(57) Abstract: Indole derivatives as alpha-l-antitrypsin modulators for treating alpha-l-antitrypsin deficiency (AATD).

WO 2021/203023 A1

IVATIVES AS ALPHA-1 -ANTITRYPSIN MODU
TREATING ALPHA-1 -ANTITRYPSIN DEFICIENCY (AATD)

[0001] This application claims the benefit of priority of U.S. Provisional Application No. 63/004,717, filed April 3, 2020, the contents of which are incorporated by reference herein in their entirety.

[0002] The disclosure provides compounds that are capable of modulating alpha-1 antitrypsin (AAT) activity and methods of treating alpha-1 antitrypsin deficiency (AATD) by administering one or more such compounds.

[0003] AATD is a genetic disorder characterized by low circulating levels of AAT. While treatments for AATD exist, there is currently no cure. AAT is produced primarily in liver cells and secreted into the blood, but it is also made by other cell types including lung epithelial cells and certain white blood cells. AAT inhibits several serine proteases secreted by inflammatory cells (most notably neutrophil elastase [NE], proteinase 3, and cathepsin G) and thus protects organs such as the lung from protease-induced damage, especially during periods of inflammation.

[0004] The mutation most commonly associated with AATD involves a substitution of lysine for glutamic acid (E342K) in the SERPINA1 gene that encodes the AAT protein. This mutation, known as the Z mutation or the Z allele, leads to misfolding of the translated protein, which is therefore not secreted into the bloodstream and can polymerize within the producing cell. Consequently, circulating AAT levels in individuals homozygous for the Z allele (*PiZZ*) are markedly reduced; only approximately 15% of mutant Z-AAT protein folds correctly and is secreted by the cell. An additional consequence of the Z mutation is that the secreted Z-AAT has reduced activity compared to wild-type protein, with 40% to 80% of normal antiprotease activity (American thoracic society/European respiratory society, Am J Respir Crit Care Med. 2003;168(7):818-900; and Ogushi et al. J Clin Invest. 1987;80(5):1366-74).

[0005] The accumulation of polymerized Z-AAT protein within hepatocytes results in a gain-of-function cytotoxicity that can result in cirrhosis or liver cancer later in life and neonatal liver disease in 12% of patients. This accumulation may spontaneously remit but can be fatal in a small number of children. The deficiency of circulating AAT results in unregulated protease activity that degrades lung tissue over time, resulting in emphysema, a form of chronic obstructive pulmonary disease (COPD). This effect is severe in *PiZZ* individuals and typically manifests in middle age, resulting in a decline in quality of life and shortened lifespan (mean 68 years of age) (Tanash et al. Int J Chron Obstruct Pulm Dis. 2016;11:1663-9). The effect is more pronounced in *PiZZ* individuals who smoke, resulting in an even further shortened lifespan (58

years). (Piitulainen and Tanash, COPD 2015;12(1):36-41). *PiZZ* individuals account for the majority of those with clinically relevant AATD lung disease. Accordingly, there is a need for additional and effective treatments for AATD.

[0006] A milder form of AATD is associated with the SZ genotype in which the Z-allele is combined with an S-allele. The S allele is associated with somewhat reduced levels of circulating AAT but causes no cytotoxicity in liver cells. The result is clinically significant lung disease but not liver disease. (Fregonese and Stolk, Orphanet J Rare Dis. 2008; 33:16). As with the ZZ genotype, the deficiency of circulating AAT in subjects with the SZ genotype results in unregulated protease activity that degrades lung tissue over time and can result in emphysema, particularly in smokers.

[0007] The current standard of care for AAT deficient individuals who have or show signs of developing significant lung or liver disease is augmentation therapy or protein replacement therapy. Augmentation therapy involves administration of a human AAT protein concentrate purified from pooled donor plasma to augment the missing AAT. Although infusions of the plasma protein have been shown to improve survival or slow the rate of emphysema progression, augmentation therapy is often not sufficient under challenging conditions such as during an active lung infection. Similarly, although protein replacement therapy shows promise in delaying progression of disease, augmentation does not restore the normal physiological regulation of AAT in patients and efficacy has been difficult to demonstrate. In addition, augmentation therapy requires weekly visits for treatment and augmentation therapy cannot address liver disease, which is driven by the toxic gain-of-function of the Z allele. Thus, there is a continuing need for new and more effective treatments for AATD.

I. Definitions

[0034] The term "AAT" as used herein means alpha-1 antitrypsin or a mutation thereof, including, but not limited to, the AAT gene mutations such as Z mutations. As used herein, "Z-AAT" means AAT mutants which have the Z mutation.

[0035] As used herein, "mutations" can refer to mutations in the *SERPINA1* gene (the gene encoding AAT) or the effect of alterations in the gene sequence on the AAT protein. A "*SERPINA1* gene mutation" refers to a mutation in the *SERPINA1* gene, and an "AAT protein mutation" refers to a mutation that results in an alteration in the amino acid sequence of the

AAT protein. A genetic defect or mutation, or a change in the nucleotides in a gene in general, results in a mutation in the AAT protein translated from that gene.

[0036] As used herein, a patient who is "homozygous" for a particular gene mutation has the same mutation on each allele.

[0037] As used herein, a patient who has the *PiZZ* genotype is a patient who is homozygous for the Z mutation in the AAT protein.

[0038] The term "AATD" as used herein means alpha-1 antitrypsin deficiency, which is a genetic disorder characterized by low circulating levels of AAT.

[0039] The term "compound," when referring to a compound of this disclosure, refers to a collection of molecules having an identical chemical structure unless otherwise indicated as a collection of stereoisomers (for example, a collection of racemates, a collection of cis/trans stereoisomers, or a collection of (*E*) and (*Z*) stereoisomers), except that there may be isotopic variation among the constituent atoms of the molecules. Thus, it will be clear to those of skill in the art that a compound represented by a particular chemical structure containing indicated deuterium atoms, will also contain lesser amounts of isotopologues having hydrogen atoms at one or more of the designated deuterium positions in that structure. The relative amount of such isotopologues in a compound of this disclosure will depend upon a number of factors including the isotopic purity of reagents used to make the compound and the efficiency of incorporation of isotopes in the various synthesis steps used to prepare the compound. However, as set forth above the relative amount of such isotopologues in toto will be less than 49.9% of the compound. In other embodiments, the relative amount of such isotopologues in toto will be less than 47.5%, less than 40%, less than 32.5%, less than 25%, less than 17.5%, less than 10%, less than 5%, less than 3%, less than 1%, or less than 0.5% of the compound.

