Definitions

The terms "a" and "an" do not denote a limitation of quantity, but rather denote the presence of at least one of the referenced item. The term "or" or "and/or" is used as a function word to indicate that two words or expressions are to be taken together or individually. The terms "comprising", "having", "including", and "containing" are to be construed as open-ended terms (i.e., meaning "including, but not limited to"). The endpoints of all ranges directed to the same component or property are inclusive and independently combinable.

The term "compound(s) of the present invention" refers to compounds encompassed by structural formulae disclosed herein and includes any subgenus
and specific compounds within these formulae whose structure is disclosed herein. Compounds may be identified either by their chemical structure and/or chemical name. When the chemical structure and chemical name conflict, the chemical structure is determinative of the identity of the compound. The compounds described herein may contain one or more chiral centers and/or double bonds and therefore, may exist as stereoisomers, such as double-bond isomers (i.e., geometric isomers), enantiomers or diastereomers. Accordingly, the chemical structures depicted herein encompass all possible enantiomers and stereoisomers of the illustrated compounds including the stereoisomerically pure form (e.g., geometrically pure, enantiomerically pure or diastereomerically pure) and enantiomerically and stereoisomeric mixtures. Enantiomeric and stereoisomeric mixtures can be resolved into their component enantiomers or stereoisomers using separation techniques or chiral synthesis techniques well known to the skilled artisan. The compounds may also exist in several tautomeric forms including the enol form, the keto form and mixtures thereof. Accordingly, the chemical structures depicted herein encompass all possible tautomeric forms of the illustrated compounds. The compounds described also include isotopically labeled compounds where one or more atoms have an atomic mass different from the atomic mass conventionally found in nature. Examples of isotopes that may be incorporated into the compounds of the invention include, but are not limited to, $^2$H, $^3$H, $^{13}$C, $^{14}$C, $^{15}$N, $^{18}$O, $^{17}$O, etc. Compounds may exist in unsolvated forms as well as solvated forms, including hydrated forms and as N-oxides. In general, compounds may be hydrated, solvated or N-oxides. Certain compounds may exist in multiple crystalline or amorphous forms. A "ingestibly acceptable carrier or excipient" is a medium and/or composition that is used to prepare a desired dispersed dosage form of the inventive compound, in order to administer the inventive compound in a dispersed/diluted form, so that the biological effectiveness of the inventive compound is maximized. The medium and/or composition may be in any form depending on the intended use of a product, e.g., solid, semi-solid, liquid, paste, gel, lotion, cream, foamy material, suspension, solution, or any combinations thereof (such as a liquid containing solid contents). Ingestibly acceptable carriers includes many common food ingredients, such as water at neutral, acidic, or basic pH, fruit or vegetable juices, vinegar, marinades, beer, wine, natural water/fat emulsions such as milk or condensed milk, edible oils and shortenings, fatty acids and their alkyl esters, low molecular weight oligomers of propylene glycol, glyceryl esters of fatty acids, and dispersions or emulsions of such hydrophobic substances in aqueous media, salts such as sodium chloride, wheat flours, solvents such as ethanol, solid edible diluents such as vegetable powders or flours, or other liquid vehicles; dispersion or suspension aids; surface active agents; isotonic agents; thickening or emulsifying agents, preservatives; solid binders; lubricants and the like.

A "flavor" herein refers to the perception of taste in a subject, which include sweet, sour, salty, bitter and umami (also known as savory). The subject may be a human or an animal.
A "flavoring agent" herein refers to a compound or the ingestibly acceptable salt or solvate thereof that induces a flavor or taste in an animal or a human. The flavoring agent can be natural, semi-synthetic, or synthetic.

A "modulator" herein refers to a compound that can regulate the activity of TRPM8. Such regulation includes activating TRPM8, blocking TRPM8, or potentiating/reducing the activation of TRPM8. That is, the modulators include agonists, antagonists, enhancers, and etc.

The term "chemesthesia" or "chemesthetic sensation" herein refers to the sensibility of bodily surface, e.g., the skin and/or mucosal surfaces which arise either when the bodily surface is exposed to heat or coldness or when chemical compounds activate receptors associated with senses that mediate pain, touch, and thermal/cold perception. Particularly, these chemical-induced reactions do not fit into the traditional sense categories of taste and smell. Examples of chemesthetic sensations include the burn-like irritation from chili pepper, the coolness of menthol in mouthwashes and topical analgesic creams, the stinging or tingling of carbonation in the nose and mouth, and the tear-induction of onions. That is, chemesthetic sensations can arise by direct chemical activation of ion channels on sensory nerve fibers, e.g. TRPM8. Because chemoresponsive nerve fibers are present in all types of skin, chemesthetic sensations can be aroused from anywhere on the body's surface as well as from mucosal surfaces in the nose, mouth, eyes, etc.

A "chemesthetic sensation modifier" or "chemesthetic sensation modifying agent" herein refers to a compound, or a salt or solvate thereof, that modulates, including enhancing or potentiating, inducing, or blocking, the chemesthetic sensation in an animal or a human.

