame oil. Alternatively, the solution can be lyophilised and then reconstituted with a suitable solvent just prior to administration.

Compositions for nasal administration may conveniently be formulated as aerosols, drops, gels and powders. Aerosol formulations typically comprise a solution or fine suspension of the active ingredient in a pharmaceutically acceptable aqueous or non-aqueous solvent and are usually presented in single or multidose quantities in sterile form in a sealed container which can take the form of a cartridge or refill for use with an atomising device. Alternatively, the sealed container may be a disposable dispensing device such as a single dose nasal inhaler or an aerosol dispenser fitted with a metering valve. Where the dosage form comprises an aerosol dispenser, it will contain a propellant which can be a compressed gas e.g. air, or an organic propellant such as a fluorochlorohydrocarbon or hydrofluorocarbon. Aerosol dosage forms can also take the form of pump-atomisers.

Compositions suitable for buccal or sublingual administration include tablets, lozenges and pastilles where the active ingredient is formulated with a carrier such as sugar and acacia, tragacanth, or gelatin and glycerin.

Compositions for rectal administration are conveniently in the form of suppositories containing a conventional suppository base such as cocoa butter.

Compositions suitable for transdermal administration include ointments, gels and patches.

In one embodiment the composition is in unit dose form such as a tablet, capsule or ampoule.

The composition may contain from 0.1% to 100% by weight, for example from 10 to 60% by weight, of the active material, depending on the method of administration. The composition may contain from 0% to 99% by weight, for example 40% to 90% by weight, of the carrier, depending on the method of administration. The composition may contain from 0.05mg to 1000mg, for example from 1.0mg to 500mg, of the active material, depending on the method of administration. The composition may contain from 50mg to 1000mg, for example from 100mg to 400mg of the carrier, depending on the method of administration. The dose of the compound used in the treatment of the aforementioned disorders will vary in the usual way with the seriousness of the disorders, the weight of the sufferer, and other similar factors. However, as a general guide suitable unit doses may be 0.05 to 1000mg, more suitably 1.0 to 500mg, and such unit doses may be administered more than once a day, for example two or three a day. Such therapy may extend for a number of weeks or months.
The invention provides, in a further aspect, a combination comprising a compound of formula (I) or a pharmaceutically acceptable derivative thereof together with a further therapeutic agent or agents.

The invention provides a compound of formula (I), for use in combination with a further therapeutic agent or agents.

When the compounds are used in combination with other therapeutic agents, the compounds may be administered either sequentially or simultaneously by any convenient route.

The combinations referred to above may conveniently be presented for use in the form of a pharmaceutical formulation and thus pharmaceutical formulations comprising a combination as defined above together with a pharmaceutically acceptable carrier or excipient comprise a further aspect of the invention. The individual components of such combinations may be administered either sequentially or simultaneously in separate or combined pharmaceutical formulations. The individual components of combinations may also be administered separately, through the same or different routes.

When a compound of formula (I) or a pharmaceutically acceptable derivative thereof is used in combination with a second therapeutic agent active against the same disease state the dose of each compound may differ from that when the compound is used alone. Appropriate doses will be readily appreciated by those skilled in the art.

A pharmaceutical composition of the invention, which may be prepared by admixture, suitably at ambient temperature and atmospheric pressure, is usually adapted for oral, parenteral or rectal administration and, as such, may be in the form of tablets, capsules, oral liquid preparations, powders, granules, lozenges, reconstitutable powders, injectable or infusible solutions or suspensions or suppositories. Orally administrable compositions are generally preferred.

The present invention also provides Kv3 modulators, or their pharmaceutically acceptable salts, for use in the treatment or prophylaxis of depression and mood disorders, hearing disorders, schizophrenic, substance abuse disorders, sleep disorders or epilepsy.

In particular Kv3 modulators or their pharmaceutically acceptable salts may be particularly useful in the treatment or prophylaxis of depression and mood disorders including Major Depressive Episode, Manic Episode, Mixed Episode and Hypomanic Episode; Depressive Disorders including Major Depressive Disorder, Dysthmic Disorder (300.4), Depressive Disorder Not Otherwise Specified (311); Bipolar Disorders including Bipolar I Disorder, Bipolar II Disorder (Recurrent Major Depressive Episodes with Hypomanic Episodes) (296.89), Cyclothymic Disorder (301.13) and Bipolar Disorder Not Otherwise Specified (296.80); Other Mood Disorders including Mood Disorder Due to a General Medical Condition
(293.83) which includes the subtypes With Depressive Features, With Major Depressive-like Episode, With Manic Features and With Mixed Features), Substance-Induced Mood Disorder (including the subtypes With Depressive Features, With Manic Features and With Mixed Features) and Mood Disorder Not Otherwise Specified (296.90), Seasonal affective disorder.

The invention also provides a method of treating depression and mood disorders, hearing disorders, schizopherenea, substance abuse disorders, sleep disorders or epilepsy, including for example those disorders mentioned hereinabove, which comprises administering to a subject in need thereof an effective amount of Kv3 modulator or a pharmaceutically acceptable salt thereof.

The invention also provides a Kv3 modulator, or a pharmaceutically acceptable salt thereof, for use in the treatment or prophylaxis of depression and mood disorders, hearing disorders, schizopherenea, substance abuse disorders, sleep disorders or epilepsy, including for example those disorders mentioned hereinabove.

The invention also provides the use of a Kv3 modulator, or a pharmaceutically acceptable salt thereof, in the manufacture of a medicament for the treatment or prophylaxis of depression and mood disorders, hearing disorders, schizopherenea, substance abuse disorders, sleep disorders or epilepsy, including for example those disorders mentioned hereinabove.

For use in therapy the Kv3 modulators are usually administered as a pharmaceutical composition for example a composition comprising a Kv3 modulator or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier. Examples of such compositions, and methods of administration thereof, which compositions comprise a compound of formula (I) or a pharmaceutically acceptable salt thereof, are described hereinabove. Such compositions and methods of administration may also be used for other Kv3 modulators or pharmaceutically acceptable salts thereof, in the treatment of depression and mood disorders, hearing disorders, schizopherenea, substance abuse disorders, sleep disorders or epilepsy, including for example those disorders mentioned hereinabove.

Furthermore, the invention relates to a method for manufacturing compounds of formula I, to novel intermediates of use in the manufacture of compounds of formula I and to the manufacture of such intermediates.

Particular intermediates of interest include:

3,3-dimethyl-2,3-dihydro-l-benzofuran-4-ol (Intermediate 50)
Other intermediates of interest are the anilides of formula (IV):

**Brief description of the drawings**

The present invention is illustrated, by way of example only, with reference to the following figures in which:

Figure 1a  hKv3.2 currents recorded using the assay described in Biological Example 1. Data shown are the individual currents over the period of the depolarising voltage step to -15mV recorded from 4 different cells at two concentrations of the compound of Reference Example RE1. The data are fitted by a single exponential curve (solid lines) using the fitting procedure in Prism version 5 (Graphpad Software Inc).

**Experimental**

The invention is illustrated by the Compounds described below. The following Examples describe the laboratory synthesis of specific compounds of the invention and are not meant to limit the scope of the invention in any way with respect to compounds or processes. It is understood that, although specific reagents, solvents, temperatures and time periods are used, there are many possible equivalent alternatives that can be used to produce similar results. This invention is meant to include such equivalents.

**Analytical Equipment**

Starting materials, reagents and solvents were obtained from commercial suppliers and used without further purification unless otherwise stated. Unless otherwise stated, all compounds with chiral centres are racemic. Where reactions are described as having been carried out in a similar manner to earlier, more completely described reactions, the general reaction conditions used were essentially the same. Work up conditions used were of the types standard in the art, but may have been adapted from one reaction to another. The starting material may not necessarily have been prepared from the batch referred to. Compounds synthesised may have various purities ranging from for example 85% to 98%.

Calculations of number of moles and yield are in some cases adjusted for this.

Proton Magnetic Resonance (NMR) spectra were recorded either on Varian instruments at 300, 400, 500 or 600 MHz, or on Bruker instruments at 400 MHz. Chemical shifts are reported in ppm (δ) using the residual solvent line as internal standard. Splitting patterns are designed as s (singlet), br.s (broad...
singlet), d (doublet), t (triplet), q (quartet), dd (doublet of doublets), dt (doublet of triplets) and m (multiplet). The NMR spectra were recorded at temperatures ranging from 25 to 30°C.

HPLC analyses indicated by HPLC (walk-up): rt = x min, were performed on a Agilent 1100 series instrument using a Luna 3u C18(2) 100A column (50 x 2.0 mm, 3 μm particle size) [Mobile phase, solvent A: (water + 0.05% TFA), solvent B: (acetonitrile + 0.05% TFA), Gradient: 100% of (A) to 95% of (B) in 8 min. Column T = 40 °C. Flow rate = 1 ml/min. UV detection wavelength = 220 nm]. The use of this methodology is indicated by "LC-MS_B" in the analytic characterization of the described compounds.

Alternatively, CH3CN. The use of this methodology is indicated by "MS_1 (ESI)" in the analytic characterization of the described compounds.

Direct infusion Mass spectra (MS) were run on an Agilent 1100 Series LC/MSD Mass Spectrometer, operating in ES (+) and ES (-) ionization mode |ES (+): Mass range: 100-1000 amu. Infusion solvent: water + 0.1% HC02H / CH3CN 50/50. ES (-): Mass range: 100-1000 amu. Infusion solvent: water + 0.05% NH4OH / CH3CN 50/50]. The use of this methodology is indicated by "MS_2 (ESI)" in the analytic characterization of the described compounds.

HPLC-Mass spectra (HPLC-MS) were taken on an Agilent 1100 Series LC/MSD Mass Spectrometer coupled with HPLC instrument Agilent 1100 Series, operating in positive or negative electrospray ionization mode and in both acidic and basic gradient conditions. Acidic gradient: LC/MS-ES (+ or -) analyses were performed on a Supelcosil ABZ+ Plus column (33 x 4.6 mm, 3 μm) (mobile phase: from 10%[CH3CN+0.05%TFA] to 90 %[CH3CN+0.05%TFA] and 10% [water] in 2.2 min, under these conditions for 2.8 min. T = 45 °C, flux = 0.9 mL/min). The use of this methodology is indicated by "LC-MS_A" in the analytic characterization of the described compounds. Basic gradient: LC/MS-ES (+ or -) analyses were performed on an XTerra MS C18 column (30 x 4.6 mm, 2.5 μm). Mobile phase: A: (water + 0.1% HC02H) / B: CH3CN. Gradient (standard method): t = 0 min 0% (B), from 0% (B) to 95% (B) in 5 min lasting for 1.5 min, from 95% (B) to 0% (B) in 0.1 min, stop time 8.5 min. Column T = r.t.. Flow rate = 1 ml/min. The use of this methodology is indicated by "LC-MS_B" in the analytic characterization of the described compounds. Mass range ES (+ or -): 100-1000 amu. UV detection range: 220-350 nm. The use of this methodology is indicated by "LC-MS_B" in the analytic characterization of the described compounds.
Quality Control: LC/MS-ES+ under acidic conditions was performed on a Zorbax SB C18 column (1.8 µm 3 x 50 mm). Mobile phase: A: (H2O + 0.05% TFA by vol.) / B: (CH3CN + 0.05% TFA by vol). Gradient: t = 0 min 0% (B), from 0 to 95% (B) in 2.5 min, 95% (B) for 0.2 min, from 95 to 100% (B) in 0.2 min, 100% (B) for 0.4 min, From 100% to 0% (B) in 0.1 min. Stop time 4 min. Column T = 60°C. Flow rate: 1.5 ml/min. Mass range ES+: (100-1000 amu, F = 60). UV detection wavelengths: DAD 1A = 220.8, DAD 1B = 254.8.

The use of this methodology is indicated by "LC/MS: QC_3_M1_N" in the analytic characterization of the described compounds.

For reactions involving microwave irradiation, a Personal Chemistry Emrys™ Optimizer was used or a Biotage Initiator.

In a number of preparations, purification was performed using Biotage manual flash chromatography (Flash+), Biotage automatic flash chromatography (Horizon, SPI and SP4), Companion CombiFlash (ISCO) automatic flash chromatography, Flash Master Personal or Vac Master systems.

Flash chromatographies were carried out on silica gel 230-400 mesh (supplied by Merck AG Darmstadt, Germany) or on silica gel 300-400 mesh (supplied by Sinopharm Chemical Reagent Co., Ltd.), Varian Mega Be-Si pre-packed cartridges, pre-packed Biotage silica cartridges (e.g. Biotage SNAP cartridge), KP-NH prepacked flash cartridges, ISOLUTE NH₂ prepacked cartridges or ISCO RediSep Silica cartridges.

SPE-SCX cartridges are ion exchange solid phase extraction columns supplied by Varian. The eluent used with SPE-SCX cartridges is DCM and MeOH or only MeOH followed by ammonia solution in MeOH. The collected fractions are those eluted with the ammonia solution in MeOH unless otherwise stated.

SPE-Si cartridges are silica solid phase extraction columns supplied by Varian.