[0040] Compounds of the disclosure may optionally be substituted with one or more substituents. It will be appreciated that the phrase "optionally substituted" is used interchangeably with the phrase "substituted or unsubstituted." In general, the term "substituted," whether preceded by the term "optionally" or not, refers to the replacement of hydrogen radicals in a given structure with the radical of a specified substituent. Unless otherwise indicated, an "optionally substituted" group may have a substituent at each substitutable position of the group, and when more than one position in any given structure may be substituted with more than one substituent chosen from a specified group, the substituent may be either the same or different at every position. Combinations of substituents envisioned by this disclosure are those that result in the formation of stable or chemically feasible compounds.

[0041] The term "isotopologue" refers to a species in which the chemical structure differs from a specific compound of this disclosure only in the isotopic composition thereof. Additionally, unless otherwise stated, structures depicted herein are also meant to include compounds that differ only in the presence of one or more isotopically enriched atoms. For example, compounds having the present structures except for the replacement of hydrogen by deuterium or tritium, or the replacement of a carbon by a ^{13}C or ^{14}C are within the scope of this disclosure.

[0042] Unless otherwise indicated, structures depicted herein are also meant to include all isomeric forms of the structure, e.g., racemic mixtures, cis/trans isomers, geometric (or conformational) isomers, such as (*Z*) and (*E*) double bond isomers, and (*Z*) and (*E*) conformational isomers. Therefore, geometric and conformational mixtures of the present compounds are within the scope of the disclosure. Unless otherwise stated, all tautomeric forms of the compounds of the disclosure are within the scope of the disclosure.

[0043] The term "tautomer," as used herein, refers to one of two or more isomers of a compound that exist together in equilibrium, and are readily interchanged by migration of an atom or group within the molecule.

[0044] "Stereoisomer" refers to both enantiomers and diastereomers.

[0045] As used herein, "deuterated derivative" refers to a compound having the same chemical structure as a reference compound, but with one or more hydrogen atoms replaced by a deuterium atom ("D"). It will be recognized that some variation of natural isotopic abundance occurs in a synthesized compound depending on the origin of chemical materials used in the synthesis. The concentration of naturally abundant stable hydrogen isotopes, notwithstanding this variation is small and immaterial as compared to the degree of stable isotopic substitution of deuterated derivatives described herein. Thus, unless otherwise stated, when a reference is made to a "deuterated derivative" of a compound of the disclosure, at least one hydrogen is replaced with deuterium at well above its natural isotopic abundance (which is typically about 0.015%). In some embodiments, the deuterated derivatives of the disclosure have an isotopic enrichment factor for each deuterium atom, of at least 3500 (52.5% deuterium incorporation at each designated deuterium) at least 4500, (67.5% deuterium incorporation), at least 5000 (75% deuterium incorporation) at least 5500 (82.5% deuterium incorporation), at least 6000 (90% deuterium incorporation), at lease 6333.3 (95% deuterium incorporation, at least 6466.7 (97% deuterium incorporation, or at least 6600 (99% deuterium incorporation).

[0046] The term "isotopic enrichment factor" as used herein means the ratio between the isotopic abundance and the natural abundance of a specified isotope.

[0047] The term "alkyl" as used herein, means a straight-chain (i.e., linear or unbranched) or branched, substituted or unsubstituted hydrocarbon chain that is completely saturated or may contain one or more units of saturation, without being fully aromatic. [00195] Some embodiments of the disclosure include derivatives of Compounds 1-457, Compounds 458-532, Compounds B1-B25, Compounds W1-W32, Compounds P1-P225 (e.g., Compounds 1-457, or e.g., Compounds 1-142, 144-177, 179-399, 401-422, 425-433, and 435-457) or compounds of Formulae (I), (IIa)-(IIf), (IIIa)-(IIIb), (IVa)-(IVb), (Va)-(Vb), (VIa)-(VIe), (VIIa)-(VIIe), and (IXa)-(IXe) or tautomers thereof. In some embodiments, the derivatives are silicon derivatives in which at least one carbon atom in a compound selected from Compounds 1-457, Compounds 458-532, Compounds B1-B25, Compounds W1-W32, and Compounds P1-P225 (e.g., Compounds 1-457, or e.g., Compounds 1-142, 144-177, 179-399, 401-422, 425-433, and 435-457) or compounds of Formulae (I), (IIa)-(IIf), (IIIa)-(IIIb), (IVa)-(IVb), (Va)-(Vb), (VIa)-(VIe), (VIIa)-(VIIe), and (IXa)-(IXe) has been replaced by silicon. In some embodiments, the derivatives are boron derivatives, in which at least one carbon atom in a compound selected from Compounds 1-457, Compounds 458-532, Compounds B1-B25, Compounds W1-W32, and Compounds P1-P225 (e.g., Compounds 1-457, or e.g., Compounds 1-142, 144-177, 179-399, 401-422, 425-433, and 435-457) or compounds of Formulae (I), (IIa)-(IIf), (IIIa)-(IIIb), (IVa)-(IVb), (Va)-(Vb), (VIa)-(VIe), (VIIa)-(VIIe), and (IXa)-(IXe) or tautomers thereof has been replaced by boron. Step 1. Synthesis of methyl 4-[4-benzyloxy-1-(3,4-difluorophenyl)-2-tetrahydropyran-4-yl-indol-3-yl]benzoate (C73)

[00326] A 2 L 5 neck flask fitted with a mechanical stirrer, a heating mantle, a J-Kem temperature probe, a water cooled reflux condenser and a nitrogen inlet/outlet was charged 4-benzyloxy-1-(3,4-difluorophenyl)-3-iodo-2-tetrahydropyran-4-yl-indole **S1** (80 g, 144.6 mmol), (4-methoxycarbonylphenyl)boronic acid (35 g, 194.5 mmol), CsF (105 g, 691.2 mmol) and degassed DME (1.6 L). The solution was bubbled through with nitrogen for 5 minutes and then $Pd_2(dba)_3$ (6.4 g, 6.99 mmol) and dicyclohexyl-[2-(2,6-dimethoxyphenyl)phenyl]phosphane (5.6 g, 13.64 mmol) were added. The resulting reaction mixture was bubbled through with nitrogen for 20 minutes , warmed to 80 °C, and stirred at this temperature for 8 hours.

