PREPARATION OF OLIGOMERS AND CO-OLIGOMERS OF HIGHLY
FLUORINATED SULFINIC ACIDS AND SALTS THEREOF

FIELD

The present disclosure relates to highly fluorinated sulfmic acid oligomers and co-oligomers and salts thereof. The present disclosure relates to methods of making highly fluorinated sulfmic acid oligomers and co-oligomers and salts thereof.

BACKGROUND

Fluorinated sulfmates have utility in fluoropolymer and hydrocarbon processing. Methods for the synthesis of fluorinated sulfmates and their use as intermediates have been widely reported in the literature. For example, perfluoroalkane sulfmates can be prepared from the corresponding perfluoroalkanehalides via a dehalogenation and supination reaction, as reported in C. M. Hu, F. L. Quing, and W. Y. Huang, J Org Chem, 1991, 2801-2804 and W. Y. Huang, Journal of Fluorine Chemistry, 58, 1992, 1-8. Several reagent systems have been developed for use in this reaction, such as sulfite plus an oxidant, hydroxymethane sulfmate, thiourea dioxide and sodium dithionite. The use of sodium dithionite as dehalogenating and sulfinating reagent has also been reported by W. Y. Huang, B. N. Huang and W. Wang in Acta Chim. Sinica (Engl. Ed.), 1986, 178-184, and Acta Chim. Sinica (Engl. Ed.), 1986, 68-72. The later publication discloses that the reaction with an aqueous solution of the sodium dithionite is too slow for reactions involving water-insoluble perfluoroalkyl bromides, and that cosolvents are needed to improve the mutual solubility of the various reactants and permit completion of the reaction within 30 to 35 hours. Mentioned cosolvents include acetonitrile, glycol and diethylene glycol.

In another example, F. H. Wu and B. N. Huang, Journal of Fluorine Chem, 67, 1994, 233-234 reported that if DMF, acetonitrile or alcohols are used as cosolvent, both polyfluoroalkyl iodides and polyfluoroalkyl bromides will react with sodium disulfite in neutral aqueous solution to give the corresponding sulfmates in good yield. In a similar manner, CF₃CCl₃ reacts with sodium disulfite to give the corresponding sodium sulfmate. A disadvantage of preparing fluorinated sulfmates starting from the corresponding fluorinated iodide or bromide is that the resulting reaction product contains a large amount
of by-products, particularly, inorganic salts which typically must be removed from the sulfmate.

Alternative processes for the preparation of fluorocarbon sulfimates have also been disclosed, for example, in U.S. Pat. No. 3,420,877 (Pavlik). This particular preparation involves reacting perfluoroalkyl sulfonyl fluoride with an alkali metal sulfite or alkaline earth sulfite in an aqueous medium containing from about 10 to about 50 weight percent of a dissolved polar, inert organic solvent selected from the group consisting of dioxane, dimethoxyethane, di-n-butyl ether, tetrahydrofuran, and diethylene glycol diethyl ether. This process generally does not result in large amounts of salts that need to be removed from the resultant product, but requires use of a cosolvent that may be toxic and may have a negative impact on processes in which the sulfmate is ultimately employed, e.g., free-radical polymerization reactions. Reduction of these fluorinated sulfonyl fluorides using NH₂NH₂ are also known to make the corresponding sulfmates. However, all known processes are limited to making mono-sulfinates and di-sulfinates.

There continues to be a need for a process for preparing highly fluorinated sulfmic acid oligomers and co-oligomers and salts thereof that do not require the use of solvents and preferably do not require further processing or purification of the resulting reaction mixture. It is further desirable to have a favorable yield of the highly fluorinated sulfmic acid oligomers and co-oligomers and salts thereof.

**SUMMARY**

In one aspect, there is provided a method for preparing an oligomer comprising:

(a) providing a highly fluorinated vinyl sulfonyl halide;

(b) oligomerizing the highly fluorinated vinyl sulfonyl halide with an initiator to provide a highly fluorinated oligomeric sulfonyl halide according to the following formula (I):

\[
\begin{array}{c}
\text{R} \\
\text{X}_1 \\
\text{X}_2 \\
\text{X}_3 \\
\text{O} \\
\text{R} \\
\text{m} \\
\text{R}_1 \\
\text{SO}_2\text{Y}
\end{array}
\]
(c) and, reducing the highly fluorinated oligomeric sulfonyl halide to a highly fluorinated sulfmate oligomer according to the following formula (IV),

\[
\begin{align*}
\text{R} & \quad \text{X}_1 & \quad \text{X}_2 & \quad \text{R} \\
\text{X}_3 & \quad \text{O} & \quad \text{R}_1 \\
& \quad \text{S}_0 \text{M}
\end{align*}
\]

wherein \( \text{X}_1, \text{X}_2, \) and \( \text{X}_3 \) are independently selected from \( \text{F}, \text{Cl} \) and \( \text{CF}_3 \); \( \text{R} \) is independently selected from \( \text{H, I, Br, linear or branched alkyl, and linear or branched fluoroalkyl group optionally containing catenary heteroatoms} \); \( \text{R}_1 \) is a linear or branched perfluorinated linking group, which may be saturated or unsaturated, substituted or unsubstituted, and optionally comprises catenary heteroatoms; \( \text{Y} \) is a halide; \( \text{M} \) is a cation; and \( m \) is at least 2.

In another aspect, there is provided the method disclosed above where step (b) further comprises co-oligomerization of the highly fluorinated sulfonyl halide according to formula (I) with a highly fluorinated vinyl ether to provide a structure according to formula (II):

\[
\begin{align*}
\text{X}_4 & \quad \text{X}_5 & \quad \text{R}_2 \\
\text{X}_6 & \quad \text{O} & \quad \text{G}
\end{align*}
\]

wherein \( \text{X}_4, \text{X}_5, \) or \( \text{X}_6 \) are independently selected from \( \text{H, F, Cl and CF}_3 \); \( \text{R}_2 \) is a linear or branched fluorinated linking group, which may be saturated or unsaturated and substituted or unsubstituted, and optionally comprises catenary heteroatoms; \( \text{G} \) is selected from a perfluoroalkyl, a perfluoroalkoxy, a functional group, and combinations thereof; \( n \) is at least 1; and wherein \( \text{X}_4, \text{X}_5, \text{X}_6, \text{G} \) and \( \text{R}_2 \) are selected such that the highly fluorinated vinyl ether according to formula (II) is different than the highly fluorinated oligomeric sulfonyl halide according to formula (I).
In still another aspect, there is provided the method disclosed above wherein step (b) further comprises co-oligomerization of the highly fluorinated sulfonyl halide according to formula (I) and/or highly fluorinated vinyl ether according to formula (II) with an ethylenically-unsaturated monomer to provide a structure according to formula (III):

\[
\left[ -Z \right]_p
\]

wherein Z is derived from monomers selected from ethylene, propylene, tetrafluoroethylene, chlorotrifluoroethylene, hexafluoropropylene, vinylidene fluoride, vinyl fluoride, fluorinated alkyl vinyl ethers, fluorinated alkoxy vinyl ethers, fluorinated vinyl ethers containing a functional group, perfluoro-1,3-dioxoles, and combinations thereof, and further wherein p is at least 1.

The above summary is not intended to describe each embodiment. The details of one or more embodiments of the invention are also set forth in the description below.

Other features, objects, and advantages will be apparent from the description and from the claims.

**DETAILED DESCRIPTION**

As used herein, the term:

"a", "an", and "the" are used interchangeably and mean one or more; and "and/or" is used to indicate one or both stated cases may occur, for example A and/or B includes, (A and B) and (A or B). Also herein, recitation of ranges by endpoints includes all numbers subsumed within that range (e.g., 1 to 10 includes 1.4, 1.9, 2.33, 5.75, 9.98, etc.).

Also herein, recitation of "at least one" includes all numbers of one and greater (e.g., at least 2, at least 4, at least 6, at least 8, at least 10, at least 25, at least 50, at least 100, etc.).

"Oligomer" means less than 20,000 g/mol, less than 15,000 g/mol, less than 10,000 g/mol, less than 5,000 g/mol, less than 2,000 g/mol, less than 1,000 g/mol, and even less than 500 g/mol.

"Linking group" means a divalent linking group. In one embodiment, the linking group includes at least 1 carbon atom (in some embodiments, at least 2, 4, 8, 10, or even 20 carbon atoms). The linking group can be a linear or branched, cyclic or acyclic...
structure, that may be saturated or unsaturated, substituted or unsubstituted, and optionally contains one or more hetero-atoms selected from the group consisting of sulfur, oxygen, and nitrogen, and/or optionally contains one or more functional groups selected from the group consisting of ester, amide, sulfonamide, carbonyl, carbonate, urethane, urea, and carbamate.

