The present invention relates to a cosmetic composition for keratin fibers, in a mousse form, comprising: (a) at least one fatty material; (b) at least one amphoteric surfactant; (c) at least one amphoteric polymer; (d) at least one non-volatile alkaline agent; (e) at least one oxidizing agent; and (f) at least one foam stabilizer, wherein the amount of the (a) fatty material is 20% by weight or more, preferably 30% by weight or more, and more preferably 40% by weight or more, relative to the total weight of the composition. The present invention is useful, because the cosmetic composition according to the present invention can have good foamability as well as good bleaching or coloring ability, without offensive odor from ammonia.
DESCRIPTION
COSMETIC COMPOSITION FOR KERATIN FIBERS

TECHNICAL FIELD

The present invention relates to a cosmetic composition in the form of a mousse, particularly a dyeing or a bleaching composition, for keratin fibers such as hair.

BACKGROUND ART

In addition to higher performance of products for bleaching or coloring hair, consumers of such products are more and more sensitive to the usage quality of the products. From the viewpoint of usage quality, for example, malodor from ammonia which is typically contained as an alkaline agent in conventional hair bleaching or coloring products; difficulty in self-handling conventional hair bleaching or coloring products which are in the form of a liquid, gel or cream; risk of the product dripping during the application to the hair; and the like can be regarded as strong drawbacks.

In order to reduce the problems occurring with the pungent odor of ammonia, it has been proposed to replace totally or partially replacing this alkaline agent by another one such as monoethanolamine. However, the consequence of this modification is a decrease of the bleaching or coloring efficiency of the composition.

Recently, an alternative to the hair dyeing or bleaching compositions based on ammonia as alkaline agent has been proposed, with compositions comprising high amounts of fatty materials. Such compositions usually comprise more than 20% of fatty compounds, in combination with an oxidizing agent, with or without an oxidative dye. Such compositions provide high bleaching or coloring ability with relative small amount of alkaline agent and advantageously without ammonia.

In order to enhance the usage quality of hair bleaching or coloring products, foam textures have been recently recognized on the market as strong improvements, especially from the viewpoint of easier self-handling.

Current hair bleaching or coloring products to be applied in the form of a mousse in the market generally include a foaming surfactant, an oxidizing agent, and an alkaline agent, with or
without an oxidative dye. In order to realize adequate bleaching or coloring property comparable to conventional hair bleaching or coloring products, ammonia is in general used as the alkaline agent in such products. Consequently, the problem of the odor due to the presence of ammonia is not solved.

To obtain compositions in the form of a mousse from the compositions comprising high amounts of fatty compounds was not proposed because it was thought that high amounts of fatty materials may suppress or collapse foam.

DISCLOSURE OF INVENTION

An objective of the present invention is to provide a cosmetic composition for keratin fibers such as hair which is in the form of a mousse, which comprises high amounts of fatty compounds but still can have a good foamability and exhibit a good stability of the resulting foam, as well as a good bleaching or dyeing ability.

The above objective of the present invention can be achieved by a cosmetic composition for keratin fibers, in a mousse form, comprising:

(a) at least one fatty material;
(b) at least one amphoteric surfactant;
(c) at least one amphoteric polymer;
(d) at least one non-volatile alkaline agent;
(e) at least one oxidizing agent; and
(f) at least one foam stabilizer,

wherein

the amount of the (a) fatty material (s) is 20% by weight or more, preferably 30% by weight or more, and more preferably 40% by weight or more, relative to the total weight of the composition.

It is preferable that the (a) fatty material be in the form of a liquid at ambient temperature and under atmospheric pressure.

The (a) fatty material may preferably be selected from the group consisting of oils of animal or plant origin, synthetic glycerides, fatty esters other than animal or plant oils and synthetic glycerides, fatty alcohols, fatty acids, silicone oils, and aliphatic hydrocarbons. More preferably, the fatty material is aliphatic hydrocarbon such as mineral oil.

The (b) amphoteric surfactant may preferably be selected from the group consisting of betaines and amidoaminecarboxylated derivatives, preferably in the group consisting of betaines.
The (b) amphoteric surfactant may preferably be selected from the group consisting of (C₈-C₂₄) alkylbetaines, (C₁-C₄) alkylamido (C₁-C₄) alkylbetaines, sulfobetaines, (C₈-C₂₄) alkylamido (C₁-C₄) alkylsulfobetaines, (C₈-C₂₄)-alkyl amphomonoacetates, (C₈-C₂₄) alkyl amphodiacetates, (C₈-C₂₄) alkyl amphononopropionates, (C₈-C₂₄) alkyl amphodipropionates and phosphobetaines.

It is preferable that the amount of the (b) amphoteric surfactant (s) be 0.1 to 20% by weight, preferably 0.5 to 15% by weight, and more preferably 1 to 10% by weight, relative to the total weight of the composition.

The (c) amphoteric polymer may preferably be selected from:
(1) polymers resulting from the copolymerization of at least a monomer derived from a vinyl compound carrying a carboxylic group such as more particularly acrylic acid, methacrylic acid, maleic acid, alpha-chloroacrylic acid, and from a basic monomer derived from a substituted vinyl compound containing at least one basic atom,
(2) polymers containing units which are derived from:
a) at least one monomer chosen from acrylamides or methacrylamides substituted on the nitrogen by an alkyl radical,
b) at least one acidic comonomer containing one or more reactive carboxylic groups, and
c) at least one basic comonomer such as esters with primary, secondary, tertiary and quaternary amine substituents of acrylic and methacrylic acids and the product of quaternization of dimethylaminoethyl methacrylate with dimethyl or diethyl sulphate, and
more preferably selected from polymers containing a salt of dialkyldiallyl ammonium as a cationic monomer.

It is preferable that the amount of the (c) amphoteric polymer (s) be 0.01 to 15% by weight, preferably 0.05 to 10% by weight, and more preferably 0.1 to 5% by weight, relative to the total weight of the composition.

The (d) non-volatile alkaline agent may be an inorganic alkaline agent selected from the group consisting of alkaline metal hydroxides; alkaline earth metal hydroxides; alkaline metal (hydrogeno) carbonates; alkaline earth metal (hydrogeno) carbonates; and alkaline metal metasilicates.

The (d) non-volatile alkaline agent may be an organic alkaline agent selected from the group consisting of monoamines and
derivatives thereof; diamines and derivatives thereof; polyamines and derivatives thereof; amino acids and derivatives thereof; oligomers of amino acids and derivatives thereof; polymers of amino acids and derivatives thereof; urea and derivatives thereof; and guanidine and derivatives thereof.

It is preferable that the (d) non-volatile alkaline agent be selected from alkanolamines. More preferably, the non volatile alkaline agent is monoethanolamine.

It is preferable that the amount of the (d) non-volatile alkaline agent(s) be 0.01 to 15% by weight, preferably 0.1 to 10% by weight, and more preferably 1 to 5% by weight, relative to the total weight of the composition.

The (e) oxidizing agent may be hydrogen peroxide or persalts such as persulfates. More preferably, the oxidizing agent is hydrogen peroxide.

It is preferable that the amount of the (e) oxidizing agent(s) be 0.1 to 15% by weight, preferably 0.5 to 10% by weight, and more preferably 1 to 5% by weight, relative to the total weight of the composition.

The cosmetic composition according to the present invention may further comprise at least one coloring substance selected from the group consisting of direct dyes and oxidation dyes.

The cosmetic composition according to the present invention comprise (f) at least one foam stabilizer.

The foam stabilizer may be a rheology modifier selected from hydrophilic or lipophilic, organic or inorganic polymers and non-polymer, preferably chosen from organophilic clays; fumed silicas; fatty acid amides; thickening polymers such as cellulose polymers, galactomannans and derivatives thereof, gums of microbial origin, acrylic acid or acrylamidopropanesulfonic acid crosslinked homopolymers; associative polymers, and mixture thereof.

The (e) foam stabilizer may preferably be selected from cellulose polymers.

It is preferable that the amount of the (f) foam stabilizer(s) be 0.05 to 20% by weight, preferably 0.1 to 15% by weight, and more preferably 0.5 to 10% by weight, relative to the total weight of the composition.
The cosmetic composition according to the present invention may further comprise (g) at least one coloring substance selected from the group consisting of direct dyes and oxidation dyes.

The present invention also relates to a cosmetic process for keratin fibers comprising a step of forming a foam by mixing or shaking the cosmetic composition according to the present invention; and applying the foam to the keratin fibers. It is possible to use a non-aerosol device or an aerosol device to form the foam.

Finally, the invention also relates to a multi-compartments system or kit comprising at least a first compartment and a second compartment, in which the first compartment comprises the components (d) and optionally at least one coloring substance, and the second compartment comprises at least one oxidizing agent (component (e)), the other essential components (a), (b), (c) and (f) being present, separately or not, in at least one of the first and second compartments or in others; the amount of fatty material (z) (component (a)) in the composition obtained by mixing the compartments being of 20 % by weight or more, preferably 30 % by weight or more, and more preferably 40 % by weight or more, relative to the total weight of the composition.

BEST MODE FOR CARRYING OUT THE INVENTION

The inventors performed diligent research and found that a specific foam approach in combination with the technology relating to composition with high amounts of fatty materials could lead to good foamability and stability of the resulting foam, as well as good bleaching or coloring ability, in addition to no-malodor.