[00327] The reaction mixture was cooled to room temperature, partitioned between dichloromethane (400 mL), EtOAc (800 mL) and water (400 mL). The organic phase was separated and washed successively with water (400 mL), sat. aqueous $NaHCO_3$ solution (400

The residue was dissolved/suspended in MTBE (~500 mL), refluxed for 30 seconds and the resulting suspension was allowed to stand for 2 hours at room temperature. The mixture was filtered and the collected solid was washed with MTBE (~100 mL), dried under suction to afford ~60 g white crystals which contained ~5% deiodination starting material and also ~7% boroxine. A 5 L 3 neck flask was fitted with a mechanical stirrer, a heating mantle, a J-Kem temperature probe, a water cooled reflux condenser was charged with ~60 g white crystals, suspended in EtOAc (800 mL) then heated to reflux. Additional EtOAc was added portionwise until a clear solution was attained (total amount of EtOAc required = ~1.6 L). The mixture was refluxed for 30 minutes, then heat was switched off, flask was left in heating mantle to cool down slowly. *Step 2. Synthesis of 4-[4-benzyloxy-1-(3,4-difluorophenyl)-2-tetrahydropyran-4-yl-indol-3-yl]benzoic acid (**C74**)*

[00328] A 5 L 3 neck flask fitted with overhead stirrer, a heating mantle, a J-Kem temperature probe, and a water cooled reflux condenser was charged with methyl 4-[4-benzyloxy-1-(3,4-difluorophenyl)-2-tetrahydropyran-4-yl-indol-3-yl]benzoate **C73** (52 g, 93.9 mmol) in a mixture of THF (1.5 L) and methanol (220 mL). LiOH (15 g, 626.3 mmol) in water (450 mL) was added and the resulting reaction mixture was warmed to 50 °C. The reaction was stirred at this temperature for 14 hours. The mixture was then cooled to 0 °C with ice/water bath, acidified with 2 *N* HCl to pH = 1, and a white suspension was obtained. The resulting reaction mixture was concentrated under reduced pressure to remove THF and methanol (~1.7 L). The white precipitate formed was filtered through a medium fritted funnel, washed with water (2 x 500 mL), dried in a convection oven at 80 °C for 14 hours to afford 4-[4-benzyloxy-1-(3,4-difluorophenyl)-2-tetrahydropyran-4-yl-indol-3-yl]benzoic acid (49 g, 95%) as a white sold which contained traces of ethyl acetate and THF. This material was taken into the next step

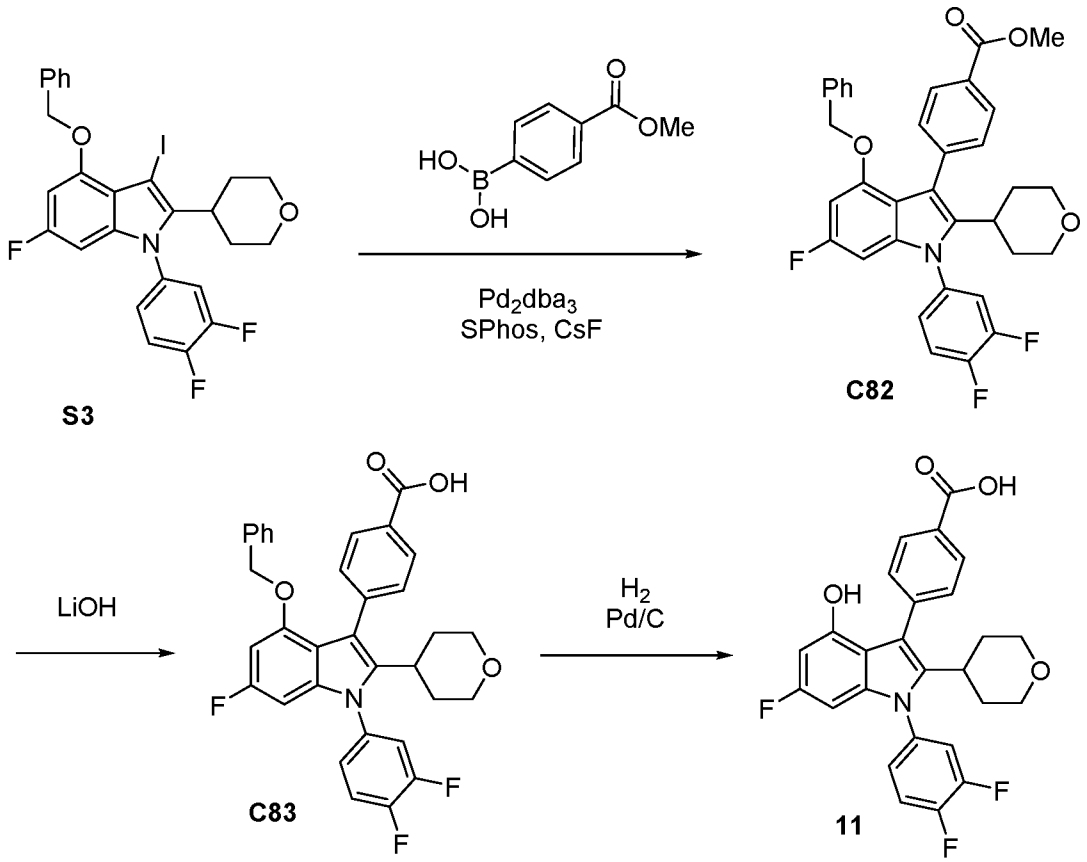
(11)



Step 1. Synthesis of methyl 4-[4-benzyloxy-1-(3,4-difluorophenyl)-6-fluoro-2-tetrahydropyran-4-yl-indol-3-yl]benzoate (C82)