A "chemesthetic sensation modulating amount" herein refers to an amount of a compound of the present invention that is sufficient to alter (either induce, increase, or decrease) the chemesthetic sensation in a personal product, sufficiently to be perceived by an animal or human subject. In many embodiments of the invention, at least about 0.001 ppm of the present compound would need to be present in order for most animal or human subjects to perceive a modulation of the chemesthetic sensation in a personal product comprising the present compound. A broad range of concentration that would typically be employed in order to economically provide a desirable degree of chemesthetic sensation modulation can be from about 0.001 ppm to 1000 ppm, or from about 0.01 ppm to about 500 ppm, or from about 0.05 ppm to about 300 ppm, or from about 0.1 ppm to about 200 ppm, or from about 0.5 ppm to about 150 ppm, or from about 1 ppm to about 100 ppm.
A "chemesthetic sensation inducing amount" or "chemesthetic sensation increasing amount" herein refers to an amount of a compound that is sufficient to induce or increase a chemesthetic sensation as perceived by an animal or a human. A broad range of a chemesthetic sensation inducing/increasing amount can be from about 0.001 ppm to 100 ppm, or a narrow range from about 0.1 ppm to about 10 ppm. Alternative ranges of chemesthetic sensation inducing/increasing amounts can be from about 0.01 ppm to about 30 ppm, from about 0.05 ppm to about 15 ppm, from about 0.1 ppm to about 5 ppm, or from about 0.1 ppm to about 3 ppm.

The present compounds are important to the flavorings and fragrance industry because they can increase or induce/generate a cooling or cold sensation which is often associated with freshness and cleanliness.
As modulators of the TRPM8 receptor, the present compounds also have repellent
effect on insects, therapeutic effect in antitumor treatments (e.g. an influencing of prostate
tumors), activity in the treatment of inflammatory pain/hyperalgesia, and efficacy (as TRPM8
antagonists) in the treatment of bladder syndrome or overactive bladder.

In one embodiment, the pharmaceutical composition comprises one or more
compounds of the present invention and at least one pharmaceutically acceptable carrier. The
pharmaceutical composition includes both the prescription medications and the over-the-
counter medications. The present compound may or may not be the therapeutically active
ingredient in the pharmaceutical composition. The pharmaceutical composition can be used
by any mode of administration known to one skilled in the art, particularly by topical
administration, such as application of analgesic cream to the skin surface. In general, over
the counter (OTC) product and oral hygiene product generally refer to product for household
and/or personal use which may be sold without a prescription and/or without a visit to a
medical professional. Examples of the OTC products include, but are not limited to vitamins
and dietary supplements; topical analgesics and/or anesthetic; cough, cold and allergy remedies; antihistamines and/or allergy remedies; and combinations thereof. Vitamins and dietary supplements include, but are not limited to vitamins, dietary supplements, tonics/bottled nutritive drinks, child-specific vitamins, dietary supplements, any other products of or relating to or providing nutrition, and combinations thereof. Topical analgesics and/or anesthetic include any topical creams/ointments/gels used to alleviate superficial or deep-seated aches and pains, e.g. muscle pain; teething gel; patches with analgesic ingredient; and combinations thereof. Cough, cold and allergy remedies include, but are not limited to decongestants, cough remedies, pharyngeal preparations, medicated confectionery, antihistamines and child-specific cough, cold and allergy remedies; and combination products. Antihistamines and/or allergy remedies include, but are not limited to any systemic treatments for hay fever, nasal allergies, insect bites and stings. Examples of oral hygiene product include, but are not limited to mouth cleaning strips, toothpaste, toothbrushes, mouthwashes/dental rinses, denture care, mouth fresheners, mouth moisturizers, at-home teeth whiteners and dental floss.

As used herein, a "personal care composition" refers to a composition to be directly applied to the skin, mucosal, or other surface area of the body. Examples of personal care composition include, but are not limited to, an oral care composition, such as toothpaste, chewing gum, breath refresher, dentifrices, and mouthwashes; a skincare or haircare composition, such as sunscreen cream, sunburn lotions, shaving cream, plasters, shampoos, conditioners, face cleaners, soaps, bath oils or bath foam, antiperspirants, and deodorant; a cosmetic composition, such as moisturizer, lip balms, foundation, etc.; an insect repellent composition; or an insecticide composition.

In one embodiment of the invention, the present compounds are provided in a chemesthetic concentrate formulation, e.g., suitable for subsequent processing to produce a ready-to-use (i.e., ready-to-serve) product. By "a chemesthetic concentrate formulation", it is meant a formulation which should be reconstituted with one or more diluting medium to become a ready-to-use composition. The term "ready-to-use composition" is used herein interchangeably with "ingestible composition", which denotes any substance that, either alone or together with another substance, can be taken by mouth whether intended for consumption or not. In one embodiment, the ready-to-use composition includes a composition that can be directly consumed by a human or animal. The chemesthetic concentrate formulation is typically used by mixing with or diluted by one or more diluting medium, e.g., any consumable or ingestible ingredient or product, to impart or modify a
chemesthetic sensation to the diluting medium. Such a use process is often referred to as reconstitution. The reconstitution can be conducted in a household setting or an industrial setting. For example, a frozen fruit juice concentrate can be reconstituted with water or other aqueous medium by a consumer in a kitchen to obtain the ready-to-use fruit juice beverage.

In another example, a mouthwash concentrate can be reconstituted with water or other aqueous medium by a manufacture in large industrial scales to produce the ready-to-use mouthwash. Since the chemesthetic concentrate formulation has the present compound and optionally a flavoring agent and/or flavor modifying agent in a concentration higher than the ready-to-use composition, the chemesthetic concentrate formulation is typically not suitable for being consumed directly without reconstitution. There are many benefits of using and producing a chemesthetic concentrate formulation. For example, one benefit is the reduction in weight and volume for transportation as the chemesthetic concentrate formulation can be reconstituted at the time of usage by the addition of suitable solvent, solid or liquid.

