DESCRIPTION

PIPERAZINE-SUBSTITUTED BENZOTHIOPHENES FOR TREATMENT OF MENTAL DISORDERS

TECHNICAL FIELD

The present invention relates to a novel heterocyclic compound.

BACKGROUND ART

Since causal factor of schizophrenia as well as of bipolar disorder, mood disorders and emotional disorders is heterogeneous, it is desirable that a drug has multiple pharmacological effects so as to develop wide treatment spectrum.

WO2004/026864A1 discloses that a carbostyril derivative represented by the general formula:

![Chemical Structure](image)

(wherein A' represents -(CH₂)ₘCH₂-, -(CH₂)ₘO-, etc.; m represents an integer of 1 to 4; and RA represents a hydrogen atom, a C1-4 alkyl group which may be substituted with 1 to 3 fluorine atoms, etc.) has D₂ receptor antagonist activity and serotonin 2A (5-HT₂A) receptor antagonist activity and it is effective for
treatment of schizophrenia and other central nervous system disorders).

However, there is no description in WO2004/026864A1 that carbostyril derivatives described in the document have D₂ receptor partial agonist activity, 5-HT₂A receptor antagonist activity, α₁ receptor antagonist activity and serotonin uptake inhibitory activity together and have a wide treatment spectrum.

WO 2005/019215 A1 discloses the compounds represented by the following formula:

![Chemical Structure](image)

(wherien A is -(CH₂)ₘCH₂-, -(CH₂)ₘO- or the like; m is an integer of 2 to 5; D is N, C or the like; Z and Q are independently N, C or CH, provided that at least one of Z and Q is N; X and Y are independently C, N or the like, and the bond between X and Y is a single or double bond; R¹ is hydrogen, (C₁-C₃)alkyl group or the like; R⁴, R⁵, R⁶ and R⁷ each represents hydrogen, alkyl group or the like; and G represents a group of monocyclic or bicyclic compound), which bind to dopamine D₂ receptors. WO 2005/019215 A1 teaches that some compounds disclosed therein have an activity as
partial agonists of D₂ receptors or an activity as antagonists of D₂ receptors, and may be effective for the treatment of schizophrenia and other central nervous system.

However, WO 2005/019215 A1 does not specifically disclose the compounds of the present invention.

DISCLOSURE OF THE INVENTION

An object of the present invention is to provide an antipsychotic drug which has a wider treatment spectrum, less side effects and excellent tolerability and safety as compared with well-known typical and atypical antipsychotic drugs.

The present inventors have conducted intensive studies on the above-described problem and consequently succeeded in synthesizing a novel compound which has dopamine D₂ receptor partial agonist activity (D₂ receptor partial agonist activity), serotonin 5-HT₂A receptor antagonist activity (5-HT₂A receptor antagonist activity) and adrenalin α₁ receptor antagonist activity (α₁ receptor antagonist activity) and further has serotonin uptake inhibitory effect (or serotonin reuptake inhibitory effect) together in addition to these effects. The present invention has been completed based on this finding.

receptor partial agonist effect, 5-HT_{2A} receptor antagonist effect and serotonin uptake inhibitory effect (or serotonin uptake inhibitory effect).

The D_{3} receptor partial agonist effect suppresses dopaminergic (DA) neurotransmission when it is enhanced, and accelerates the DA neurotransmission when it is lowered and thus has a function to stabilize the DA neurotransmission to a normal state (dopamine system stabilizer). According to this function, excellent clinically improving effect on the conditions based on the DA abnormal neurotransmission (enhancement and lowering), for example, improving effect on positive and negative symptoms, improving effect on cognitive impairment, improving effect on depressive symptom, etc. are developed without developing side effects (See Michio Toru: Seishin-Igaku (Psychiatry), Vol. 46, pp. 855-864 (2004), Tetsuro Kikuchi and Tsuyoshi Hirose: Nou-no-Kagaku (Brain Science), Vol. 25, pp. 579-583 (2003) and Harrison, T.S. and Perry, C.M.: Drugs 64: 1715-1736, 2004).