In a number of preparations, purification was performed on a Mass-Directed Autopurification (MDAP) system Fractionlynx™ equipped with Waters 2996 PDA detector and coupled with ZQ™ mass spectrometer (Waters) operating in positive and negative electrospray ionisation mode ES+, ES- (mass range 100-1000 or 100-900)

2-(2-propyn-1-yloxy)methylfuran

To a suspension of sodium hydride (1.570 g, 39.2 mmol) in DMF (46 ml) stirred under argon at 0°C was dropped a solution of 2-furanylmethanol (3.5 g, 35.7 mmol) in DMF (4 ml) in 20 minutes. The reaction mixture was stirred at 0°C for 15 minutes. 3-bromo-1-propyne (4.24 g, 35.7 mmol) 80% in toluene was dropped in 10 minutes at 0°C, then the mixture was left stirring at room temperature overnight. Water
was added and then the mixture was extracted with ethyl ether 3 times. The organic phase was dried over sodium sulphate and concentrated under vacuum. The residue was purified by flash chromatography on silica (Biotage SPI instrument), eluting with a gradient cyclohexane/ethyl acetate 95/5 to 85/15. Evaporation afforded the title compound (1.63 g).

$^1$H NMR (400 MHz, DMSO-d$_6$): $\delta$ ppm 7.66 (1H, d), 6.41 - 6.49 (2H, m), 4.46 (2H, s), 4.12 (2H, d), 3.48 (1H, t); UPLC-MS: 0.66 min

Intermediate 2 - 3

1,3-dihydro-2-benzofuran-4-ol and 1,3-dihydro-2-benzofuran-5-ol

To a solution of [2-[(2-propyn-1-yloxy)methyl]furan] (Intermediate 1, 1.63 g) in acetonitrile (60 ml) stirred under argon at room temperature was added neat gold trichloride (0.182 g, 0.599 mmol). The reaction mixture was stirred overnight at room temperature. Gold trichloride was then added (120 mg) and after 2 hours another gold trichloride addition was carried out (226 mg). After 1 hour the mixture was concentrated and the crude was purified by flash chromatography (Biotage SPI), eluting with cyclohexane/ethyl acetate 90/10. Evaporation of the two fractions gave respectively the title compounds: 1,3-dihydro-2-benzofuran-4-ol (100 mg) and 1,3-dihydro-2-benzofuran-5-ol (356 mg)

Intermediate 2: 1,3-dihydro-2-benzofuran-4-ol: $^1$H NMR (400 MHz, DMSO-c$_6$): $\delta$ ppm 9.59 (IH, s), 7.15 - 7.00 (IH, m), 6.78 - 6.60 (2H, m), 5.03 - 4.84 (4H, m); UPLC-MS : 0.41 min, 135 [M-H]-

A solution of hydroxylamine hydrochloride (510 mg, 7.3 mmol) and sodium acetate trihydrate (629 mg, 4.6 mmol) dissolved in 20 ml of a mixture EtOH/H2O (7/3) was added to a solution of L-(2,6-dihydroxyphenyl)-l-propanone (Intermediate 28, 1.0 g) in 15 ml of a mixture EtOH/H2O (7/3). After refluxing and stirring under N2 overnight, additional hydroxylamine hydrochloride (510 mg, 7.3 mmol) and sodium acetate trihydrate (629 mg, 4.6 mmol) dissolved in 4.5 ml of water were added. The reaction mixture was heated at reflux an additional 3 hours. After cooling down to room temperature, the volatiles were removed. Then water was added and reaction mixture was extracted with ethyl acetate. The gathered organic layers were dried over sodium sulphate, filtered and evaporated to afford the title compound (1.05g).

4-{(3,3-dimethyl-2,3-dihydro-1-benzofuran-4-yl)oxy}aniline

To a solution of 3,3-dimethyl-4-[(4-nitrophenyl)oxy]-2,3-dihydro-1-benzofuran (Intermediate 54, 0.9 g) in tetrahydrofuran (20 ml, SCRC) and water (10 ml) were added ammonium chloride (1.687 g, 31.5 mmol, SCRC) and zinc powder (1.031 g, 15.77 mmol, SCRC). The mixture was heated at 40°C for 2 hours and then filtered through a pad of celite. The filtrate was partitioned with water (20 ml) and ethyl acetate (50 ml, SCRC). The organic layer was dried, evaporated and purified by column chromatography on silica gel (EtOAc/PE = from 1/50 to 1/30) to afford the title compound as a yellow liquid (0.625 g, 76%).

Under argon flush, in a 8 ml vial l-(2-(hydroxymethyl)-6-(((methyloxy)methyl)oxy)phenyl)-l-propanol (Intermediate 105, 99 mg) was dissolved in tetrahydrofuran (2 ml) to give a pale yellow solution. The reaction mixture was cooled at 0°C. In those conditions, a solution of BuLi in hexane (1.6M, 0.246 ml, 0.394 mmol) was added. The reaction mixture was stirred at 0°C. After 30 minutes, 4-methylbenzenesulfonyl chloride (75 mg, 0.394 mmol) was added at 0°C. The reaction was stirred at that temperature. After 1 hour, additional BuLi in hexane (1.6M, 0.246 ml, 0.394 mmol) was added at 0°C. The reaction mixture was stirred at 0°C for 1 h, then at room temperature for 30 minutes. After that time the reaction mixture was quenched with 2 ml of 2M hydrochloric acid and diluted with 5 ml of dichloromethane. The phases were separated through a phase separator cartridge. The organic phase was evaporated under vacuum to afford the crude product as a pale yellow oil which was dissolved in methanol (3.00 ml). HCl (0.788 ml, 1.575 mmol) was added thereto. The obtained reaction mixture was warmed at 80°C and shaken. After 30 minutes, the reaction was completed. The reaction mixture was quenched with 5 ml of water and diluted with 25 ml of dichloromethane. The phases were separated through a phase separator cartridge. The organic phase was evaporated under vacuum to afford the crude product as a pale yellow oil which was purified via Biotage SP1 (with Cyclohexane/EtOAc as eluents from 1:0 to 3:1 in 10 CV; then 3:1 for 5 CV; then from 3:1 to 1:1 in 5 CV; then 1:1 for 5 CV; 10g SNAP Silica column). la-methyl-l,la,2,7b-tetrahydrocyclopropa[c]chromen-7-ol

To a solution of la-methyl-7-[(methyloxy)methyl]oxy]-l,la,2,7b-tetrahydrocyclopropa[c]chromene (Intermediate 124, 280 mg) in methanol (16 ml) a 2.0 M aqueous solution of HCl (1.271 ml, 2.54 mmol) was added. The reaction mixture was stirred at 50 °C for 2 hours and then at room temperature overnight at which time the reaction still showed some unreacted starting material, therefore more 2.0 M HCl was added (2 eq.) and stirring was continued at 50°C for 2 hours. The reaction mixture was then quenched with water and diluted and extracted with dichloromethane, washed with brine, dried over sodium sulphate, filtered and concentrated under vacuum. The residue obtained was purified by silica gel chromatography (Companion system, with a gradient from pure cyclohexane to cyclohexane/ethyl acetate 5/1) to give the title compound as a white solid (192 mg).

To a solution of 2-[(la-methyl-la,2,7b-tetrahydrocyclopropa[c]chromen-7-yl)oxy]-5-nitropyridine (Intermediate 126, 250 mg) in tetrahydrofuran (6 ml)/ water (3 ml) were added iron (234 mg, 4.19 mmol) and ammonium chloride (224 mg, 4.19 mmol). The reaction mixture was stirred at room temperature overnight at which time UPLC showed partial formation of the target compound with some hydroxyl-amine intermediate, therefore additional 3 equivalents of ammonium chloride and iron were added and the reaction was left stirring for another 5 hours. The iron was then filtered off over a pad of celite and the solution was diluted with an aqueous saturated solution of NaHCO$_3$ (100ml) and ethyl acetate (200ml). Two phases were separated and the aqueous layer was extracted with ethyl acetate. Organic layers were combined, dried over sodium sulphate, filtered and evaporated. The residue was purified by silica gel chromatography (Companion system, with a gradient from cyclohexane/ethyl acetate 8:2 to cyclohexane/ethyl acetate 1:1) to give the title compound as a light brown solid (150 mg).

(5R)-3-(2-chloropyrimidin-5-yl)-5-ethyl-5-methyl-imidazolidine-2,4-dione

To a solution of triphosgene (1.38 g, 4.65mmol) in Ethyl acetate (20 ml) at 0°C a solution of 2-chloro-5-aminopyrimidine (1 g, 7.75 mmol)/DIPEA (8 ml, 4.65 mmol) in ethyl acetate (40 ml) was slowly added (20 minutes) and the reaction mixture was stirred for 15 minutes at the same temperature. Maintaining the reaction mixture at 0°C, vacuum was applied (10 minutes) for removing the excess of phosgene. A solution of DMAP (0.945g, 7.75mmol) in ethyl acetate/dichloromethane 1:1 (8 ml) was added and the reaction mixture was stirred for 5 minutes at the same temperature. A solution of methyl (R)-2-amino-2-methyl-butyrate hydrochloride (2.59 g, 15.5 mmol) in ethyl acetate (30 ml) was slowly added (15 minutes) at 0°C and the reaction mixture was stirred for 30 minutes at the same temperature. The reaction was quenched with aqueous buffer (pH3) while the pH was allowed to reach ~5-6 and two phases were separated. The organic layer was washed with aqueous buffer (pH3) (2x20 ml) and then brine (20 ml), dried (Na₂SO₄), filtered and evaporated affording the urea intermediate as orange foam.

The urea was dissolved in MeOH (20 ml), NaOMe (0.41 g, 7.75 mmol) was added and the reaction mixture was stirred for 15 minutes at r.t.. The mixture was quenched with an aqueous saturated
solution of ammonium chloride (25 ml) and diluted with ethyl acetate (50 ml). Two phases were separated and the organic layer was washed with brine (2x20 ml), dried (Na₂SO₄), filtered and evaporated. The residue was triturated with B₂O (10 ml) and the solid collected affording the title compound (1.22 g) as a beige solid.

(Intermediate 186, 405 mg, 1.27 mmol) was suspended in ethyl acetate (4 mL). Triethylamine (0.44 mL, 3.175 mmol) was added followed by the addition of (2R)-2-(((1,1-dimethylethyl)oxy)carbonyl)amino)butanoic acid (258 mg, 1.27 mmol). The resulting suspension was cooled to 0°C and T3P 50 % w/w solution in ethyl acetate (1.4 mmol) was added drop wise. The reaction mixture was stirred at 0°C for 1 hour and then warmed to room temperature and stirred for a further hour. An aqueous saturated solution of Na₂CO₃ was added and the mixture stirred for 10 min. Two phases were separated and the organic layer was washed with water and brine, dried over Na₂SO₄ and evaporated to dryness. The residue was purified by flash chromatography on silica gel using cyclohexane/ethyl acetate 80:20 to cyclohexane/ethyl acetate 70:30 as eluents affording the title compound (0.50 g) as white foam.

5-nitro-2-[(3,3,7-trimethyl-2,3-dihydro-1-benzofuran-4-yl)oxy]pyrimidine (Intermediate 189, 243 mg, 0.81 mmol) was dissolved in THF (4 mL) and Palladium on charcoal (5 mol %, 85mg) was added. The reaction mixture was stirred under hydrogen atmosphere (3 bar) for 1 hour at room temperature. The catalyst was filtered on a pad of celite, washed with THF and the resulting solution was concentrated under vacuum. The residue was diluted with ethyl acetate and water, the organic phase collected, dried over Na$_2$SO$_4$ and evaporated to afford the title compound (220 mg) as colorless oil. The crude product, was used in the next step without further purification.

7-(methoxymethoxy)-3H-isobenzofuran-1-one

4-Hydroxy-1,3-dihydro-2-benzofuran-1,3-dione (685 mg, 4 mmol) was dissolved in dry THF (30 mL) at -78°C. K-Selectride 1M solution in THF (13 mL, 13 mmol) was added drop wise in 20 min then the mixture was warmed from -78°C to -30°C over 3 hrs. The final mixture was poured into ethyl acetate (lOOmL), brine (25mL) and a 3M hydrochloric acid solution (25mL). The organic layer was collected, washed with brine and evaporated to dryness. The resulting compound was dissolved in MeOH (20mL) and treated under stirring with a 3M hydrochloric acid solution (lOOmL). The mixture was then diluted with ethyl acetate (lOOmL) and brine (25mL), the organic layer was collected and evaporated under vacuum. The residue was purified by flash chromatography on silica gel using dichloromethane as eluent affording the phenol intermediate (430 mg).
The phenol intermediate (430 mg, 2.9 mmol) was dissolved in dry dichloromethane (20 mL) at 0°C, DIMEA (5 mL, 5.5 mmol) was added followed by a drop wise addition of chloromethylmethylether (0.44 mL, 5.7 mmol) over 10 min. The resulting solution was stirred at 0°C for 30 minutes then at room temperature for 15 minutes. Dichloromethane was partially evaporated and the obtained suspension was dissolved in ethyl acetate (20 mL), washed with a 50/50 mixture of water and brine (2x10 mL), dried over Na₂SO₄ and evaporated to give the title compound (549 mg) as a pale yellow solid.