In addition, the foam formed by the cosmetic composition according to the present invention can show good consistency, as well as good applicability to the keratin fibers.

Furthermore, the cosmetic composition according to the present invention can provide superior cosmetic properties other than bleaching or coloring ability, such as good feeling to touch.

According to the present invention, the improvement of the cosmetic composition for treating keratin fibers such as hair can be achieved by specific conditions of the type and the amount of components in the cosmetic composition.
Thus, the cosmetic composition according to the present invention is characterized by being in the form of a mousse, and comprising:

(a) at least one fatty material;
(b) at least one amphoteric surfactant;
(c) at least one amphoteric polymer;
(d) at least one non-volatile alkaline agent;
(e) at least one oxidizing agent; and
(f) at least one foam stabilizer,

wherein the amount of the (a) fatty material(s) is 20% by weight or more, preferably 30% by weight or more, and more preferably 40% by weight or more, relative to the total weight of the composition.

Hereinafter, the cosmetic composition according to the present invention will be explained in a more detailed manner.

In the present invention, the terms foam or mousse are used indifferently.

A mousse according the present invention is the mixture of gas, preferably air, with a composition, preferably in the form of liquid, cream or gel, and the mixture (expanded or aerated composition) can have at room temperature (preferably 25°C) a density preferably less than 0.5, more preferably less than 0.3, better less than 0.2. The cosmetic composition according to the present invention may be an aerated composition.

(a) Fatty Material

The cosmetic composition according to the present invention comprises at least one fatty material, and two or more fatty materials may be used in combination. Thus, a single type of fatty material or a combination of different type of fatty materials may be used.

The term "fatty material" means an organic compound that is insoluble in water at ordinary temperature (25°C) and at atmospheric pressure (760 mmHg) (solubility of less than 5%, preferably 1% and even more preferentially 0.1%). The fatty material may contain, in its structure, a sequence of at least two siloxane groups or at least one hydrocarbon-based chain containing at least 6 carbon atoms. In addition, the fatty substances may be soluble in organic solvents under the same temperature and pressure conditions, for instance chloroform, ethanol, benzene or decamethylcyclopentasiloxane.
In the scope of the invention, it has to be noted that fatty material (s) do(es) not comprise any C_2-C_3 oxyalkylene units or any glycerolated units.

The fatty material may be in the form of a liquid or a solid. Here, "liquid" and "solid" mean that the fatty material is in the form of a liquid or a paste (non-solid) or solid, respectively, at ambient temperature (25°C) under atmospheric pressure (760 mmHg or 10^5 Pa). It is preferable that the fatty material be in the form of a liquid or a paste, more preferably in the form of a liquid, at ambient temperature and under atmospheric pressure.

The fatty material may be selected from the group consisting of oils of animal or plant origin, mineral oils, synthetic glycerides, esters of fatty alcohols and/or fatty acids other than animal or plant oils and synthetic glycerides, fatty alcohols, fatty acids, silicone oils and aliphatic hydrocarbons. These fatty materials may be volatile or non-volatile. Preferably, the fatty material (s) is (are) selected from aliphatic hydrocarbons, plant oils, fatty alcohols, esters of a fatty acid and/or of a fatty alcohol other than animal or plant oils and synthetic glycerides, or mixtures thereof.

As examples of aliphatic hydrocarbons, mention may be made of, for example, linear or branched hydrocarbons such as mineral oil (e.g., liquid paraffin), paraffin, vaseline or petrolatum, naphthalenes, and the like; hydrogenated polyisobutene, isoeicosan, polydecenes, hydrogenated polyisobutenes such as Parleam, and decene/butene copolymer; and mixtures thereof.

As examples of other aliphatic hydrocarbons, mention may also be made of linear or branched, or possibly cyclic C_6-C_16 lower alkanes. Examples that may be mentioned include hexane, undecane, dodecane, tridecane and isoparaffins such as isohexadecane and isodecane.

As example of synthetic glycerides, mention may be made of, for instance, caprylic/capric acid triglycerides, for instance those sold by the company Stearineries Dubois or those sold under the names Miglyol® 810, 812 and 818 by the company Dynamit Nobel.

As examples of silicone oils, mention may be made of, for example, linear organopolysiloxanes such as dimethylpolysiloxane, methylphenylpolysiloxane, methylhydrogenpolysiloxane, and the like; cyclic organopolysiloxanes such as octamethylcyclotetrasiloxane, decamethylcyclopentasiloxane, dodecamethylcyclohexasiloxane, and the like; and mixtures thereof.
As examples of plant oils, mention may be made of, for example, linseed oil, camellia oil, macadamia nut oil, sunflower oil, apricot oil, soybean oil, arara oil, hazelnut oil, corn oil, mink oil, olive oil, avocado oil, sasanqua oil, castor oil, safflower oil, jojoba oil, sunflower oil, almond oil, grapeseed oil, sesame oil, soybean oil, peanut oil, and mixtures thereof.

As examples of animal oils, mention may be made of, for example, squalene, perhydrosqualene and squalane.

As examples of the esters of a fatty acid and/or of a fatty alcohol, which are advantageously different from the animal or plant oils as well as the synthetic glycerides mentioned above, mention may be made especially of esters of saturated or unsaturated, linear or branched \( \text{C}_1-\text{C}_{26} \) aliphatic mono- or polyacids and of saturated or unsaturated, linear or branched \( \text{C}_1-\text{C}_{26} \) aliphatic mono- or polyalcohols, the total carbon number of the esters being greater than or equal to 10.

Among the monoesters, mention may be made of dihydroabietyl behenate; octylidodecyl behenate; isocetyl behenate; cetyl lactate; \( \text{C}_{12}-\text{C}_{15} \) alkyl lactate; isostearyl lactate; lauryl lactate; linoleyl lactate; oleyl lactate; (iso)stearyl octanoate; isocetyl octanoate; octyl octanoate; cetyl octanoate; decyl oleate; isocetyl isostearate; isocetyl stearate; isodecyl octanoate; isodecyl oleate; isononyl isononanoate; isostearyl palmitate; methylacetyl ricinoleate; myristyl stearate; octyl isononanoate; 2-ethylhexyl isononate; octyl palmitate; octyl pelargonate; octyl stearate; octylidodecyl erucate; oleyl erucate; ethyl and isopropyl palmitates, 2-ethylhexyl palmitate, 2-octyldeceyl palmitate, alkyl myristates such as isopropyl, butyl, cetyl, 2-octylidodecyl, myristyl or stearyl myristate, hexyl stearate, butyl stearate, isobutyl stearate; dioctyl malate, hexyl laurate, 2-hexyldeceyl laurate.

Still within the context of this variant, esters of \( \text{C}_4-\text{C}_{22} \) dicarboxylic or tricarboxylic acids and of \( \text{C}_1-\text{C}_{22} \) alcohols and esters of mono-, di- or tricarboxylic acids and of \( \text{C}_2-\text{C}_{26} \) di-, tri-, tetra- or pentahydroxy alcohols may also be used.

The following may especially be mentioned: diethyl sebacate; diisopropyl sebacate; diisopropyl adipate; di-n-propyl adipate; dioctyl adipate; diisostearyl adipate; dioctyl maleate; glyceryl undecylenate; octylidodecyl stearoyl stearate; pentaerythrityl monoricinoleate; pentaerythrityl tetraisononoate; pentaerythrityl tetrapelargonate; pentaerythrityl
tetraisostearate; pentaerythrityl tetraoctanoate; propylene glycol dicaprylate; propylene glycol dicaprate; tridecyl erucate; triisopropyl citrate; trisostearyl citrate; glycercyl trioctanoate; trioctyldodecyl citrate; trioleyl citrate; propylene glycol dioctanoate; neopentyl glycol diheptanoate; diethylene glycol diisononanoate; and polyethylene glycol distearates.

Among the esters mentioned above, it is preferred to use ethyl, isopropyl, myristyl, cetyl or stearyl palmitate, 2-ethylhexyl palmitate, 2-octyldecyl palmitate, alkyl myristates such as isopropyl, butyl, cetyl or 2-octyldecyl myristate, hexyl stearate, butyl stearate, isobutyl stearate; dioctyl malate, hexyl laurate, 2-hexyldecyl laurate, isononyl isononanoate or cetyl octanoate.

The composition may also comprise, as fatty ester, sugar esters and diesters of C₆-C₁₀ and preferably C₁₂-C₂₂ fatty acids. It is recalled that the term "sugar" means oxygen-bearing hydrocarbon-based compounds containing several alcohol functions, with or without aldehyde or ketone functions, and which contain at least 4 carbon atoms. These sugars may be monosaccharides, oligosaccharides or polysaccharides.

Examples of suitable sugars that may be mentioned include sucrose (or saccharose), glucose, galactose, ribose, fructose, maltose, mannose, arabinose, xylose and lactose, and derivatives thereof, especially alkyl derivatives, such as methyl derivatives, for instance methylglucose.

The sugar esters of fatty acids may be chosen especially from the group comprising the esters or mixtures of esters of sugars described previously and of linear or branched, saturated or unsaturated C₆-C₁₀ and preferably C₁₂-C₂₂ fatty acids. If they are unsaturated, these compounds may comprise one to three conjugated or non-conjugated carbon-carbon double bonds.

The esters according to this variant may also be chosen from mono-, di-, tri-, tetraesters and polyesters, and mixtures thereof.