[00337] In a 3 L 4-neck RBF equipped with mechanical stirrer, heating jacket and a temp probe, a solution/suspension of 4-benzyloxy-1-(3,4-difluorophenyl)-6-fluoro-3-iodo-2-tetrahydropyran-4-yl-indole **S3** (42.0 g, 74.6 mmol), (4-methoxycarbonylphenyl)boronic acid (26.8 g, 148.9 mmol), $Pd_2(dba)_3$ (1.36 g, 1.49 mmol), dicyclohexyl-[2-(2,6-dimethoxyphenyl)phenyl]phosphane (2.47 g, 6.02 mmol) and CsF (51 g, 335.7 mmol) in DME (1.0 L) was bubbled through with nitrogen for 10 minutes via gas dispersion tube. The reaction was placed under a positive pressure of nitrogen then heated to 80 °C for 3 hours. The reaction was slowly allowed to cool to room temperature, without removing the heating jacket. After 16 hours, dichloromethane (1.3 L) was added (slight exotherm 22 → 34 °C), the mixture was stirred for 10 minutes, then filtered. The solid was collected, washed with dichloromethane (200 mL). The combined filtrate was concentrated and the residue was partitioned between water and dichloromethane (1.5 L each). The organic layer was separated, washed with brine (1 L), dried ($MgSO_4$), filtered and concentrated. The residue was dissolved/suspended in MTBE (400 mL),

spun on rotovap (no vacuum) at 60 °C for 3 minutes, then allowed to stand at room temperature for 40 minutes. The solid was isolated via filtration, washing with MTBE (100 mL) and dried under suction. The material was dissolved in refluxing EtOAc (1.4 L), refluxed for 30 minutes, then the heat was switched off and the solution was slowly allowed to cool to room temperature. After 18 hours, the suspension was filtered, and the collected solid was washed with EtOAc (50 mL) and dried under suction to afford the product. Methyl 4-[4-benzyloxy-1-(3,4-difluorophenyl)-6-fluoro-2-tetrahydropyran-4-yl-indol-3-yl]benzoate (29.14 g, 68%) as a white solid. ^{1}H NMR (400 MHz, DMSO-d_6) δ 7.96 - 7.91 (m, 2H), 7.82 (ddd, J = 11.0, 7.2, 2.5 Hz, 1H), 7.72 (dt, J = 10.5, 8.8 Hz, 1H), 7.53 (d, J = 7.8 Hz, 2H), 7.45 - 7.38 (m, 1H), 7.23 - 7.15 (m, 1H), 7.13 - 7.05 (m, 2H), 6.78 - 6.72 (m, 2H), 6.63 (dd, J = 12.0, 2.1 Hz, 1H), 6.32 (dd, J = 9.5, 2.0 Hz, 1H), 4.95 (s, 2H), 3.92 (s, 3H), 3.65 (dd, J = 11.5, 3.6 Hz, 2H), 3.01 (ddt, J = 13.7, 7.3, 3.7 Hz, 2H), 2.80 - 2.67 (m, 1H), 1.63 - 1.37 (m, 4H). ^{19}F NMR (376 MHz, DMSO-d_6) δ -117.67, -135.24 (d, J = 23.0 Hz), -137.03 (d, J = 22.8 Hz). *Step 1. Synthesis of tert-butyl 4-benzyloxy-3-iodo-indole-1-carboxylate (**C91**)*

[00350] 4-benzyloxy-1H-indole **C90** (2.5 g, 11.2 mmol) in DMF (25 mL) at rt. was added KOH (1.6 g, 28.5 mmol) and the mixture was heated to 75 °C for 15 minutes. Upon cooling to

room temperature, a solution of I_2 (3.1 g, 12.2 mmol) in DMF (5 mL) was added dropwise. The reaction mixture was stirred for 45 minutes. The mixture was then poured into ice water containing 1% v/v NH_4OH and 0.2% w/v sodium metabisulfite and stirred for 20 minutes. A pink solid was collected by filtration and dried to give 4-benzyloxy-3-iodo-1H-indole (3 g, 77%) which was used without further purification. To a solution of 4-benzyloxy-3-iodo-1H-indole (3 g, 77%) and boc anhydride (2.5 g, 11.5 mmol) in dichloromethane (25 mL) was added DMAP (150 mg, 1.23 mmol) and the solution was stirred at room temperature for 2 hours. The solvent was removed under reduced pressure. Purification by silica gel chromatography (Gradient: 10-50%) EtOAc in heptane) afforded tert-butyl 4-benzyloxy-3-iodo-indole-1-carboxylate (3.3 g, 63%) as light brown solid. ^{1}H NMR (400 MHz, DMSO-d_6) δ 7.72 (d, J = 2.0 Hz, 2H), 7.63-7.61 (m, 2H), 7.45 - 7.38 (m, 2H), 7.35 - 7.21 (m, 2H), 6.95 (m, 1H), 5.28 (s, 2H), 1.61 (s, 9H). *Synthesis of 4-[[1-(4-fluorophenyl)-4-hydroxy-2-tetrahydropyran-4-yl-indol-3-yl]methyl]benzoic acid (**60**)*

[00401] Compound **60** was prepared in three steps from **S13** using the method described for the preparation of **54**. Purification by silica gel chromatography (Gradient: 0-10% MeOH in dichloromethane) afforded the product as a white solid. 4-[[1-(4-fluorophenyl)-4-hydroxy-2-tetrahydropyran-4-yl-indol-3-yl]methyl]benzoic acid (25 mg, 94%). ^{1}H NMR (400 MHz, Methanol-d/$CDCl_3$) δ 7.97 - 7.83 (m, 2H), 7.43 - 7.19 (m, 6H), 6.92 - 6.76 (m, 1H), 6.45 - 6.36 (m, 1H), 6.35 - 6.22 (m, 1H), 4.59 (s, 2H), 3.85 (dd, J = 11.5, 4.1 Hz, 2H), 3.29 - 3.19 (m, 2H), 3.00 - 2.82 (m, 1H), 1.86 (qd, J = 12.7, 4.3 Hz, 2H), 1.58 - 1.44 (m, 2H). LCMS *m/z* 446.21 $[M+H]^+$.