7-(methoxymethoxy)-3H-isobenzofuran-3-one (Intermediate 192, 550 mg, 2.8 mmol) was dissolved at -70°C in dry THF (150 mL). A 3 M solution of methylmagnesium bromide in diethyl ether (5.6 mL, 16.8 mmol) was added drop wise in 30 minutes and the obtained mixture stirred for 30 minutes at -70°C and then 30 minutes at room temperature. The reaction mixture was poured into ethyl acetate (100 mL) and aqueous saturated solution of ammonium chloride (50 mL) at 0°C. The organic layer was collected, washed with an aqueous saturated solution of ammonium chloride (50 mL), brine (50 mL) and evaporated to give a yellow oil that was dissolved in acetonitrile (15 mL) and treated with sulphuric acid (0.15 mL). Acetonitrile was replaced with methyl alcohol (15 mL) and the resulting solution treated with p-toluensulfonic acid (100 mg). The solution was heated to 60°C and stirred for 2 hours. The solvent was evaporated and the residue dissolved in ethyl acetate (30 mL), washed twice with an aqueous saturated solution of sodium bicarbonate (10 mL) and then with an aqueous diluted solution of hydrochloric acid, dried over Na₂SO₄, and evaporated to dryness. The residue was purified by flash chromatography on silica gel using cyclohexane/ethyl acetate 90:10 as eluent affording the title compound (210 mg) as white solid.

6-Chloropyridin-3-amine (3.0 g, 23.3 mmol) was dissolved in a 3:1 v/v mixture of CH₃CN/ethyl acetate (20 mL) and (3R)-2-amino-2-methyl butanoic acid hydrochloride (3.97 g, 25.63 mmol) was added, followed by a 50% w/w solution in ethyl acetate of T3P (15.3 mL, 25.63). The mixture was heated to 60°C for 2 hrs, then quenched with NaOH 3N while the pH was -10 and then diluted with ethyl acetate (100 mL). The organic phase was collected, dried over Na₂SO₄ and concentrated under vacuum to a final volume of ~15 mL. The solution was cooled down to 0-5°C and Et₃N (11.4 mL, 81.9 mmol) was added. A solution of triphosgene (2.76 g, 6.96 mmol) in 10 mL of ethyl acetate was added dropwise in 15 min, keeping the internal temperature below 5°C. The mixture was stirred at 5°C for 30 minutes then quenched with water (100 mL) and finally diluted with additional ethyl acetate (100 mL). Two phases were separated and the organic layer was washed with water and brine, dried over Na₂SO₄ and concentrated under vacuum. The crude product was suspended in 15 mL of ethyl acetate followed by the dropwise addition of 65 mL of n-heptane. The resulting suspension was stirred at room temperature for 2 hrs, filtered, and the cake washed with a 2:8 v/v mixture of ethyl acetate/n-heptane (2 x 10 mL) before being dried at 40°C for 18 hrs affording the title compound (35 g) as white solid.

2-(2,2-dimethyl-2,3-dihydro-1-benzofuran-4-yl)oxy-5-nitopyridine

In a microwave vial, 2-chloro-5-nitopyridine (97 mg, 0.609 mmol) was dissolved in 3 mL of dimethylformamide. 2,2-dimethyl-2,3-dihydro-1-benzofuran-4-ol (100 mg, 0.609 mmol) and potassium carbonate (253 mg, 1.827 mmol) were added. The reaction mixture was heated under microwave irradiation for 1 hour at HOC. The reaction mixture was filtered. The filtrated solid was washed with dichloromethane (5 mL). The volatiles were evaporated under vacuum. The crude compound was dissolved in dichloromethane (8 mL) and brine was added (8 mL). The compound was extracted 2 times with dichloromethane (2 x 8 mL) and 2 times with ethylacetate (2 x 8 mL). Combined organic layers were dried over sodium sulphate and evaporated. The residue was purified by silica gel chromatography (Companion system, 12g Si cartridge) with cyclohexane/ethyl acetate from 100:0 to 80:20 as eluents affording the title compound (120 mg).

![Chemical Structure](image)

A solution of Ni-[4-(l,3-dihydro-2-benzofuran-4-yloxy)phenyl]-D-alaninamide (Intermediate 7, 80 mg) and TEA (0.187 ml, 1.341 mmol) in dichloromethane (10 ml) was stirred under argon at 0°C. Triphosgene (39.8 mg, 0.134 mmol) in dichloromethane (4 ml) was added and the mixture was left under stirring at 0 °C for 45 minutes. An aqueous saturated solution of NaHCO\(_3\) was then added. The phases were separated and the aqueous one was extracted 3 times with dichloromethane. The gathered organic phases were dried over sodium sulphate and concentrated under vacuum. The crude was purified by flash chromatography (FlashMasterPersonal), using as eluents a gradient Cyclohexane/ Ethyl acetate from 100:0 to 40:60. This afforded the title compound as a white solid (58.5 mg).

TEA (0.049 ml, 0.354 mmol) was added. A solution of triphosphene (9.46 mg, 0.032 mmol) in 0.7ml of dichloromethane was added dropwise to the reaction mixture at 0°C. After 20 minutes, the reaction mixture was quenched with 5 ml of water and diluted with 5 ml of dichloromethane. Phases were separated through a phase separator cartridge. The organic phase was evaporated under vacuum to afford the crude product which was purified by silica gel chromatography (Biotage SP1 system, IOg SNAP Silica column) with Cyclohexane/EtOAc as eluents (from 2/1 to 1/2 in 15 CV; then 1/2 for 10 CV). The collected fractions afforded the title compound as a 1:1 mixture of diastereoisomers (20.2 mg).

Example 25 and Example 26
5,5-dimethyl-3-{6-[(3-methyl-3,4-dihydro-2H-chromen-5-yl)oxy]-3-pyridinyl}-2,4-imidazolidinedione (enantiomers 1 and enantiomer 2)

Both enantiomers of Example 24 were separated by preparative chiral chromatography.

Chiral preparative HPLC conditions were the following ones: Column: Chiralpak AD-H (25 x 2 cm), 5u; Mobile phase: n-Hexane/Ethanol 40/60 v/v; Flow rate: 15 ml/min; UV: 220 nm; Sample preparation: 50 mg dissolved in 2 ml of ethanol Added 1 ml n-Hexane; Sample concentration: 16.7 mg/ml; Injection volume: 1000 µL.

Chiral analytical chromatography conditions were the following ones: Column: Chiralpak AD-H (25 x 0.46 cm); Mobile phase: n-Hexane/Ethanol 40:60 % v/v; Flow rate: 0.8 ml/min; DAD: 210-340 nm.

This preparative chiral chromatography afforded

- Example 25 which was the enantiomer 1 of 5,5-dimethyl-3-{6-[(3-methyl-3,4-dihydro-2H-chromen-5-yl)oxy]-3-pyridinyl}-2,4-imidazolidinedione (16.6 mg). 1H NMR (400 MHz, CDCl3) δ ppm 8.28 (IH, d), 7.75 (IH, dd), 7.13 (IH, t), 6.95 (IH, d), 6.74 (IH, dd), 6.65 (IH, dd), 5.76 (IH, br. s.), 4.15 - 4.20 (IH, m), 3.63 - 3.74 (IH, m), 2.72 - 2.82 (IH, m), 2.06 - 2.23 (2H, m), 1.57 (6H, s), 1.02 (3H, d). UPLC_B: 0.81 min, 368 [M+H]+. Chiral Analytical Chromatography HPLC: 12.48 min, 100.0% e.e.

- Example 26 which was the enantiomer 2 of 5,5-dimethyl-3-{6-[(3-methyl-3,4-dihydro-2H-chromen-5-yl)oxy]-3-pyridinyl}-2,4-imidazolidinedione (17.0 mg). 1H NMR (400 MHz, CDCl3) δ ppm 8.28 (IH, d), 7.75 (IH, dd), 7.13 (IH, t), 6.95 (IH, d), 6.74 (IH, dd), 6.65 (IH, dd), 5.76 (IH, br. s.), 4.15 - 4.20 (IH, m), 3.63 - 3.74 (IH, m), 2.72 - 2.82 (IH, m), 2.06 - 2.23 (2H, m), 1.57 (6H, s), 1.02 (3H, d). Example 27

5,5-dimethyl-3-{6-[(1a-methyl-1,1a,2,7b-tetahydrocyclopropa[clchromen-7-yl]oxy]-3-pyridinyl}-2,4-imidazolidinedione (racemic mixture)
To a solution of 2-methyl-N 1-{6-[(la-methyl-l,la,2,7b-tetrahydrcyclopropa[c]chromen-7-yl)oxy]-3-pyridinyl}alaninamide (Intermediate 129, 100 mg) in dry dichloromethane (10 ml) TEA (0.177 ml, 1.273 mmol) was added and the reaction mixture was cooled to 0°C. At this point a solution of triphosgene (37.8 mg, 0.127 mmol) in dry dichloromethane (2.5 ml) was slowly added (over 30 minutes) and the reaction mixture was stirred for 1 hour at the same temperature. The reaction was then quenched with water and the two phases were separated. The organic layer was dried over sodium sulphate, filtered and evaporated and the residue was purified by silica gel chromatography (Companion system, with a gradient from cyclohexane/ethyl acetate 8:2 to cyclohexane/ethyl acetate 1:1) to give the title compound as a white solid (40 mg, 0.103 mmol).

5,5-dimethyl-3-6-{[(la-methyl-l,la,2,7b-tetrahydrcyclopropa[c]chromen-7-yl)oxy]-3-pyridinyl}-2,4-imidazolidinedione (enantiomer 1 and enantiomer 2)

Both enantiomers of Example 27 were separated by semi-preparative chiral SFC chromatography. Chiral SFC conditions were the following ones: Column: Chiralpak IC (25 x 2.1 cm); Mobile phase: Ethanol +0.1% l-propylyamine 20%; Flow rate: 45 ml/min; Pressure: 120 bar; UV: 220 nm;

This semi-preparative chiral SFC chromatography on 30 mg of Example 27 afforded:

- Example 28 which was the enantiomer 1 of 5,5-dimethyl-3-6-{[(la-methyl-l,la,2,7b-
tetrahydrcyclopropa[c]chromen-7-yl)oxy]-3-pyridinyl}-2,4-imidazolidinedione (12mg).
Example 29 which was the enantiomer of 5,5-dimethyl-3-{6-[(1a-methyl-1a,2,7b-
tetrahydrocyclopenta[c]chromen-7-yl)oxy]-3-pyridinyl}-2,4-imidazolidinedione
(14 mg).

Example 30

To a solution of N1-[6-(lH-spiro[2-benzopyran-4',cyclopropan-5-yloxy]-3-pyridinyl]-D-isovalinamide (Intermediate 141, 40 mg) in dry dichloromethane (8 mL) TEA (0.076 mL, 0.544 mmol) was added and the reaction mixture was cooled to 0 °C. A solution of triphosgene (14.54 mg, 0.049 mmol) in dry dichloromethane (4 mL) was slowly added and the reaction mixture was stirred for 3 hours at the same temperature. The reaction was quenched with water (10 mL) and two phases separated. The organic layer was dried over sodium sulphate, filtered and evaporated and the residue was purified by flash chromatography (Biotage system) on silica gel using 10 g SNAP column and cyclohexane/ethyl acetate as eluents from 7:3 to 3:7 as eluent. This afforded the title compound (25 mg) as a white solid.

Example 31
3-{2-[(3,3-dimethyl-2,3-dihydro-l-benzofuran-4-yl)oxy]-5-pyrimidinyl}-5,5-dimethyl-2,4-imidazolidinedione

To a solution of NI-[2-[(3,3-dimethyl-2,3-dihydro-l-benzofuran-4-yl)oxy]-5-pyrimidinyl]-2-methylalaninamide (Intermediate 143, 18 mg, 0.053 mmol) in dry Dichloromethane (DCM) (3 mL) TEA (0.037 ml, 0.263 mmol) was added and the reaction mixture was cooled to 0 °C. A solution of triphosgene (7.02 mg, 0.024 mmol) in dry Dichloromethane (1 mL) was slowly added and the reaction mixture was stirred for 2 hours while the temperature was allowed to reach r.t.. The reaction was quenched with water (3ml) and two phases were separated. The organic layer was dried (Na₂SO₄), filtered and evaporated and the residue was purified by flash chromatography (Biotage system) on silica gel using a column SNAP 10g and cyclohexane/ethyl acetate from 8:2 to 1:1 as eluents affording the title compound (13 mg) as a white solid.

H NMR (400MHz, DMSO-d₆): δ ppm 8.72-8.77 (3H, m), 7.17 (1H, t), 6.65-6.75 (2H, m), 4.23 (2H, s), 1.43 (6H, s), 1.25 (6H, s). UPLC: 0.67 min, 369 [M+H]+.

Example 32

(5R)-3-{2-[(3,3-dimethyl-2,3-dihydro-l-benzofuran-4-yl)oxy]-5-pyrimidinyl}-5-(l-methylethyl)-2,4-imidazolidinedione

To a solution of NI-[2-[(3,3-dimethyl-2,3-dihydro-l-benzofuran-4-yl)oxy]-5-pyrimidinyl]-D-valinamide (Intermediate 145, 38 mg, 0.107 mmol) in dry Dichloromethane (DCM) (5 mL) TEA (0.074 mL, 0.533 mmol) was added and the reaction mixture was cooled to 0 °C. A solution of triphosgene (14.24 mg, 0.048 mmol) in dry Dichloromethane (DCM) (1 mL) was slowly added and the reaction mixture was stirred for 30 minutes at the same temperature. The reaction was quenched with water (3ml) and two phases were separated. The organic layer was dried (Na₂SO₄), filtered and evaporated and the residue was purified by flash chromatography (Biotage system) on silica gel using a column SNAP 25g and
cyclohexane/ethyl acetate from 8:2 to 1:1 as eluent affording the title compound (15 mg) as a white solid.