These esters may be chosen, for example, from oleates, laurates, palmitates, myristates, behenates, cocoates, stearates, linoleates, linolenates, caprates and arachidonates, or mixtures thereof such as, especially, oleo-palmitate, oleo-stearate and palmito-stearate mixed esters.
It is more particularly preferred to use monoesters and diesters and especially sucrose, glucose or methylglucose mono- or dioleates, stearates, behenates, oleopalmi
tates, linoleates, linolenates and oleostearates.

An example that may be mentioned is the product sold under the name Glucate® DO by the company Amerchol, which is a methylglucose dioleate.

Examples of esters or mixtures of esters of sugar and of fatty acid that may also be mentioned include:

- the products sold under the names F160, F140, F110, F90, F70 and SL40 by the company Crodesta, respectively denoting sucrose palmitostearates formed from 73% monoester and 27% diester and triester, from 61% monoester and 39% diester, triester and tetraester, from 52% monoester and 48% diester, triester and tetraester, from 45% monoester and 55% diester, triester and tetraester, from 39% monoester and 61% diester, triester and tetraester, and sucrose monolaurate;
- the products sold under the name Ryoto Sugar Esters, for example referenced B370 and corresponding to sucrose behenate formed from 20% monoester and 80% di- triester-polyester;
- the sucrose mono-dipalmito-stearate sold by the company Goldschmidt under the name Tegosoft® PSE.

The fatty material may be at least one fatty acid. Two or more fatty acids may be used. The fatty acids should be in acidic form (i.e., unsalified, to avoid soaps) and may be saturated or unsaturated and contain from 6 to 30 carbon atoms and in particular from 9 to 30 carbon atoms, which is optionally substituted, in particular with one or more hydroxy groups (in particular 1 to 4). If they are unsaturated, these compounds may comprise one to three conjugated or non-conjugated carbon-carbon double bonds. They are more particularly chosen from myristic acid, palmitic acid, stearic acid, behenic acid, oleic acid, linoleic acid, linolenic acid and isostearic acid. Preferably the fatty material is not a fatty acid.

The fatty material may be at least one fatty alcohol, and two or more fatty alcohols may be used.

The term "fatty alcohol" here means any saturated or unsaturated, linear or branched C₉-C₂₀ fatty alcohol, which is optionally substituted, in particular with one or more hydroxy groups (in particular 1 to 4). If they are unsaturated, these compounds may comprise one to three conjugated or non-conjugated carbon-carbon double bonds.
Among the C₈-C₃₀ fatty alcohols, C₁₂-C₂₂ fatty alcohols, for example, are used. Mention may be made among these of lauril alcohol, cetyl alcohol, stearyl alcohol, isostearyl alcohol, oleyl alcohol, behenyl alcohol, linoleyl alcohol, undecylenyl alcohol, palmitoleyl alcohol, linolenyl alcohol, myristyl alcohol, arachidonyl alcohol and erucyl alcohol, and mixtures thereof. In one embodiment, cetyl alcohol, stearyl alcohol or a mixture thereof (e.g., cetearyl alcohol), as well as myristyl alcohol, can be used as a solid fatty material. In another embodiment, isostearyl alcohol can be used as a liquid fatty material.

The fatty material may be a wax. Here, "wax" means that the fatty material is substantially in the form of a solid at room temperature (25°C) under atmospheric pressure (760 mmHg), and has a melting point generally of 35°C or more. As the waxy fatty material, waxes generally used in cosmetics can be used alone or in combination thereof.

For example, the wax may be chosen from carnauba wax, microcrystalline waxes, ozokerites, hydrogenated jojoba oil, polyethylene waxes such as the wax sold under the name "Perfomalene 400 Polyethylene" by the company New Phase Technologies, silicone waxes, for instance poly(C₄-C₈)-alkylmethyldimethylsiloxane, such as the product sold under the name "Abil Wax 9810" by the company Goldschmidt, palm butter, the C₂₀-C₄₀ alkyl stearate sold under the name "Kester Wax K82H" by the company Kester Keunen, stearyl benzoate, shellac wax, and mixtures thereof. For example, a wax chosen from carnauba wax, candelilla wax, ozokerites, hydrogenated jojoba oil and polyethylene waxes is used. In at least one embodiment, the wax is preferably chosen from candelilla wax and ozokerite, and mixtures thereof.

As fatty materials, mineral oils are preferable.

The amount of the (a) fatty material (s) is 20% by weight or more, preferably 30% by weight or more, more preferably 40% by weight or more, and further more preferably 50% by weight or more, relative to the total weight of the cosmetic composition according to the present invention.

(b) Amphoteric Surfactant

The cosmetic composition according to the present invention comprises at least one amphotetic surfactant, and two or more amphoteric surfactants may be used. Thus, a single type of
amphoteric surfactant or a combination of different type of
amphoteric surfactants may be used.

The amphoteric or zwitterionic surfactants can be, for example
(nonlimiting list), amine derivatives such as aliphatic secondary
or tertiary amine, and optionally quaternized amine derivatives,
in which the aliphatic radical is a linear or branched chain
comprising 8 to 22 carbon atoms and containing at least one
water-solubilizing anionic group (for example, carboxylate,
sulphonate, sulphate, phosphate or phosphonate)

The amphoteric surfactant may preferably be selected from the
group consisting of betaines and amidoaminecarboxylated
derivatives.

The betaine-type amphoteric surfactant is preferably selected
from the group consisting of alkylbetaines, alkylamidoalkylbetaines, sulfobetaines, phosphobetaines, and
alkylamidoalkylsulfobetaines, in particular, \((C_8-C_{24})\)alkylbetaines, \((C_8-C_{24})\)alkylamido \((C_{1-C_8})\)alkylbetaines, sulphobetaines, and \((C_8-
C_{24})\)alkylamido \((C_{1-C_8})\)alkylsulphobetaines. In one embodiment, the
amphoteric surfactants of betaine type are chosen from \((C_8-
C_{24})\) alkylbetaines, \((C_4-C_{24})\) alkylamido \((C_{1-C_8})\)alkylsulphobetaines, sulphobetaines, and phosphobetaines.

Non-limiting examples that may be mentioned include the compounds
classified in the CTFA dictionary, 9th edition, 2002, under the
names cocobetaine, laurylbetaine, cetylbetaine, coco/oleamidopropylbetaine, cocamidopropylbetaine, palmitamidopropylbetaine, stearamidopropylbetaine, cocamidoethylbetaine, cocamidopropylhydroxysultaine, oleamidopropylhydroxysultaine, cocohydroxysultaine, laurylhydroxysultaine, and cocosultaine, alone or as mixtures.

The betaine-type amphoteric surfactant is preferably an
alkylbetaine and an alkylamidoalkylbetaine, in particular
cocobetaine and cocamidopropylbetaine.

Among the amidoaminecarboxylated derivatives, mention may be made
of the products sold under the name Miranol, as described in U.S.
Pat. Nos. 2,528,378 and 2,781,354 and classified in the CTFA
dictionary, 3rd edition, 1982 (the disclosures of which are
incorporated herein by reference), under the names
Amphocarboxyglycinates and Amphocarboxypropionates, with the
respective structures:

\[
\text{R}_1\text{-CONHCH}_2\text{-N}^+ (\text{R}_2) (\text{R}_3) (\text{CH}_2\text{COO}^-)
\]
in which:
$R_1$ denotes an alkyl radical of an acid $R_1$-COOH present in
hydrolysed coconut oil, a heptyl, nonyl or undecyl radical,
$R_2$ denotes a beta-hydroxyethyl group, and
$R_3$ denotes a carboxymethyl group; and

$R_1^{'}$-CONHCH$_2$CH$_2$-N(B) (C)

in which:
B represents $-\text{CH}_2\text{CH}_2\text{OH}'$,
C represents $-(\text{CH}_2)_z-Y'$, with $z=1$ or 2,
$X'$ denotes a $-\text{CH}_2\text{CH}_2$-COOH group, $-\text{CH}_2$-COOZ', $-\text{CH}_2\text{CH}_2$-COOH, $-\text{CH}_2\text{CH}_2$-COOZ' or a hydrogen atom,
$Y'$ denotes $-\text{COOH}$, $-\text{COOZ}'$, $-\text{CH}_2$-CHOH-SO$_3$Z', or a $-\text{CH}_2$-CHOH-SO$_3$H radical,
$Z'$ represents an ion of an alkaline or alkaline earth metal such
as sodium, an ammonium ion or an ion issued from an organic amine, and
$R_1^{'}$ denotes an alkyl radical of an acid $R_1^{'}$-COOH present in
coconut oil or in hydrolysed linseed oil, an alkyl radical, such
as a C$_7$, C$_9$, C$_{11}$ or C$_{13}$ alkyl radical, a C$_{17}$ alkyl radical and its
iso form, or an unsaturated C$_{17}$ radical.

It is preferable that the amphoteric surfactant be selected from
(\text{C}_8-\text{C}_{24}) \text{-alkyl amphomonoacetates}, (\text{C}_8-\text{C}_{24}) \text{-alkyl amphodiacetates},
(\text{C}_8-\text{C}_{24}) \text{-alkyl ammononopropionates}, and (\text{C}_8-\text{C}_{24}) \text{-alkyl}
 amphodipropionates

These compounds are classified in the CTFA dictionary, 5th
edition, 1993, under the names Disodium Cocoamphodiacetate,
Disodium Lauroamphodiacetate, Disodium Caprylamphodiacetate,
Disodium Caprylamphodiacetate, Disodium Cocoamphodipropionate,
Disodium Lauroamphopropionate, Disodium Caprylamphopropionate,
Disodium Caprylamphopropionate, Lauroamphopropionic acid and
Cocoamphopropionic acid.