"Highly fluorinated" means repeating monomer units that are perfluorinated with perfluorinated or partially fluorinated end groups which may optionally contain chlorine on oligomers derived therefrom. For example, when a perfluorinated initiator is used, a perfluorinated sulfmic acid oligomer is produced. In another example, when an organic initiator is used, hydrogen atoms will be present in the "R" end groups of formula (I) (shown above).

"Sulfmate" is used to indicate both sulfmic acids and sulfmic acid salts. Also herein, "fluorosulfinate" and "fluorinated sulfmate" are used interchangeably to indicate sulfmic acids and sulfmic acid salts which contain at least one fluorine atom.

Fluoroolefins are useful as comonomers for making fluoropolymers. Fluorosulfimates are useful for producing fluoropolymers without ionic ends that benefit the processing of the polymers. A fluorosulfinic reactive monomer can be used as a surfactant, initiator and reactive monomer giving unique branched fluoropolymers. Oligomers containing fluorosulfinic acid group can initiate chain growth to provide complex fluoropolymer structures, such as, for example, a comb fluoropolymer structure.

The present disclosure relates to a method for preparing highly fluorinated oligomeric sulfmic acids. In some embodiments, the method for preparing highly fluorinated oligomeric sulfmic acids includes the steps of:

(a) providing a highly fluorinated vinyl sulfonyl halide;
(b) oligomerizing the highly fluorinated vinyl sulfonyl halide with an initiator to provide a highly fluorinated oligomeric sulfonyl halide according to the following formula (I):

\[
\begin{align*}
R & \quad X_1 \quad X_2 \quad R \\
\quad X_3 & \quad O \\
R1 & \quad SO_2Y
\end{align*}
\]

(c) and, reducing the highly fluorinated oligomeric sulfonyl halide to a highly fluorinated sulfmate oligomer according to the following formula (IV),

\[
\begin{align*}
R & \quad X_1 \quad X_2 \quad R \\
\quad X_3 & \quad O \\
R1 & \quad SO_2M
\end{align*}
\]

In some embodiments, \(X_1, X_2, \) and \(X_3\) are independently selected from \(F, \text{Cl} \text{and CF}_3\). \(R\) is independently selected from hydrogen, iodine, bromine, linear or branched alkyl, and linear or branched fluoroalkyl group optionally containing catenary heteroatoms. In some embodiments, the alkyl group has up to 20 carbon atoms. In some embodiments, \(R1\) is a linear or branched perfluorinated linking group. This linking group may be saturated or unsaturated, substituted or unsubstituted, and optionally comprises catenary heteroatoms.

In some embodiments, \(Y\) is a halide. Halides useful in the present disclosure include fluorine and chloride. \(M\) is a cation. Exemplary cations useful in the present disclosure include \(H^+, NH_4^+, \text{PH}_3^+, H_3O^+, \text{Na}^+, \text{Li}^+, \text{Cs}^+, \text{Ca}^{2+}, \text{K}^+, \text{Mg}^{2+}, \text{Zn}^{2+}, \text{and Cu}^{2+}, \) and/or an organic cation including, but not limited to \(\text{NH}_2(\text{CH}_3)_2^+, \text{N}(\text{CH}_2\text{CH}_3)_4^+, \text{NH}(\text{CH}_2\text{CH}_3)_3^+, \text{NH}(\text{CH}_3)_3^+, (\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2)_4^+\text{P}^+\text{a}^\text{and the like, and combinations thereof. For methods useful in the present disclosure, }m\text{ is selected from any number of 2 or higher.}

6
In some embodiments, the highly fluorinated vinyl sulfonyl halide is a perfluorovinyl sulfonyl halide, such as, for example, a perfluorovinyl ether sulfonyl fluoride. Exemplary perfluorovinyl ether sulfonyl fluorides according to the present disclosure include, but are limited to,

\[
\begin{align*}
\text{CF}_2 & \equiv \text{CF} - \text{O} - \text{CF}_2 \text{CF}_2 \text{S}0_2 \text{F} \\
\text{CF}_2 & \equiv \text{CF} - \text{O} - \text{CF}_2 \text{CF}_2 \text{S}0_2 \text{Cl} \\
\text{CF}_2 & \equiv \text{CF} - \text{O} - \text{CF}_2 \text{CF}_2 \text{SO}_2 \text{F} \\
\text{CF}_2 & \equiv \text{CF} - \text{O} - \text{CF}_2 \text{CF}_2 \text{SO}_2 \text{Cl} \\
\text{CF}_2 & \equiv \text{CF} - \text{O} - \text{CF}_2 \text{CF}_2 \text{SO}_2 \text{F} \\
\text{CF}_2 & \equiv \text{CF} - \text{O} - \text{CF}_2 \text{CF}_2 \text{SO}_2 \text{Cl} \\
\text{CF}_2 & \equiv \text{CF} - \text{O} - \text{CF}_2 \text{CF}_2 \text{SO}_2 \text{F} \\
\text{CF}_2 & \equiv \text{CF} - \text{O} - \text{CF}_2 \text{CF}_2 \text{SO}_2 \text{Cl} \\
\end{align*}
\]
In some embodiments, the method for preparing highly fluorinated oligomeric sulfmic acids also includes step (d) acidifying the highly fluorinated sulfmate oligomer from step (c) and extracting a highly fluorinated sulfmic acid oligomer therefrom. Any acid can be used in step (d). Exemplary acids include sulfuric acid, hydrochloric acid and other strong mineral acids, and the like, and combinations thereof. Extraction can be conducted using any known extraction techniques, such as for example, using vacuum stripping and/or filtration with or without addition of an additional component. Exemplary components include, but are not limited to, an alcohol, an ether, and the like. In some embodiments, methanol is a preferred. In some embodiments methyl-t-butyl ether is preferred.

In some embodiments, the method for preparing the highly fluorinated oligomeric sulfmic acids also includes step (e) converting the highly fluorinated sulfmic acid oligomer from step (d) to form a salt thereof. In some embodiments, step (e) is conducted using an organic base. In some embodiments, step (e) is conducted using an inorganic base. In some embodiments, ammonium hydroxide is preferred. In some embodiments, potassium hydroxide is preferred.

In some embodiments, the method for preparing highly fluorinated oligomeric sulfmic acids also includes sulfonate that is produced by partial reduction of the highly
fluorinated oligomeric sulfonyl halide following hydrolysis of remaining sulfonyl halide to sulfonate.

In some embodiments, the method for preparing highly fluorinated sulfuric acids also includes co-oligomerization of the highly fluorinated oligomeric sulfonyl halide according to formula (I) with a highly fluorinated vinyl ether to provide a structure according to formula (II):

\[
\begin{array}{c}
\text{X}_4 \quad \text{X}_5 \\
\text{Xe} \quad \text{O} \\
\text{R}_2 \\
\text{G}
\end{array}
\]

In some embodiments, \(X_4, X_5, \text{or } X_6\) are independently selected from H, F, CI and CF3. In some embodiments, \(R_2\) is a linear or branched fluorinated linking group. The linking group may be saturated or unsaturated and substituted or unsubstituted, and optionally comprises catenary heteroatoms.

\(G\) is selected from a perfluoroalkyl, a perfluoroalkoxy, a functional group, and combinations thereof. In some embodiments, the perfluoroalkyl group has up to 30 carbon atoms. In some embodiments, the perfluoroalkoxy group has up to 30 carbon atoms. In some embodiments, when \(G\) is a functional group, the functional group is selected from carboxylic acids and derivatives thereof, nitriles, sulfonyl halides, sulphonates, imidates, amidines, alcohols, mercaptans, iodine, bromine, and the like, and combinations thereof.

The variable \(n\) is at least 1. For methods useful in the present disclosure, \(X_4, X_5, X_6, G\) and \(R_2\) are selected such that the highly fluorinated vinyl ether according to formula (II) is different than the highly fluorinated oligomeric sulfonyl halide according to formula (I).