5-HT_{2A} receptor antagonist effect reduces extrapyramidal side effects, develops superior clinical effects, and is effective for improvement of negative symptoms, improvement of cognitive impairment, improvement of depression condition, improvement of insomnia, for example (See Jun Ishigooka and Ken Inada: Rinsho-Seishin-Yakuri (Japanese Journal of Clinical Psychopharmacology), Vol. 4, pp. 1653-1664 (2001),

Serotonin uptake inhibitory effect (or serotonin reuptake inhibitory effect) is effective for improving depressive symptoms, for example (See Mitsukuni Murasaki: Rinsho-Seishin-Yakuri (Japanese Journal of Clinical Psychopharmacology), Vol. 1, pp. 5-22 (1998)).

The compounds of the present invention are excellent in all of these three effects, or remarkably excellent in one or two of these effects.

In addition, some of the compounds of the present invention have $\alpha_1$ receptor antagonist effect in addition to the above-described effects. The $\alpha_1$ receptor antagonist effect is effective for improving positive symptoms of schizophrenia (See Svensson, T.H.: Prog. Neuro-Psychopharmacol. Biol. Psychiatry 27: 1145-1158, 2003).

Therefore, the compounds of the present invention have a wide treatment spectrum for and excellent clinical effect on schizophrenia and other central nervous system disorders.

Accordingly, the compounds of the present invention are extremely effective for the treatment or prevention of central nervous system disorders.
including the group consisting of schizophrenia; refractory, intractable or chronic schizophrenia; emotional disturbance; psychotic disorder; mood disorder; bipolar disorder (for example, bipolar I type disorder and bipolar II type disorder); depression; endogenous depression; major depression; melancholy and refractory depression; dysthymic disorder; cyclothymic disorder; anxiety disorder (for example, panic attack, panic disorder, agoraphobia, social phobia, obsessive-compulsive disorder, post-traumatic stress disorder, generalized anxiety disorder, acute stress disorder, etc.); somatoform disorder (for example, hysteria, somatization disorder, conversion disorder, pain disorder, hypochondriasis, etc.); factitious disorder; dissociative disorder; sexual disorder (for example, sexual dysfunction, sexual desire disorder, sexual arousal disorder, erectile dysfunction, etc.); eating disorder (for example, anorexia nervosa, bulimia nervosa, etc.); sleep disorder; adjustment disorder; substance-related disorder (for example, alcohol abuse, alcohol intoxication, drug addiction, stimulant intoxication, narcotism, etc.); anhedonia (for example, iatrogenic anhedonia, anhedonia of a psychic or mental cause, anhedonia associated with depression, anhedonia associated with schizophrenia, etc.); delirium; cognitive impairment; cognitive impairment associated with Alzheimer's disease, Parkinson's disease, and other neurodegenerative diseases; cognitive impairment

The reaction mixture was concentrated under reduced pressure. The residue was purified by basic silica gel column chromatography (ethyl acetate : methanol = 11:1), and concentrated under reduced pressure. The residue (166 mg) was dissolved in ethyl acetate. 1N-HCl – ethanol solution (0.7 ml) was further added thereto, then crystals precipitated were filtered out and dried to obtain 4-[3-(4-benzo[b]thiophen-4-yl-piperazin-1-yl)propoxy]quinolin-2-carboxymethylamide dihydrochloride (0.17 g, yield: 54%) as white powder.

Melting point: 224.0°C (decomposed)

Example 62

Preparation of 4-[3-(4-benzo[b]thiophen-4-yl-piperazin-1-yl)propoxy]quinolin-2-carboxylic acid hydrochloride

An aqueous solution of 4N lithium hydroxide (3 ml) was added to a methanol solution (7 ml) of ethyl
4-[3-(4-benzo[b]thiophen-4-yl-piperazin-1-yl)propoxy]-quinolin-2-carboxylate (1.5 g), followed by stirring at room temperature overnight. Then, water (10 ml) and aqueous solution (3 ml) of 4N lithium hydroxide were further added, followed by stirring at 50°C for 11 hours. The reaction mixture was cooled in an ice-bath, and an aqueous solution (4 ml) of 6N-HCl was added thereto. Then, crystals precipitated were filtered out, washed with water and dried to obtain 4-[3-(4-benzo[b]thiophen-4-yl-piperazin-1-yl)propoxy]quinolin-2-carboxylic acid hydrochloride (1.43 g, yield: 98%) as white powder. Melting point: 235.0°C

Example 63

Preparation of 4-[3-(4-benzo[b]thiophen-4-yl-piperazin-1-yl)propoxy]quinolin-2-carboxamide