$^1$H NMR (400MHz, DMSO-d$_6$): $\delta$ ppm 8.77 (1H, br.s), 8.62 (2H, s), 7.18 (1H, t), 6.65-6.75 (2H, m), 4.22 (2H, s), 4.15-4.20 (1H, m), 2.10-2.20 (1H, m), 1.25 (6H, s), 1.03 (3H, d), 0.90 (3H, d). UPLC: 0.71 min, 383 [M+H]+.

Example 33

(5R)-3-(6'-t-(2,2-dimethyl-2,3-dihydro-1-benzofuran-4-yl)oxyl-3-pyridinyl)-5-ethyl-2,4-imidazolidinedione

(Intermediate 209, 10 mg, 0.029 mmol) was dissolved in dry dichloromethane (1 ml). The reaction mixture was cooled down in an ice bath. Triethylamine (0.024 ml, 0.176 mmol) was added at 0°C. Then 0.5 ml of a solution of triphosgene in dry dichloromethane (4.78 mg, 0.016 mmol in 0.5 ml) was added dropwise. The reaction mixture was stirred under argon during 20 min at 0°C. A saturated aqueous solution of NaHCO$_3$ was added (3 ml). The aqueous layer was extracted with dichloromethane 4 times (4 x 4 mL). Combined organic layers were dried over Na$_2$SO$_4$ and evaporated, the residue was purified by flash chromatography (Companion system) on silica gel using a 4g silica cartridge and cyclohexane/ethyl acetate from 100:0 to 60:40 as eluents affording the title compound (7mg).

$^1$H NMR (400MHz, CDC$_3$): $\delta$ ppm 8.29 (1H, d), 7.74 (1H, dd), 7.14 (1H, d), 7.00 (1H, d), 6.61 (1H, dd), 6.55 (1H, d), 5.91 (1H, br.s), 4.20-4.25 (1H, m), 3.02 (2H, s), 1.85-2.10 (2H, m), 1.51 (6H, s), 1.08 (3H, t).

5,5-dimethyl-3-{6-[(4-methyl-3,4-dihydro-2H-chrome n-5-yl)oxy]-3-pyridinyl}-2,4-imidazolidinedione
(racemate mixture, enantiomer 1, enantiomer 2)

In a 50 mL round-bottomed flask the 2-amino-2-methyl-N-[6-(4-methyl chroman-5-yl)oxy]-3-
pyridyl]propanamide (Intermediate 215, 22.9 mg, 0.064 mmol) was dissolved in Dichloromethane (3 mL)
to give a colourless solution. TEA (0.051 mL, 0.369 mmol) was added and the obtained mixture was cooled at 0 °C. Triphosgene (21.87 mg, 0.074 mmol) was dissolved in 1 mL of DCM and obtained solution was added to the reaction mixture. The reaction mixture was stirred at 0 °C for 15 minutes. Additional TEA (0.051 mL, 0.369 mmol) and triphosgene (21.87 mg, 0.074 mmol) dissolved in 1 mL of DCM were added to the reaction mixture at 0 °C and the reaction mixture was stirred for 15 minutes. The reaction mixture was quenched with 5 mL of saturated sodium bicarbonate solution and diluted with 10 mL of DCM. Phases were separated through a phase separator cartridge. The organic phase was evaporated in vacuo and the residue was purified by flash chromatography (Biotage system) on silica gel using a column SNAP 10g and cyclohexane/ethyl acetate from 2:1 to 1:2 as eluents affording the title compound Example 36 (19.1 mg) as a colorless oil.

$^1$H NMR (400 MHz, CDCl$_3$) δ ppm 8.30 (1H, d), 7.76 (1H, dd), 7.12 (1H, t), 6.97 (1H, d), 6.72 (1H, dd), 6.61 (1H, dd), 5.74 (1H, br. s), 4.23 - 4.32 (1H, m), 4.15 - 4.22 (1H, m), 2.97 - 3.11 (1H, m), 2.07 - 2.16 (1H, m), 1.62 - 1.70 (1H, m), 1.57 (6H, s), 1.28 (3H, d).

Both enantiomers of Example 36 were separated by preparative chiral chromatography.
Chiral preparative HPLC conditions were the following ones: Column: Chiralcel OD-H (25 x 2 cm), 5u; Mobile phase: n-Hexane/2-propanol 85:15 % v/v; Flow rate: 18 ml/min; UV: 220 nm; Sample preparation: 18 mg dissolved in 1.2 ml of ethanol. Sample concentration: 15 mg/ml; Injection volume: 600 µL.

This preparative chiral chromatography afforded:

Example 45, Example 46 and Example 47
In a 50 mL round-bottomed flask NI-6-[(3-ethyl-1,3-dihydro-2-benzofuran-4-yl)oxy]-3-pyridinyl]-2-methylalaninamide (Intermediate 149, 17.2 mg, 0.050 mmol) was dissolved in Dichloromethane (3 mL) to give a pale yellow solution that was cooled at 0 °C. TEA (0.035 mL, 0.252 mmol) was added followed by a dropwise addition of a solution of triphosgene (6.43 mg, 0.023 mmol) in dichloromethane (0.5 mL) and the reaction mixture was stirred at 0 °C for 20 minutes. The reaction mixture was evaporated in vacuo and the residue was purified by flash chromatography (Biotage system) on silica gel using a column SNAP IOg and cyclohexane/ethyl acetate from 2:1 to 1:2 as eluents affording the title compound Example 45 (15.3 mg) as a white solid.

$^1$H NMR (400 MHz, CDCl$_3$) δ ppm 8.29 (IH, d), 7.80 (IH, dd), 7.33 (IH, t), 7.09 (IH, d), 6.97- 7.04 (2H, m), 5.70 (IH, br. s.), 5.23 - 5.30 (IH, m), 5.19 (IH, dd), 5.12 (IH, d), 1.85 - 1.98 (IH, m), 1.67 - 1.80 (IH, m), 1.57 (6H, s), 0.86 - 0.92 (3H, m).

Both enantiomers of Example 45 were separated by preparative chiral chromatography.

Chiral preparative HPLC conditions were the following ones: Column: Chiralpack AD-H (25 x 2 cm), 5u; Mobile phase: n-Hexane/2-propanol 85:15 %v/v; Flow rate: 18 ml/min; UV: 220 nm; Sample preparation: 15 mg dissolved in 1.0 mL of ethanol (sample needs some drops of methanol for a complete solubilisation). Sample concentration: 15 mg/mL; Injection volume: 1000 µL.

This preparative chiral chromatography afforded:

Example 46: 5.6 mg (enantiomer 1); Rt (Chiral preparative HPLC) = 9.877 minutes

$^1$H NMR (400 MHz, MeOD) δ ppm 8.20 (IH, d), 7.92 (IH, dd), 7.38 (IH, t), 7.18 (IH, d), 7.10 (IH, d), 7.02 (IH, d), 5.14 - 5.24 (2H, m), 5.09 (IH, d), 1.81 - 1.96 (IH, m), 1.65 - 1.79 (IH, m), 1.52 (6H, s), 0.86 (3H, s).

Example 47: 5.5 mg (enantiomer 2); Rt (Chiral preparative HPLC) = 13.203 minutes

(5R)-5-ethyl-5-methyl-3-[2-(4-methylchroman-5-yl)oxypyrimidin-5-yllimidazolidi ne-2,4-dione

\(\text{diastereoisomeric mixture, diastereoisomer 1, diastereoisomer 2}\)

To a solution of \(\text{Nl-[2-(4-methyl-3,4-dihydro-2H-chromen-5-yl)oxy]-5-pyrimidinyl]-Disovalinamide}\) (Intermediate 219, 78 mg, 0.219 mmol) in dry Dichloromethane (4 mL) TEA (0.076 mL, 0.547 mmol) was added. The mixture was cooled to \(0^\circ\)C then a solution of triphosgene (29.2 mg, 0.098 mmol) in dry Dichloromethane (1.0 mL) was added dropwise. The reaction mixture was stirred for 10 minutes at \(0^\circ\)C then it was maintained in the ice-bath and quenched with water (10 mL). The organic layer was collected and the aqueous phase was extracted with DCM (2x5 mL). The combined organic layers were dried (\(\text{Na}_2\text{SO}_4\)), filtered and evaporated. The residue was purified by flash chromatography on silica gel using a column SNAP 25g and cyclohexane/ethyl acetate from 8:2 to 1:1 as eluents affording the title compound (66 mg) as a white solid.

UPLC PQC: 0.99 min, 383 [M+H]+.

Both diastereoisomers of Example 48 were separated by Semipreparative chiral SFC.

Semipreparative chiral SFC conditions were the following ones: Column: Chiralpack AD-H (25 x 0.46 cm), 5um; Modifier (Ethanol + 0.1% isopropylamine) 20%; Flow rate 2.5 ml/min; Pressure 120 bar; Temperature 38°C; UV detection 210 -340 nm.

This preparative chiral chromatography afforded:

Example 49: 24 mg as white solid (diastereoisomer 1); \(\text{Rt (Chiral preparative SFC)} = 7.583\) min
(5R)-5-ethyl-5-methyl-3-[2-(7-methylspiro[2H-benzofuran-3J'-cyclopropane-4-yl)oxypyrimidi n-5-yllimidazolidine-2,4-dione

To a solution of 7-methylspiro[2H-benzofuran-3,l'-cyclopropane]-4-ol (Intermediate 156, 18 mg, 0.1 mmol) in dry DMF (1ml) potassium carbonate (27.6 mg, 0.2 mmol) and then (5R)-3-(2-chloropyrimidin-5-yl)-5-ethyl-5-methyl-imidazolidine-2,4-dione (Intermediate 165, 20 mg, 0.08 mmol) were added and the reaction mixture was stirred for 2 hours at 80°C. After cooling the reaction mixture was quenched with water (1ml), diluted with brine (5ml) and extracted with ethyl acetate (2x10ml). The organic layer was dried over sodium sulfate, filtered and evaporated and the residue was purified by flash chromatography (Biotage system) on silica gel using a 10g SNAP column and cyclohexane/ethyl acetate 7:3 to cyclohexane/ethyl acetate 3:7 as eluents affording the title compound (21mg) as a white solid.

The following Reference Intermediates and Examples describe the preparation of compounds for use in assays.

Reference Intermediate RI

4-methyl-3-(methyloxy)aniline
To a solution of 1-methyl-2-(methyloxy)-4-nitrobenzene (2.5 g, 14.96 mmol) in methanol (50 mL) Ni-Raney (~2 g) was added and the reaction mixture was stirred overnight at room temperature under H₂ atmosphere (1 atm). The catalyst was filtered off and the residue was purified by SCX cartridge (50 g) to afford the title compound (1.86 g) as a colourless oil.

\(^1\)H-NMR (400 MHz, DMSO-d₆) δ ppm: 6.73 (1H, d), 6.19 (1H, d), 6.05 (1H, dd), 4.85 (2H, s), 3.68 (3H, s), 1.97 (3H, s); UPLC_B: 0.62 min, 138 [M+H]+.

Reference Intermediate R2

4-methyl-3-(methyloxy)phenol

To a suspension of 4-methyl-3-(methyloxy)aniline (Reference Intermediate RI, 1.86 g) in water (100 mL)/H₂SO₄ (30 mL, 563 mmol) at 0°C a solution of sodium nitrite (1.029 g, 14.91 mmol) in water (10 mL) was slowly added and the reaction mixture was stirred for 30 minutes at 0°C. The reaction mixture was slowly added to a solution of H₂SO₄ 98% (20 mL) in Water (80 mL) pre-heated at 90°C and stirred at this temperature for 1 h. After cooling the mixture was extracted with Et₂O (2x200mL), the organic layer was dried on sodium sulphate, filtered and evaporated to afford the title compound (1.86 g) as a red/brown oil.

\(^1\)H-NMR (400 MHz, DMSO-d₆) δ ppm: 9.14 (1H, br.s), 6.87 (1H, d), 6.35 (1H, d), 6.24 (1H, dd), 3.71 (3H, s), 2.01 (3H, s); UPLC_B: 0.63 min, 137 [M-H]-.

Reference Intermediate R3

2-([4-methyl-3-(methyloxy)phenyloxy]-5-nitropyridine
To a solution of 4-methyl-3-(methyloxy)phenol (Reference Intermediate R2, 400 mg) in dry N,N-
dimethylformamide (15 mL), potassium carbonate (1200 mg, 8.69 mmol) and then 2-chloro-5-
nitropyridine (551 mg, 3.47 mmol) were added and the reaction mixture was stirred for 2 hours at
115°C. The reaction was quenched with water (10 mL), diluted with brine (20 mL) and extracted with
ethyl acetate (3 times 30 mL). The organic layer was washed with ice cold brine (2 times 30 mL), dried
over sodium sulphate, filtered and evaporated. The residue was purified by silica gel chromatography
(Biotage system, 100 g SNAP column) with a gradient cyclohexane/ethyl acetate from 10/0 to 8/2.
Evaporation afforded the title compound as a light yellow oil (570 mg).