In some embodiments, the highly fluorinated vinyl ether according to formula (II) is reduced, such as for example in step (c), to produce an alcohol derivative of the highly fluorinated vinyl ether. For example, when the \(G\) in formula (II) is selected to be a carbonyl group, the highly fluorinated vinyl ether according to formula (II) is reduced in step (c) to produce an alcohol derivative thereof.
R1 in formula (I) and R2 in formula (II) are linear or branched fluorinated linking groups. In some embodiments, R1 and R2 are independently selected from \(-(\text{CF}_2)_n\), \(-0(\text{CF}_2)_a\), \(-(\text{CF}_2)_a-0(\text{CF}_2)_b\), \(-(\text{CF}_2)_a-[0-(\text{CF}_2)_b]_c\), and \-[(\text{CF}_2)_a-0]-[(\text{CF}_2)_c-0]_{d} \-[(\text{CF}_2)_a-[0-(\text{CF}_3)\text{CF}_2b]_c\) and combinations thereof, where \(a\), \(b\), \(c\), and \(d\) are independently at least 1. Exemplary linear and branched linking groups that are useful as R1 and R2 in the present disclosure include, but are not limited to, \-\text{CF}_2\text{CF}_2\), \-\text{CF}_2\text{CF}_2\text{CF}_2\text{CF}_2\), \-\text{CF}_2\text{CF}(\text{CF}_3)-0\text{CF}_2\text{CF}_2\) and \-\text{CF}_2\text{CF}(\text{CF}_3)-0\text{CF}_2\text{CF}_2\).

In some embodiments, the method for preparing highly fluorinated sulfuric acids may also include, in step (b) shown above, co-oligomerization of the highly fluorinated vinyl sulfonate halide according to formula (I) with an ethylenically-unsaturated monomer to provide a structure according to formula (III):

\[
\left[\text{\(-Z\)}\right]_p
\]

In some embodiments, Z is derived from monomers selected from ethylene, propylene, tetrafluoroethylene, chlorotrifluoroethylene, hexafluoropropylene, vinylidene fluoride, vinyl fluoride, fluorinated alkyl vinyl ethers, fluorinated alkoxy vinyl ethers, fluorinated vinyl ethers containing a functional group, perfluoro-1,3-dioxoles, and the like, and combinations thereof. The variable \(p\) is at least 1.

In some embodiments, the ethylenically-unsaturated monomer according to formula (III) can be co-oligomerized with the highly fluorinated vinyl sulfonate halide according to formula (I) and the highly fluorinated vinyl ether according to formula (II).

In some embodiments, when Z is an ethylenically-unsaturated monomer containing a functional group, the functional group is selected from bromine and/or iodine. Exemplary ethylenically-unsaturated monomers containing a functional group are derived from one or more compounds of the following formula (V):

\[
\text{CX}_2=\text{CX}(\text{Z})
\]

In some embodiments, each X is independently selected from hydrogen or fluorine. In some embodiments, Z is selected from iodine, bromine or R/-U where U is selected from iodine or bromine, and R\(_f\) is a perfluorinated or partially perfluorinated alkylene group optionally containing oxygen atoms. In some embodiments, non-fluorinated bromo-or iodo-olefins, e.g., vinyl iodide and allyl iodide, can be used. Exemplary
ethylenically-unsaturated monomer containing a functional group include, but are not
limited to:

CH$_2$=CHI
CF$_2$=CHI

5 CF$_2$=CFI
CH$_2$=CHCH$_2$I
CF$_2$=CFCH$_2$I
CH$_2$=CHCF$_2$CF$_2$I
CH$_2$=CHCF$_2$CF$_2$CH$_2$CH$_2$I

10 CH$_2$=CH(CF$_2$)$_4$I
CH$_2$=CH(CF$_2$)$_4$CH$_2$CH$_2$I
CH$_2$=CH(CH(CF$_2$)$_6$I
CH$_2$=CH(CH(CF$_2$)$_6$CH$_2$CH$_2$I
CF$_2$=CFCH$_2$CH$_2$I

15 CF$_2$=CFCF$_2$CF$_2$I
CF$_2$=CFOCF$_2$CF$_2$I
CF$_2$=CFOCF$_2$CF$_2$CH$_2$CH$_2$I
CF$_2$=CFOCF$_2$CF$_2$CF$_2$I
CF$_2$=CFOCF$_2$CF$_2$CF$_2$CF$_2$I

20 CF$_2$=CFOCF$_2$CF$_2$CF$_2$CH$_2$CH$_2$I
CF$_2$=CFOCF$_2$CF$_2$CH$_2$I
CF$_2$=CFOCF$_2$CF$_2$CF$_2$CH$_2$I
CF$_2$=CFCF$_2$OCH$_2$CH$_2$I
CF$_2$=CFO(CF$_2$)$_3$OCF$_2$CF$_2$I

25 CH$_2$=CHBr
CF$_2$=CHBr
CF$_2$=CFBr
CH$_2$=CHCH$_2$Br
CF$_2$=CFCF$_2$Br

30 CH$_2$=CHCF$_2$CF$_2$Br
CF$_2$=CFOCF$_2$CF$_2$Br
CF$_2$=CFCF$_2$Br
CF$_2$=CFCF$_2$C$_1$
and combinations thereof.

In some embodiments, the oligomerization step (b) is conducted in the absence of a solvent. That is, a solvent is not added to the mixture being oligomerized or co-oligomerized in step (b). In some embodiments, the oligomerization step (b) is conducted in the presence of a solvent. Solvents useful in the present disclosure include perfluorocarbons, perfluoroethers, chlorofluoroethers, chlorocarbons, hydrofluoroethers and water, and the like, and combinations thereof.

The solvent should be present in an amount sufficient to allow adequate stirring and heat transfer during the reaction. In some embodiments, the solvent can be removed after completion of the reaction.

Any conventional method may be used to remove the solvent, such as extraction, distillation under reduced pressure, column chromatography, and any other separation method.

In some embodiments, an initiator is used. Any conventional initiator can be used, such as, for example, persulfates, peroxides (e.g., organic peroxides, such as diaeryl peroxides, peroxyesters, dialkyl peroxides, hyrdoperoxides, etc.), photo irradiation, gamma irradiation, azo compounds, and the like. In some embodiment, the preferred initiator is selected from peroxodic compounds. Hydrogen peroxide, acyl peroxides such as, for example, diacetyl peroxide, dipropionyl peroxide, dibutryl peroxide, dibenzoyl peroxide, benzoyl acetyl peroxide, dilauroyl peroxide, disuccinic peroxide or diglutaric peroxide may be mentioned here, but only as examples. In addition, water-soluble peracids, such as peracetic acid, and their water-soluble salts (in particular the ammonium, sodium or potassium salts) or their esters, such as, for example, tert.-butyl peroxyacetate and tert.-butyl peroxyvalerate, may be mentioned. The water-soluble salts, in particular the ammonium, potassium and sodium salts of other peracids, such as peroxymono- and peroxydisulfates, perphosphates, perborates and percarbonates may also be employed. Perfluoroacyl peroxides or Ω-hydroperfluoroacyl peroxides are furthermore suitable. Azo compounds useful in the present disclosure include azoisobutyronitrile and azo-2-cyanovaleric acid and the like. In some embodiments, certain water-soluble azo compounds are preferred. Conventional active redox systems that generate radicals to an adequate extent at temperatures between 10°C and 50°C can also be employed as
initiators, above all in the low temperature range. An exemplary redox systems includes the combination of water-soluble peroxidic compounds, preferably peroxodisulfates, with hydrogen sulfite or with disulfite or its addition products with formaldehyde, with thiosulfate and with diimine-liberating compounds, such as, for example, with hydrazine or azodicarboxamide may be mentioned, but only as example. The salts, preferably the alkali metal salts and, in particular, the ammonium salts, of the compounds mentioned are also present in the redox combinations. If the oligomerization takes place in an organic solvent, in each case those of the abovementioned catalysts must be selected such that they are adequately soluble in the solvent concerned.

In this process, the entire amount of initiator can be added at the beginning of the oligomerization reaction in step (b). However, it may be expedient in relatively large batches to add initiator continuously during the course of the oligomerization in step (b). Equally, part of the amount of the initiator can alternatively be added at the beginning and the remainder in one or more batches can be added later. The addition of coactivators, i.e. for example, soluble salts of iron and of silver, may be advantageous, in particular when redox systems are used as initiators.

Reducing agents useful in the present disclosure include those commonly known as reducing agents, such as, for example, those listed below. Exemplary reducing agents include metal hydrides, such as MeL₄, where Me is an alkaline metal and L is either an aluminum or a boron and MeHₓ, where Me is either an alkaline metal or an alkaline earth metal, and x is 1 or 2. These types of reducing agents include, for example, lithium aluminum hydride, lithium boron hydride, potassium boron hydride, sodium boron hydride, sodium hydride, lithium hydride, potassium hydride, barium hydride, calcium hydride, and the like. In some embodiments, the preferred reducing agent is sodium borohydride.

In some embodiments, useful reducing agents include reductive inorganic acids. These types of reducing agents include, for example, hydracid iodide, hydracid bromide, hydrophosphoric acid, hydracid sulfide, arsenious acid, phosphorous acid, sulfurous acid, nitrous acid, formic acid, oxalic acid, and the like. In some embodiments, useful reducing agents include mixtures of metals and acids. Metals useful in these types of reducing agents include, for example, tin, iron, zinc, amalgam of zinc, and the like. Acids useful in these types of reducing agents include, for example, hydrochloric acid, sulfuric acid,
acetic acid, phosphoric acid, formic acid, trifluoromethane sulfonic acid, trifluoroacetic acid, trichloroacetic acid, and the like.