Triethylamine (0.25 ml, 1.8 mmol) and isobutyl chloroformate (0.19 ml, 1.4 mmol) were added to a solution (10 ml) of 4-[3-(4-benzo[b]thiophen-4-yl-piperazin-1-yl)propoxy]quinolin-2-carboxylic acid (0.53 g, 1.2 mmol) in acetonitrile with cooling in an ice-bath, followed by stirring at 0°C for 3 hours. 28% Aqueous ammonia (0.15 ml) was added thereto and the reaction mixture was stirred at room temperature for 5 minutes. Ethyl acetate was further added thereto, then the reaction mixture was washed with water and concentrated under reduced pressure. The residue was
purified by basic silica gel column chromatography (n-hexane : ethyl acetate = 3:1), and concentrated under reduced pressure. The residue (0.2 g) was dissolved and recrystallized from the mixed solvent of ethyl acetate and isopropyl ether to obtain 4-[3-(4-benzo[b]thiophen-4-yl-piperazin-1-yl)propoxy]-quinolin-2-carboxamide (79 mg, yield: 16%) as white powder.

Melting point: 153.0-154.5°C

Examples 64 to 196

Compounds of Example 64 to 196 shown in the following Tables 1 to 21 can be prepared in the same manner as in Example 1, using corresponding starting materials. In the following Tables, compounds with the physical properties, such as crystalline form, m.p. (melting point), salt, $^1$H-NMR and MS (mass spectrum), were prepared actually.

Pharmacological Test 1

1) Dopamine D₂ receptor binding assay

The assay was performed according to the method by Kohler et al. (Kohler C, Hall H, Ogren SO and Gawell L, Specific in vitro and in vivo binding of 3H-raclopride. A potent substituted benzamide drug with high affinity for dopamine D-2 receptors in the rat brain. Biochem. Pharmacol., 1985; 34: 2251-2259).

Wistar male rats were decapitated, the brain was retrieved immediately and corpus striatum was taken out. It was homogenized in 50 mM tris(hydroxymethyl)aminomethane (Tris)-hydrochloric acid buffer (pH 7.4) of a volume 50 times of the weight of the tissue using a homogenizer with a high-speed rotating blade, and centrifuged at 4°C, 48,000 x g for 10 minutes. The obtained precipitate was suspended again in the above-described buffer of a volume 50 times of the weight of the tissue and after incubated at 37°C for 10 minutes, centrifuged in the above-described condition. The obtained precipitate was suspended in 50 mM (Tris)-hydrochloric acid buffer (containing 120 mM NaCl, 5 mM KCl, 2 mM CaCl₂, 1 mM MgCl₂, pH 7.4) of a volume 25 times of the weight of the tissue and preserved by freezing at -85°C till it was used for binding assay as a membrane specimen.

The binding assay was performed using 40 µl of the membrane specimen, 20 µl of [³H]-raclopride (final concentration 1 to 2 nM), 20·µl of a test drug
and 50 mM Tris-hydrochloric acid buffer (containing 120 mM NaCl, 5 mM KCl, 2 mM CaCl$_2$, 1 mM MgCl$_2$, pH 7.4) so that the total amount was 200 µl (final dimethyl sulfoxide concentration 1%). The reaction was performed at room temperature for 1 hour and terminated by conducting suction filtration with a cell harvester on a glass fiber filter plate. The filter plate made of glass fiber was washed with 50 mM Tris-hydrochloric acid buffer (pH 7.4), and after dried, a microplate liquid scintillation cocktail was added and the radioactivity was measured with a microplate scintillation counter. Radioactivity in the presence of 10 µM (+)-butaclamol hydrochloride was assumed as nonspecific binding.

IC$_{50}$ value was calculated from concentration-dependent reaction using a non-linear analysis program. Ki value was calculated from IC$_{50}$ value using Cheng-Prussoff formula. The results are shown in the following Table 22.

2) Serotonin 5-HT$_{2A}$ receptor binding assay

The assay was performed according to the method by Leysen JE et al. (Leysen JE, Niemegeers CJE, Van Nueten JM and Laduron PM. [3H] Ketanserin (R 41 468), a selective 3H-ligand for serotonin 2 receptor binding sites. Mol. Pharmacol., 1982, 21: 301-314).