In one embodiment, the chemesthetic concentrate formulation comprises i) as chemesthetic sensation modifying ingredient, a compound of the present invention; ii) a carrier; and iii) optionally at least one adjuvant. The term "as chemesthetic sensation modifying ingredient" denotes that the compound of the present invention acts as a modulator of a chemesthetic sensation (such as, a cold or cooling sensation modulator) in the formulation. The term "carrier" denotes a usually inactive accessory substance, such as solvents, binders, or other inert medium, which is used in combination with the present compound and one or more optional adjuvants to form the formulation. For example, water or starch can be a carrier for a flavoring concentrate formulation. In some embodiments, the carrier is the same as the diluting medium for reconstituting the chemesthetic concentrate formulation; and in other embodiments, the carrier is different from the diluting medium. The term "carrier" as used herein includes, but is not limited to, ingestibly acceptable carrier.

The term "adjuvant" denotes an additive which supplements, stabilizes, maintains, or enhances the intended function or effectiveness of the active ingredient, such as the compound of the present invention. In one embodiment, the at least one adjuvant comprises one or more flavoring agents. The flavoring agent may be of any flavor known to one skilled in the art or consumers, such as the flavor of chocolate, coffee, tea, mocha, French vanilla, peanut butter, chai, or combinations thereof. In another embodiment, the at least one adjuvant comprises one or more sweeteners. In another embodiment, the at least one adjuvant comprises one or more ingredients selected from the group consisting of an emulsifier, a stabilizer, an antimicrobial preservative, an antioxidant, vitamins, minerals, fats,
starches, protein concentrates and isolates, salts, and combinations thereof. Examples of
emulsifiers, stabilizers, antimicrobial preservatives, antioxidants, vitamins, minerals, fats,
starches, protein concentrates and isolates, and salts are described in U.S. 6,468,576, the
contents of which are hereby incorporated by reference in its entirety for all purposes.

In one embodiment, the present chemesthetic concentrate formulation can be in a
form selected from the group consisting of liquid including solution and suspension, solid,
foamy material, paste, gel, cream, and a combination thereof, such as a liquid containing
certain amount of solid contents. In one embodiment, the chemesthetic concentrate
formulation is in form of a liquid including aqueous-based and nonaqueous-based. The
present chemesthetic concentrate formulation can be carbonated or non-carbonated.

The chemesthetic concentrate formulation may further comprise a freezing point
depressant, nucleating agent, or both as the at least one adjuvant. The freezing point
depressant is a ingestibly acceptable compound or agent which can depress the freezing point
of a liquid or solvent to which the compound or agent is added. That is, a liquid or solution
containing the freezing point depressant has a lower freezing point than the liquid or solvent
without the freezing point depressant. In addition to depress the onset freezing point, the
freezing point depressant may also lower the water activity of the flavoring concentrate
formulation. The examples of the freezing point depressant include, but are not limited to,
carbohydrates, oils, ethyl alcohol, polyol, e.g., glycerol, and combinations thereof. The
nucleating agent denotes a ingestibly acceptable compound or agent which is able to facilitate
nucleation. The presence of nucleating agent in the flavoring concentrate formulation can
improve the mouthfeel of the frozen sluses of a frozen slush and to help maintain the
physical properties and performance of the slush at freezing temperatures by increasing the
number of desirable ice crystallization centers. Examples of nucleating agents include, but
are not limited to, calcium silicate, calcium carbonate, titanium dioxide, and combinations
thereof.

In one embodiment, the chemesthetic concentrate formulation is formulated to have a
low water activity for extended shelf life. Water activity is the ratio of the vapor pressure of
water in a formulation to the vapor pressure of pure water at the same temperature. In one
embodiment, the chemesthetic concentrate formulation has a water activity of less than about
0.85. In another embodiment, the chemesthetic concentrate formulation has a water activity
of less than about 0.80. In another embodiment, the chemesthetic concentrate formulation
has a water activity of less than about 0.75.
In one embodiment, the chemesthetic concentrate formulation has the present compound in a concentration that is at least 2 times of the concentration of the compound in a ready-to-use composition. In one embodiment, the chemesthetic concentrate formulation has the present compound in a concentration that is at least 5 times of the concentration of the compound in a ready-to-use composition. In one embodiment, the chemesthetic concentrate formulation has the present compound in a concentration that is at least 10 times of the concentration of the compound in a ready-to-use composition. In one embodiment, the chemesthetic concentrate formulation has the present compound in a concentration that is at least 15 times of the concentration of the compound in a ready-to-use composition. In one embodiment, the chemesthetic concentrate formulation has the present compound in a concentration that is at least 20 times of the concentration of the compound in a ready-to-use composition. In one embodiment, the chemesthetic concentrate formulation has the present compound in a concentration that is at least 30 times of the concentration of the compound in a ready-to-use composition. In one embodiment, the chemesthetic concentrate formulation has the present compound in a concentration that is at least 40 times of the concentration of the compound in a ready-to-use composition. In one embodiment, the chemesthetic concentrate formulation has the present compound in a concentration that is at least 50 times of the concentration of the compound in a ready-to-use composition. In one embodiment, the chemesthetic concentrate formulation has the present compound in a concentration that is at least 60 times of the concentration of the compound in a ready-to-use composition. In one embodiment, the chemesthetic concentrate formulation has the present compound in a concentration that is up to 100 times of the concentration of the compound in a ready-to-use composition.

The personal product can be provided as a textile product. Examples of the textile product includes, but are not limited to, shirts, pants, socks, towels, and etc. The present compound can be applied to the textile product in any suitable methods known to one skilled in the art. For example, the present compound can be associated with the textile by spin-coating, imprinting, in the form of microencapsulation, direct incorporation into the textile material (e.g. extruding), covalent coupling of suitable derivatives of the modulators (via suitable spacer/linker groups, with the help of which the molecule is reversibly or irreversibly bonded to the packaging material).