In some embodiments, useful reducing agents include organic metal compounds, such as, for example, butyl lithium, Grignard reagent (such as alkyl carbon atom of 1 to 8), aryl magnesium halide, triethyl aluminum, trisobutyl aluminum, sodium-benzene, sodium-naphthalene, and the like. In some embodiments, metal compounds with low valences are useful reducing agents, such as, for example, stannous chloride, ferrous sulfate, titanium trichloride, ferrous chloride, stannous sulfate, ferrous sulfide, stannous sulfide, ferrous bromide, stannous bromide, ferrous hydroxide, and the like. In some embodiments, reductive salts of inorganic acids and compounds of the same are useful reducing agents. These types of reducing agents include, for example, iodides, bromides, sulfides, phosphites, sulfites, arsenites, dithionites, nitrites, formates, and the like. Mixtures of metals, water, steam, alcohols or alkalis can also be used as reducing agents in the present disclosure. Also useful as reducing agents are reductive organic compounds, such as, for example, triethanolamine, acetaldehyde, formaldehyde, propyl aldehyde, and the like, and reductive gases, such as, for example, carbon monooxide, sulfur dioxide, hydrogen iodide, hydrogen bromide, hydrogen sulfide, and the like. In some embodiments, a reducing agent useful in the present disclosure is selected from at least one of sodium borohydride, potassium borohydride, lithium aluminum hydride, $\text{NH}_2\text{NH}_2$, $\text{K}_2\text{SO}_3$, $\text{Na}_2\text{SO}_3$, $\text{NaHSO}_3$ and $\text{KHSO}_3$. 
The following embodiments are representatives of the subject matter of the present application:

Embodiment 1. A method for preparing an oligomer comprising:

(a) providing a highly fluorinated vinyl sulfonyl halide;

(b) oligomerizing the highly fluorinated vinyl sulfonyl halide with an initiator to provide a highly fluorinated oligomeric sulfonyl halide according to the following formula (I):

(c) and, reducing the highly fluorinated oligomeric sulfonyl halide to a highly fluorinated sulfmate oligomer according to the following formula (IV),

wherein \( X_1, X_2, \) and \( X_3 \) are independently selected from F, Cl and CF\(_3\); R is independently selected from H, I, Br, linear or branched alkyl, and linear or branched fluoroalkyl group optionally containing catenary heteroatom; \( R_1 \) is a linear or branched perfluorinated linking group, which may be saturated or unsaturated, substituted or unsubstituted, and optionally comprises catenary heteroatoms; \( Y \) is a halide; \( M \) is a cation; and \( m \) is at least 2.
Embodiment 2. The method of embodiment 1 further comprising (d) acidifying the highly fluorinated sulfmate oligomer from step (c) and extracting a highly fluorinated sulfmic acid oligomer therefrom.

Embodiment 3. The method of embodiment 2 further comprising (e) converting the highly fluorinated sulfmic acid oligomer from step (d) to form a salt thereof.

Embodiment 4. The method of embodiment 3 wherein the highly fluorinated sulfmic acid oligomer is converted to the salt thereof using an organic or inorganic base.

Embodiment 5. The method of embodiment 3 wherein the highly fluorinated sulfmic acid oligomer is converted to the salt thereof using ammonium hydroxide.

Embodiment 6. The method of embodiment 3 wherein the highly fluorinated sulfmic acid oligomer is converted to the salt thereof using sodium or potassium hydroxide.

Embodiment 7. The method of any of the preceding embodiments wherein step (b) further comprises co-oligomerization of the highly fluorinated sulfonyl halide according to formula (I) with a highly fluorinated vinyl ether to provide a structure according to formula (II):

\[
\begin{array}{c}
\text{X}_4 \\
\text{X}_5 \\
\text{X}_e \\
\text{O} \\
\text{R}_2 \\
\text{G} \\
\end{array}
\]

wherein \(X_4, X_5, \text{ or } X_6\) are independently selected from H, F, Cl and CF₃; \(R_2\) is a linear or branched fluorinated linking group, which may be saturated or unsaturated and substituted or unsubstituted, and optionally comprises catenary heteroatoms; \(G\) is selected from a perfluoroalkyl, a perfluoroalkoxy, a functional group, and combinations thereof; \(n\) is at least 1; and wherein \(X_4, X_5, X_6, G\) and \(R_2\) are selected such that the highly fluorinated
vinyl ether according to formula (II) is different than the highly fluorinated oligomeric sulfonyl halide according to formula (I).

Embodiment 8. The method according to embodiment 7 wherein when G is a functional group, the functional group is selected from carboxylic acids and derivatives thereof, nitriles, sulfonyl halides, sulphonates, imidates, amidines, alcohols, mercaptans, iodine, bromine and combinations thereof.

Embodiment 9. The method of embodiment 8 wherein when the functional group is a carbonyl group, the functional group is reduced to provide an alcohol derivative.

Embodiment 10. The method of embodiments 1, 2, 3, 4, 5, or 6 wherein step (b) further comprises co-oligomerization of the highly fluorinated oligomeric sulfonyl halide with an ethylenically-unsaturated monomer to provide a structure according to formula (III):

\[
Z_p
\]

wherein Z is derived from monomers selected from ethylene, propylene, tetrafluoroethylene, chlorotrifluoroethylene, hexafluoropropylene, vinylidene fluoride, vinyl fluoride, fluorinated alkyl vinyl ethers, fluorinated alkoxy vinyl ethers, fluorinated vinyl ethers containing a functional group, perfluoro-1,3-dioxoles, and combinations thereof, and further wherein p is at least 1.

Embodiment 11. The method of embodiment 10 wherein the ethylenically-unsaturated monomer is selected from \(\text{CH}_2=\text{CHI}, \text{CF}_2=\text{CHI}, \text{CF}_2=\text{CFI}, \text{CH}_2=\text{CHCH}_2\text{I}, \text{CF}_2=\text{CFCF}_2\text{I}, \)

\(\text{CH}_2=\text{CHCF}_2\text{CF}_2\text{I}, \text{CH}_2=\text{CHCF}_2\text{CF}_2\text{CH}_2\text{I}, \text{CH}_2=\text{CH(FCF}_2)_4\text{I}, \text{CH}_2=\text{CH(FCF}_2)_4\text{CH}_2\text{CH}_2\text{I}, \text{CH}_2=\text{CH(FCF}_2)_6\text{I}, \text{CH}_2=\text{CH(FCF}_2)_6\text{CH}_2\text{CH}_2\text{I}, \text{CF}_2=\text{CFCH}_2\text{CH}_2\text{I}, \text{CF}_2=\text{CFCF}_2\text{CF}_2\text{I}, \text{CF}_2=\text{CFOCF}_2\text{CF}_2\text{CH}_2\text{CH}_2\text{I}, \text{CF}_2=\text{CFOCF}_2\text{CF}_2\text{CF}_2\text{CH}_2\text{I}, \)

\(\text{CF}_2=\text{CFOCF}_2\text{CF}_2\text{CF}_2\text{CF}_2\text{I}, \text{CF}_2=\text{CFOCF}_2\text{CF}_2\text{CF}_2\text{CH}_2\text{I}, \text{CF}_2=\text{CFOCF}_2\text{CF}_2\text{CF}_2\text{CH}_2\text{I}, \text{CF}_2=\text{CFCF}_2\text{OCH}_2\text{CH}_2\text{I}, \text{CF}_2=\text{CFO(FCF}_2)_3\text{OCF}_2\text{CF}_2\text{I}, \text{CH}_2=\text{CHBr}, \text{CF}_2=\text{CHBr}, \text{CF}_2=\text{CFBr}, \text{CH}_2=\text{CHCH}_2\text{Br}, \text{CF}_2=\text{CFCF}_2\text{Br}, \text{CH}_2=\text{CHCF}_2\text{CF}_2\text{Br}, \text{CF}_2=\text{CFOCF}_2\text{CF}_2\text{Br}, \text{CF}_2=\text{CFCl}, \text{CF}_2=\text{CFCF}_2\text{Cl}, \) and combinations thereof.
Embodiment 12. The method of embodiment 7, 8, or 9 wherein step (b) further comprises co-oligomerization of the highly fluorinated sulfonyl halide with an ethylenically-unsaturated monomer to provide a structure according to formula (III):

\[
\underbrace{Z}_{\text{p}}
\]

wherein Z is derived from monomers selected from ethylene, propylene, tetrafluoroethylene, chlorotrifluoroethylene, hexafluoropropylene, vinylidene fluoride, vinyl fluoride, fluorinated alkyl vinyl ethers, fluorinated alkoxy vinyl ethers, fluorinated vinyl ethers containing a functional group, perfluoro-1,3-dioxoles, and combinations thereof, and further wherein p is at least 1.