Wistar male rats were decapitated, the brain was retrieved immediately and frontal cortex was taken out. It was homogenized in 0.25 M sucrose of a volume 10 times of the weight of the tissue using a Teflon glass homogenizer, and centrifuged at 4°C, 1,000 x g for 10 minutes. The obtained supernatant was transferred
to another centrifuge tube and suspended in 0.25 M sucrose of a volume 5 times of the weight of the tissue and the precipitate was centrifuged in the above-described condition. The obtained supernatant was combined with the supernatant obtained above and adjusted to a volume 40 times of the weight of the tissue with 50 mM Tris-hydrochloric acid buffer (pH 7.4), and centrifuged at 4°C, 35,000 x g for 10 minutes. The obtained precipitate was suspended again in the above-described buffer of a volume 40 times of the weight of the tissue and centrifuged in the above-described condition. The obtained precipitate was suspended in the above-described buffer of a volume 20 times of the weight of the tissue and preserved by freezing at -85°C till it was used for binding assay as a membrane specimen.

The binding assay was performed using 40 μl of the membrane specimen, 20 μl of [3H]-Ketanserin (final concentration 1 to 3 nM), 20 μl of a test drug and 50 mM Tris-hydrochloric acid buffer (pH 7.4) so that the total amount was 200 μl (final dimethylsulfoxide concentration 1%). The reaction was performed at 37°C for 20 minutes and terminated by conducting suction filtration with a cell harvester on a glass fiber filter plate.

The filter plate made of glass fiber was washed with 50 mM Tris-hydrochloric acid buffer (pH 7.4), and after dried, a microplate liquid
scintillation cocktail was added and the radioactivity was measured with a microplate scintillation counter. Radioactivity in the presence of 10 μM spiperone was assumed as nonspecific binding.

IC₅₀ value was calculated from concentration-dependent reaction using a non-linear analysis program. Ki value was calculated from IC₅₀ value using Cheng-Prussoff formula. The results are shown in the following Table 23.

3) Adrenalin α1 receptor binding assay

The assay was performed according to the
method by Groβ G et al. (Groβ G, Hanft G and Kolassa N. Urapidil and some analogues with hypotensive properties show high affinities for 5-hydroxytryptamine (5-HT) binding sites of the 5-HT1A subtype and for α1-adrenoceptor binding sites. Naunyn-Schmiedeberg's Arch Pharmacol., 1987, 336: 597-601).

Wistar male rats were decapitated, the brain was retrieved immediately and cerebral cortex was taken out. It was homogenized in 50 mM Tris-hydrochloric acid buffer (100 mM NaCl, containing 2 mM dihydrogen disodium ethylene diamine tetraacetate, pH 7.4) of a volume 20 times of the weight of the tissue using a homogenizer with a high-speed rotating blade, and centrifuged at 4°C, 80,000 x g for 20 minutes. The obtained precipitate was suspended in the above-described buffer of a volume 20 times of the weight of the tissue and after incubated at 37°C for 10 minutes, centrifuged in the above-described condition. The obtained precipitate was suspended again in the above-described buffer of a volume 20 times of the weight of the tissue and centrifuged in the above-described condition. The obtained precipitate was suspended in 50 mM (Tris)-hydrochloric acid buffer (containing 1 mM dihydrogen disodium ethylene diamine tetraacetate, pH 7.4) of a volume 20 times of the weight of the tissue and preserved by freezing at -85°C till it was used for binding assay as a membrane specimen.

The binding assay was performed using 40 µl
of the membrane specimen, 20 μl of [3H]-prazosin (final concentration 0.2 to 0.5 nM), 20 μl of a test drug and 50 mM Tris-hydrochloric acid buffer (containing 1 mM EDTA, pH 7.4) so that the total amount was 200 μl (final dimethylsulfoxide concentration 1%). The reaction was performed at 30°C for 45 minutes and terminated by conducting suction filtration with a cell harvester on a glass fiber filter plate.

The filter plate made of glass fiber was washed with 50 mM Tris-hydrochloric acid buffer (pH 7.4), and after dried, a microplate liquid scintillation cocktail was added and the radioactivity was measured with a microplate scintillation counter. Radioactivity in the presence of 10 μM phenotolamine hydrochloride was assumed as nonspecific binding.

IC₅₀ value was calculated from concentration-dependent reaction using a non-linear analysis program. Ki value was calculated from IC₅₀ value using Cheng-Prussoff formula.

Pharmacological Test 2

Partial agonistic activity on dopamine D₂ receptor using D₂ receptor expression cells

Partial agonistic activity on dopamine D₂ receptor was evaluated by quantitatively determining cyclic AMP production inhibitory effect of a test compound in dopamine D₂ receptor expression cells in which adenosine 3',5'-cyclic monophosphate (cyclic AMP)
production was induced by forskolin stimulation.