By way of example, mention may be made of the cocoamphodiacetate
sold under the trade name Miranol® C2M concentrate by the company
Rhodia Chimie.

According to one embodiment of the present invention, the amount
of the (b) amphotetic surfactant (s) may range from 0.1 to 20% by
weight, preferably from 0.5 to 15% by weight, and more preferably
from 1 to 10% by weight, relative to the total weight of the
cosmetic composition according to the present invention.
(c) **Amphoteric Polymer**

The cosmetic composition according to the present invention comprises at least one amphoteric polymer, and two or more amphoteric polymers may be used in combination. Thus, a single type of amphoteric polymer or a combination of different type of amphoteric polymers may be used.

The amphoteric polymers which can be used in accordance with the present invention may be chosen from the polymers containing K and M units distributed randomly in the polymer chain where K denotes a unit which is derived from a monomer containing at least one basic nitrogen atom and M denotes a unit which is derived from an acidic monomer containing one or more carboxylic or sulphonic groups or alternatively K and M may denote groups which are derived from zwitterionic monomers of carboxybetaines or of sulphobetaines. K and M may also denote a cationic polymer chain containing primary, secondary, tertiary or quaternary amine groups, in which at least one of the amine groups carries a carboxylic or sulphonic group linked through a hydrocarbon radical or alternatively K and M form part of a chain of a polymer with an α,β-dicarboxylic ethylene unit in which one of the carboxylic groups has been caused to react with a polyamine containing one or more primary or secondary amine groups.

The amphoteric polymers corresponding to the definition given above which are more particularly preferred are chosen from the following polymers:

1. The polymers resulting from the copolymerization of a monomer derived from a vinyl compound carrying a carboxylic group such as more particularly acrylic acid, methacrylic acid, maleic acid, alpha-chloroacrylic acid, and from a basic monomer derived from a substituted vinyl compound containing at least one basic atom such as more particularly dialkylaminoalkyl methacrylate and acrylate, dialkyldiallylammonium chloride copolymer sold under the name POLYQUART KE 3033 by the company HENKEL. The vinyl compound may also be a dialkyldiallylammonium salt such as dimethyldiallylammonium chloride. The copolymers of acrylic acid and of the latter monomer are provided under the names MERQUAT 280, MERQUAT 295 and MERQUAT PLUS 3330 by the company CALGON.

2. The polymers containing units which are derived from:
a) at least one monomer chosen from acrylamides or methacrylamides substituted on the nitrogen by an alkyl radical,
b) at least one acidic comonomer containing one or more reactive carboxylic groups, and
c) at least one basic comonomer such as esters with primary, secondary, tertiary and quaternary amine substituents of acrylic and methacrylic acids and the product of quaternization of dimethylaminoethyl methacrylate with dimethyl or diethyl sulphate.

The N-substituted acrylamides or methacrylamides most particularly preferred according to the invention are groups whose alkyl radicals contain from 2 to 12 carbon atoms and more particularly N-ethylacrylamide, N-tert-butylacrylamide, N-tert-octylacrylamide, N-octylacrylamide, N-decylacrylamide, N-dodecylacrylamide as well as the corresponding methacrylamides.

The acidic comonomers are chosen more particularly from acrylic, methacrylic, crotonic, itaconic, maleic and fumaric acids as well as the alkyl monoesters having 1 to 4 carbon atoms of maleic or fumaric anhydrides or acids.

The basic comonomers preferred are methacrylates of aminoethyl, butylaminoethyl, N,N'-dimethylaminoethyl, N-tert-butylaminoethyl.

Particularly used are the copolymers whose CTFA name (4th ed. 1991) is Octylacrylamide/acrylates/butylaminoethylmethacrylate copolymer such as the products sold under the name AMPHOMER or LOVOCRYL 47 by the company NATIONAL STARCH.

(3) The partially or completely alkylated and crosslinked polyaminoamides derived from polyaminoamides of the following general formula:

\[-[\text{CO-R}_4-\text{CO-Z}]\]

in which \( \text{R}_4 \) represents a divalent radical derived from a saturated dicarboxylic acid, a mono- or dicarboxylic aliphatic acid with ethylenic double bond, an ester of a lower alkanol having 1 to 6 carbon atoms of these acids or a radical which is derived from the addition of any one of the said acids with a bis-primary or bis-secondary amine, and \( \text{Z} \) denotes a radical of a bis-primary, mono- or bis-secondary polyalkylene-polyamine and preferably represents:

a) in the proportions of 60 to 100 mol%, the radical

\[-\text{NH-[ (CH}_2\text{)}_x-\text{NH-}]_p^-\]
where \( x = 2 \) and \( p = 2 \) or 3, or alternatively \( x = 3 \) and \( p = 2 \), this radical being derived from the diethylenetriamine, triethylenetetramine or dipropylenetriamine;

b) in the proportions of 0 to 40 mol\%, the radical (IV) above, in which \( x = 2 \) and \( p = 1 \) and which is derived from ethylenediamine, or the radical which is derived from piperazine:

\[
\begin{array}{c}
\text{N} \\
\text{N}
\end{array}
\]

c) in the proportions of 0 to 20 mol\%, the radical \(-\text{NH-} (\text{CH}_2)_6\text{-NH-} \) which is derived from hexamethylenediamine, these polyamino amines being crosslinked by adding a bifunctional crosslinking agent chosen from the epihalohydrins, diepoxides, dianhydrides, bis-unsaturated derivatives, by means of 0.025 to 0.35 mol of crosslinking agent per amine group of the polyamino amide and alkylated by the action of acrylic acid, chloroacetic acid or of an alkanesultone or of their salts.

The saturated carboxylic acids are preferably chosen from the acids having 6 to 10 carbon atoms such as adipic, 2,2,4-trimethyladipic and 2,4,4-trimethyladipic acid, terephthalic acid, the acids with ethylene double bond such as for example acrylic, methacrylic and itaconic acids.

The alkanesultones used in the alkylation are preferably propane or butanesultone, the salts of the alkylation agents are preferably the sodium or potassium salts.

(4) The polymers containing zwitterionic units of formula:

\[
\begin{array}{c}
R_6 \quad \text{N} \\
\text{C} \\
R_7 \quad \text{y} \\
\vdots \\
\text{C} \quad \text{O} \\
R_8 \quad \text{z} \\
\end{array}
\]

in which \( R_5 \) denotes a polymerizable unsaturated group such as an acrylate, methacrylate, acrylamide or methacrylamide group, \( y \) and \( z \) represent an integer from 1 to 3, \( R_6 \) and \( R_7 \) represent a hydrogen atom, methyl, ethyl or propyl, \( R_8 \) and \( R_9 \) represent a hydrogen atom or an alkyl radical such that the sum of the carbon atoms in \( R_8 \) and \( R_9 \) does not exceed 10.

The polymers comprising such units may also comprise units derived from nonzwitterionic monomers such as dimethyl or diethylaminooethyl acrylate or methacrylate or alkyl acrylates or methacrylates, acrylamides or methacrylamides or vinyl acetate.
By way of example, there may be mentioned the copolymer of butyl methacrylate/dimethylcarboxymethylammonioethyl methacrylate such as the product sold under the name DIAFORMER Z301 by the company SANDOZ.

The polymers derived from chitosan containing monomeric units corresponding to the following formulae (VI), (VII), (VIII):

![Chemical structures](image)

the (VI) unit being present in proportions of from 0 to 30%, the (VII) unit in proportions of from 5 to 50% and the (VIII) unit in proportions of from 30 to 90%, it being understood that in this (VIII) unit, $R_{10}$ represents a radical of formula:

$$R_{12} R_{13} R_{11} C - (0)_q C -$$

in which

if $q=0$, $R_{11}$, $R_{12}$ and $R_{13}$, which are identical or different, each represent a hydrogen atom, a methyl, hydroxyl, acetoxy or amino residue, a monoalkylamine residue or a dialkylamine residue optionally interrupted by one or more nitrogen atoms and/or optionally substituted with one or more amine, hydroxyl, carboxyl, alkylthio or sulphonic groups, or an alkylthio residue whose alkyl group carries an amino residue, at least one of the $R_{11}$, $R_{12}$ and $R_{13}$ radicals being in this case a hydrogen atom; or if $q=1$, $Rn$, $R_{12}$, and $R_{13}$ each represent a hydrogen atom, as well as the salts formed by these compounds with bases or acids.

The polymers derived from the N-carboxyalkylation of chitosan such as N-carboxymethyl chitosan or N-carboxybutyl chitosan sold under the name "EVALSAN" by the company JAN DEKKER.