Embodiment 13. The method according to any of the preceding embodiments wherein R1 and R2 are independently selected from: -(CF\(_2\))\(_a\)-, -0(CF\(_2\))\(_a\)-0-(CF\(_2\))\(_b\)-, -(CF\(_2\))\(_a\)-[0-(CF\(_2\))\(_b\)]\(_c\)-, [0-(CF\(_2\))\(_b\)]\(_c\)-[0-(CF(CF\(_3\))CF\(_2\))]\(_b\)]\(_c\)-, and -[(CF\(_2\))\(_a\)-0-]\(_b\)-[0-(CF\(_2\))\(_c\)-0-]\(_d\)-, and combinations thereof, wherein a, b, c, and d are independently at least 1.

Embodiment 14. The method according to any of the preceding embodiments, wherein R1 and R2 are independently selected from: -CF\(_2\)CF\(_2\)-, -CF\(_2\)CF\(_2\)OCF\(_2\)CF\(_2\)-, -CF\(_2\)CF(CF\(_3\))-0-CF\(_2\)CF\(_2\)-.

Embodiment 15. The method of any of the preceding embodiments further comprising an initiator in step (a).

Embodiment 16. The method of embodiment 15 wherein the initiator is selected from a persulfate, a peroxide, photo irradiation, gamma irradiation, and an azo compound.

Embodiment 17. The method of embodiment 15 wherein the initiator is a perfluorinated peroxide.

Embodiment 18. The method of embodiment 17 wherein the perfluorinated peroxide is selected from CF\(_3\)OC\(_2\)F\(_4\)COOOCOC\(_2\)F\(_4\)OFC\(_3\) and C\(_3\)F\(_7\)COOOCOC\(_3\)F\(_7\).
Embodiment 19. The method of any of the preceding embodiments wherein the oligomerization in step (b) is conducted in the absence of a solvent.

Embodiment 20. The method of any of the preceding embodiments wherein the oligomerization in step (b) is conducted in the presence of a solvent.

Embodiment 21. The method of any of the preceding embodiments wherein the oligomerization in step (b) is conducted as aqueous emulsion oligomerization.

Embodiment 22. The method of any of the preceding embodiments wherein the oligomerization in step (b) is conducted under an inert atmosphere.

Embodiment 23. The method of any of the preceding embodiments wherein the highly fluorinated oligomeric sulfanyl halide is a perfluorovinyl sulfanyl halide.

Embodiment 24. The method of any of embodiment 23 wherein the perfluorovinyl sulfanyl halide is a perfluorovinyl ether sulfanyl fluoride.

Embodiment 25. The method of embodiment 24 where in the perfluorovinyl ether sulfanyl fluoride is selected from:

\[

     |  and combinations thereof.
Embodiment 26. The method according to any of the preceding embodiments wherein the reduction step (c) is conducted using a reducing agent.

Embodiment 27. The method according to any of the preceding embodiments where in the reduction step (c) is conducted using sodium borohydride, potassium borohydride, lithium aluminum hydride, NH₂NH₂, K₂SO₃, Na₂SO₃, NaHSO₃ and KHSO₃ as the reducing agent.

Examples

The following examples are merely for illustrative purposes and are not meant to limit in any way the scope of the appended claims. All parts, percentages, ratios, and the like in the examples are by weight, unless noted otherwise. All materials used herein were obtained from Sigma-Aldrich Chemical Company; Milwaukee, Wisconsin unless otherwise noted.

Example 1

200 grams (0.53 mol) of MV4S and 20 grams (0.09 mol) of "LUPEROX 575" were charged to an evacuated 600 ml reactor, such as the reactor commercially available under the trade designation “600 ml SERIES 4520 PARR” from Parr Instruments, Moline, IL ("600 ml PARR reactor"). The mixture was stirred and heated to 65°C for 20 hours. A slight pressure rise was measured and vented after the reaction reached 20°C. A product mixture of 217 grams was drained and fractionated to give 97 grams of unreacted MV4S and 106 grams of oligomerized MV4S (o-MV4S) for a 53% yield. A 38 gram sample of the 0-MV4S was heated under vacuum to remove a cut boiling at 145°C and 4.6mm. The
higher boiling product of 28.4 grams remained in the pot. The 28.4 grams of higher boiling material was subjected to Liquid Chromatography-Mass Spectroscopy (LCMS) and relative areas indicated the general structure $R-[CF_2CF(OC_4F_8SO_2F)]_n-R$ where $n$ equaled 2 to 5 and $R$ was $H$, $C_2H_5$ and/or $C_7H_{15}$. The average oligomer had 2.9 units and an average molecular weight of 1200 grams per mole.

**Example 2**

6.3 grams (0.17 mol) of sodium borohydride in 100 grams of tetrahydorfurran (THF) was charged to a 500ml 3-neck round bottom flask and stirred. 25 grams (0.06mol) of o-MV4S made in Example 1 (having an average of 2.9 oligomer units) was dissolved in 50 grams of THF and added over 15 minutes. A slight exothermic reaction occurred upon addition of the 0-MV4S solution. The mixture was allowed to react at 65°C for two hours. Solvent was vacuum stripped and 14 grams of concentrated sulfuric acid in 200 grams of water was added at 20°C. This mixture was vacuum stripped and the resulting solids were extracted with 100 grams of methanol. The extracted mixture was then filtered and vacuum stripped again to give 26.5 grams of tacky solid product that was then diluted to 50 grams with water. Nuclear magnetic resonance spectroscopy (NMR) gave the desired 0-MV4S02H for a 98% yield.

**Example 3**

200 grams (0.53 mol) of MV4S, 27 grams (0.12 mol) of "LUPEROX 575" and 52 grams of CTFE-Dimer were placed in an evacuated 600ml PARR reactor and the mixture was stirred and heated to 65°C for 20 hours. A slight pressure rise was measured and vented after the reaction was at 20°C. A product mixture of 268 grams was drained and fractionated to give 50 grams of 0-MV4S having a boiling point greater than 225°C at 15 mm vacuum. Relative area percents from LCMS showed oligomers with the general structure of $R-[CF_2CF(OC_4F_8SO_2F)]_n-R$ where $n$ equaled 2 to 5 and $R$ was one of $H$, $C_2H_5$ and/or $C_7H_{15}$. The average oligomer had 3.2 units and an average molecular weight of 1320 grams per mole under this reaction condition and work up.
Example 4
In a 1 liter 3-neck round bottom flask were added 40 grams (0.11 mol) of 0-MV4S product from Example 3 in 100 grams of THF to a stirred solution of 9 grams (0.24 mol) of sodium borohydride in 100 grams of THF. A slight exothermic reaction occurred within 10 minutes of adding the 0-MV4S solution. The reaction was allowed to run at 65°C for 20 hours. 25 grams of concentrated sulfuric acid in 200 grams of water was added at 20°C. A top product phase of 135 grams of product with THF was vacuum stripped. A 50 gram methanol charge was used to dissolve the product and this was filtered and vacuum stripped to give 35 grams of 0-MV4S02H. NMR showed the presence of the desired 0-MV4S02H.

Example 5
The ammonium salt was made by adding 35 grams of 0-MV4S02H made in Example 4 to 6.1 grams (0.1 mol) of ammonia as 27% ammonium hydroxide and vacuum stripping to give 38 grams of 0-MV4S02NH4 salt as a tacky solid. No melting point was found and at 209°C onset of decomposition was measured for 0-MV4S02NH4.