The personal product can be provided as packaging materials. Examples of the packaging materials include paper and plastic wrapping, which may be in various processing forms including fibers, fabrics, and moldings. The present compound can be applied to the
packaging material in any suitable methods known to one skilled in the art. For example, the present compound can be associated with the packaging material by spin-coating, imprinting, in the form of microencapsulation, direct incorporation into the packaging material (e.g. extruding), covalent coupling of suitable derivatives of the modulators (via suitable spacer/linker groups, with the help of which the molecule is reversibly or irreversibly bonded to the packaging material.

The compounds of the present invention can be used for modulating transient receptor potential channel melastatin member 8 (TRPM8) by contacting the receptor with a compound of the present invention. This modulation process can be carried out either *in vitro* or *in vivo*.

In one embodiment, the compound is a TRPM8 receptor agonist.

The compounds of the present invention can also be formulated into a precursor of the above-described compositions. By "precursor", it is meant a substance or composition from which another composition, such as those described above, is formed. For example, the present compounds may be provided as a concentrated formulation or composition which may be further mixed or diluted to form another composition suitable for consumption or personal use.

The present compounds can be used to modify the chemesthetic sensation of a composition by contacting the present compounds with the composition to form a taste-modified composition. In one embodiment, the present compounds can convey or impart a cooling taste to a composition.

In one embodiment, the present invention provides a method of modulating the cold or cooling sensation of a composition comprising combining the composition with a compound of the present invention, or a salt or solvate thereof, to form a modified composition.

In one embodiment, the present invention provides a method of inducing a cold or cooling sensation in a human or animal by contacting the human or animal with a compound of the present invention.
**Biological Assay**

A mammalian cell line derivative which stably expresses hTRPM8 was used in biological assays in association with testing the present compounds with cool-tasting or -feeling properties (Servant et al. US 2007/0259354 A1 and references cited therein). Typical compound concentrations tested were 100 µM, 50 µM, 10 µM, 1 µM, and 0.5 µM. Sensory studies

Two typical sensory studies are described below followed by a table summarizing sensory results of selected compounds of the invention (Table 6).

Cool Line Scale Test with Example 26 (15 uM):

Formulation:

All samples made with Low Sodium Buffer (LSB) pH ~7.1 and contain 0.1% ethanol.

General Protocol:

Compounds are rated on a 15 point line scale where 45 µM WS-3 (N-Ethyl-p-menthane-3-carboxamide) is ranked as a 5 in cool intensity. In most cases our compounds are tested to determine at what concentration the cooling intensity is equivalent to 45 µM WS-3. In each test, the panelist is presented with a 0 µM control sample, a 45 µM WS-3 control sample and the experimental compound sample and asked to rate the cooling intensity of each sample. Panelists are also asked to rate bitterness. In the table below there was no significant bitterness detected unless otherwise noted. Also, in the table below, n represents the number of tests completed for a given experiment (# panelists x # repetitions).

Conclusions:

Panelists found 15 µM Compound Z1 was significantly more cooling than 0 µM WS-3 (p<0.05) and not significantly different in cooling than 45µM WS-3 (p>0.05). There were no significant bitter offtastes in any of the samples (p>0.05). Analytical for 15µM Compound Z1 from a sample cup from the test was 70% of the expected value, while analytical from the bottle of solution was within the expected range.
Table 2. Average Cooling, n = 30 (15 Panelists x 2 rep). Tukey's Value = 1.103 (α = 0.05).

Cool Line Scale Test with Compound F1 (3 µM in LSB):

Formulation:
All samples were prepared with Low Sodium Buffer (LSB) pH -7.1 and contain 0.1% ethanol

Conclusions:
Panelists found 3 µM Compound F1 was significantly more cooling than 0µM WS-3 (p<0.05) and not significantly different in cooling than 45µM WS-3 (p>0.05).

There were no significant bitter offtastes in any of the samples (p>0.05).

Biological test results of various compounds have also indicated that the present compounds wherein the hAr is a five-membered heteroaryl are surprisingly much more potent than those compounds wherein the hAr is an aryl or heteroaryl which is not five-membered. Exemplifying data are provided in Tables 7 and 8 below.

Preparation and Examples

Standard procedures and chemical transformation and related methods are well known to one skilled in the art, and such methods and procedures have been described, for example, in standard references such as Fiesers' Reagents for Organic Synthesis, John Wiley and Sons, New York, NY, 2002; Organic Reactions, vols. 1-83, John Wiley and Sons, New York, NY, 2006; March J. and Smith M., Advanced Organic Chemistry, 6th ed., John Wiley and Sons, New York, NY; and Larock R.C., Comprehensive Organic Transformations, Wiley-VCH Publishers, New York, 1999. All texts and references cited herein are incorporated by reference in their entirety.

Reactions using compounds having functional groups may be performed on compounds with functional groups that may be protected. A "protected" compound or derivatives means derivatives of a compound where one or more reactive site or sites or functional groups are blocked with protecting groups. Protected derivatives are useful in the
preparation of the compounds of the present invention or in themselves; the protected
derivatives may be the biologically active agent. An example of a comprehensive text listing
suitable protecting groups may be found in T. W. Greene, Protecting Groups in Organic

Synthesis of the examples of presented compounds is illustrated in the following
schemes and procedures. The general synthetic schemes and related procedures used for the
preparation of the examples compounds are given hereinafter.