The polymers corresponding to the general formula (IX) such as those described for example in French Patent 1,400,366:
in which $R_{14}$ represents a hydrogen atom, a $\text{CH}_3OH$, $\text{CH}_3\text{CH}_2OH$ or phenyl radical, $R_{15}$ denotes hydrogen or a lower alkyl radical such as methyl or ethyl, $R_{16}$ denotes hydrogen or a lower alkyl radical such as methyl or ethyl, $R_{17}$ denotes a lower alkyl radical such as methyl or ethyl or a radical corresponding to the formula: $\text{COOH}$ $\begin{array}{c} \text{CO} \\ \text{N} \text{--} R_{15} \\ \text{N} \text{--} R_{17} \\ R_{16} \end{array}$ $- \text{Ri}8 - \text{N} [\text{Ri}4]2$, $\text{Ri}8$ representing a group $-\text{CH}_2-\text{CH}_2-$, $-\text{CH}_2-\text{CH}_2-\text{CH}_2-$ or $-\text{CH}_2-\text{CH}(\text{CH}_3)-$, $R_{16}$ having the meanings mentioned above, as well as the higher homologues of these radicals and containing up to 6 carbon atoms.

(8) Amphoteric polymers of the $-\text{D-X-D-X-}$ type chosen from:

a) the polymers obtained by the action of chloroacetic acid or sodium chloroacetate on the compounds containing at least one unit of formula:

$$-\text{D-X-D-X-} \quad \text{(X)}$$

where D denotes a radical

$$\begin{array}{c} \text{N} \\ \text{N} \end{array}$$

and X denotes the symbol E or $E'$, E or $E'$, which are identical or different, denote a bivalent radical which is an alkylene radical with a linear or branched chain containing up to 7 carbon atoms in the principal chain which is unsubstituted or substituted with hydroxyl groups and which may contain, in addition, oxygen, nitrogen or sulphur atoms, 1 to 3 aromatic and/or heterocyclic rings; the oxygen, nitrogen and sulphur atoms being present in the form of ether, thioether, sulphoxide, sulphone, sulphonium,
alkylamine or alkenylamine groups, or hydroxyl, benzylamine, amine oxide, quaternary ammonium, amide, imide, alcohol, ester and/or urethane groups,
b) The polymers of formula:

\[-D-X-D-X-\] (XI)

where D denotes a radical

and X denotes the symbol E or E' and, at least once, E'; E having the meaning indicated above and E' is a bivalent radical which is an alkylene radical with a linear or branched chain having up to 7 carbon atoms in the principal chain, which is unsubstituted or substituted with one or more hydroxyl radicals and containing one or more nitrogen atoms, the nitrogen atom being substituted with an alkyl chain optionally interrupted by an oxygen atom and necessarily containing one or more carboxyl functional groups or one or more hydroxyl functional groups and betainized by reaction with chloroacetic acid or sodium chloroacetate.

(9) The copolymers (Ci-C₅)alkyl vinyl ether/maleic anhydride partially modified by semiamidation with an N,N-dialkylaminoalkylamine such as N,N-dimethylaminopropylamine or by semiesterification with an N,N-dialkanolamine. These copolymers may also contain other vinyl comonomers such as vinylcaprolactam.

The amphoteric polymers particularly preferred according to the invention are those of the family (1), particularly those containing a salt of dialkylidiallyl ammonium as a cationic monomer.

The amphoteric polymers may be chosen from Polyquaternium-22, Polyquaternium-39, Polyquaternium-64, and mixtures thereof. Preferably, the amphoteric polymers are chosen from Polyquaternium-22, and mixtures thereof. Polyquaternium-22, for example the product Merquat 280 sold by Nalco, is more preferable.

According to one embodiment of the present invention, the amount of the amphoteric polymer (s) may range from 0.01 to 15% by weight, preferably from 0.05 to 10% by weight, and more preferably from 0.1 to 5% by weight, relative to the total weight of the cosmetic composition according to the present invention.

(d) Non-Volatile Alkaline Agent
The cosmetic composition according to the present invention comprises at least one non-volatile alkaline agent, and two or more non-volatile alkaline agents may be used. Thus, a single type of non-volatile alkaline agent or a combination of different type of non-volatile alkaline agents may be used.

The term "non-volatile alkaline agent" means that the alkaline agent does not correspond to ammonia which is volatile. A non volatile agent in the scope of the invention means that the vapor pressure is generally lesser than 0.02 mmHg(2.66Pa) at room temperature.

The non-volatile alkaline agent may be an inorganic alkaline agent. It is preferable that the inorganic alkaline agent be selected from the group consisting of alkaline metal hydroxides; alkaline earth metal hydroxides; alkaline metal (hydrogeno) carbonates; alkaline earth metal (hydrogeno) carbonates; and alkaline metal metasilicates.

As examples of the inorganic alkaline agent, mention may be made of sodium hydroxide, potassium hydroxide, calcium hydroxide, magnesium hydroxide, sodium carbonate, potassium carbonate, sodium hydrogenocarbonate, potassium hydrogenocarbonate, and sodium metasilicate.

The non-volatile alkaline agent may be an organic alkaline agent. It is preferable that the organic alkaline agent be selected from the group consisting of monoamines and derivatives thereof, such as alkanolamines; diamines and derivatives thereof, such as alkanolamines; polyamines and derivatives thereof, such as alkanolamines; amino acids, preferably basic amino acids and derivatives thereof; oligomers of amino acids, preferably basic amino acids and derivatives thereof; polymers of amino acids, preferably basic amino acids and derivatives thereof; urea and derivatives thereof; and guanidine and derivatives thereof.

As examples of the organic alkaline agents, mention may be made of alkanolamines such as mono-, di- and tri-ethanolamine, comprising 1 to 3 hydroxyalkyl (C1-C4) groups. Particularly, alkanolamines may be selected from monoethanolamine, diethanolamine, triethanolamine, monoisopropanolamine, diisopropanol amine, N,N-dimethylethanolamine, 2-amino-2-methyl-1-propanol, triisopropanolamine, 2-amino-2-methyl-1, 3-propanediol, 3-amino-1, 2-propanediol, 3-dimethylamino-1,2-propanediol, tris (hydroxymethylamino) methane.
The organic alkaline agents may also be selected from urea, guanidine and their derivatives; aminoacids such as alanine, arginine, ornithine, citrulline, asparagine, carnitine, cysteine, glutamine, glycine, histidine, lysine, isoleucine, leucine, methionine, N-phenylalanine, proline, serine, threonine, tryptophan, tyrosine and valine; basic amino acids such as lysine, histidine, ornithine, citrulline or arginine; and diamines such as those described in the structure below:

\[
\begin{array}{c}
\text{R}_a \\
\text{N}-\text{W}-\text{N} \\
\text{R}_c \\
\text{R}_d \\
\end{array}
\]

wherein \( \text{W} \) denotes an alkyene such as propylene optionally substituted by a hydroxyl or a \( \text{C}_1-\text{C}_4 \) alkyl radical, and \( \text{R}_a, \text{R}_b, \text{R}_c \) and \( \text{R}_d \) independently denote a hydrogen atom, an alkyl radical or a \( \text{C}_3-\text{C}_4 \) hydroxyalkyl radical, which may be exemplified by 1,3-propanediamine and derivatives thereof. Among aminoacids basic amino acids such as lysine, histidine, ornithine, citrulline or arginine are preferred.

It is preferable that the non-volatile alkaline agent be selected from alkanolamines, and particularly monoethanolamine.

The non-volatile alkaline agent(s) may be used in a total amount of from 0.01 to 15% by weight, preferably from 0.1 to 10% by weight, and more preferably from 1 to 5% by weight, relative to the total weight of the cosmetic composition according to the present invention.

\( \text{(e)} \) Oxidizing agent

The cosmetic composition according to the present invention comprises at least one oxidizing agent, and two or more oxidizing agents may be used. Thus, a single type of oxidizing agent or a combination of different type of oxidizing agents may be used.

The oxidizing agent may be chosen from hydrogen peroxide, peroxygenated salts, and compounds capable of producing hydrogen peroxide by hydrolysis. For example, the oxidizing agent can be chosen from aqueous hydrogen peroxide solution, urea peroxide, alkali metal bromates and ferricyanides and persalts such as perborates and persulphates.

It is preferable that the oxidizing agent be hydrogen peroxide.
The oxidizing agent's concentration may range from 0.1 to 15% by weight, preferably from 0.5 to 10% by weight, and more preferably 1 to 5% by weight, relative to the total weight of the cosmetic composition according to the present invention.

In one embodiment, when the oxidizing agent is hydrogen peroxide, the composition may comprise at least one hydrogen peroxide stabilizer, which may be chosen, for example, from alkali metal and alkaline-earth metal pyrophosphates, alkali metal and alkaline-earth metal stannates, phenacetin and salts of acids and of oxyquinoline, for example, oxyquinoline sulphate. In another embodiment, at least one stannate optionally in combination with at least one pyrophosphate is used.

It is also possible to use salicylic acid and salts thereof, pyridinedicarboxylic acid and salts thereof, and paracetamol.

In the cosmetic composition, the concentration of the hydrogen peroxide stabilizer may range from 0.0001 to 5% by weight such as from 0.01 to 2% by weight, relative to the total weight of the cosmetic composition according to the present invention.

In the composition comprising hydrogen peroxide, the concentration ratio of the hydrogen peroxide to the stabilizer may range from 0.05:1 to 1,000:1, such as from 0.1:1 to 500:1 and further such as from 1:1 to 300:1.

(f) **Foam Stabilizer**

The cosmetic composition according to the present invention comprises at least one foam stabilize, and two or more foam stabilizers may be used in combination. Thus, a single type of foam stabilizer or a combination of different type of foam stabilizers may be used.

Any substance which can stabilize foam formed by the cosmetic composition according to the present invention may be used as the foam stabilizer.