Compounds 61-102

[00402] Compounds **61-102** (Table 6) were prepared from **S14** or **S15** according to the method described for compound **1**. Any modifications are noted in the table footnotes. In some examples, the benzyl protecting group was removed by hydrogenation with ammonium formate instead of hydrogen gas (as described in the preparation of compound **2**).

Compound 242-243

[00637] Compounds **242-243** (Table 12) were prepared as described for the preparation of compound **12**. A methyl ether protecting group was used instead of a MOM protecting group. The methyl ester and methyl ethers were simultaneously deprotected with $AlCl_3$ and octane-1-thiol (as described in the preparation of compound **179**).

1. Prepared from **S3** by Suzuki coupling with (2-fluoro-4-methoxycarbonyl-phenyl)boronic acid. The resulting intermediate was coupled with ethanolamine using HATU, DIPEA in dichloromethane at room temperature.
2. No ester hydrolysis step required.
3. Prepared by Suzuki coupling of **S3** with (4-cyano-2-fluoro-phenyl)boronic acid. The nitrile group was subjected to oxidation with H_2O_2 and K_2CO_3 to afford 4-[4-benzyloxy-1-(3,4-difluorophenyl)-6-fluoro-2-tetrahydropyran-4-yl-indol-3-yl]-3-fluoro-benzamide. Hydrogenolysis afforded the product.

Compound 251 and Compound 252

[00639] Compounds **251** and **252** (Table 14) were prepared from compound **4** by HATU coupling with the ammonia and hydroxylamine respectively.

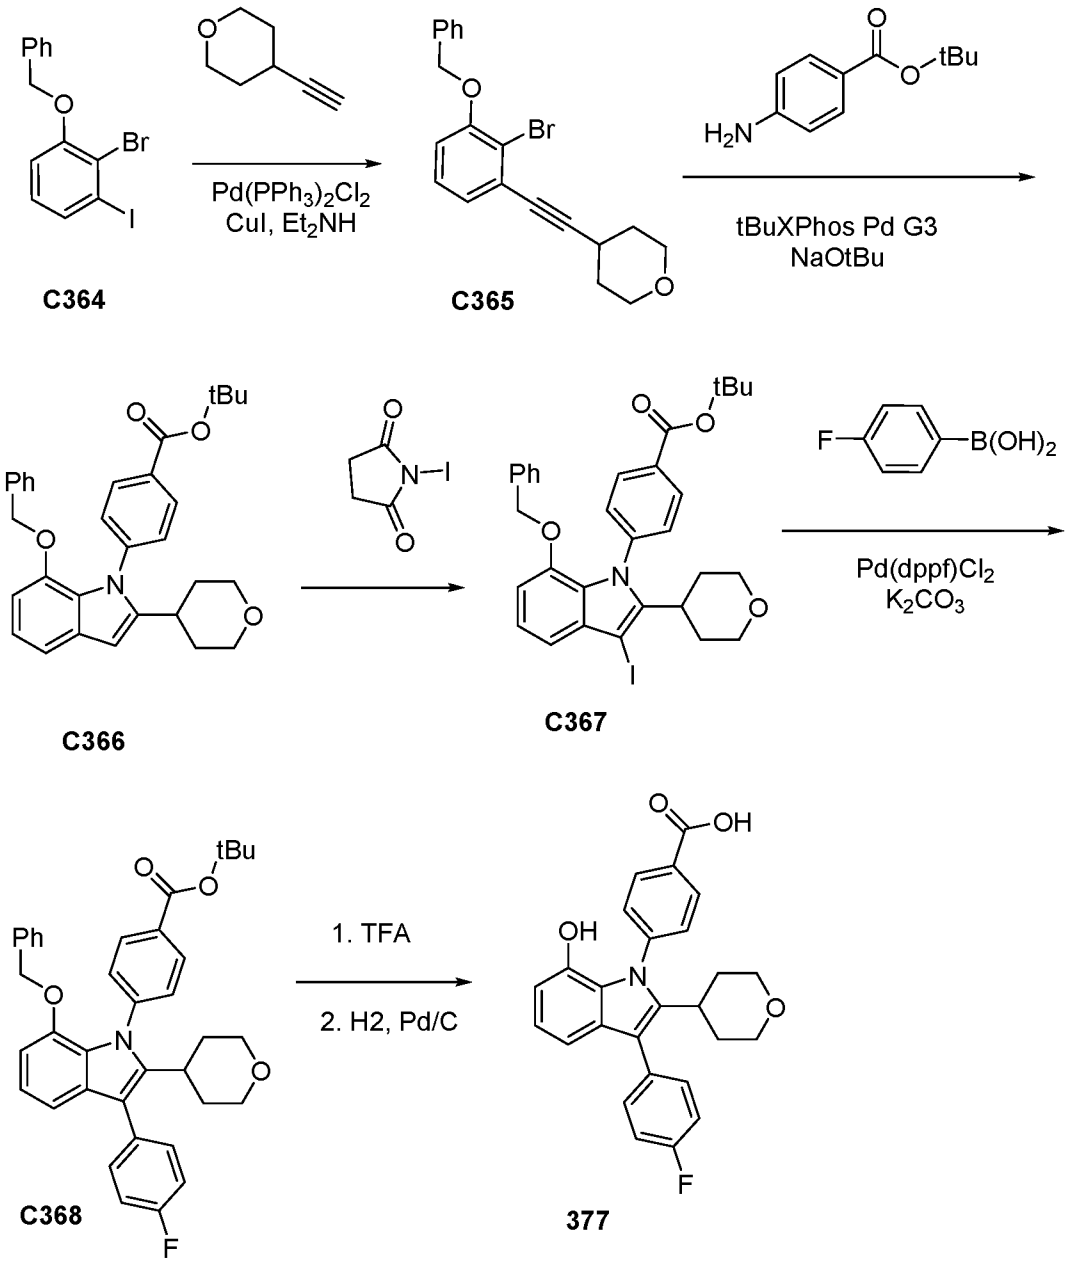
Compound 377

4-[3-(4-fluorophenyl)-7-hydroxy-2-tetrahydropyran-4-yl-indol-1-yl]benzoic acid (377)



Step 1. Synthesis of 4-[2-(3-benzyloxy-2-bromo-phenyl)ethynyl]tetrahydropyran (C365)