Scheme 1

If not commercially available or differently described, all the secondary amines were
prepared by reductive amination in a similar manner to example 6a or 21b utilizing one of the
standard reducing agents and general conditions known to those skilled in the art such as:
NaBH₄, LiAlH₄, Na(OAc)₃BH (STAB), Na(CN)BH₃, 2-picoline borane complex, 5-ethyl-2-
meethylpyridine borane (PEMB) or their equivalent, and DCM (dichloromethane), DCE
(dichloroethane), Et₂O (diethyl ether), THF (tetrahydrofuran), dioxane, MeOH, EtOH,
MeCN, AcOH alone or in binary or tertiary combinations thereof. One skilled in the art can
readily derive the synthesis of the present compounds from the following descriptions
according to the methods and principles discussed above. When commercially available,
screened compounds were purchased from one from the following vendors: Enamine,
Chemidiv, Princeton, Chembridge.

N-(IH-pyrazol-5-yl)-N-(thiophen-2-ylmethyl)-2-(p-tolyloxy)acetamide; Example 6.

2-(p-tolyloxy)acetyl chloride (500 mg, 2.68 mmol, 2.0 eq) was added to a solution of pyridine
(0.217 mL, 2.68 mmol, 2.0 eq) in dichloromethane. N-(thiophen-2-ylmethyl)-IH-pyrazol-5-
amine (240 mg, 1.34 mmol, 1.0 eq) was added to the stirring mixture at room temperature.
The reaction was allowed to stir overnight at room temperature. The mixture was diluted with
dichloromethane and washed with water and brine followed by drying over sodium sulfate.
The salts were filtered and washed with dichloromethane. The filtrate was concentrated and
the residue was re-diluted in ethanol. Sodium hydroxide (pellets, 268 mg, 6.7 mmol, 5.0 eq)
was added. The mixture was stirred at room temperature. Upon completion by LC-MS, the
volatiles were removed and the residue was re-dissolved in ethyl acetate and washed with
water and brine. The organic layer was dried over sodium sulfate. The crude was purified by
column chromatography (ethyl acetate in hexanes) to yield 126 mg of product. The procedure
was repeated on the same scale and yield 241 mg after column chromatography. The two
batches were combined and re-purified via HPLC (acetonitrile in water). The collected
fractions were combined and the volatiles were removed via rotary evaporation. The residue
was dried three times in ethanol (10 mL, 200 proof) resulting in 288 mg (0.8796 mmol) of
white solids as the desired product. Yield 16%. 1H NMR (400 MHz, DMSO-d6) δ 2.21 (s, 3H), 4.59 (br s, 2H), 4.98 (br s, 2H), 6.23 (br s, 1H), 6.67 (br d, J = 8.5 Hz, 2H), 6.91 (br m, 2H), 7.04 (br d, J = 8.1 Hz, 2H), 7.41 (m, 1H), 7.78 (br s, 1H), 12.88 (br s, 1H); M+H(328.1).

N-(thiophen-2-ylmethyl)-1H-pyrazol-5-amine; Example 6a.

1H-pyrazol-5-amine (2.0 g, 1.0 eq, 24.07 mmol) and thiophene-2-carbaldehyde (2.23 mL, 1.0 eq, 24.07 mmol) were combined in methanol and stirred at room temperature with
magnesium perchlorate (0.5 eq, 2.69 g) overnight. The volatiles were removed thereafter via rotary evaporation and the residue was re-diluted in ethyl acetate and washed with water then
subsequently with brine, followed by drying over sodium sulfate. The salts were filtered and
washed with ethyl acetate. The filtrate was concentrated to dryness followed by high vacuum
treatment. The dried residue was re-dissolved in anhydrous dichloromethane (30 mL) and the
system was flushed with nitrogen and sealed. The solution was chilled to 0°C in an ice bath.
L1A1H₄ (1.0 M in diethyl ether, 24.07 mmol, 24.07 mL, 1.0 eq) was added to the solution
slowly, changing the solution color from yellow to orange. The mixture was allowed to stir
overnight as the temperature increases to room temperature. The reaction was quenched with
1.0 N aqueous sodium hydroxide solution at 0°C. Majority of the volatiles were evaporated and the remaining aqueous layer was extracted with ethyl acetate. The organic layer was
washed with brine and then dried over sodium sulfate. The crude was purified by column
chromatography (ethyl acetate and hexanes) to give 1.97 g of yellow oil as the desired
intermediate, N-(thiophen-2-ylmethyl)-1 H-pyrazol-5-amine. 1H NMR (400 MHz, CDCl₃) δ
4.55 (s, 2H), 6.95 (dd, J = 5.1, 3.5 Hz, 1H), 6.99 - 7.01 (m, 1H), 7.20 (dd, J = 5.1, 1.3 Hz, 1H), 7.33 (d, J = 2.4 Hz, 1H).
N-ethyl-N-(thiophen-2-ylmethyl)-2-(p-tolyloxy)acetamide; Example 21.

To a round bottomed flask was added N-(thiophen-2-ylmethyl)ethanamine (0.92 g, 5 mmol), in dichloromethane (20 mL), followed by 2-(p-tolyloxy)acetyl chloride (0.93 g, 5 mmol) in 5 mL of dichloromethane and triethylamine (0.84 mL, 6 mmol). The reaction mixture was poured in water, extracted with dichloromethane (x 3), washed with 1 M NaOH, 1 M HCl and brine, dried over MgSc\(^+\) and evaporated in vacuo. The compound was purified on the biotage (dichloromethane: ethyl acetate 0-20% gradient); clean fractions were combined and concentrated. Final compound was then concentrated 3 times from ethanol. 1.259 g (4.35 mmol, 87%) of compound were obtained in purity greater than 97%. H NMR (400 MHz, DMSO-de, T=80°C) \(\delta\) H NMR (400 MHz, DMSO) \(\delta\) 1.11 (br s, 3H), 2.24 (s, 3H), 3.37 (q, \(J = 7.1\) Hz, 2H), 4.71 (br s, 2H), 4.76 (s, 2H), 6.82 (d, \(J = 8.5\) Hz, 2H), 6.97 (br s, 1H), 7.04 (br s, 1H), 7.07 (d, \(J = 8.5\) Hz, 2H), 7.40 (br s, 1H); M+H(290.1).