Example 6
In a 100 ml bottle was charged 26 grams (0.07 mol) of MV4S, 50 grams of distilled water, 1 gram (0.0004 mol) of 50% solution of 0-MV4S02NH4 made in Example 5, 0.3 grams (0.001 mol) of sodium persulfate and 0.6 grams (0.003 mol) of potassium phosphate. The solution was nitrogen purged and placed in a launder-ometer, such as the device commercially available under the trade designation "Launder-Ometer M228AA" from SDL Atlas, Rock Hill, South Caroline, for 20 hours at 80°C. 15 grams of unreacted MV4S was recovered as a lower phase. The remaining solution was freeze thawed to precipitate 5 grams of viscous cold flowing polymer that was subjected to LCMS and found to have a molecular weight that was too high for detection by this method. 19F NMR showed presence of the desired 0-MV4S having the general structure R-[CF2CF(OC4F8S02F)n-R where n equaled an average number of 25 and R was COOH and H. The average oligomer had an average molecular weight of 9,600 grams per mole under this reaction condition and work up.
Example 7

100 grams (0.26 mol) of MV4S, 17 grams (0.07 mol) of "LUPEROX 575" and 103 grams of CTFE-Dimer were charged to an evacuated 600ml PARR reactor. The mixture was stirred and 17 grams (0.27 mol) of vinylidene fluoride was charged. The resulting mixture was heated to 65°C for 20 hours. A slight pressure rise was measured and vented after the reaction was at 20°C. A product mixture of 207 grams was drained and fractionated to give 57 grams of co-oligomeric 0-MV4S/VDF having a 50% yield based on input monomers with a boiling point greater than 75°C at 15mm vacuum. Relative area percents from LCMS showed co-oligomers with the general structure of R-[CF₂CF(OC₄F₈S₀₂F)]x-[CH₂CF₂]y-R where x and y equaled 2 to 5 and R was one of H, C₂H₅ and/or C₃H₇. The average co-oligomer had 3.1 units and an average molecular weight of 1478 grams per mole under this reaction condition and work up.

Example 8

100 grams (0.26 mol) of MV4S, 15 grams (0.04 mol) of C₄F₉I, 10 grams (0.04 mol) of "LUPEROX 575" and 25 grams of CTFE-Dimer were charged to an evacuated 600ml PARR reactor. The mixture was stirred and heated to 65°C for 20 hours. A slight pressure rise was measured and vented after the reaction reached 20°C. A product mixture of 145 grams was drained and fractionated to give 9 grams of oligomeric 0-MV4S with a boiling point greater than 180°C at 15mm vacuum. Relative area percents from LCMS showed oligomers with the general structure of R-[CF₂CF(OC₄F₈S₀₂F)]n-R where n equaled 2 to 5 and R was one of C₄F₉, 1. H, C₂H₅ and/or C₃H₇. The average oligomer had 3.2 units and an average molecular weight of 1350 grams per mole under this reaction condition and work up.

Example 9

6.1 grams of KF (0.1 mol), 390 grams of diglyme were charged in a 600 ml PARR reactor and cooled to -5°C with stirring. 170 grams of perfluoroadipoyl fluoride (0.87 mol) (available from Exfluor Research in Austin, Texas) was charged to the reactor followed by 140 grams (0.85 mol) of hexafluoropropylene oxide (available from E. I. du Pont de Nemours and Company, Wilmington, Delaware) and the reaction proceeded for over one hour. The reaction was heated to 25°C and 250 grams of product FCOC₅F₁₀-O-
CF(CF₃)COF distilled over at 135°C. A 2-liter 3-neck round bottom flask was charged with 192 grams (1.8 mol) of Na₂C₀₃, 390 grams of diglyme and stirred. 250 grams (0.69 mol) of FCOC₅Fio-0-CF(CF₃)COF was slowly added and the reaction temperature heated up to 71°C. The slurry was heated up to 162°C to decarboxylate the slurry until no more CO₂ was evolved. The reaction was cooled to 25°C and 215 grams (2.19 mol) of concentrated H₂S₀₄ in 350 grams of water was added. A top phase of 540 grams was further washed with 64 grams of concentrated H₂S₀₄ in 200 grams of water to obtain 317 grams of a bottom phase as a crude product. The bottom phase product was esterified with 116 grams (3.63 mol) of methanol and 92 grams (0.94 mol) of concentrated H₂S₀₄ by heating to 82°C for 20 hours. The reaction was cooled to 25°C and 200 grams of water was added to isolate 189 grams of the bottom phase product as the crude product. Vacuum distillation yielded 129 grams (0.32 mol) of CF₂=CF-O-C₅Fio-CO₂CH₃ with a boiling point of 132°C/15mm.

100 grams (0.26 mol) of MV₄S, 20 grams (0.05 mol) of MV₅C₀₂CH₃, 10 grams (0.04 mol) of "LUPEROX 575" and 25 grams of CTFE-Dimer were charged to an evacuated 600ml PARR reactor. The mixture was stirred and heated to 65°C for 20 hours. A slight pressure rise was measured and vented after the reaction was at 20°C. A product mixture of 144 grams was drained and fractionated to give 24 grams of co-oligomeric o-MV₄S/MV₅C₀₂CH₃ with a boiling point greater than 225°C at 15mm vacuum. Relative area percents from LCMS showed oligomers with the general structure of R-[CF₂CF(OC₄F₈S₀₂F)x·CF₂CF(OC₅FioC₀₂CH₃)y]·R where x and y equaled 2 to 5 and R was one of H, C₂H₅ and/or C₇H₁₅. The average co-oligomer had 3.2 units and an average molecular weight of 1320 grams per mole under this reaction condition and work up.

**Example 10**

To a 250 milliliter 3-neck round bottom flask were added 18 grams (0.02 mol) of o-MV₄S/MV₅C₀₂CH₃ product from Example 9 in 20 grams of THF to a stirred solution of 1.5 grams (0.04 mol) of sodium borohydride in 50 grams of THF. A slight exothermic reaction occurred with the addition within 10 minutes of adding the o-MV₄S/MV₅C₀₂CH₃ solution. The reaction was allowed to run at 65°C for 1 hour. 10 grams of concentrated sulfuric acid in 50 grams of water was added at 20°C. A 50 gram
methyl-t-butyl ether charge was used to extract the product and vacuum stripped to give 17 grams of R-[CF_2CF(OCH_3CF(OCF_2CF_3))x-[CF_2CF(OCHFCF_2CF_3)]y-R where x and y equaled 2 to 5 and R was one of H, C_2H_5 and/or C_7H_15. Nuclear magnetic resonance spectroscopy (NMR) showed the desired co-oligomer having both fluorosulfmic acid and fluoroalcohol groups with a 94% yield.

**Example 11**

100 grams (0.26 mol) of MV4S, 14 grams (0.04 mol) of MV31, 10 grams (0.04 mol) of "LUPEROX 575" and 25 grams of CTFE-Dimer were charged to an evacuated 600ml PARR reactor. The mixture was stirred and heated to 65°C for 20 hours. A slight pressure rise was measured and vented after the reaction was at 20°C. A product mixture of 146 grams was drained and fractionated to give 23 grams of co-oligomeric o-MV4S/MV3 1 with a boiling point greater than 225°C at 15mm vacuum. Relative area percents from LCMS showed oligomers with the general structure of R-[CF_2CF(OCH_3CF(OCF_2CF_3))x-[CF_2CF(OCHFCF_2CF_3)]y-R where x and y equaled 2 to 5 and R was one of H, C_2H_5 and/or C_7H_15. The average co-oligomer had 3.4 units and an average molecular weight of 1375 grams per mole under this reaction condition and work up.

**Example 12**

An evacuated 600ml PARR reactor was charged with 50 grams (0.11 mol) of MV3b2S, 7 grams (0.03 mol) of "LUPEROX 575" and 196 grams of CTFE-Dimer. The mixture was stirred and heated to 65°C for 20 hours. A slight pressure rise was measured and vented after the reaction was at 20°C. A product mixture of 248 grams was drained and fractionated to give 8 grams of o-MV3b2S having a boiling point greater than 225°C at 15mm vacuum. Relative area percents from LCMS showed oligomers with the general structure of R-[CF_2CF(OCH_3CFCF_3OCF_2CF_3)]n-R where n equaled 2 to 5 and R was one of H, C_2H_5 and/or C_7H_15. The average oligomer had 2.5 units and an average molecular weight of 1250 grams per mole under this reaction condition and work up.

**Example 13**

To a 250 milliliter 3-neck round bottom flask was added 6 grams (0.01 mol) of o-MV3b2S product from example 12 in 20 grams of THF to a stirred solution of 1.5 grams (0.03 mol)
of sodium borohydride in 50 grams of THF. A slight exothermic reaction occurred with the addition within 10 minutes of adding the o-MV3b2S solution. The reaction was allowed to run at 65°C for 1 hour. 10 grams of concentrated sulfuric acid in 50 grams of water was added at 20°C. A 50 gram methyl-t-butyl ether charge was used to extract the product, which was then and vacuum stripped to give 5.3 grams of o-MV3b2S02H (91 % yield). Nuclear magnetic resonance spectroscopy (NMR) confirmed the presence of the desired o-MV3b2S02H.

Example 14

The ammonium salt was made by adding 5 grams of the o-MV3b2S02H made in example 13 to 6.1 grams (0.1 mol) of ammonia as 27% ammonium hydroxide and vacuum stripping to give 5.2 grams of o-MV3b2S02NH4 salt as a tacky solid. The melting point was 156°C and onset of decomposition was 183°C.