The foam stabilizer may be a rheology modifier selected from hydrophilic or lipophilic, organic or inorganic polymers and non-polymers.

As the rheology modifier, for example, mention may be made of: partly or totally crosslinked elastomeric organopolysiloxanes, of three-dimensional structure, such as those sold under the names KSG6, KSG16, and KSG18 by Shin-Etsu, Trefil E-505C or Trefil E-
506C by Dow Corning, Gransil SR-CYC, SR DMF10, SR DC556, SR 5CYC gel, SR DMF 10 gel, and SR DC 556 gel by Grant Industries, and SF 1204 and JK 113 by General Electric; and copolymers of a C₁₂ diacid condensed with ethylenediamine, with a weight-average molecular mass of approximately 6,000, such as the compounds sold by Arizona Chemical under the names Uniclear 80 and Uniclear 100; and silicone gums, such as the PDMS, having a viscosity of equal to or more than 100,000 centistokes.

The rheology modifier may preferably be chosen from organophilic clays; fumed silicas; fatty acid amides; thickening polymers such as cellulose polymers, galactomannans and derivatives thereof, gums of microbial origin, acrylic acid or acrylamidopropanesulfonic acid crosslinked homopolymers; associative polymers, and mixture thereof.

As the organophilic clays and fumed silicas, for example, mention may be made of:
optionally modified clays, such as hectorites modified with a C₁₀ to C₂₂ fatty acid ammonium chloride, such as hectorite modified with distearyldimethylammonium chloride; and pyrogenic silica, optionally having received a hydrophobic surface treatment, whose particle size is less than 1 µm.

As the fatty acid amide, any amide comprising in its structure at least one hydrocarbon-based chain comprising at least 6 carbon atoms may be used. The fatty acid amides may be chosen from compounds derived from an amide of alkanolamine and of a saturated or unsaturated, linear or branched C₈-C₃₀ fatty acid, the alkanolamine and/or the fatty acid being optionally oxyalkenylated and more particularly oxyethylenated with 1 to 50 mol of ethylene oxide.

The fatty acid amides are preferably chosen from amides of a C₂-C₁₀ alkanolamine and of a C₁₄-C₃₀ fatty acid, and more preferably chosen from amides of a C₂-C₁₀ alkanolamine and of a C₁₄-C₂₂ fatty acid.

Advantageously, the fatty acid amide may be chosen from:
- coconut acid monoisopropanolamide, such as the amide sold under the trade name Empilan CLS by the company Huntsman,
- oleic acid diethanolamide, such as the amide sold under the trade name Mexanyl®GT by the company Chimex,
- myristic acid monoethanolamide, such as the amide sold under the trade name Comperlan®MM by the company Cognis,
- soybean fatty acid diethanolamide, such as the amide sold under
  the trade name Comperlan®VOD by the company Cognis,
- stearic acid ethanolamide, such as the amide sold under the
  trade name Monamic®S by the company Uniqema,
- oleic acid monoisopropanolamide, such as the amide sold under
  the trade name Witcamide®61 by the company Witco,
- linoleic acid diethanolamide, such as the amide sold under the
  trade name Purton®SFD by the company Zschimmer Schwartz,
- stearic acid monoethanolamide, such as the amide sold under the
  trade name Monamic®972 by the company ICI/Uniqema,
- behenic acid monoethanolamide, such as the amide sold under the
  trade name Incromide®BEM by the company Croda,
- isostearic acid monoisopropanolamide, such as the amide sold
  under the trade name Witcamide®SPA by the company Witco,
- erucic acid diethanolamide, such as the amide sold under the
  trade name erucic acid diethanolamide by the company Stearineries
  Dubois,
- ricinoleic acid monoethanolamide, such as the amide sold under
  the trade name ricinoleic acid monoethanolamide by the company
  Stearineries Dubois, and
- rapeseed fatty acid amide containing 4 mol of ethylene oxide,
  such as the product sold under the name Amidet N by the company
  Kao.

As the cellulose polymers, for example, mention may be made of:
hydroxy ethyl celluloses , hydroxypropylcelluloses , methyl celluloses ,
ethylhydroxyethylcelluloses , carboxymethylcelluloses , and
quaternized cellulose derivatives.

As the acrylic acid or acrylamidopropanesulf onic acid crosslinked
homopolymers , for example, mention may be made of:
acrylic acid homopolymers crosslinked with an allylic alcohol
ether of the sugar series, for example, the products sold under
the names CARBOPOL 980, 981, 954, 2984, and 5984 by the company
Goodrich and the products sold under the names SYNTALEN M and
SYNTALEN K by the company 3 VSA;
crosslinked acrylamidomethanesulf onic acid homopolymers,
crosslinked acrylamidoethanesulf onic acid homopolymers,
crosslinked acrylamidopropanesulf onic acid homopolymers,
crosslinked 2-acrylamido-2-methylpropanesulf onic acid
homopolymers, crosslinked 2-methylacrylamido-2- methylpropanesulf onic acid homopolymers, and crosslinked 2-
acrylamido-n-butanesulf onic acid homopolymers , in particular,
crosslinked and partially or totally neutralized poly-2-
acrylamido-2-methylpropanesulf onic acids are described and
prepared, for example, in German Patent No. 196 25 810.
As the associative polymer, any amphiphilic polymer comprising, in its structure, at least one fatty chain and at least one hydrophilic portion, may be used.

The associative polymers in accordance with the present disclosure may be chosen from anionic, cationic, nonionic and amphoteric polymers.

Among the associative anionic polymers that non-limiting mention may be made of those comprising at least one hydrophilic unit and at least one fatty-chain allyl ether unit, for example, those in which the at least one hydrophilic unit comprises at least one ethylenic unsaturated anionic monomeric residue chosen, for example, from the residue of a vinylcarboxylic acid, the residue of an acrylic acid, and the residue of a methacrylic acid, and in which the at least one fatty-chain allyl ether unit is chosen from the residues of the monomers of formula below:

$$\text{CH}_2=\text{C}(\text{R'}\text{)}\text{CH}_2\text{OB}_n\text{R}$$

wherein R' is chosen from H and CH₃, B is an ethylenoxy radical, n is 0 or an integer ranging from 1 to 100, and R is chosen from hydrocarbon-based radicals chosen from alkyl, arylalkyl, aryl, alkylaryl and cycloalkyl radicals comprising from 8 to 30 carbon atoms, for example, from 10 to 24 and further for example from 12 to 18 carbon atoms.

Anionic amphiphilic polymers of this type are described and prepared, for example, according to an emulsion polymerization process described in document EP-0 216 479.

Associative anionic polymers that non-limiting mention may be made include anionic polymers comprising at least one hydrophilic unit of olefinic unsaturated carboxylic acid type, and at least one hydrophobic unit exclusively of (C10-C30)alkyl ester of unsaturated carboxylic acid type.

Further examples include the anionic polymers described and prepared according to U.S. Pat. Nos. 3,915,921 and 4,509,949.

Cationic associative polymers that non-limiting mention may be made include quaternized cellulose derivatives and polyacrylates comprising at least one amine side group.

The nonionic associative polymers may be chosen from at least one of:
celluloses modified with groups comprising at least one fatty chain, for example hydroxyethylcelluloses modified with groups comprising at least one fatty chain, for example CH$_3$-C$_2$, arylalkyl and alkylaryl groups, for example Natrosol Plus Grade 330 CS (C$_6$ alkyls) sold by the company Aqualon, celluloses modified with polyalkylene glycol alkylphenyl ether groups, guar, for example hydroxypropyl guar, modified with groups comprising at least one fatty chain, for example an alkyl chain, copolymers of vinylpyrrolidone and of fatty-chain hydrophobic monomeric residues, copolymers of at least one monomeric residue chosen from C$_1$-C$_6$ alkyl methacrylates and acrylates and of amphiphilic monomeric residues comprising at least one fatty chain, copolymers of monomeric residues chosen from hydrophilic methacrylates and acrylates and of hydrophobic monomeric residues comprising at least one fatty chain, for example the polyethylene glycol methacrylate/lauryl methacrylate copolymer, associative polyurethanes, and mixtures thereof.

For example, the associative polymers may be chosen from associative polyurethanes. In another example, associative polyurethanes may be chosen from nonionic block copolymers comprising in the chain both hydrophilic blocks usually of polyoxyethylene nature, and hydrophobic blocks that may be chosen from aliphatic sequences, cycloaliphatic sequences, and aromatic sequences.

Further for example, these polymers may comprise at least two hydrocarbon-based lipophilic chains comprising from 6 to 30 carbon atoms, separated by a hydrophilic block, wherein the hydrocarbon-based lipophilic chains may be chosen from pendant chains and chains at the end of a hydrophilic block. In yet another example, the polymers may comprise at least one pendant chain. In another example, the polymers may comprise a hydrocarbon-based chain at one or both ends of a hydrophilic block.

For example, the associative polyurethanes may be blocked in triblock or multiblock form. The hydrophobic blocks may thus be at each end of the chain (for example: triblock copolymer with a hydrophilic central block) or distributed both at the ends and within the chain (for example multiblock copolymer). These
polymers may also be chosen from graft polymers and starburst polymers.

In another example, the associative polyurethanes are triblock copolymers in which the hydrophilic block is a polyoxyethylene chain comprising from 50 to 1000 oxyethylene groups. In general, the associative polyurethanes comprise a urethane bond between the hydrophilic blocks, hence the name.