2-(p-tolyloxy)acetyl chloride; Example 21a

To a 0°C stirring suspension of 4.00 g of the acid (24.07 mmol; 1.0 eqmol) in 40.0 mL of dichloromethane, it was added 2.20 mL of oxalyl chloride (25.27 mmol; 1.05 eqmol) and then 56 uL of dimethylformamide (0.7221 mmol; 0.03 eqmol). The ice bath was removed and the reaction was allowed to stir at room temperature until gas evolution ceased (bubbler monitor).

All the volatiles were then evaporated in vacuo. The obtained crude liquid contained some very fine precipitate, so the neat liquid was passed over a Celite pad which was flushed with hexanes. Once again, all the volatiles were then evaporated in vacuo, to obtain a clear liquid which showed only one compound at the \(^1\)H-NMR analysis. The obtained 4.129 g (22.36 mmol; 93%) were used in the next step without further purification. H NMR (400 MHz; CDCl\(_3\)) \(\delta\) 2.30 (s, 3H), 4.92 (s, 2H), 6.84 - 6.76 (m, 2H), 7.15 - 7.08 (m, 2H).

N-(thiophen-2-ylmethyl)ethanamine; Example 21b

To a 0°C chilled round bottom flask was added ethyl amine hydrochloride (4.58 g, 56.17 mmol) and thiophene-2-carbaldehyde (5.0 mL, 53.50 mmol) in methanol (20.0 mL), followed by triethylamine (7.83 mL, 56.17 mmol) and the reaction was stirred for 30 minutes.
Sodium triacetoxyborohydride (15.87 g, 74.90 mmol) was added in one portion under vigorous stirring. The ice bath was removed and the flask was attached to a bubbler to allow gas evolution and expansion. The reaction was stirred overnight at room temp. Most of the volatiles were evaporated in vacuo. The reaction mixture was quenched by adding 1 N NaOH, and the product was extracted with dichloromethane. The organic extract was washed with brine and dried over MgSC\textsuperscript{2+}. The volatiles were evaporated to give the crude free base N-(thiophen-2-ylmethyl)ethanamine (5.85 g, 41.42 mmol, 77%), which resulted of a purity grade >97% by 1H-NMR analysis, therefore it was used in the next step without any further purification. 1H NMR (400 MHz, CDC\textsubscript{13}) \( \delta \): 1.13 (t, \( J = 7.1 \) Hz, 3H), 2.71 (q, \( J = 7.2 \) Hz, 2H), 4.00 (d, \( J = 0.7 \) Hz, 2H), 6.90 - 6.97 (m, 2H), 7.21 (dd, \( J = 5.0, 1.3 \) Hz, 1H).

N-(1-(cyanomethyl)-1H-pyrazol-3-yl)-N-(thiophen-2-ylmethyl)-2-(p-tolyloxy)acetamide; Example 17.

N-(oxazol-2-yl)-N-(thiophen-2-ylmethyl)-2-(p-tolyloxy)acetamide (example 4) (430 mgs, 1.313 mmol) was dissolved in N,N-dimethylformamide. Sodium hydride (60% in mineral oil, 55 mgs, 1.38 mmol) was added at 0°C and a bubbler was attached to observe gas evolution. The reaction was stirred with gradual warming to room temperature until gas evolution ceased. 2-bromoacetonitrile (92 µl, 1.38 mmol) was added at room temperature and the reaction was allowed to stir overnight. Upon completion by TLC (5:5 ethyl acetate:hexanes), the reaction was carefully quenched with water at 0°C. The reaction mixture was concentrated via rotary evaporation. The residue was taken up in water and extracted with ethyl acetate. The organic layer was washed with brine and dried over sodium sulfate. The crude material was purified by column chromatography (ethyl acetate and hexanes). (Yield 64%, the other possible isomer of N-alkylation was obtained as a minor product; data not reported). 1H NMR (400 MHz, DMSO-d6) δ 2.26 (s, 3H), 4.65 (broad, s, 2H), 4.96 (s, 2H), 5.05 (s, 2H), 6.09 (broad, s, 1H), 6.73 (d, 2H, J=8.8Hz), 6.91 (m, 2H), 7.03 (d, 2H, J=8.4Hz), 7.21 (dd, 1H, J1=4.8Hz, J2=1.2Hz), 7.50 (broad, s, 1H). Further two-dimensional NMR studies confirmed the structure assignment as the correct isomer; M+H(329.1).

(E)-N-(1H-pyrazol-4-yl)-N-(thiophen-2-ylmethyl)-3-p-tolylacrylamide; Example 74.

To a 0°C stirring solution of (E)-3-p-tolylacryloyl chloride (362 mg, 2.000 mmol) in DCM (4.0 mL) was added pyridine (162 uL, 2.000 mmol) and then N-(thiophen-2-ylmethyl)-1H-pyrazol-4-amine (179 mg, 1.000 mmol). The ice bath was removed and the reaction was stirred until completion. All the volatiles were evaporated under vacuum and the residue was taken up in EtOH (15.0 mL) and THF (5.0 mL). To this mixture was added 1.0 M NaOH (6.0 mL; 6.000 mmol) and the reaction was stirred overnight.

