UNITED STATES PATENT OFFICE.

FRANK ADAMS AND URIAH J. VIRGIN, OF NEW ORLEANS, LOUISIANA.

PORTABLE STOVE OR FURNACE.

SPECIFICATION forming part of Letters Patent No. 422,899, dated March 11, 1890.

Application filed July 11, 1889. Serial No. 317,164. (No model.)

To all whom it may concern:

Be it known that we, FRANK ADAMS and URIAH J. VIRGIN, of New Orleans, in the parish of Orleans and State of Louisiana, have
5 invented certain new and useful Improvements in Portable Stoves or Furnaces; and we do hereby declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the
10 art to which it appertains to make and use the same.

Our invention relates to an improvement in portable stoves and furnaces, the object being to provide a light and simple heating apparatus capable of being easily taken apart and
15 put together without injury and having but few parts, such as may be readily renewed at any time it shall be necessary; and with this end in view our invention consists in a small
20 stove or furnace having a fire-pot, a heating-chamber, and other features of construction and combinations of parts, as will be hereinafter described, and pointed out in the claims.

In the accompanying drawings, Figure 1 is
25 a vertical sectional view. Fig. 2 is a detached view of the fire-pot frame or basket, and Fig. 3 is a detached view of the top of the stove or furnace.

A represents a cylindrical drum inclosing
30 the heating-chamber A', and B is the cast-iron top placed over this drum. This top has several holes C with removable covers, the same as an ordinary stove-top.

The basket or frame D consists of a ring 1
35 at the top, a sheet-metal bottom 2, and three or more bars 3 3, connecting said parts—that is, the top ring and the bottom. The ring 1 is riveted or otherwise secured to an inwardly-projecting flange 4 on the lower portion of the
40 drum. One or more draft-passages 5 are formed in this basket to insure a free circulation of air. A clay or earthen fire-pot 6, having a perforated bottom 7 for the circula-

tion of air upward, is held in the basket with
its bottom 7 a little distance above the bot- 45
tom 2 of the basket or frame, in order to leave space for the air and also for the accumulation of ashes. The whole rests upon a
tripod or suitable support 8, which holds the
stove elevated from the floor, so that no dan- 50
ger of the latter becoming burned or blistered results, and so as to place the top of the stove within convenient reach of the person using it.

The drum is generally provided with handles 9 9, by which it is easily lifted from its
55 stand or support or placed back thereon.

It is evident that slight changes might be resorted to in the form and arrangement of the several parts described without departing
60 from the spirit and scope of our invention, and hence we do not wish to limit ourselves to the particular construction herein set forth; but,

Having fully described our invention, what we claim as new, and desire to secure by Let- 65
ters Patent, is—

1. In a portable stove or furnace, the combination, with a drum and basket or frame secured thereto, of a fire-pot located inside the
70 drum and basket, and a support upon which the said parts rest, substantially as set forth.

2. In a portable stove or furnace, the combination, with a cylindrical drum having a top with openings therein and covers, of a basket or frame secured to the drum, a fire-pot
75 located in the basket and the whole removably held on a tripod or other suitable support, substantially as set forth.

In testimony whereof we have signed this specification in the presence of two subscrib- 80
ing witnesses.

FRANK ADAMS.
URIAH J. VIRGIN.