By way of example, among the associative polymers that may be used, non-limiting mention may be made of the polymer C\textsubscript{16}-OE\textsubscript{120} from the company Servo Delden (under the name SER AD FX1100, which comprises a urethane functional group and has a weight-average molecular weight of 1300), wherein OE is an oxyethylene unit. In another example, an associative polymer that may also be used is Rheolate 205 comprising a urea functional group, sold by the company Rheox, or Rheolate 208 or 204. These associative polyurethanes are sold in pure form.

In yet another example, the product DW 1206B from Rohm & Haas comprising a C\textsubscript{2}O alkyl chain with a urethane bond, sold at a solids content of 20% in water, may also be used.

Further for example, it is also possible to use solutions or dispersions of these polymers, for example, in water or in aqueous-alcoholic medium. Examples of such polymers that non-limiting mention may be made include SER AD FX1010, SER AD FX1035 and SER AD 1070 from the company Servo Delden, and Rheolate 255, Rheolate 278 and Rheolate 244 sold by the company Rheox. It is also possible to use the product DW 1206F and DW 1206J, and also Acrysol RM 184 or Acrysol 44 from the company Rohm & Haas, or alternatively Borchigel LW 44 from the company Borchers.

In yet another example, the polymers that may be used include those described in the article by G. Fonnum, J. Bakke and Fk. Hansen--Colloid Polym. Sci 271, 380-389 (1993).

The foam stabilizer may more preferably be selected from cellulose polymers.

According to one embodiment of the present invention, the amount of the foam stabilizer (s) may range from 0.05 to 20% by weight, preferably from 0.1 to 15% by weight, and more preferably from 0.5 to 10% by weight, relative to the total weight of the cosmetic composition according to the present invention.

\((g)\) Coloring Substance
The cosmetic composition according to the present invention can comprise at least one coloring substance, and two or more coloring substances may be used. Thus, a single type of coloring substance or a combination of different type of coloring substances may be used.

The coloring substance may be an oxidation dye.

The oxidation dye can be selected from oxidation bases, oxidation couplers, and the acid addition salts thereof.

The oxidation base can be selected from those conventionally known in oxidation dyeing, preferably from the group consisting of ortho- and para-phenylenediamines, double bases, ortho- and para-aminophenols, heterocyclic bases and the acid addition salts thereof.

Among the double bases, the following bases can be cited \( \text{N,N'} - \)bis (\( \beta \)-hydroxy ethyl) -N, N'-bis (4'-aminophenyl) -1,3-diaminopropanol, N,N'-bis (\( \beta \)-hydroxyethyl) -N, N'-bis (4'-aminophenyl) ethylenediamine, N,N'-bis (4-aminophenyl) -tetramethylenediamine, N,N'-bis (\( \beta \)-hydroxyethyl) -N, N'-bis (4-aminophenyl) tetramethylenediamine, N,N'-bis (4-methylaminophenyl) tetramethylenediamine, N,N'-bis (ethyl) -N,N'-bis (\( \beta \)-aminophenyl) tetramethylenediamine, N,N'-bis (4-amino-3'-methylphenyl) ethylene-diamine, 1,8-bis (2,5-diaminophenoxy) -3, 5-dioxaoctane, and addition salts thereof with an acid.

The para-aminophenols that can be used are para-aminophenol, 4-amino-3-methylphenol, 4-amino-3-hydroxymethylphenol, 4-amino-2-methylphenol, 4-amino-2-hydroxymethylphenol, 4-amino-2-methoxyethylphenol, 4-amino-2-aminomethylphenol, 4-amino-2- (\( \beta \)-hydroxyethylaminomethyl) phenol, and addition salts thereof with an acid.

The ortho-aminophenols which can be used as oxidation bases in the context of the present invention are chosen in particular from 2-aminophenol, 2-amino-1-hydroxy-5-methylbenzene, 2-amino-1-hydroxy-6-methylbenzene, 5-acetamido-2-aminophenol, and addition salts thereof with an acid.

Among the heterocyclic bases which can be used as oxidation bases in the dyeing compositions in accordance with the invention, there may be mentioned more particularly pyridine derivatives, pyrimidine derivatives, pyrazole derivatives, and addition salts thereof with an acid.

Among the pyridine derivatives, there may be mentioned more particularly the compounds described for example in Patents GB 1,026,978 and GB 1,153,196, such as 2,5-diaminopyridine, 2- (4-methoxyphenyl) amino-3-aminopyridine, 2,3-diamino-6-methoxy pyridine, 2- (\( \beta \)-methoxyethyl) amino-3-amino-6-methoxy pyridine, 3,4-diaminopyridine, and addition salts thereof with an acid.

Among the pyrimidine derivatives, there may be mentioned more particularly the compounds described, for example, in Patents DE 2 359 399; JP 88-169571; JP 91-10659 or patent application WO 96/15765, such as 2,4,5,6-tetraaminopyrimidine, 4-hydroxy-2,5,6-triaminopyrimidine, 2-hydroxy-4,5,6-triaminopyrimidine, 2,4-dihydroxy-5,6-diaminopyrimidine, 2,5,6-triamino-pyrimidine, and the pyrazolopyrimidine derivatives such as those mentioned in patent application FR-A-2 750 048 and among which there may be mentioned pyrazolo [1,5-a] -pyrimidine-3,7-diamine, 2,5-dimethyl-
pyrazolo [1, 5-a] -pyrimidine-3 ,7-diamine; pyrazolo [1, 5-a]pyrimidine-3, 5-diamine; 2,7-dimethylpyrazolo [1,5-a]pyrimidine-3,5-diamine; 3-aminopyrazolo [1,5-a]pyrimidin-7-ol ; 3-aminopyrazolo[1,5-a]pyrimidin-5-ol; 2- (3-amino-pyrazolo- [1,5-a]pyrimidin-7-ylamino) ethanol, 2-(7-aminopyrazolo [1,5-a]pyrimidin-3-ylamino )ethanol, 2- [(3-amino-pyrazolo [1,5-a]pyrimidin-7-yl) - (2-hydroxy-ethyl) amino] -ethanol, 2- [(7-aminopyrazolo [1,5-a] -pyrimidin-3-yl) - (2-hydroxyethyl )amino] ethanol, 5, 6-dimethylpyrazolo- [1,5-a]pyrimidine-3, 7-diamine, 2,6-dimethylpyrazolo- [1,5-a]pyrimidine -3,7-diamine, 2,5,N7,N7-tetramethyl-pyrazolo [1,5-a]pyrimidine-3, 7-diamine, 3-amino-5-methyl-7-imidazolylpropyl-aminopyrazolo [1,5-a]pyrimidine, addition salts thereof and their tautomeric forms, when a tautomeric equilibrium exists, and addition salts thereof with an acid.

Among the pyrazole derivatives, there may be mentioned more particularly the compounds described in Patents DE 3 843 892, DE 4 133 957 and patent applications WO 94/08969, WO 94/08970, FR-A-2 733 749 and DE 195 43 988 such as 4,5-diamino-1-methylpyrazole , 3,4-diaminopyrazole, 4,5-diamino-1- (4'-chlorobenzyl )-pyrazole, 4,5-diamino-3,3-dimethylpyrazole, 4,5-diamino-3-methyl-1-phenylpyrazole, 4,5-diamino-1-methyl-3-phenylpyrazole, 4-amino-1,3-dimethyl-5-hydrazino-pyrazole, 1-benzyl-4, 5-diamino-3-methyl pyrazole, 4,5-diamino-3-tert-butyl-1-methylpyrazole , 4,5-diamino-1-tertbutyl-3-methylpyrazole, 4,5-diamino-1- (β-hydroxyethyl )-3-methylpyrazole, 4,5-diamino-1- (α-hydroxyethyl )pyrazole, 4,5-diamino-1-ethyl-3-methylpyrazole, 4,5-diamino-1-ethyl-3- (4'-methoxyphenyl )pyrazole, 4,5-diamino-1-ethyl-3-hydroxy-methylpyrazole, 4,5-diamino-3-hydroxymethyl-1-methylpyrazole, 4,5-diamino-3-hydroxymethyl-1-isopropyl-pyrazole, 4,5-diamino-3-methyl-1-isopropyl-pyrazole, 4-amino-5- (2'-aminoethyl) amino-1, 3-dimethylpyrazole, 3,4,5-triaminopyrazole, 1-methyl-3,4,5-triamino-pyrazole, 3,5-diamino-1-methyl-4-methylaminopyrazole, 3,5-diamino-4- (β-hydroxy-ethyl )amino-1-methylpyrazole, and addition salts thereof with an acid.

Among the heterocyclic bases which can be used as oxidation bases, there may be mentioned more particularly diaminoypyrazolopyrazolones and especially 2,3-diamino-6, 7-dihydro-1H, 5H-[pyrazolol, 2,a]pyrazol-1-one (IV) and the addition salts of these diaminoypyrazolopyrazolones with an acid.

The oxidation dye may be an oxidation coupler which can be selected from those conventionally known in oxidation dyeing, preferably from the group consisting of meta-phenylenediamines,
meta-aminophenols, meta-diphenols, naphthols, heterocyclic couplers and the acid addition salts thereof.