All the volatiles were evaporated under vacuum and the residue was taken up in DCM. The obtained organic layer was washed with water and then brine. The resulting organic solution was dried over MgSO$_4$ and concentrated. The obtained crude product was absorbed under vacuum on Florisil with the aid of DCM (dry load). The obtained dispersion was purified on the biotage (DCM:MeOH 1-15% gradient over 40 CV, 40 g Silicycle column).
The collected fractions were evaporated to afford (E)-N-(1H-pyrazol-4-yl)-N-(thiophen-2-ylmethyl)-3-p-tolylacrylamide (267 mg, 0.8256 mmol; 83%) as a white solid, which was judged less than 97% pure by 1H-NMR and LC-MS analysis. The said material was then completely dissolved in hot mixture of EtOH (5.0 mL) and DCM (2.0 mL). Upon cooling thick white needles started to form and the process was allowed to happen overnight. After decanting, the liquids were taken away with a pipette and the obtained solid was washed with three aliquots of cold EtOH. The obtained crystals were then heated in hot ethanol and the volatiles were then evaporated at the rotavap. This step was repeated 3 times in order to get rid of traces of DCM. The solids were then left overnight under high vacuum.

In this way, 169 mg (0.5226 mmol, 52%) were obtained in purity judged more than 97% pure by 1H-NMR and LC-MS analysis. 1H NMR (400 MHz, DMSO-d6, T = 80°C) δ 2.30 (s, 3H), 5.03 (s, 2H), 6.58 (s, 1H), 6.98 - 6.85 (m, 2H), 7.17 (d, J = 8.1 Hz, 2H), 7.40 (ddd, J = 41.4, 19.2, 11.8 Hz, 6H); M+H(324.1).

Example 174a: (E)-3-p-tolylacyroyl chloride.

To a 0°C stirring suspension of 4.22 g of the acid (26.02 mmol; 1.0 eqmol) in 50.0 mL of DCM, it was added 2.38 mL of oxaly chloride (27.32 mmol; 1.05 eqmol) and then 60 uL of DMF (0.7806 mmol; 0.03 eqmol). The ice bath was removed and the reaction was allowed to stir at room temperature until gas evolution ceased (bubbler monitor). All the volatiles were then evaporated at the rotavap under high vacuum. 4.723 g (26.14 mmol; quant.) of a white solid were recovered. This material was used in the next step without any further purification.

Example 174b: N-(thiophen-2-ylmethyl)-1H-pyrazol-4-amine.

To a 0°C stirring mixture of 1H-pyrazol-4-amine (250 mg, 3.008 mmol) and thiophene-2-carbaldehyde (281 uL, 3.008 mmol) in methanol and acetic acid (5.0 ml, 10:1 ratio) was added 5-ethyl-2-methylpyridine borane complex (444 uL, 3.008 mmol). The ice bath was removed and the flask was attached to a bubbler to allow gas evolution and expansion. The reaction was stirred overnight at room temp. Most of the volatiles were evaporated in vacuo. With the aid of a 0°C chilling bath, a 10 M solution of NaOH in water was carefully added. The ice bath was removed and stirring was continued for nearly 1 hour. The aqueous layer was extracted with DCM (3 x), washed with brine, and dried over MgSO4 and concentrated. The obtained crude product was left under vacuum to remove the volatiles. The obtained
viscous oil was diluted with DCM and evaporated under a gentle stream of nitrogen overnight. Solid crystals of the amine separated out and were washed with three aliquots of Hex:EtOAc = 9:1. In this way, 391 mg (2.181 mmol; 72%) of the desired product were obtained in more than 97% purity by 1H-NMR analysis. 1H NMR (400 MHz, DMSO-d6) δ 4.21 (d, J = 5.6 Hz, 1H), 4.92 (t, J = 6.0 Hz, 1H), 6.94 (dd, J = 5.1, 3.4 Hz, 1H), 7.10 - 6.99 (m, 3H), 7.36 (dd, J = 5.1, 1.2 Hz, 1H), 12.05 (br s, 1H).

Scheme 2

If not commercially available or differently described, all the secondary amines were prepared by reductive amination in a similar manner to example 6a or 21b utilizing one of the standard reducing agents and general conditions known to those skilled in the art such as:

NaBH₄, LiAlH₄, Na(OAc)₃, BH (STAB), Na(CN)BH₃, 2-picoline borane complex, 5-ethyl-2-methylpyridine borane (PEMB) or their equivalent, and DCM (dichloromethane), DCE (dichloroethane), Et₂O (diethyl ether), THF (tetrahydrofuran), dioxane, MeOH, EtOH, MeCN, AcOH alone or in binary or tertiary combinations thereof. All the employed acids were commercially available. The condensation between acid and amine was mediated by a condensing reagent such as EDCI (1-ethyl-3-(3-dimethylaminopropyl) carbodiimide), DCC (N,N'-'dicyclohexylcarbodiimide), DIC (N,N'-'diisopropylcarbodiimide), HATU (2-((H-7-azabenzoazol-l-yl)-l,l,3,3-tetramethyl uranium hexafluorophosphate Methanaminium), PyBOP (benzotriazol-l-yl-oxytripyrrolidinophosphonium hexafluorophosphate), CDI
(carbonyldiimidazole), 2-chloro-l-methylpyridinium iodide, T3P (propylphosphonic anhydride), according to synthetic protocols well established in the literature. One skilled in the art can readily derive the synthesis of the present compounds from the following descriptions according to the methods and principles discussed above.

2-(benzo[d][1,3]dioxol-5-yloxy)-N-phenyl-N-(thiophen-2-ylmethyl)acetamide; Example 5.