[00650] A solution of 1-benzyloxy-2-bromo-3-iodo-benzene (3.02 g, 7.375 mmol) in DMF (18 mL) was bubbled through with N_2 for 5 minutes. Then diethylamine (1.1 mL, 10.63 mmol) and 4-ethynyltetrahydropyran (1.06 g, 9.623 mmol) were added. The mixture was bubbled through with nitrogen for a further 2 minutes. Copper (I) iodide (211 mg, 1.108 mmol) and $Pd(PPh_3)_2Cl_2$ (260 mg, 0.3704 mmol) were added. The reaction mixture was heated to 65 °C. After 17 hours, the mixture was partitioned between EtOAc and water. The organic layer was separated, washed twice with brine, dried (MgSO4), filtered and concentrated *in vacuo*. Purification via silica gel chromatography with 80g isco column using 0-50% (EtOAc/Heptanes)

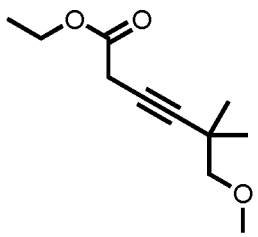
Preparation of C440



*Synthesis of ethyl 6-methoxy-5,5-dimethyl-hex-3-ynoate (**C440**)*

[00737] To a solution of CuI (0.09 g, 0.46 mmol) in acetonitrile (10.0 mL) under nitrogen atmosphere at ambient temperature was added 4-methoxy-3,3-dimethyl-but-1-yne (2.80 g, 23.71 mmol) in a single charge. The solution was stirred for 5 minutes and ethyl 2-diazoacetate (1.00 mL, 9.51 mmol) (w/v ≥13% dichloromethane) was added dropwise and the solution was stirred at ambient temperature for 16 hours. The crude reaction mixture was filtered through Florisil, washed with dichloromethane, and the filtrate was concentrated *in vacuo*. Purification by silica gel chromatography (0-25% *tert*-butyl methyl ether in heptanes) afforded 1.02 g of product (51%). ^{1}H NMR (400 MHz, $CDCl_3$) δ 4.16 (q, *J*= 7.1 Hz, 2H), 3.40 (s, 3H), 3.24 (apparent d, 4H), 1.26 (t, *J*= 7.1 Hz, 3H), 1.20 (s, 6H).

Compounds 458-514

[00738] Compounds **458-514** were prepared from the corresponding halo-anilines and alkynes by Larock cyclization as for compound **146**. Halo-anilines were prepared via Buchwald amination of the corresponding di-halo anilines. The disubstituted alkynes in Table 26 were prepared via Sonogashira coupling between the corresponding aryl halide and alkyne.

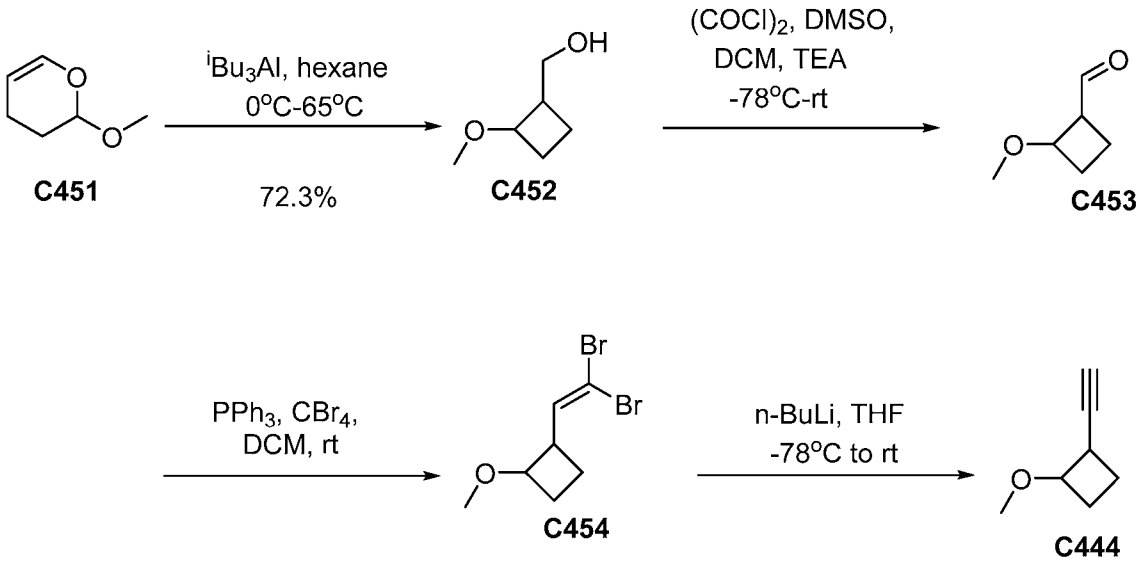
Preparation of C444



Step 1: 2-methoxy-3,4-dihydro-2H-pyran (C452)

After stirring for 30 minutes, the reaction mixture was refluxed for overnight. Then the reaction was quenched by adding of 10% H_2SO_4 (30 mL) at 0 °C and diluted with 500 mL of water. The aqueous phase was extracted with EtOAc (500 mL x 3). The combined organic phase was dried over Na_2SO_4, then concentrated to give a crude material, which was purified by vacuum distillation to give compound **C452** (21.0 g, 72.3%) as a colorless oil. ^{1}H NMR (400 MHz, $CDCl_3$):δ 3.69-3.59 (m, 3H), 3.25 (s, 3H), 2.45-2.34 (m, 1H), 2.17-2.09 (m, 1H), 1.91 (s, 1H), 1.83-1.69 (m, 2H), 1.34-1.23 (m, 1H).

After 10 minutes of stirring, **C452** (12.0 g, 103.0 mmol, 1.0 eq) was added dropwise. The reaction was stirred for 30 minutes at -78 °C. Then TEA (62.0 g, 618.0 mmol, 6.0 eq) was added, followed by adding 200 mL of water. After extraction with DCM (150 mL, x2), the organic layers (**C453** in DCM (450 mL)) were dried over Na_2SO_4, which was not further purified prior to the next step.