H-NMR (400 MHz, DMSO-d6) δ ppm: 2.16 (3H, s), 3.76 (3H, s), 6.68 - 6.73 (1H, m), 6.83 - 6.86 (1H, m),

Reference Intermediate R4

6-{[4-methyl-3-(methyloxy)phenylloxy]-3-pyridinamine

To a solution of 2-{[4-methyl-3-(methyloxy)phenylloxy]-5-nitropyridine (Reference Intermediate R3, 568
mg) in tetrahydrofuran (25 mL)/water (12.50 mL), iron (609 mg, 10.91 mmol) and then ammonium
chloride (584 mg, 10.91 mmol) were added and the reaction mixture was stirred for 8 hours at room
temperature. The catalyst was filtered off and the solution was diluted with an aqueous saturated
solution of Na2CO3 (5 mL) and extracted with ethyl acetate (2 times 40mL). Combined organic layers
were dried over sodium sulphate, filtered and evaporated and the residue was purified by silica gel
chromatography (Biotage system with a 50g SNAP column) using a as eluent a gradient
cyclohexane/ethyl acetate from 8/2 to 1/1. Evaporation afforded the title compound as light yellow oil
(465 mg).

H-NMR (400 MHz, DMSO-d6) δ ppm: 7.54 (1H, d), 7.06 (2H, ddd), 6.72 (1H, d), 6.59 (1H, d), 6.38 (1H,

2-(l,l-dimethylethyl)phenol (10 g, 66.67 mmol) was dissolved in 40 mL of MeOH and NaOH (40 g, 1 mol) dissolved in 40 mL of water was added dropwise. Then 40 mL of CHCl₃ was added (during the course of 1 h) at 60°C. The reaction mixture was stirred at that temperature for 3 h. After cooling down to r.t., the mixture was cooled to 0°C and 4M HCl was added until the solution reached pH 5-6. The mixture was extracted with DCM (three times) and the collected organic were dried over Na₂SO₄, filtered and evaporated. The crude was charged on a silica gel column and eluted with Cyclohexane/EtOAc (from 100:0 to 80:20 Cyclohexane/EtOAc, then plateau at 80:20) affording 766 mg of the title compound.

4-hydroxy-2-[(trifluoromethyl)oxy]benzonitrile

Two reactions were carried out in parallel (A and B) and then the two reaction mixtures were combined to run work-up and purification.

Reaction A: To a solution of 4-Methoxy-2-(trifluoromethoxy)benzonitrile (50 mg, 0.23 mmol) in 1,2-dichloroethane (1 mL) was added 1 M BBr3 solution in DCM (0.69 mL, 0.69 mmol) dropwise. The resulting reaction mixture was stirred under microwave irradiation five times (set parameters: T= 100°C, t= 1 hour) adding further 1 M BBr3 solution in DCM (1 mL) each time. The total amount of 1 M BBr3 solution in DCM used was 4.69 mL.
Reaction B: In a vial were added 4-Methoxy-2-(trifluoromethoxy)benzonitrile (750 mg, 3.45 mmol), 1,2-dichloroethane (5 mL) and then 1M BBr₃ solution in DCM (10.36 mL, 10.36 mmol) dropwise. The resulting reaction mixture was stirred under microwave irradiation for 1 hour (set T= 100°C). To the reaction mixture further 1M BBr₃ solution in DCM (1 mL) was added and the resulting reaction mixture was stirred under microwave irradiation three more times (set parameters: T= 100°C, t= 1.5 hours), adding further 1M BBr₃ solution in DCM (0.8 mL) each time. The total amount of 1M BBr₃ solution in DCM used was 13.76 mL.

The two reactions mixtures A and B were added dropwise to a NaHCO₃ saturated aqueous solution and the pH was adjusted to 7 with the addition of solid NaHCO₃. The two phases were separated and the aqueous phase was extracted with DCM (1x) and with EtOAc (2x). The combined organic phases were dried and evaporated to dryness to give the title compound in mixture with unreacted starting material (1.48 g) as a black oil. This mixture was used in the next step without further purification.

1,1-dimethylethyl ((IR)-1-{[(6-{r4-cyano-3-(l-methylethyl)phenylloxy}-3-pyridinyl)amino]carbonyl}propyl)carbamate

To a solution of 1,1-dimethylethyl((IR)-1-[(6-{[4-cyano-3-(l-methylethenyl)phenyl]oxy}-3-pyridinyl)amino]carbonyl)propyl)carbamate (Reference Intermediate R32, 73 mg) in MeOH (10 mL) was added Pd 10% w/w on activated carbon (14 mg) and the reaction mixture was stirred for 30 minutes under H₂ atmosphere (P= 1 atm). The catalyst was filtered off and the solvent removed under reduced pressure. The residue was purified by flash chromatography on silica gel (SNAP 10 g) eluting from 75:25 to 40:60 cyclohexane/ethyl acetate affording the title compound (62 mg) as white solid.

1,1-dimethylethyl \((\text{R}^\text{R})\)-1-[(6-[(4-cyano-2-cyclopropylphenyl)oxy]-3-pyridinyl]amino)carbonyl]propyl]carbamate  (Reference Intermediate R30, 133 mg) was dissolved in DCM (6 mL) and, at 0 °C, TFA (3.0 mL) was slowly added. The reaction mixture was stirred at that temperature for 2 h. After the removal of the volatiles, the crude obtained was charged on a SCX cartridge and eluted with MeOH and then 2M NH₃ in MeOH affording 102 mg of the title compound.

\(^1\)H-NMR (400 MHz, CDCl₃): \(\delta\) ppm 9.68 (1H, br. s), 8.32 - 8.18 (2H, m), 7.51 - 7.43 (1H, m), 7.25 - 7.31 (1H, m), 7.08 (1H, d), 6.99 (1H, d), 3.59 - 3.51 (1H, m), 2.06 - 1.95 (2H, m), 1.73 - 1.63 (1H, m), 1.03 (3H, t), 0.95 - 0.89 (2H, m), 0.74 - 0.63 (2H, m); UPLCqpc: 0.68 min, 337 [M+H] 

The following compounds were prepared using the foregoing methodology, replacing 1,1-dimethylethyl \((\text{R}^\text{R})\)-1-[(6-[(4-cyano-2-cyclopropylphenyl)oxy]-3-pyridinyl]amino)carbonyl]propyl]carbamate

(Reference Intermediate R30) with the appropriate N-BOC protected amine. Final products were purified by SCX (MeOH and then 2M ammonia solution in MeOH) and fractions eluted with ammonia, containing the product, were concentrated to provide the free-base. Alternatively, after removing the volatiles, to the crude taken up with an appropriate organic solvent was added NaHCO₃ saturated aqueous solution, the two phases were separated and the organic layer was dried, filtered and evaporated affording the final compound as the free-base.

Biological Example 1

The ability of the compounds of the invention to modulate the voltage-gated potassium channel subtypes Kv3.2/3.1 may be determined using the following assay.

Cell biology

To assess compound effects on human Kv3.2 channels (hKv3.2), a stable cell line expressing hKv3.2 was created by transfecting Chinese Hamster Ovary (CHO)-K1 cells with a pCMV5-hKv3.2 vector. Cells were cultured in DMEM/F12 medium supplemented by 10% Foetal Bovine Serum, 1X non-essential amino acids (Invitrogen) and 500ug/ml of Hygromycin-B (Invitrogen). Cells were grown and maintained at 37°C in a humidified environment containing 5% CO₂ in air.

To assess compound effects on human Kv3.1 channels (hKv3.1), CHO/Gam/EIA-clone22 alias CGE22 cells were transduced using a hKv3.1 BacMam reagent. This cell line was designed to be an improved CHO-K1-based host for enhanced recombinant protein expression as compared to wild type CHO-K1. The cell line was generated following the transduction of CHO-K1 cells with a BacMam virus expressing the Adenovirus-Gaml protein and selection with Geneticin-G418, to generate a stable cell line, CHO/Gam-A3. CHO/Gam-A3 cells were transfected with pCDNA3-EIA-Hygro, followed by hygromycin-B selection and FACS sorting to obtain single-cell clones. BacMam-Luciferase and BacMam-GFP viruses were then used in transient transduction studies to select the clone based on highest BacMam transduction and recombinant protein expression. CGE22 cells were cultured in the same medium used for the hKv3.2 CHO-K1 stable cell line with the addition of 300ug/ml hygromycin-B and 300ug/ml G418. All other conditions were identical to those for hKv3.2 CHO-K1 cells. The day before an experiment 10 million CGE22 cells were plated in a T175 culture flask and the hKv3.1 BacMam reagent (pFBM/human Kv3.1) was added (MOI of 50). Transduced cells were used 24 hours later.

Cell preparation for IonWorks Quattro™ experiments

The day of the experiment, cells were removed from the incubator and the culture medium removed. Cells were washed with 5 ml of Dulbecco’s PBS (DPBS) calcium and magnesium free and detached by the addition of 3 ml of Versene (Invitrogen, Italy) followed by a brief incubation at 37°C for 5 minutes. The flask was tapped to dislodge cells and 10 ml of DPBS containing calcium and magnesium was added to prepare a cell suspension. The cell suspension was then placed into a 15 ml centrifuge tube and centrifuged for 2 min at 1200 rpm. After centrifugation, the supernatant was removed and the cell pellet re-suspended in 4 ml of DPBS containing calcium and magnesium using a 5ml pipette to break up the
pellet. Cell suspension volume was then corrected to give a cell concentration for the assay of approximately 3 million cells per ml.

All the solutions added to the cells were pre-warmed to 37°C.

Electrophysiology

Experiments were conducted at room temperature using IonWorks Quattro™ planar array electrophysiology technology (Molecular Devices Corp.) with PatchPlate™ PPC. Stimulation protocols and data acquisition were carried out using a microcomputer (Dell Pentium 4). Planar electrode hole resistances (Rp) were determined by applying a 10 mV voltage step across each well. These measurements were performed before cell addition. After cell addition and seal formation, a seal test was performed by applying a voltage step from -80 mV to -70 mV for 160 ms. Following this, amphotericin-B solution was added to the intracellular face of the electrode to achieve intracellular access. Cells were held at -70 mV. Leak subtraction was conducted in all experiments by applying 50 ms hyperpolarizing (10 mV) prepulses to evoke leak currents followed by a 20 ms period at the holding potential before test pulses. From the holding potential of -70 mV, a first test pulse to -15 mV was applied for 100 ms and following a further 100 ms at -70 mV, a second pulse to 40 mV was applied for 50 ms. Cells were then maintained for a further 100 ms at -100 mV and then a voltage ramp from -100 mV to 40 mV was applied over 200 ms. In all experiments, the test pulses protocol was performed in the absence (pre-read) and presence (post-read) of the test compound. Pre- and post-reads were separated by the compound addition followed by a 3 minute incubation.

Solutions and drugs

The intracellular solution contained the following (in mM): K-glucuronate 100, KCl 54, MgCl₂ 3.2, HEPES 5, adjusted to pH 7.3 with KOH. Amphotericin-B solution was prepared as 50 mg/ml stock solution in DMSO and diluted to a final working concentration of 0.1 mg/ml in intracellular solution. The external solution was Dulbecco's Phosphate Buffered Saline (DPBS) and contained the following (in mM): CaCl₂ 0.90, KCl 2.67, KH₂PO₄ 1.47, MgCl₂ 6H₂O 0.493, NaCl 136.9, Na₃PO₄ 8.06, with a pH of 7.4.

Compounds of the invention (or reference compounds such as 3-V-cyclohexyl-3-V-[7,8-dimethyl-2-oxo-1,2-dihydro-3-quinolinyl)methyl]-/V'-phenylurea were dissolved in dimethylsulfoxide (DMSO) at a stock concentration of 10 mM. These solutions were further diluted with DMSO using a Biomek FX (Beckman Coulter) in a 384 compound plate. Each dilution (1 µL) was transferred to another compound plate and external solution containing 0.05% pluronic acid (66 µL) was added. 3.5 µL from each plate containing a compound of the invention was added and incubated with the cells during the IonWorks Quattro™
experiment. The final assay dilution was 200 and the final compound concentrations were in the range 50 µM to 50 nM.

Data analysis

The recordings were analysed and filtered using both seal resistance (>20 MΩ) and peak current amplitude (>500pA at the voltage step of 40 mV) in the absence of compound to eliminate unsuitable cells from further analysis. Kv3 channel-mediated outward currents were measured determined from the mean amplitude of the current over the final 10 ms of the -15 mV voltage pulse minus the mean baseline current at -70 mV over a 10 ms period just prior to the -15 mV step. This Kv3 channel currents following addition of the test compound were then compared with the currents recorded prior to compound addition. Data were normalised to the maximum effect of the reference compound (50µM of A/cyclohexyl-\(-\)[(7,8-dimethyl-2-oxo-1,2-dihydro-3-quinolinyl)methyl]-\(\wedge\)-phenylurea) and to the effect of a vehicle control (0.5% DMSO). The normalised data were analysed using ActivityBase or Excel software. The concentration of compound required to increase currents by 50% of the maximum increase produced by the reference compound (pEC50) was determined by fitting of the concentration-response data using a four parameter logistic function.

A/cyclohexyl-\(-\)[(7,8-dimethyl-2-oxo-1,2-dihydro-3-quinolinyl)methyl]-\(\wedge\)-phenylurea was obtained from ASINEX (Registry Number: 552311-06-5).