Human recombinant dopamine D2 receptor
expressing Chinese hamster ovary/DHFR(-) cells were
cultured in a culture medium (Iscove's Modified Dulbecco's Medium (IMDM culture medium), 10% fetal
bovine serum, 50 I.U./ml penicillin, 50 µg/ml
streptomycin, 200 µg/ml Geneticin, 0.1 mM sodium
hypoxanthine, 16 µM thymidine) at 37°C and 5% carbon
dioxide condition. Cells were seeded at 10^4 cells/well
on a 96-well microtiter plate coated with poly-L-lysine
and grown under the same condition for 2 days. Each
well was washed with 100 µl of a culture medium (IMDM
culture medium, 0.1 mM sodium hypoxanthine, 16 µM
thymidine). The culture medium was replaced with 50 µl
of culture medium (IMDM culture medium, 0.1% sodium
ascorbate, 0.1 mM sodium hypoxanthine, 16 µM thymidine)
having dissolved therein 3 µM of a test compound.
After allowed to incubate at 37°C, 5% carbon dioxide
condition for 20 minutes, the culture medium was
replaced with 100 µl of forskolin stimulative culture
medium (IMDM culture medium, 0.1% sodium ascorbate, 0.1
mM sodium hypoxanthine, 16 µM thymidine, 10 µM
forskolin, 500 µM 3-isobutyl-1-methylxanthine) having 3
µM of the test compound dissolved therein and allowed
to incubate at 37°C, 5% carbon dioxide condition for 10
minutes. After the culture medium was removed, 200 µl
of Lysis 1B aqueous solution (Amersham Bioscience,
reagent attached to cyclic AMP biotrack enzyme
immunoassay system) was dispensed and shaken for 10 minutes. The aqueous solution of each well was used as a sample for measurement. Samples for measurement quadruply diluted were subjected to measurement of the quantity of cyclic AMP using the above-described enzyme immunoassay system. Inhibition ratio of the respective test compound was calculated assuming that the quantity of cyclic AMP of the well to which no test compound was added was 100%. In this empiric test system, dopamine which was used as a control drug suppressed the quantity of cyclic AMP to about 10% as the maximum activity.

It was confirmed that test compounds had partial agonistic activity for dopamine D₂ receptor in the above-described test.

Since the test compounds has partial agonistic activity for dopamine D₂ receptor, they can stabilize dopamine neurotransmission to a normal condition in a schizophrenia patient and as a result, exhibit, for example, positive and negative condition improving effect, cognitive impairment improving effect and the other symptom improving effects without causing side effects.

Pharmacological Test 3

Inhibitory effect on apomorphine-induced stereotyped behavior in rats

Wistar rats (male, six-seven weeks old, Japan
SLC, Inc.) were used as test animals. A test compound was suspended in 5% gum arabic/(physiological saline or water) using an agate mortar and was diluted with the same solvent if necessary.

Test animals were fasted overnight from the day before. Apomorphine (0.7 mg/kg) was subcutaneously administered (1 ml/kg) 1 hour after each test compound was orally administered (5 ml/kg). Stereotyped behavior was observed for 1 minute respectively 20, 30 and 40 minutes after apomorphine injection.

The stereotyped behavior of each animal was quantified according to the following condition and score made at three points were summed up and the anti-apomorphine effect was evaluated. Six test animals were used for each group.

0: The appearance of the animals is the same as saline treated rats;
1: Discontinuous sniffing, constant exploratory activity;
2: Continuous sniffing, periodic exploratory activity;
3: Continuous sniffing, discontinuous biting, gnawing or licking. Very brief periods of locomotor activity;
4: Continuous biting, gnawing or licking; no exploratory activity.

Non-clinical statistical analysis system was used for all statistical processing. When the
significance probability value was lower than 0.05, it was judged that a significant difference existed. The difference of the score between the solvent administration group and each test compound administration group was analyzed using Wilcoxon rank-sum test or Steel test. In addition, linear regression analysis was used for calculating 50% effective dose (95% confidence interval).

Since the test compounds showed inhibitory effect for apomorphine-induced stereotyped behavior, it was confirmed that the test compounds have D₂ receptor antagonistic effect.