*Step 1. Synthesis of methyl 4-(4-cyano-3,3-dimethyl-but-1-ynyl)-2-methoxy-benzoate (**M6**)*

[00807] To a solution of methyl 4-bromo-2-methoxy-benzoate (2 g, 8.161 mmol) and 3,3-dimethylpent-4-ynenitrile (1.045 g, 9.752 mmol) in 1,4-dioxane (12 mL) and Et_3N (12 mL) was added in one portion dichloropalladium;triphenylphosphane (286 mg, 0.4075 mmol) and iodocopper (78 mg, 0.4096 mmol). The reaction mixture was stirred under nitrogen at 75 °C for 3 hours, then diluted with water and extracted with EtOAc. The organic layer was concentrated to dryness and purified via silica gel chromatography, eluting with 0-40% EtOAc in heptane. Pure fractions were combined and concentrated to give 2.2 g amber oil that solidified upon standing. Methyl 4-(4-cyano-3,3-dimethyl-but-1-ynyl)-2-methoxy-benzoate (**M6**) (2.2 g, 99%) ^1H NMR (400 MHz, Chloroform-d) δ 7.76 (d, J = 8.0 Hz, 1H), 7.04 (dd, J = 8.0, 1.4 Hz, 1H), 7.01 (d, J = 1.3 Hz, 1H), 3.93 (s, 3H), 3.90 (s, 3H), 2.64 (s, 2H), 1.52 (s, 6H).

*Step 2. Synthesis of N-(2-bromo-5-fluoro-phenyl)-4-fluoro-3-methoxy-aniline (**M4**)*

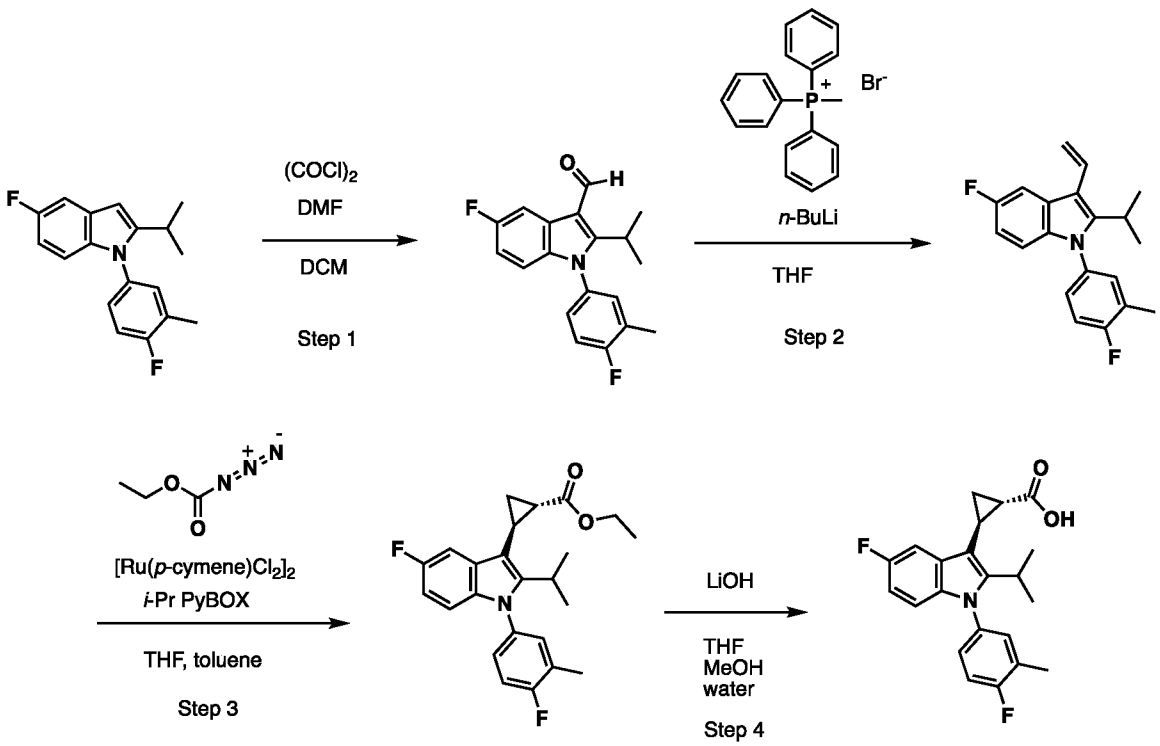
Compound W30



Step 1. Synthesis of 5-fluoro-1-(4-fluoro-3-methyl-phenyl)-2-isopropyl-indole-3-carbaldehyde

[00823] To a solution of oxalyl chloride (6.7 mL of 2 M in DCM, 13.4 mmol) in DCM (20 mL) at 0 °C was added dropwise anhydrous DMF (6.5 mL, 84 mmol). The reaction mixture was stirred at 0 °C and then a solution of 5-fluoro-1-(4-fluoro-3-methyl-phenyl)-2-isopropyl-indole (2 g, 7.01 mmol) in DCM (20 mL) was added dropwise. The reaction mixture was gradually warmed to room temperature and stirred for 3 hours, then treated with saturated aqueous $NaHCO_3$ and stirred an additional 30 minutes. The organic layer was removed, concentrated to dryness, and purified via silica gel chromatography, eluting with 0-35% EtOAc in heptane. Pure fractions were combined and concentrated to give 1.89 g (86%) of the desired product as a light tan solid. 5-fluoro-1-(4-fluoro-3-methyl-phenyl)-2-isopropyl-indole-3-carbaldehyde (1.89 g, 86%) ^{1}H NMR (400 MHz, Chloroform-d) δ 10.51 (s, 1H), 8.08 (dd, J = 9.4, 2.5 Hz, 1H), 7.25 (t, J = 8.7 Hz, 1H), 7.21 - 7.12 (m, 2H), 6.94 (td, J = 8.9, 2.6 Hz, 1H),

Step 2. Synthesis of 5-fluoro-1-(4-fluoro-3-methyl-phenyl)-2-isopropyl-3-vinyl-indole