To a microwave vial was added 2-(benzo[d][1,3]dioxol-5-yloxy)acetic acid (195 mg, 1.0 mmol) in DCM (1.0 mL), followed by N-(thiophen-2-ylmethyl)aniline (190 mg, 1.0 mmol), EDC (230 mg, 1.2 mmol) and HOBr (270 mg, 2.0 mmol) in DCM (2.0 mL) and DMF (2.0 mL). The microwave vial was capped and reacted under microwave irradiation (Emrys Optimizer reactor) at 100°C for 10 minutes. The compound was purified on HPLC; clean fractions were combined and concentrated. Final compound was recrystallized from ethanol and water, affording 169 mg (0.46 mmol, 46%). H NMR (400 MHz, DMSO-d6) δ 4.36 (s, 2H), 5.00 (s, 2H), 5.94 (s, 2H), 6.15 (br d, J = 6.2 Hz, 1H), 6.45 (br s, 1H), 6.75 (d, J = 8.5 Hz, 1H), 6.83 (br s, 1H), 6.90 (dd, J = 5.1, 3.4 Hz, 1H), 7.22 - 7.29 (m, 2H), 7.33 - 7.46 (m, 4H); M+H(368.1).

N-(thiophen-2-ylmethyl)aniline; Example 5a.

To a 0°C chilled round bottom flask was added aniline (3.0 g, 30 mmol) and thiophene-2-carbaldehyde (3.4 g, 30 mmol) in methanol and acetic acid (30.0 ml, 10:1), followed by 2-picoline borane complex (3.2 g, 30 mmol). The ice bath was removed and the flask was attached to a bubbler to allow gas evolution and expansion. The reaction was stirred overnight at room temp. Most of the volatiles were evaporated in vacuo. With the aid of a 0°C chilling bath, 10% HC1 (150 mL) was added to the residue and stirred for 2 hours at room temp. Around 60 mL of a 10 M solution of NaOH in water was added under cooling to make the solution alkaline. Aqueous layer was extracted with DCM (3 times), washed with brine, and dried over MgSO\(_4\) and concentrated. The obtained crude was absorbed under vacuum on Florisil with the aid of DCM (dry load). The obtained dispersion was purified by
column chromatography (Biotage system; hex:EtOAc 25-100% gradient over 30 CV, 80 g Silicycle silica column). The collected fractions were evaporated to afford 5.68 g (29.87 mmol; 99%), which was judged more than 97% pure by 1H-NMR analysis.

The ice bath was then removed and the reaction was allowed to warm to room temperature with stirring until reaction completion. The mixture was poured in to a stirring mixture of water (20.0 mL) and 6.0 M HCl (6.0 mL), and the product was collected by filtration and dried under vacuum affording, 692 mg of 2-(2-hydroxy-4-methylphenoxy)acetic acid as a white solid in 70% yield.

Scheme 3

If not commercially available or differently described, all the secondary amines were prepared by reductive amination in a similar manner to example 6a or 21b utilizing one of the standard reducing agents and general conditions known to those skilled in the art such as: NaBH₄, LiAlH₄, Na(OAc)₃BH (STAB), Na(CN)BH, 2-picoline borane complex, 5-ethyl-2-methylpyridine borane (PEMB) or their equivalent, and DCM (dichloromethane), DCE (dichloroethane), Et₂O (diethyl ether), THF (tetrahydrofuran), dioxane, MeOH, EtOH, MeCN, AcOH alone or in binary or tertiary combinations thereof. All the employed phenols or alcohols were commercially available. One skilled in the art can readily derive the synthesis of the present compounds from the following descriptions according to the methods and principles discussed above.
To a microwave vial was added 3-hydroxybenzonitrile (60 mg, 0.50 mmol) in DMF (1.0 mL), followed by K$_2$CO$_3$ (140 mg, 1.0 mmol) and 2-bromo-N-phenyl-N-(thiophen-2-ylmethyl)acetamide (150 mg, 0.5 mmol) in DMF (4.0 mL). The microwave vial was capped and reacted under microwave irradiation (Emrys Optimizer reactor) at 120°C for 10 minutes. The compound was purified on HPLC; clean fractions were combined and concentrated, affording 101 mg (0.29 mmol, 58%). $^1$H NMR (400 MHz, DMSO-d$_6$) $\delta$ 4.57 (s, 2H), 5.00 (s, 2H), 6.84 (br s, 1H), 6.91 (dd, $J = 5.1, 3.4$ Hz, 1H), 7.15 (br d, $J = 7.9$ Hz, 1H), 7.23 - 7.33 (m, 3H), 7.34 - 7.52 (m, 6H); M+H(349.1).

To a 0°C stirring suspension of the N-(thiophen-2-ylmethyl)aniline (3.51 g, 18.53 mmol) and sodium bicarbonate (1.71 g, 20.38 mmol) in dimethylformamide (15.0 mL), it was added bromoacetyl chloride (1.54 mL, 18.53 mmol). The ice bath was removed and the flask was attached to a bubbler to allow gas evolution and expansion. The reaction was stirred overnight at room temp. Most of the volatiles were evaporated in vacuo, then the residue was taken up in dichloromethane and was washed with water first and then brine. The resulting organic layer was dried over MgSO$_4$ and concentrated. The obtained crude was absorbed under vacuum on Florisil with the aid of DCM (dry load). The obtained dispersion was purified by column chromatography (Biotage system, hex:EtOAc 1-20% gradient over 30 CV, 40 g Silicycle silica column). The collected fractions were evaporated to afford 4.51 g of 2-bromo-N-phenyl-N-(thiophen-2-ylmethyl)acetamide (14.55 mmol; 78%), which was judged more than 97% pure by 1H-NMR analysis.