All the Example compounds were tested in the above assay and demonstrated potentiation of Kv3.1 or Kv3.2 or Kv3.1 and Kv3.2 (herein after "Kv3.1 and/or Kv3.2") whole-cell currents of, on average, at least 20% of that observed with 50µM A/cyclohexyl-A/-[(7,8-dimethyl-2-oxo-1,2-dihydro-3-quinolinyl)methyl]-\(\wedge\)-phenylurea. Thus, in the recombinant cell assays of Biological Example 1, all of the Example compounds act as positive modulators. As used herein, a Kv3.1 and/or Kv3.2 positive modulator is a compound which has been shown to produce at least 20% potentiation of whole-cell currents mediated by human Kv3.1 and/or human Kv3.2 channels recombinantly expressed in mammalian cells, as determined using the assays described in Biological Example 1 (Biological Assays).

A secondary analysis of the data from the assays described in Biological Example 1 investigates the effect of the compounds on rate of rise of the current from the start of the depolarising voltage pulses. The magnitude of the effect of a compound can be determined from the time constant (\(\tau_{act}\)) obtained from a non-linear fit, using the equation given below, of the rise in Kv3.1 or Kv3.2 currents following the start of the -15mV depolarising voltage pulse.
\[ Y = (Y_0 - Y_{\text{max}}) \times \exp(-K \times X) + Y_{\text{max}} \]

where:
- \( Y_0 \) is the current value at the start of the depolarising voltage pulse;
- \( Y_{\text{max}} \) is the plateau current;
- \( K \) is the rate constant, and \( \text{Tau}_{\text{act}} \) is the activation time constant, which is the reciprocal of \( K \).

Similarly, the effect of the compounds on the time taken for Kv3.1 and Kv3.2 currents to decay on closing of the channels at the end of the -15mV depolarising voltage pulses can also be investigated. In this latter case, the magnitude of the effect of a compound on channel closing can be determined from the time constant (\( \text{Tau}_{\text{deact}} \)) of a non-linear fit of the decay of the current ("tail current") immediately following the end of the depolarising voltage pulse.

The time constant for activation (\( \text{Tau}_{\text{act}} \)) has been determined for several of the compounds of the Examples. Figure 1 shows the data for two compounds of the invention. Table 1 provides the \( \text{Tau}_{\text{act}} \) data for all of the Examples analysed in this way.

Figure 1a shows hKv3.2 currents recorded using the assay described in Biological Example 1. Data shown are the individual currents over the period of the depolarising voltage step to -15mV recorded from 4 different cells at two concentrations of compound (Reference Example RE1). The data are fitted by a single exponential curve (solid lines) using the fitting procedure in Prism version 5 (Graphpad Software Inc).

Figure 1b shows hKv3.2 currents recorded using the assay described in Biological Example 1. Data shown are the individual currents over the period of the depolarising voltage step to -15mV recorded from 2 different cells at two concentrations of the compound of Reference Example RE3. The data are fitted by a single exponential curve (solid lines) using the fitting procedure in Prism version 5 (Graphpad Software Inc).

Table 1: Summary hKv3.2 data from the analysis of activation time (\( \text{Tau}_{\text{act}} \)). To allow for comparison between compounds, the compound concentration chosen was that which produced a similar current (~0.3nA) at the end of the voltage pulse, with the exception of the vehicle, where maximum currents were <0.1nA.

As can be seen from Table 1, in the absence of compound and presence of vehicle the Tau$_{sq}$ was 7.1±1.7 msec. A range of Tau$_{sq}$ values (7.3 - 50.1 msec) was observed in the presence of the test compounds when each was tested at a concentration that increased the Kv3.2 current to a similar level (~ 0.3nA).

Kv3.1 and Kv3.2 channels must activate and deactivate very rapidly in order to allow neurons to fire actions potentials at high frequency (Rudy and McBain, 2001, Trends in Neurosciences 24, 517-526). Slowing of activation is likely to delay the onset of action potential repolarisation; slowing of deactivation could lead to hyperpolarising currents that reduce the excitability of the neuron and delay the time before the neuron can fire a further action potential. Together these slowing effects on channel activation and deactivation are likely to lead to a reduction rather than a facilitation of the neurons ability to fire at high frequencies. Thus compounds that have this slowing effect on the Kv3.1 and/or Kv3.2 channels may slow neuronal firing. This slowing of neuronal firing by a compound of the invention, specifically Example 15 which markedly increases Tau$_{sq}$ to 50.1 ± 7.5 msec (Table 1), can be observed from recordings made from "fast-firing" interneurons in the cortex of rat brain, using electrophysiological techniques, *in vitro*. As can be observed in Figure 2, the addition of Example 15 reduces the ability of the neurons to fire in response to trains of depolarising pulses at 300Hz.
Figure 2 shows recordings made from identified “fast-firing” interneurons in the somatosensory cortex of the mouse. The neurons are induced to fire at high frequencies by trains of high frequency depolarising current pulses at 100, 200, and 300Hz. The ability of the neuron to fire an action potential on each pulse is determined. A spike probability of 1 on the y-axis of the graph indicates that an action potential is generated by the neuron on each of the depolarising current pulses. In the absence of drug (closed circles, n=9), the neurons maintained a spike probability of 1 up to 300Hz. However, in the presence of Example 15 (ImicroM; open circles, n=6), the neurons were unable to follow trains at the highest frequency. * p < 0.05, ANOVA for repeated measures.

Therefore, although all the Examples herein identified act as positive modulators in the recombinant cell assay of Biological Example 1, those compounds which markedly increase the value of Tau<sub>τ9</sub>, such as Example 15, may reduce the ability of neurons in native tissues to fire at high frequency.

In one aspect of the invention, there is provided a Kv3 potentiating compound which is associated with a mean tau value that is not more than 2 standard deviations greater than the mean value obtained in the presence of vehicle (DMSO 0.5%), for use in the treatment of disorders where positive modulation of Kv3.1 and/or Kv3.2 channel function is beneficial, including schizophrenia, bipolar disorder, hearing disorders, sleep disorders, substance-related disorders, and epilepsy.

In one aspect of the invention, there is provided a Kv3 potentiating compound which is associated with a mean tau value that is more than 2 standard deviations greater than the mean value obtained in the presence of vehicle (DMSO 0.5%), for use in the treatment of disorders where inhibition of Kv3.1 and/or Kv3.2 channel function is beneficial, including hyperacusis, Fragile-X, and autism.

**Preclinical Experiments**

All in vivo studies were conducted in compliance with Project Licences obtained according to Italian law (art. 7, Legislative Decree no. 116, 27 January 1992), which acknowledged the European Directive 86/609/EEC, and with the GlaxoSmithKline company policy on the care and use of laboratory animals and related codes of practice.

In the studies that follow, Compound 48 is the compound of Reference Example RE1.

**Biological Example 2**

**Evaluation of compound effects on the firing of interneurons in the somatosensory cortex of mice, in vitro**

**Animals**
Transgenic mice [CB6-Tg (Gadl-EGFP) G42Zjh/J] were purchased from The Jackson Laboratory (Maine, USA). These mice selectively express enhanced green fluorescent protein (EGFP) in the calcium-binding protein parvalbumin (Pv)-expressing subclass of basket interneurons. EGFP expression is not reported in other interneuron classes positive for somatostatin (SOM), cholecystokinin (CCK), calretinin (CR), and VIP. These mice are therefore useful for the identification of the Pv-expressing subset of GABAergic neurons that express Kv3.1 and Kv3.2 channels and are able to fire at high frequency.

**Slice preparation**

Experiments were performed on 250-μm-thick brain slices containing the somatosensory cortex. Briefly, brains were removed from deeply anaesthetized (isoflurane) 25-35 day-old Gadl-EGFP mice. Slices were cut using a DTK 1000 microslicer (DSK, Japan) in the following solution (in mM): KCl (2.5), CaCl₂ (0.1), NaH₂PO₄ (1.2), MgCl₂ (5), NaHCO₃ (26), sucrose (189) and glucose (10), kept at 2-6°C and gassed with 95% O₂-5% CO₂. After cutting, the slices were left to equilibrate in a recovery chamber for at least one hour in an artificial cerebrospinal fluid (ACSF) containing (in mM): NaCl (120), KCl (2.5), CaCl₂ (2), NaH₂PO₄ (2.5), MgCl₂ (1.5), NaHCO₃ (26), and glucose (10), at room temperature and saturated with 95% O₂-5% CO₂.

**Electrophysiological recordings**

For electrophysiological recordings, a slice was transferred to a submersion chamber mounted on the stage of an upright microscope (Axioskop, Carl Zeiss, Germany) and superfused with oxygenated ACSF. Visualization of neurons in the slices was accomplished with a 40X objective using infrared-differential interference contrast (IR-DIC) video microscopy (Hamamatsu C5985, Hamamatsu City, Japan). Parvalbumin-positive interneurons were identified by illuminating the preparation with a fluorescence lamp with a GFP-filter and switching between fluorescence and IR-DIC video microscopy. Only GFP-positive neurons were recorded. Whole-cell recordings were made using borosilicate-glass patch pipettes pulled using a Sutter P-97 electrode puller and filled with an internal solution containing (in mM): KGlucenate (125), EGTA (10), HEPES (10), MgCl₂ (1), KCl (10) and MgATP (2); pH 7.3 adjusted with KOH. When filled with this internal solution, patch electrodes had a tip resistance of 4-7 MΩ. Recordings were carried out at room temperature (20-22°C) using a Multiclamp 700B amplifier (Axon Instruments, Foster City, CA, USA). Current-command protocols (indicated below) and data acquisition were performed using pClamp 10.0 software and a Digidata 1320A interface (Axon Instruments, Foster City, CA, USA). Capacitive transients were neutralized and series-resistance was monitored continuously throughout the experiment. If it changed by >20% the cell was discarded. Data were filtered at 3 kHz and sampled at 10 kHz.
Drugs

Compounds of the invention were dissolved in DMSO (100%), tetraethylammonium (TEA) and tetrodotoxin (TTX), (both from Sigma, Italy) were dissolved in distilled water and stored at -20°C until use. Drugs were diluted to the final concentration on the day of the experiment. The highest final concentration of DMSO used was 0.1%.

Experimental procedure

The firing activity of the recorded interneurons was evaluated by applying long current steps at different intensities. Thus, after the formation of a giga-seal, the amplifier was switched to current-clamp mode, allowing the neuron to reach its resting membrane potential. A negative current was then injected into the cell in order to obtain a resting potential close to -80 mV. From this condition, step current injections (50 pA increments, 600 ms) were applied to elicit action potentials. This protocol was repeated at least 2 times for each cell.

Online bridge-balance compensation was carried out and Rm value was monitored continuously throughout the experiment.

Drug application

Slices were incubated in the recovery chamber for at least 1 hour in the presence of either vehicle (0.1% DMSO), TEA (0.5mM) + 0.1% DMSO, or TEA (0.5mM) + Reference Example RE1 (1 or 10 microM). After transfer of a slice to the recording chamber, the same drug condition was maintained by superfusion of the appropriate drugs in the circulating ACSF.

Data acquisition and analysis

Raw data were acquired using Clampex 10.0 (Molecular Devices, USA). Data were analyzed using Clampfit 10.0 software (Molecular Devices, USA). The frequency of action potential firing (expressed in Hz) in response to step current injections was calculated from the number of action potentials detected over the 600ms step current. Values of frequency obtained for each current step in the same experimental condition and in the same cell were averaged. Since the threshold to evoke action potentials differed from one cell to another, current step intensity was expressed as pA from the current threshold for action potential generation, rather than in absolute values.

Action potential half-width was calculated for each action potential using Clampfit. The values of the 2nd, 5th or the last ten action potentials evoked by a non-saturating current step (typically 100-150 pA from threshold) were averaged for each experimental condition in each analyzed cell.
Statistical analysis

Statistical differences between the effect of treatments on action firing frequency were evaluated using a two-way ANOVA for repetitive measurements and, if necessary, post hoc planned comparisons (differences were considered significant where p<0.05). The effect of drug treatment on action potential half-width and on the first derivative amplitude was evaluated using an ANOVA. All statistical analyses were conducted using Statistica Software (StatSoft version 8). When appropriate, results were reported as mean ± SEM.

Criteria for data inclusion/exclusion

The criteria used to include or exclude a cell from the analysis were based on accurate current-clamp conditions and the stability of the recording throughout the experiment. Online evaluation allowed the exclusion of a cell when the R_3 and/or R_n values changed by >20%.

Results

Interneurons recorded from slices incubated with 0.5mM TEA fired at a lower maximal frequency in response to step currents compared to neurons recorded from control slices (Figure 3). This effect was significantly reversed in slices incubated with TEA (0.5mM) plus Reference Example REI at 1µM or 10µM (one-way ANOVA for repeated measurements, * p<0.05 with respect to TEA alone).

Figure 3. The frequency of action potentials recorded from parvalbumin-positive interneurons in the somatosensory cortex of the mouse, evoked by depolarizing current steps (600ms duration and Δ-increment of 50pA) after at least 1 hour with either vehicle (0.1% DMSO; filled circles, n=6), TEA (0.5mM) +0.1% DMSO (open circles, n=7), TEA (0.5mM) + Reference Example REI (1µM; filled triangles, n=9), or TEA (0.5mM) + Reference Example REI (10µM; open triangles, n=5). * p<0.05; One-way ANOVA for repeated measurements.

Furthermore, the action potential half-width and was significantly increased in cells recorded from slices incubated with TEA (0.5mM) compared to control slices (0.1% DMSO) (Figure 4). In slices incubated with TEA (0.5mM) plus Reference Example REI at 1µM or 10µM, the mean action potential half-width was significantly decreased by 24% and 36%, respectively, compared to slices incubated with TEA (0.5mM) only (ANOVA and Dunnett test, * p<0.05, n=9; ** p<0.01, n=5, respectively).