[00824] To a suspension of methyl(triphenyl)phosphonium bromide (1.44 g, 4.03 mmol) in THF (25 mL) at 0 °C under nitrogen was added dropwise n-BuLi (1.61 mL of 2.5 M, 4.03 mmol) in hexane. The mixture was stirred at 0 °C for 1 hour and then a solution of 5-fluoro-1-(4-fluoro-3-methyl-phenyl)-2-isopropyl-indole-3-carbaldehyde (900 mg, 2.872 mmol) in THF (6 mL) was added dropwise. A. AAT Function Assay (MSD Assay NL20-SI Cell Line)

[00830] Alpha-1 antitrypsin (AAT) is a SERPIN (serine protease inhibitor) that inactivates enzymes by binding to them covalently. This assay measured the amount of functionally active AAT in a sample in the presence of the disclosed Compounds 1-457, Compounds 458-532, Compounds B1-B25, and Compounds W1-W32 by determining the ability of AAT to form an irreversible complex with human neutrophil Elastase (hNE). In practice, the sample

(cell supernatant, blood sample, or other) was incubated with excess hNE to allow AAT-Elastase complex to be formed with all functional AAT in the sample. This complex was then captured to a microplate coated with an anti-AAT antibody. The complex captured to the plate was detected with a labeled anti-Elastase antibody and quantitated using a set of AAT standards spanning the concentration range present in the sample. Meso Scale Discovery (MSD) plate reader, Sulfo-tag labeling, and microplates were used to provide high sensitivity and wide dynamic range.

2. Seed at 16,000 cells/well in 30 µL (384 well plate).
3. Centrifuge plates briefly up to speed (1200 rpm) and place into 37°C incubator overnight.

Day 2: Compound Addition and Coating Plates with Capture Antibody

Compound Addition:

1. Dispense 40 µL of OptiMEM™ (P/S) with doxycycline (1:1000 stock = 0.1 µM final) to each well of the compound plate using a multidrop Combi in hood.
2. Remove cell plate from incubator, flip/blot and take immediately to Bravo to transfer compounds.
3. Return plates to incubator overnight.

Coat MSD Plates

1. Dilute capture antibody (Polyclonal Goat anti-AAT) to 5 µg/mL (1:200) in PBS (no BSA).
2. Dispense 25 µL of diluted capture antibody into all wells of MSD 384-well High Bind plate using the Multidrop equipped with a standard cassette.
3. Incubate overnight at 4°C.

Prepare Blocker A (BSA) Solutions

1. Prepare solution of 5% MSD Blocker A (BSA) following the manufacturer's instructions.
2. Further dilute the 5% MSD Blocker A in PBS to 1% (Blocker A) as needed.

Day 3: Run MSD Assay

Block Plates

1. Wash plate 1x with 50 µL Wash buffer (PBS + 0.5% Tween 20), and adds 35 µL 5% Block A buffer to block non-specific binding on washer dispenser.
2. Rotate plates on shaker for 1 hour at 600 rpm.

Prepare M-AAT Standards

1. Dilute M-AAT stock to 1.6 µg/mL in 1% BSA Blocker A (Stock in -70 °C); then prepare 12 x 1:2 serial dilutions in 1% Blocker A.

2. The top starting final concentration on MSD plate is 320 ng/mL. These dilutions correspond to a final concentration of 320, 160, 80, 40, 20, 10, 5, 2.5, 1.25, 0.625, 0.312, 0.156 ng/mL.

Dilution plate

1. Add 80 µL of 1% Assay buffer to all wells except columns 1/24 (standards) with Multidrop Combi.
2. Add diluted standards to columns 1 and 24.
3. Centrifuge dilution plates 1200 rpm briefly.

Cell plate

1. Aspirate columns which will have the standards from the cell plates in the hood using 16-pin aspirator.

Prepare human Neutrophil Elastase (hNE)

1. Prepare 1 µg/mL Human Neutrophil Elastase by diluting in 1% Blocker A.
    a. Small 100 µg vial – add 1 mL PBS (100 µg/mL)
        i. This can then be diluted 1:100 in 1% Assay Buffer for a final 1 µg /mL concentration.

MSD – add hNE (20 µL/well)

1. After the MSD plate has blocked for at least 1 hour, wash plate 1x with 50 µL Wash buffer (PBS + 0.5% Tween 20) and then add 20 µL hNE to each well.

Bravo – Cell Plate – Dilution Plate – MSD Plate

Using the Bravo, aspirate 10 µL from the cell plate, transfer to the dilution plate (9-fold dilution)

1. Mix 25 µL 3x, then aspirate 5 µL, transfer to MSD plate (5-fold dilution).
2. Mix 10 µL 3x. Total dilution is 45 fold.
3. Shake plates at 600 rpm for 1.5 hours.

Add Functional detection hNE antibody

1. Wash plate 1x with wash buffer.
2. Add 25 µL Sulfo-tagged anti-Elastase Monoclonal Mouse anti-Elastase) diluted to 0.45 µg/mL (1:2000) in 1% Blocker A into all wells of the functional activity MSD plates using the washer/dispenser.

    Note: The dilution required for sufficient signal must be determined for each new lot of labeled antibody.

3. Incubate at RT shaking at 600 rpm for 1 hour.

Final wash and MSD imager read

1. Wash the plate 1x, and add 25 µL of Wash Buffer to the plate.
2. Make 2x Read buffer.
3. Remove wash buffer from MSD plate.
4. Transfer 35 µL 2x Read Buffer to MSD plate using Bravo and take to MSD to read immediately.

Data analysis in MSD Discovery Workbench 4.0 software and EC_{50} values were determined using Genedata. See Table 33 for data.

B. Biochemical Assay (Z-AAT Elastase Activity Assay)

[00831] This assay measured the modulation of Compounds 1-457, Compounds 458-532, Compounds B1-B25, and Compounds W1-W32 on Z-AAT SERPIN activity using purified Z-AAT protein and purified human neutrophil elastase (hNE). Normally, when active monomeric Z-AAT encounters a protease such as trypsin or elastase, it forms a 1:1 covalent "suicide" complex in which both the AAT and protease are irreversibly inactivated. However, compounds binding to Z-AAT can lead to a decrease in SERPIN activity. In such cases, when a protease encounters compound-bound Z-AAT, the protease cleaves and inactivates Z-AAT without itself being inactivated.