Example 15

280 g (1.2mol) CF$_3$OC$_2$F$_4$COF (made by electrochemical fluorination as described in example 2 of U.S. Pat. No. 2,713,593 to Brice et al) was added to excess methanol cooled to -20°C in a 1 L 3-neck round bottom flask. This was then water washed to isolate 295 g (1.2mol) CF$_3$OC$_2$F$_4$CO$_2$CH$_3$ as the fluorochemical lower phase. A charge of 89 g (1.35mol) KOH in 150 g water was then added to the previous fluorochemical to make the CF$_3$OC$_2$F$_4$CO$_2$K salt. This was dried and acidified with 150 g of concentrated H$_2$SO$_4$ in 150 g water and vacuumed distilled to isolate 314 g (1.3mol) of CF$_3$OC$_2$F$_4$CO$_2$H. 50 g (0.22mol) CF$_3$OC$_2$F$_4$CO$_2$H, 4 g dimethylformamide and 30 g (0.2.5mol) thionyl chloride were reacted in a 500 mL 3-neck round bottom flask at 72°C for one hr followed by distillation to give 46 g (0.19mol) CF$_3$OC$_2$F$_4$COCl. To a 250ml 3-neck round bottom flask was added 4.7 g (0.05mol) 35% HOOH which was then cooled to 0°C with stirring followed by the addition of 4 g (0.1mol) of NaOH in 90 g water. The reaction was kept at 10°C and held for 30 min followed by addition at 10°C of 20 g (0.08mol) CF$_3$OC$_2$F$_4$COCl in 180 g of "FC-72 FLUORINERT" (commercially available from 3M Company, St. Paul, MN). The solution was stirred at 10°C for 30 min and the lower phase was removed containing 10 weight % CF$_3$OC$_2$F$_4$COOOCOC F$_4$OCF$_3$ in "FC-72 FLUORINERT" confirmed by FNMR and FTIR. 120 g (0.32mol) MV4S was added to a 500ml 3-neck
round bottom flask with a stir bar and cooled to 0°C. This was followed by addition of 100 g of 10 weight percent (0.02 mol) CF₃OC₂F₄COOOCOC₂F₄OCF₃ in "FC-72 FLUORINERT" with stirring at 10°C for 2 hrs. The solution was further reacted for 20 hrs at 25°C. The product mixture was fractionated to give 11 g of 0-MV4S having a boiling point greater than 150°C at 8 mm vacuum. FNMR confirmed the desired perfluoro 0-MV4S having CF₃OCF₂CF₂ end groups and the general structure CF₃OCF₂CF₂-[CF₂CF(OC₄F₈S₀₂F)]ₙ-CF₂CF₂OCF₃ where n was an average of 15. The oligomer had an average molecular weight of 6050 g per mole under this reaction condition and work up.

Example 16

50 grams of MV4S was oligomerized with 6.21 grams of "LUPEROX TAEC" at 120°C under nitrogen for 24 hours. The low boilingfractions were stripped out at 120°C under vacuum to yield 31 grams of a viscous liquid with a 62% isolated yield. FTIR showed a signal at 2968 cm⁻¹ for CH from the hydrocarbon initiator and strong signals at 1463, 1349, 1212, 1148 and 1072 cm⁻¹ for C-F and -S₀₂F groups. ¹⁹F NMR showed no signal for a CF=CFO- group, two signals for -CF₂O- at -81 and -87 ppm, a S₀₂F signal at +43 ppm, -CF₂S₀₂F signal at -110 ppm, and CF₂CF₂- signals at -123 and -128. The oligomerized vinyl signals of -(CF₂CF(0-))ₙ were seen at -121 and -147 ppm with complicated multiplets. From LCMS analysis the oligomer had an average of 3.2 units and an average molecular weight of 1320 grams per mole.

25.6 grams of the above viscous oligomer liquid (-0.067 eq -S₀₂F) in 37 grams of THF solvent was treated with 0.5 grams of NaBFL (0.0132 mol) at -5 to 10°C under nitrogen for 20 minutes followed by reaction at 20°C for 2 additional hours. ¹⁹F NMR indicated 20% -S₀₂F (+43 ppm) was reacted to give the corresponding -S₀₂M, the corresponding signal of -CF₂S₀₂F at -111 ppm was decreased and a new signal at -132 ppm for -CF₂S₀₂M appeared. 0.28 grams of NaBH₄ (total 0.78 grams, 0.0206 mole) was added at -5 to 10°C over 20 minutes followed by reaction at 20°C for 2 hours. The conversion was increased to 36%. Repeating the addition of NaBFL a third time the conversion was increased to 50% when 1.1 grams of total NaBFL, (0.029 mol) was added. ¹⁹F NMR indicated -OCF₂CF₂CF₂CF₂S₀₂M with chemical shifts at -126, -128 and -132, and -
OCF₂CF₂CF₂CF₂SO₂F with chemical shifts at -123, -128 and -111 ppm. The remaining signal of -SCF was seen at +42 ppm.

5 grams water was added with stirring to the above partially reduced oligomer solution in THF to destroy any unreacted reducing agent. This solution was then treated with 10% KOH aqueous solution at 20°C while stirring until the pH of solution was basic (pH greater than 9). The solution was stirred at 20°C for another 30 minutes. ¹⁹F NMR indicated the -SO₂F signal at +42 ppm had completely disappeared. After acidification of the solution with 2N H₂SO₄ to a pH of less than 2 the mixture was extracted with methyl-t-butyl ether (3x50 mL). After stripping out the solvent, 32 grams of a wet product was obtained. The wet product was dissolved in 20 grams of water. ¹⁹F NMR analysis of the solution indicated about 50 wt% solids and a mole ratio of -CF₂SO₂H (-132 ppm) and -CF₂SO₃H (-111 ppm) of 54:46.

Example 17

Similar to what was done in Example 16, 50 grams of MV4S was oligomerized with 2.81 grams of VAZO 67 (5.6 wt%) under nitrogen at 120°C for 24 hours. Filtration to remove solids at 25°C, the filtered solution was stripped at 100°C under full vacuum to remove low boiling point components. 9.7 grams of high viscous liquid oligomers were obtained (19% yield). ¹⁹F NMR analysis showed no more CF=CFO- signal. From LCMS analysis the oligomer had an average of 2.6 units and an average molecular weight of 1071 grams per mole.

The complete disclosures of the patents, patent documents, and publications cited herein are incorporated by reference in their entirety as if each were individually incorporated. Various modifications and alterations to this invention will become apparent to those skilled in the art without departing from the scope and spirit of this invention. It should be understood that this invention is not intended to be unduly limited by the illustrative embodiments and examples set forth herein and that such examples and embodiments are presented by way of example only with the scope of the invention intended to be limited
only by the claims set forth herein as follows and multi-layer articles created by this process.
What is claimed is:

1. A method for preparing an oligomer comprising:
   (a) providing a highly fluorinated vinyl sulfonyl halide;
   (b) oligomerizing the highly fluorinated vinyl sulfonyl halide with an initiator to provide a highly fluorinated oligomeric sulfonyl halide according to the following formula (I):

   \[
   \begin{align*}
   &R \left[ \begin{array}{c} X_1 \\ X_2 \\ X_3 \end{array} \right] \left[ \begin{array}{c} R \end{array} \right]_m \\
   &\downarrow \quad O \\
   &\quad R_1 \\
   &\quad \text{SO}_2Y
   \end{align*}
   \]

   (c) and, reducing the highly fluorinated oligomeric sulfonyl halide to a highly fluorinated sulfmate oligomer according to the following formula (IV),

   \[
   \begin{align*}
   &R \left[ \begin{array}{c} X_1 \\ X_2 \\ X_3 \end{array} \right] \left[ \begin{array}{c} R \end{array} \right]_m \\
   &\downarrow \quad O \\
   &\quad R_1 \\
   &\quad \text{SO}_2M
   \end{align*}
   \]

   wherein \( X_1, X_2, \) and \( X_3 \) are independently selected from \( F, \text{Cl} \) and \( \text{CF}_3; R \) is independently selected from \( H, \text{I}, \text{Br}, \text{linear or branched alkyl, and linear or branched fluoroalkyl group optionally a heteroatom; R1 is a linear or branched perfluorinated linking group, which may be saturated or unsaturated, substituted or unsubstituted, and optionally comprises a heteroatom; Y is a halide; M is a cation; and m is at least 2.}

2. The method of claim 1 further comprising (d) acidifying the highly fluorinated sulfmate oligomer from step (c) and extracting a highly fluorinated sulfinic acid oligomer therefrom.
3. The method of claim 2 further comprising (e) converting the highly fluorinated sulfmic acid oligomer from step (d) to form a salt thereof.