Figure 4. The half-width of evoked action potentials from parvalbumin-positive interneurons in the somatosensory cortex of the mouse. Prior to recordings, slices were incubated for at least 1 hour with either vehicle (Control; 0.1% DMSO, n=6), TEA (0.5mM) + 0.1% DMSO (n=7), TEA (0.5mM) + Reference
Example RE1 (1µM; n=9), or TEA (0.5mM) + Reference Example RE1 (10µM; n=5). * p<0.05; ** p<0.01, *** p<0.001, ANOVA followed by Dunnett test.

These results demonstrate the ability of compounds which have activity in the assays of Biological Example 1 to modulate the behaviour of fast-firing interneurons in the mouse brain in a manner consistent with positive modulation of Kv3.1 and/or Kv3.2 channels. The ability to enhance Kv3 function in cortical brain areas is also consistent with the potential of these compounds to treat a range of central nervous syste, disorders, including schizophrenia, bipolar disorder, and epilepsy.

Biological Example 3

**Evaluation of compound effects on potassium currents recorded from neurons in the medial nucleus of the trapezoid body in mice, in vitro**

**Animals**

Male CBA/Ca mice (aged 12 - 16 days) were used in these experiments (in accordance with the UK Animals Scientific Procedures Act, 1986). Brain slices containing the medial nucleus of the trapezoid body (MNTB) were prepared as described previously (Brew and Forsythe, 2005).

**Drugs**

Chemicals and reagents were purchased from Sigma, (Poole, UK) unless otherwise noted. Reference Example RE1 was dissolved in DMSO and diluted in ACSF to the required concentration.

**Electrophysiological recording**

Recordings from identified MNTB neurons were conducted as previously described (Brew and Forsythe, 2005). Slices were placed in a superfusion chamber on an inverted microscope stage and continuously perfused with gassed (95% O₂-5% CO₂) ACSF at a rate of 1 ml min⁻¹ at room temperature. Whole-cell recordings were made from visually identified MNTB neurons using an Axopatch 700B amplifier (Molecular Devices, Union City, CA, USA). Patch solution comprised (in mM) potassium gluconate (97.5), KCl (32.5), Hepes (40), EGTA (5), MgCl₂ (1), Na₂phosphocreatin (5), pH 7.2 with KOH. Pipettes had resistances of 3-5 MΩ and series resistances were 6-10 MΩ (compensated by 70%, 10 µls lag). Access resistance was frequently monitored and the recording discarded if increases were more than 2 MΩ.

Once a whole-cell configuration had been obtained, cells were held at -60mV prior to application of voltage protocols as follows: cells were stepped from the holding potential to -90 for 700ms and stepped to -40mV for 25ms and then a voltage pulse to a range of voltages from -100 to +40mV (10mV
increments) was applied for 220ms before returning to the holding potential. Following completion of this protocol, TEA (ImM) was added to the superfusion medium. After 5 minutes, a second set of recordings using the same voltage protocol was carried out. Following this, Reference Example RE1 (10 microM) was added to the ACSF, in the continuing presence of TEA (ImM), and after a further 5 minutes, a final set of recordings with the voltage protocol was made.

Statistical analysis

Currents evoked by the voltage step to +40mV were compared across drug treatments for each cell using an unpaired t-test.

Results

TEA (ImM) significantly reduced the amplitude of outward, high voltage-activated potassium currents evoked by voltage steps to +40mV (Figure 5). This effect was reversed by the subsequent application of Reference Example RE1 (10 microM).

Figure 5. High-voltage activated potassium currents recorded from visually identified MNTB neurons in the mouse, in vitro. Data shown are the mean (+/- s.d.) of the current amplitude evoked by voltage steps to +40mV under different drug conditions. TEA (ImM), TEA (ImM) + Reference Example RE1 (10 microM). Statistical analysis was conducted using an unpaired t-test.

These data indicate that compounds which have activity in the assays of Biological Example 1 can modulate high voltage-activated potassium currents (presumed to be mediated by Kv3.1 channels; Brew and Forsythe, 2005) in neurons of the MNTB, a region of the brainstem that processes auditory information. This result supports the utility of compounds of the invention for the treatment of hearing disorders.

Biological Example 4

Electroshock seizure model in rats

Experimental Preparation

Male CD rats (85-130g) were supplied by Charles River, Italy. Animals were group housed with free access to food (Standard rodent chow) and water under a 12 h light/dark cycle (lights on at 0600h). A period of at least 5 days between arrival at GSK and the study was allowed in all cases.

Experimental Protocol
Animals were administered a test compound at the appropriate dose, route and pre-treatment time and returned to their home cage. Testing occurred in a separate room from that used for housing. Testing involved determining the threshold for tonic hindlimb extensor seizures using a Hugo Sachs Electronik stimulator which delivers a constant current of 0.3 second duration, 50Hz, sinewave form, fully adjustable between 1 and 300 mA. Stimuli were delivered via corneal electrodes (Stean TO, Atkins AR, Heidbreder CA, Quinn LP, Trail BK, Upton N. (2005) Br J Pharmacol. 144(5):628-35). Seizure threshold was determined using the 'up and down' method of Kimball et al. (1957)( Kimball AW, Burnett WT Jr, Doherty DG. (1957) Radiat Res. 7(1):1-12). The first animal tested in each group was stimulated with a current that might be expected to be close to the threshold for induction of a seizure. If a tonic seizure was not induced, then the next animal in the group received a stimulus 5 mA higher. If a tonic seizure was induced, then the next animal received a stimulus 5 mA lower. This is repeated for all animals within the control (vehicle) group. In the case of groups treated with a test compound steps of 5 to 10 mA were used. At the end of the study, blood samples were taken for analysis of the drug concentrations in this compartment (n=4/group).

Drugs and Materials

All doses were calculated as base. Sodium valproate was suspended in Methocell 1% (w/v) and dosed via the oral (p.o.) route at 5 mL/kg 1 hour before test. Reference Example RE1 was dissolved in DMSO and then suspended in Methocell 1% (w/v) to a final DMSO concentration of 5% (v/v). Reference Example RE1 was then dosed p.o. at 5mL/kg 2 hours before test.

Data Analysis

Induction of seizure is measured as an all-or-nothing effect scored as either present (+) or absent (0) for each animal. The data for each treatment group were recorded as the number of +’s and 0’s at each current level employed and this information was then used to calculate the CC50 value (current required for 50% of animals to show seizure behaviour) + standard error of the mean according to the method of Kimball et al. (1957). Drug effects were calculated as the % change in CC50. Significant differences between drug-treated animals and appropriate vehicle treated groups were assessed according to the methods of Litchfield and Wilcoxon (1949).

Results

Pretreatment with Reference Example RE1 was associated with a significant increase in seizure threshold at both doses tested: At the dose of 30mg/kg p.o., Reference Example RE1 produced a 91% increase in seizure threshold, whereas at the dose of 60mg/kg p.o., the increase in seizure threshold was
+218%. The increase produced by the higher dose of Reference Example REI was similar to the increase produced by the positive control, sodium valproate at 300mg/kg p.o. (+ 258%).

Blood concentrations of Reference Example REI measured in satellite animals 2 hours after dosing were 5.3 and 9.8^g/mL following the doses of 30 and 60mg/kg p.o., respectively. These concentrations are equivalent to unbound concentrations in blood of 1.3 and 2.2µM, respectively, and thus are consistent with concentrations of Reference Example REI that produce a significant increase in Kv3-mediated currents observed in the in vitro recombinant human Kv3 electrophysiology assay, described above.

Conclusions

These results suggest that Reference Example REI has anticonvulsant efficacy, and that this effect is likely to be mediated by the positive modulation of Kv3 potassium channels. Consequently, compounds which have activity in the assays of Biological Example 1 can have anticonvulsant efficacy.

Biological Example 5

**Psychostimulant-induced hyperactivity in mice**

*Experimental Preparation*

Male CD-I mice (25-35g) were supplied by Charles River, Italy. Animals were group housed with free access to food (Standard rodent chow) and water under a 12 h light/dark cycle (lights on at 0600h). A period of at least 5 days between arrival at GSK and the study was allowed in all cases.

*Experimental Protocol*

Animals were administered a test compound at the appropriate dose, route and pre-treatment time, and then returned to their home cage. Testing occurred in a separate room from that used for housing. Mice were treated orally (p.o.) with the test compound and placed individually into a Perspex box (length 20.5 cm, width 20.5 cm, height 34 cm) covered with a perforated lid. Infrared monitoring sensors were located around the perimeter walls (horizontal sensors). Two additional sensors were located 2.5 cm above the floor on opposite sides (vertical sensors). Data were collected and analysed using a VersaMax System (Accuscan Instruments Inc., Columbus, OH) which in turn transferred information to a computer. After 30 minutes of habituation, mice were treated with amphetamine dosed intraperitoneally (i.p.) at 2mg/kg at 10mL/kg, and subsequent locomotor activity in the test arena was assessed over a further 60 minutes. Locomotor activity was determined as the total distance (cm) travelled by each mouse in the test arena over the 60 minute test period.
Drugs and Materials

All doses were calculated as base. Clozapine was dissolved in distilled water and dosed at 3mg/kg intraperitoneum (i.p.) at 10mL/kg. Reference Example REI (10, 30 or 60mg/kg) or vehicle (HPMC 0.5% w/v, Tween80 0.1% v/v in water) was administered p.o. at 10mL/kg. Both clozapine and Reference Example REI were dosed immediately before placing the animal in the test arena (30 minutes before amphetamine administration).

Results

Amphetamine alone produced a large and significant increase in total distance travelled. A dose of 30mg/kg p.o. of Reference Example REI significantly reduced the increase in total distance travelled produced by amphetamine. A higher dose of 60mg/kg p.o. of Reference Example REI further reduced the increase in locomotor activity induced by amphetamine in a manner similar to the positive control, clozapine (3mg/kg i.p.). Data are summarised in Table 1.

Data were subjected to one-way analysis of variance (ANOVA) followed by Dunnett's test (** = p<0.01 vs amphetamine treatment alone).
These results show that Reference Example RE1, at doses similar to those that show anticonvulsant efficacy, is able to prevent hyperactivity induced by the psychostimulant, amphetamine. Thus, reference Example RE1 and other compounds that positively modulate Kv3.1 and/or Kv3.2 channels, as can be observed from the assay described in Biological Example 1, may be useful in the treatment of disorders associated with hyperactivity, such as bipolar mania, or disruption of the dopamine system, such that may occur in drug dependence, attention deficit hyperactivity disorder (ADHD), or schizophrenia.

Biological Example 6

Pharmaco-electroencephalography (phEEG) in the common marmoset

Animals and surgery

Laboratory bred male (vasectomised) and female common marmosets (Callithrix jacchus) over 2 years of age, weighing 250-500g were used in this study. The animals were caged in couples, in a housing room maintained at 25 ± 1°C, 60% humidity and a 12 hour light/dark cycle (lights on at 0600, with 30 min simulated dawn and twilight). Animals received a standard diet and drinking water ad libitum. Only one animal of each pair was involved in the test, which was carried out with the animal situated in the home cage.

The effect of compounds of the invention was assessed using telemetric recording of cortical EEG (ECoG). A multichannel telemetric transmitter (DSI model TL11M2-F40-EET) is implanted intraperitoneaally using standard surgical techniques in anaesthetised marmosets. Recording electrodes were permanently fixed, with dental cement, to the skull directly in contact with the dura mater through two drilled holes in the fronto-parietal region. Following surgery, animals were housed in pairs (one implanted, one unoperated partner) in their home cage with access to food and water ad libitum. Animals demonstrated a normal behavioural repertoire immediately after recovery from surgery; however, phEEG was assessed at least 3 weeks later. All in vivo studies were conducted in accordance with the Italian laws and conformed to GlaxoSmithKline ethical standards.

Experimental procedure

The animals were placed in the nest-boxes in their room cages and EEG traces were recorded using Dataquest ART software for a 5-min period for each time-point and analyzed using Spike2 software (CED, UK). The spectral power in each frequency band was determined for each 2 sec epoch during the pre-treatment period and averaged; similarly spectral power in each band was determined for
successive 2 sec epochs of each 5-min period of recording following vehicle or drug treatment. Change in the absolute spectral power, for each of the different bands (delta, theta, alpha and beta) was calculated offline.

Drug treatments were assigned according to a complete crossover design: All treatments were randomly distributed between animals, in separate experimental sessions, each animal received vehicle and each dose of drug, after an appropriate wash-out period.

Six animals were treated orally with Reference Example RE2 at the doses of 0.3, 1 and 3 mg/kg (lml/kg) and the EEG traces were recorded at +15, 30, 60, 90, 120 and 180 minutes following treatment. Reference Example RE2 was suspended in 12.5% (w/v) aqueous captisol containing 0.1% (w/v) Tween80 and 0.5 % (w/v) HPMC.

Data analysis

Four different frequency bands were considered: delta (1.50-6.00 Hz), theta (6.00-8.00 Hz), alpha (8.00-12.00 Hz) and beta (12.00-30.00 Hz). Values for spectral power in each band at each time point were first log transformed and then analysed with a mixed effect model with time as fixed effect, the baseline level as covariate, and animal as random term. Data are summarised as mean of the percentage changes from baseline and standard error.