Pharmacological Test 4
Inhibitory effect on (±)D-2,5-dimethoxy-4-iodoamphetamine (DOI) induced head twitch in rats

Wistar rats (male, six-seven weeks old, Japan SLC, Inc.) were used as test animals. A test compound was suspended in 5% gum arabic/(physiological saline or water) using an agate mortar and was diluted with the same solvent if necessary.

Test animals were fasted overnight from the day before. DOI (5.0 mg/kg) was subcutaneously administered (1 ml/kg) 1 hour after each test compound was orally administered (5 ml/kg). The number of head twitches was counted for 10 minutes immediately after DOI injection. Six test animals were used for each group.
Non-clinical statistical analysis was used for all statistical processing. When the significance probability value was lower than 0.05, it was judged that a significant difference existed. The difference of the number of head twitches between the solvent administration group and each test compound administration group was analyzed using t-test or Dunnett's test. In addition, linear regression analysis was used for calculating 50% effective dose (95% confidence interval).

Since the test compounds showed inhibitory effect for DOI-induced head twitch, it was confirmed that the test compounds have serotonin 5HT₂A receptor antagonistic effect.

Pharmacological Test 5

Catalepsy inducing effect in rats

Wistar rats (male, six-seven weeks old, Japan SLC, Inc.) were used as test animals. A test compound was suspended in 5% gum arabic/(physiological saline or water) using an agate mortar and was diluted with the same solvent if necessary.

Test animals were fasted overnight from the day before observation on catalepsy and ptosis was performed 1, 2, 4, 6 and 8 hours after each test compound was orally administered (5 ml/kg). Six test animals were used for each group.

One forepaw of a rat was placed on an edge of
a steel small box (width: 6.5 cm, depth: 4.0 cm, height: 7.2 cm) (an unnatural pose) and when the rat maintained the pose for more than 30 seconds, it was judged that the case was catalepsy positive. This observation was performed three times at each point, and if there was at least one positive case, it was judged that catalepsy occurred in the individual.

As a result, catalepsy induction effect of a test compound was dissociated from inhibitory effect on apomorphine-induced stereotyped behavior, therefore it was suggested that apprehension for extrapyramidal side effect in clinic would be low.

Pharmacological Test 6

Measurement of serotonin (5-HT) uptake

Inhibitory activity of a test compound by rat brain synaptosome

Wistar male rats were decapitated, the brain was retrieved and frontal cortex was dissected out, and it was homogenized in 0.32 M sucrose solution of a weight 20 times of the weight of the tissue using a Potter type homogenizer. The homogenate was centrifuged at 4°C, 1,000 × g for 10 minutes, the obtained supernatant was further centrifuged at 4°C, 20,000 × g for 20 minutes, and the pellet was suspended in an incubation buffer (20 mM Hepes buffer (pH 7.4) containing 10 mM glucose, 145 mM sodium chloride, 4.5 mM potassium chloride, 1.2 mM magnesium chloride, 1.5
mM calcium chloride), which was used as crude synaptosome fraction.

5-HT uptake reaction was performed in a volume of 200 μl using a 96-well round bottom plate and pargyline (final concentration 10 μM) and sodium ascorbate (final concentration 0.2 mg/ml) were contained in the incubation buffer upon reaction and used.

Incubation buffer (total counting), non-labeled 5-HT (final concentration 10μM, non-specific counting) and the diluted test compound (final concentration 300nM) were added to each well. One-tenth quantity of the final volume of the synaptosome fraction was added and after preincubated at 37°C for 10 minutes, tritium labeled 5-HT solution (final concentration 8 nM) was added and uptake reaction was started at 37°C. The uptake time was 10 minutes and the reaction was terminated by vacuum filtration through a 96-well fiber glass filter paper plate, and after the filter paper was washed with cold normal saline, it was dried enough and Microscint0 (Perkin-Elmer) was added to the filter and remaining radioactivity on the filter was measured.

Serotonin uptake inhibitory activity (%) was calculated from the radioactivity of total counting as 100%, of non-specific counting as 0%, and of counting obtained with test compound.
% of inhibition of 5-HT(%) =
100 - [(Count obtained with test compound - Nonspecific count (0% Uptake)) / (Total count (100% Uptake) - Nonspecific count (0% Uptake))] × 100

The results are shown in the next Table 24.

Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. X Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
   
   Although claims 13–15 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound./.
   
2. ☐ Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
   
3. ☐ Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest.

☐ No protest accompanied the payment of additional search fees.