4. The method of claim 3 wherein the highly fluorinated sulfmic acid oligomer is converted to the salt thereof using an organic or inorganic base.

5. The method of claim 3 wherein the highly fluorinated sulfmic acid oligomer is converted to the salt thereof using ammonium hydroxide.

6. The method of claim 3 wherein the highly fluorinated sulfmic acid oligomer is converted to the salt thereof using sodium or potassium hydroxide.

7. The method of claim 1 wherein step (b) further comprises co-oligomerization of the highly fluorinated sulfonyl halide according to formula (I) with a highly fluorinated vinyl ether to provide a structure according to formula (II):

\[ 
\begin{array}{c}
X_4 \\
\mid \\
Xe \\
\mid \\
O \\
\mid \\
R_2 \\
\mid \\
G \\
\end{array} 
\]

\[ X_5 \]

\[ \text{X}_1 \text{X}_2 \text{X}_3 \text{X}_4 \text{X}_5 \text{X}_6 \text{G} \text{R}_2 \]

wherein \( X_4, X_5, \) or \( X_6 \) are independently selected from H, F, Cl and CF_3; \( R_2 \) is a linear or branched fluorinated linking group, which may be saturated or unsaturated and substituted or unsubstituted, and optionally comprises catenary heteroatoms; \( G \) is selected from a perfluoroalkyl, a perfluoroalkoxy, a functional group, and combinations thereof; \( n \) is at least 1; and wherein \( X_4, X_5, X_6, G \) and \( R_2 \) are selected such that the highly fluorinated vinyl ether according to formula (II) is different than the highly fluorinated oligomeric sulfonyl halide according to formula (I).

8. The method of claim 7 wherein when \( G \) is a functional group, the functional group is selected from carboxylic acids and derivatives thereof, nitriles, sulfonyl halides,
sulphonates, imidates, amidines, alcohols, mercaptans, iodine, bromine and combinations thereof.

9. The method of claims 1 wherein step (b) further comprises co-oligomerization of the highly fluorinated oligomeric sulfonyl halide with an ethylenically-unsaturated monomer to provide a structure according to formula (III):

\[
\left[ \begin{array}{c}
Z \\
p
\end{array} \right]
\]

wherein \( Z \) is derived from monomers selected from ethylene, propylene, tetrafluoroethylene, chlorotrifluoroethylene, hexafluoropropylene, vinylidene fluoride, vinyl fluoride, fluorinated alkyl vinyl ethers, fluorinated alkoxy vinyl ethers, fluorinated vinyl ethers containing a functional group, perfluoro-1,3-dioxoles, and combinations thereof, and further wherein \( p \) is at least 1.

10. The method of claim 9 wherein the ethylenically-unsaturated monomer is selected from \( \text{CH}_2=\text{CHI}, \text{CF}_2=\text{CHI}, \) \( \text{CF}_2=\text{CFI}, \) \( \text{CH}_2=\text{CHCH}_2\text{I}, \text{CF}_2=\text{CFCF}_2\text{I}, \) \( \text{CH}_2=\text{CHCF}_2\text{CF}_2\text{I}, \) \( \text{CH}_2=\text{CHCF}_2\text{CH}_2\text{CF}_2\text{I}, \) \( \text{CH}_2=\text{CH}[(\text{CF}_2)_n\text{CH}_2\text{I}], \) \( \text{CF}_2=\text{CFCH}_2\text{CH}_2\text{I}, \) \( \text{CF}_2=\text{CFCF}_2\text{CF}_2\text{I}, \) \( \text{CF}_2=\text{CFCF}_2\text{C}_2\text{I}, \) \( \text{CF}_2=\text{CFOCF}_2\text{C}_2\text{CF}_2\text{I}, \) \( \text{CF}_2=\text{CFOCF}_2\text{CF}_2\text{CH}_2\text{I}, \) \( \text{CF}_2=\text{CFOCF}_2\text{CF}_2\text{CF}_2\text{I}, \) \( \text{CF}_2=\text{CFCF}_2\text{CF}_2\text{CF}_2\text{I}, \) \( \text{CF}_2=\text{CFCF}_2\text{CF}_2\text{CH}_2\text{I}, \) \( \text{CF}_2=\text{CFCF}_2\text{CH}_2\text{CH}_2\text{I}, \) \( \text{CF}_2=\text{CFOCF}_2\text{CF}_2\text{C}_2\text{I}, \) \( \text{CF}_2=\text{CFOCF}_2\text{CF}_2\text{CH}_2\text{I}, \) \( \text{CF}_2=\text{CFOCF}_2\text{CF}_2\text{CF}_2\text{I}, \) \( \text{CF}_2=\text{CFCF}_2\text{OCH}_2\text{CH}_2\text{I}, \) \( \text{CF}_2=\text{CFO}(\text{CF}_2)_3\text{OCF}_2\text{CF}_2\text{I}, \) \( \text{CH}_2=\text{CHBr}, \) \( \text{CF}_2=\text{CHBr}, \) \( \text{CF}_2=\text{CFBr}, \) \( \text{CH}_2=\text{CHCH}_2\text{Br}, \) \( \text{CF}_2=\text{CFCF}_2\text{Br}, \) \( \text{CH}_2=\text{CHCF}_2\text{CF}_2\text{Br}, \) \( \text{CF}_2=\text{CFOCF}_2\text{CF}_2\text{Br}, \) \( \text{CF}_2=\text{CFCl}, \) \( \text{CF}_2=\text{CFCF}_2\text{Cl}, \) and combinations thereof.

11. The method of claim 7 wherein step (b) further comprises co-oligomerization of the highly fluorinated sulfonyl halide with an ethylenically-unsaturated monomer to provide a structure according to formula (III):

\[
\left[ \begin{array}{c}
Z \\
p
\end{array} \right]
\]

wherein \( Z \) is derived from monomers selected from ethylene, propylene, tetrafluoroethylene, chlorotrifluoroethylene, hexafluoropropylene, vinylidene fluoride, vinyl fluoride, fluorinated alkyl vinyl ethers, fluorinated alkoxy vinyl ethers, fluorinated
vinyl ethers containing a functional group, perfluoro-1,3-dioxoles, and combinations thereof, and further wherein p is at least 1.

12. The method according to claim 1 wherein R1 and R2 are independently selected from: 
\[-(\text{CF}_2)_a\text{-}, -(\text{CF}_2)_d\text{-0-(CF}_2\text{)_b}\text{-}, -(\text{CF}_2\text{)}_a\text{-}[0-(CF}_2\text{)_b]\text{-}, -(\text{CF}_2\text{)}_a\text{-[0-(CF}_3\text{)CF}_2\text{)]_c}\text{-}, \text{ and } -(\text{CF}_2\text{)}_a\text{-0-[(CF}_2\text{)_c\text{-0-}]d}\text{-, and combinations thereof, wherein } a, b, c, \text{ and } d \text{ are independently at least 1.}

13. The method according to claim 1, wherein R1 and R2 are independently selected from: 
\[-\text{CF}_2\text{CF}_2\text{-}, -\text{CF}_2\text{CF}_2\text{OCF}_2\text{CF}_2\text{-}, -\text{CF}_2\text{CF}(\text{CF}_2\text{)}\text{-0-}\text{CF}_2\text{CF}_2\text{-}.

15. The method of claim 1 further comprising providing an initiator in step (a), wherein the initiator is a perfluorinated peroxide.

16. The method of claim 15 wherein the perfluorinated peroxide is selected from 
\[\text{CF}_3\text{OCF}_2\text{OCF}_2\text{COOCOC}_2\text{CF}_3 \text{ and } \text{C}_3\text{F}_7\text{COOCOC}_3\text{F}_7.\]

17. The method of claim 1 wherein the highly fluorinated oligomeric sulfonoyl halide is a perfluorovinyl sulfonoyl halide.

18. The method of any of claim 17 wherein the perfluorovinyl sulfonoyl halide is selected from:
\[
\begin{align*}
\text{CF}_2\text{CF}_2\text{CF}_2\text{S0}_2\text{F} \\
\text{CF}_2\text{CF}_2\text{S0}_2\text{C}1 \\
\text{CF}_2\text{CF}_2\text{S0}_2\text{F} \\
\text{CF}_2\text{CF}_2\text{S0}_2\text{C}1 \\
\text{CF}_2\text{CF}_2\text{CF}_2\text{S0}_2\text{F} \\
\text{CF}_2\text{CF}_2\text{CF}_2\text{S0}_2\text{C}1 \\
\text{CF}_2\text{CF}_2\text{CF}_2\text{CF}_2\text{S0}_2\text{F}
\end{align*}