Results

The pharmaco-EEG changes observed in these studies show that, compared to vehicle, Reference Example RE2 at the highest dose (3 mg/kg) induced a statistically significant increase of the absolute power in the delta band between 30 and 120 minutes (p<0.05) and a statistically significant increase in theta band power at 60 minutes (p<0.05). At the intermediate dose (1 mg/kg) Reference Example RE2 induced a marginally significant (p<0.10) increase in the absolute power in delta band at 30 minutes and a concomitant significant reduction in the beta band (p<0.05). No significant effects were observed in the alpha band at any dose of Reference Example RE2.

These results suggest that compounds which have activity in the assays of Biological Example 1 can modify the EEG of awake primates. Increases in delta-band EEG activity have previously been observed with antipsychotic compounds in humans.

Biological Example 7

Circadian pattern of expression of Kv3.1 and Kv3.2 channels in the superchiasmatic nucleus of mice
Material & Methods

Thirty adult male C57BL/6J mice (age: 4-5 weeks at the arrival; Charles River FR) were stored in six different cages (5 mice per cage) and maintained for 4 weeks in a dedicated room with 12 h light - 12 h dark condition (lights on at 06:00, designated as Circadian time [CT] 6; lights off at 18:00, designated as CT 18). The room temperature was maintained at 21 ± 2°C; food and water were available ad libitum. After this period, mice were sacrificed by cervical dislocation at different time points over a 24 hour period; 5 mice per time point. The animals were transferred from the storage room to the surgery room and then immediately sacrificed. During the dark phase, all these actions were performed under a dim red light.

Brains were removed from the skull and immediately immersed in isopentane maintained approximately at -30°C and then stored at -70°C prior to in situ hybridization analysis.

All the brains were cut by cryostat and a number of 14 µm-thick coronal sections were collected at the level in which the suprachiasmatic nucleus is present, approximately between -0.22 mm and -0.82 mm from Bregma (Paxinos and Franklin, "The mouse brain in stereotaxic coordinates"). The sections were then stored at -80°C until usage. For each time point (CT12, 16, 20, 24, 4 and 8), five mice were collected and two non-consecutive sections for each mouse were selected and allowed to dry at room temperature, then immediately exposed to in situ hybridization protocol, as described in the previous experiments.

Results

A one-way ANOVA found no significant effect of time on Kv3.1 mRNA expression within the mouse suprachiasmatic nucleus (Figure 6a). In contrast, one-way ANOVA indicated that there was a highly significant effect of the time on Kv3.2 mRNA expression within the mouse suprachiasmatic nucleus (p < 0.001), with a significant peak of expression at ZT 10, the time point corresponding to 2 hours before the shift from the light to the dark phase, which is the active phase of the mice (Figure 6b).

Figure 6: (a) Expression of Kv3.1 mRNA in the suprachiasmatic nucleus of mice sacrificed during at different Circadian times over a 24-hour light-dark cycle. Kv3.1 mRNA expression is expressed in nCi/g as mean ± S.E.M. from n = 5 mice per time point, (b) Expression of Kv3.2 mRNA in the superchiasmatic nucleus. Kv3.2 mRNA expression is expressed as mean ± S.E.M. from n = 5 mice per time point. *** p < 0.001: Kv3.2 mRNA expression at CT 16 is significantly different from all the other timepoints. * p < 0.05: the Kv3.2 mRNA expression at CT 20 is significantly different from the expression measured at CT 24 and 4.
These results indicate that Kv3.2 channel expression in the superchiasmatic nucleus varies over the 24-hour circadian cycle. Thus, given the central role of the superchiasmatic nucleus in setting the circadian clock in mammals, Kv3.2 channels are likely to be important to the function of this clock. Consequently, compounds that modulate Kv3.2 channels may have potential in the treatment of disorders associated with circadian dysfunction, including sleep and bipolar disorders.

Biological Example 9

Assessment of physiological sleep in the rat

Methods:

Adult male CD rats (C. River, Italy) were implanted with telemetric probes and housed singly, under controlled condition (temperature 18-20°C; relative humidity 45-50%; 12 hours light-dark cycle, lights on at 3 p.m., designated Circadian Time (CT) 0) with free access to food and water.

Reference Example REI was formulated in tween (0.1% v/v) and HPMC (0.5% v/v) and was administered orally at doses of 10, 30 and 60 mg/kg (vol. 2ml/kg) at CT18 (6 hours before lights on). The electroencephalogram (EEG) and electromyogram (EMG) were recorded continuously, starting immediately after administration, using telemetric apparatus (DSI dataquest® A.R.T. system). EEG and EMG recordings were analysed to evaluate sleep patterns using sleepSign® (Kissei Comtec Co.). Statistical analyses (1-way Anova followed by a Dunnett's test) was performed using Statistica-8 software.

Results:

Reference Example REI at 60mg/kg significantly increased total sleep time (p<0.05, n=8) and time spent in non-REM sleep (p<0.05, n=8) over the 5 hour period immediately following dosing, but did not affect time spent in REM sleep.

These results suggest that compounds of the invention can increase physiological sleep in animals, which suggests that they may be useful in the treatment of sleep disorders in humans.
Claims:

1. A compound of formula (I):

   \[ \text{(I)} \]

wherein:

- \( R_1 \) is \( \text{H}, \text{C}_2\text{-alkyl}, \text{halo}, \text{haloC}_2\text{-alkyl}, \text{CN}, \text{C}_1\text{-alkoxy}, \text{haloC}_1\text{-alkoxy} \);
- \( R_2 \) is \( \text{H}, \text{C}_1\text{-alkyl}, \text{C}_3\text{-spiro carbocycly}, \text{haloC}_3\text{-alkyl} \) or halo;
- \( R_3 \) is \( \text{H}, \text{C}_1\text{-alkyl}, \text{haloC}_1\text{-alkyl}, \text{halo} \) or \( R_3 \) is absent;
- \( R_{i3} \) is \( \text{H}, \text{C}_1\text{-alkyl}, \text{haloC}_1\text{-alkyl}, \text{halo} \) or \( R_{i3} \) is absent;
- \( A \) is a 5 or 6 membered saturated or unsaturated heterocycle, with at least one O atom; which heterocycle is optionally fused with a cyclopropyl group to form a tricycle when considered together with the phenyl;
- \( X \) is \( \text{C} \) or \( \text{N} \);
- \( Y \) is \( \text{C} \) or \( \text{N} \);
- \( R_5 \) is \( \text{C}_1\text{-alkyl} \);
- \( R_5 \) is \( \text{H}, \text{Deuterium}, \text{C}_1\text{-alkyl} \);
- or \( R_5 \) and \( R_5 \) can be fused to form \( \text{C}_2\text{-spiro carbocycly} \);
- wherein \( R_2 \) and \( R_3 \) may be attached to the same or a different ring atom; and wherein \( R_2 \) may be attached to a fused ring atom;
- or a pharmaceutically acceptable salt and/or solvate thereof.
2. The compound according to claim 1, which is:

\[
\text{R}_1: \text{H, or C}_{2-4}\text{alkyl, halo, haloC}_{2-4}\text{alkyl, CN, C}_{2-4}\text{alkoxy, haloC}_{2-4}\text{alkoxy;}
\]
\[

\]
\[
\text{R}_3: \text{H, C}_{2-4}\text{alkyl, haloC}_{2-4}\text{alkyl, halo; or R}_3\text{ is absent;}
\]
\[
\text{R}_4: \text{H, C}_{2-4}\text{alkyl, haloC}_{2-4}\text{alkyl, halo; or R}_3\text{ is absent;}
\]
\[
\text{A is a 5 or 6 membered saturated or unsaturated heterocycle, with at least one O atom; which heterocycle is optionally fused with a cyclopropyl group to form a tricycle when considered together with the phenyl;}
\]
\[
\text{X is C or N;}
\]
\[
\text{Y is C or N;}
\]
\[
\text{R}_5: \text{C}_{2-4}\text{alkyl;}
\]
\[
\text{R}_5: \text{H, Deuterium, C}_{2-4}\text{alkyl;}
\]

or \( R_5 \) and \( R_6 \) can be fused to form \( \text{C}_{3-4}\text{spiro carbocycly;} \)

wherein \( R_2 \) and \( R_3 \) may be attached to the same or a different ring atom; and wherein \( R_2 \) may be attached to a fused ring atom.

3. The compound according to claim 1, which is:
wherein

R₁ is H, or C₁₋₄ alkyl, halo, haloC₁₋₄ alkyl, CN, C₁₋₄ alkoxy, haloC₁₋₄ alkoxy;

R₂ is H, C₁₋₄ alkyl, C₃₋₄ spiro carbocycl, haloC₁₋₄ alkyl or halo;

R₃ is H, C₁₋₄ alkyl, haloC₁₋₄ alkyl, halo;

A is a 5 or 6 membered saturated or unsaturated heterocycle, with at least one O atom; which heterocycle is optionally fused with a cyclopropyl group to form a tricycle when considered together with the phenyl;

X is C or N;

Y is C or N;

R₄ is C₁₋₄ alkyl;

R₅ is H, Deuterium, C₁₋₄ alkyl;

or R₄ and R₅ can be fused to form C₃₋₄ spiro carbocycl;

wherein R₂ and R₃ may be attached to the same or a different ring atom;

and wherein R₅ may be attached to a fused ring atom;

or a pharmaceutically acceptable salt thereof.

4. The compound according to any one of claims 1 to 3, wherein R₁ is H.

5. The compound according to any one of claims 1 to 3, wherein R₁ is methyl.
6. The compound according to any one of claims 1 to 5, wherein A is a 5 membered saturated or unsaturated heterocycle, with at least one O atom; which heterocycle is optionally fused with a cyclopropyl group to form a tricycle when considered together with the phenyl.

7. The compound according to any one of claims 1 to 5, wherein A is a 6 membered saturated or unsaturated heterocycle, with at least one O atom; which heterocycle is optionally fused with a cyclopropyl group to form a tricycle when considered together with the phenyl.

8. The compound according to claim 6 or 7, wherein the ring A contains one heteroatom.

9. The compound according to any one of claims 1 to 8, wherein the ring A contains an oxygen in the meta position relative to the phenyl ring.

10. The compound according to any one of claims 1 to 9, wherein the ring A is dihydrofuran or dihydropyran.

11. The compound according to any one of claims 1 to 10, wherein the ring A is not fused with a cyclopropyl group.

12. The compound according to any one of claims 1 to 10, wherein the ring A is fused with a cyclopropyl group.

13. The compound according to any one of claims 1 to 12, wherein R₂ is H, F, methyl, ethyl, isopropyl or a C₃ spiro group.

14. The compound according to claim 13, wherein R₂ is H, methyl or a C₃ spiro group.

15. The compound according to any one of claims 1 to 14, wherein R₃ is H, C₁₋₄ alkyl, haloC₁₋₄ alkyl or halo.

16. The compound according to claim 15, wherein R₃ is H, F, methyl or ethyl.

17. The compound according to claim 16, wherein R₃ is H or methyl.

18. The compound according to any one of claims 1 to 14, wherein R₃ is absent.

19. The compound according to any one of claims 1 to 18, wherein R₂₃ is H, C₁₋₄ alkyl, haloC₁₋₄ alkyl or halo.

20. The compound according to claim 19, wherein R₁₃ is H, F or methyl.

21. The compound according to claim 20, wherein R₁₃ is H.
22. The compound according to claim 20, wherein $R_3$ is methyl.

23. The compound according to any one of claims 1 to 18, wherein $R_3$ is absent.

24. The compound according to any one of claims 1 to 23, wherein $X$ is C.

25. The compound according to any one of claims 1 to 23, wherein $X$ is N.

26. The compound according to any one of claims 1 to 25, wherein $Y$ is C.

27. The compound according to any one of claims 1 to 25, wherein $Y$ is N.

28. The compound according to any one of claims 1 to 27, wherein $R_6$ is methyl.

29. The compound according to any one of claims 1 to 27, wherein $R_6$ is ethyl.

30. The compound according to any one of claims 1 to 29, wherein $R_5$ is H.

31. The compound according to any one of claims 1 to 29, wherein $R_5$ is methyl.

32. The compound according to any one of claims 1 to 31, wherein $R_5$ and $R_5$ have the stereochemical arrangement:

![Chemical structure diagram]

33. The compound according to any one of claims 1 to 27, wherein $R_4$ and $R_5$ together form a $C_{3,4}$ spiro carbocycle.

34. A compound according to any one of Examples 1 to 70.

35. The compound according to any one of claims 1 to 34, for use as a medicament.

36. The compound according to claim 35, for use in the prophylaxis or treatment of hearing disorders, schizophrenia, bipolar disorder, epilepsy or sleep disorders.

37. The compound according to claim 36, for use in the prophylaxis or treatment of hearing loss or tinnitus.
38. The compound according to any one of claims 35 to 37, for use in conjunction with a further pharmaceutically active agent.

39. A method for the prophylaxis or treatment of hearing disorders, schizophrenia, bipolar disorder, epilepsy or sleep disorders by administering to a subject a compound according to any one of claims 1 to 34.

40. Use of a compound according to any one of claims 1 to 34 in the manufacture of a medicament for the prophylaxis or treatment of hearing disorders, schizophrenia, bipolar disorder, epilepsy or sleep disorders.

41. A pharmaceutical composition comprising a compound according to any one of claims 1 to 34 and a pharmaceutically acceptable carrier or excipient.

42. A compound selected from:

- 3,3-dimethyl-2,3-dihydro-1-benzofuran-4-ol