The heterocyclic couplers may be selected from the group consisting of indole derivatives, indoline derivatives, sesamol and its derivatives, pyrazolotriazole derivatives, pyrazolones, indazoles, benzimidazoles, benzothiazoles, benoxazoles, 1,3-benzodioxoles, quinolines and addition salts thereof with an acid.

These couplers are more particularly chosen from 2,4-diamino-1-(β-hydroxyethyloxy) benzene, 2-methyl-5-aminophenol, 5-N-β-hydroxyethyl)amino-2-methylphenol, 3-aminophenol, 2-chloro-3-amino-6-methylphenol, 1,3-dihydroxybenzene, 1,3-dihydroxy-2-methylbenzene, 4-chloro-1,3-dihydroxybenzene, 2-amino-4-(β-hydroxyethylamino)-1-methoxybenzene, 1,3-diaminobenzene, 2-methyl-5-hydroxyethylaminophenol, 4-amino-2-hydroxytoluene, 1,3-bis(2,4-diaminophenoxy)-propane, sesamol, 1-amino-2-methoxy-4,5-methylene-dioxybenzene, a-naphthol, 6-hydroxyindole, 4-hydroxyindole, 4-hydroxy-N-methylindole, 6-hydroxy-indoline, 2,6-dihydroxy-4-methylpyridine, 1-H-3-methylpyrazol-5-one, 1-phenyl-3-methylpyrazol-5-one, 2-amino-3-hydroxypyridine, 3,6-dimethylpyrazolo[3,2-c]-1,2,4-triazole, 2,6-dimethylpyrazolo[1,5-b]-1,2,4-triazole and addition salts thereof with an acid.

In general, the addition acid salts of the oxidation bases and couplers are chosen in particular from hydrochlorides, hydrobromides, sulphates, tartrates, lactates and acetates.

The cosmetic composition according to the present invention may comprise an oxidation dye or dyes in an amount of from 0.0001 to 20% by weight, preferably from 0.0005 to 15% by weight, and more preferably from 0.005 to 10% by weight, relative to the total weight of the composition.

The coloring substance may be a direct dye.

The direct dye can be selected from ionic and nonionic species, preferably cationic or nonionic species.

Examples of suitable direct dyes that may be mentioned include the following direct dyes: azo dyes; methine dyes; carbonyl dyes; azine dyes; nitro (hetero)aryl dyes; tri (hetero) arylmethane dyes; porphyrin dyes; phthalocyanin dyes, and natural direct dyes, alone or as mixtures.
More particularly, the azo dyes comprise an -N=N- function, the two nitrogen atoms of which are not simultaneously engaged in a ring. However, it is not excluded for one of the two nitrogen atoms of the sequence -N=N- to be engaged in a ring.

The dyes of the methine family are more particularly compounds comprising at least one sequence chosen from >C=C< and -N=C<, the two atoms of which are not simultaneously engaged in a ring. However, it is pointed out that one of the nitrogen or carbon atoms of the sequences may be engaged in a ring. More particularly, the dyes of this family are derived from compounds of the type such as methines, azomethines, mono- and diarylmethanes, indoamines (or diphenylamines), indophenols, indoanilines, carbocyanins, azacarbocyanins and isomers thereof, diazacarbocyanins and isomers thereof, tetraazacarbocyanins and hemicyanins.

As regards the dyes of the carbonyl family, examples that may be mentioned include dyes chosen from acridone, benzoquinone, anthraquinone, naphthoquinone, benzanthrone, anthranthrone, pyranthrone, pyrazolanthrone, pyrimidinoanthrone, flavanthrone, idanthrone, flavone, (iso) violanthrone, isoindolinone, benzimidazole, isoquinolinone, anthrapyridone, pyrazoloquinazolone, perinone, quinacridone, quinophthalone, indigoid, thioindigo, naphthalimide, anthrapyrimidine, diketopyrrolopyrrole and coumarin.

As regards the dyes of the cyclic azine family, mention may be made especially of azine, xanthene, thioxanthene, fluorindine, acridine, (di)oxazine, (di)thiazine and pyronin.

The nitro (hetero) aromatic dyes are more particularly nitrobenzene or nitropyridine direct dyes.

As regards the dyes of porphyrin or phthalocyanin type, it is possible to use cationic or non-cationic compounds, optionally comprising one or more metals or metal ions, for instance alkali metals, alkaline-earth metals, zinc and silicon.

Examples of particularly suitable direct dyes that may be mentioned include nitrobenzene dyes; azo direct dyes; azomethine direct dyes; methine direct dyes; azacarbocyanin direct dyes; for instance tetraazacarbocyanins (tetraazapentamethines); quinone and in particular anthraquinone, naphthoquinone or benzoquinone direct dyes; azine; xanthene; triarylmethane; indoamine; indigoid; phthalocyanin direct dyes, porphyrins and natural direct dyes, alone or as mixtures.
Among the natural direct dyes that may be used according to the invention, mention may be made of lawsone, juglone, alizarin, purpurin, carminic acid, kermesic acid, purpurogallin, protocatechualdehyde, indigo, isatin, curcumin, spinulosin, apigenidin and orceins. It is also possible to use extracts or decoctions containing these natural dyes and especially henna-based poultices or extracts.

When they are present, the direct dye(s) more particularly represent from 0.0001 to 10% by weight, and preferably from 0.005 to 5% by weight, relative to the total weight of the composition.

(h) Other Components

The cosmetic composition according to the present invention may comprise an aqueous medium.

The aqueous medium in the cosmetic composition according to the present invention may comprise water. The amount of water may be less than 80%, preferably 5 wt% to 75 wt%, more preferably 10 wt% to 75 wt%, and further more preferably 20 wt% to 70 wt%, relative to the total weight of the composition.

The aqueous medium may further comprise at least one organic solvent. The organic solvent is preferably water-miscible. As the organic solvent, there may be mentioned, for example, C₁-C₄ alkanols, such as ethanol and isopropanol; polyols and polyolethers such as glycerol, 2-butoxyethanol, propylene glycol, monomethyl ether of propylene glycol, monoethyl ether and monomethyl ether of diethylene glycol; and aromatic alcohols such as benzyl alcohol and phenoxyethanol; analogous products; and mixtures thereof.

The organic solvents may be present in an amount ranging from 1 to 40 wt%, preferably from 1 to 30 wt%, and more preferably from 5 to 20 wt%, relative to the total weight of the composition.

The cosmetic composition according to the present invention may or may not comprise at least one additional surfactant other than the above (b) amphoteric surfactant.

The additional surfactant used in the present invention may be selected from the group consisting of anionic surfactants, cationic surfactants and nonionic surfactants. Two or more additional surfactants may be used in combination. Thus, a
single type of additional surfactant or a combination of different type of additional surfactants may be used.

(Anionic Surfactants)

According to the present invention, the type of anionic surfactant is not limited. It is preferable that the anionic surfactant be selected from the group consisting of \((C_6-C_{30})\) alkyl sulfates, \((C_6-C_{30})\) alkyl ether sulfates, \((C_6-C_{30})\) alkylamido ether sulfates, alkylaryl polyether sulfates, monoglyceride sulfates; \((C_6-C_{30})\) alkylsulfonates, \((C_6-C_{30})\) alkylamido sulfonates, \((C_6-C_{30})\) alkylaryl sulfonates, \((C_6-C_{30})\) alkyl phosphates; \((C_6-C_{30})\) alkyl sulfosuccinates, \((C_6-C_{30})\) alkyl ether sulfosuccinates, \((C_6-C_{30})\) alkylamido sulfosuccinates; \((C_6-C_{30})\) alkyl sulfaacetates; \((C_6-C_{4})\) acyl sarcosinates; \((C_6-C_{4})\) acyl glutamates; \((C_6-C_{30})\) alkylpolyglycoside carboxylic ethers; \((C_6-C_{30})\) alkylpolyglycoside sulfosuccinates; \((C_6-C_{30})\) alkyl sulfosuccinamates; \((C_6-C_{24})\) acyl isethionates; \((C_6-C_{4})\) acyl taurates; \((C_6-C_{30})\) fatty acid salts; coconut oil acid salts or hydrogenated coconut oil acid salts; \((C_6-C_{20})\) acyl lactylates; \((C_6-C_{30})\) alkyl-D-galactoside uronic acid salts; polyoxyalkylated \((C_6-C_{30})\) alkyl ether carboxylic acid salts; polyoxyalkylated \((C_6-C_{30})\) alkylamido ether carboxylic acid salts; and polyoxyalkylated \((C_6-C_{30})\) alkylamido ether carboxylic acid salts.

It is more preferable that the anionic surfactant be selected from salts of \((C_6-C_{30})\) alkyl sulfate.

In at least one embodiment, the anionic surfactants are in the form of salts such as salts of alkali metals, for instance sodium; salts of alkaline-earth metals, for instance magnesium; ammonium salts; amine salts; and amino alcohol salts. Depending on the conditions, they may also be in acid form.

(Cationic Surfactants)

According to the present invention, the type of cationic surfactant is not limited. The cationic surfactant may be selected from the group consisting of optionally polyoxyalkylated, primary, secondary or tertiary fatty amine salts, quaternary ammonium salts, and mixtures thereof.

Examples of quaternary ammonium salts that may be mentioned include, but are not limited to:

those of general formula (I) below:
wherein

\( R_1, R_2, R_3, \) and \( R_4, \) which may be identical or different, are chosen from linear and branched aliphatic radicals comprising from 1 to 30 carbon atoms and optionally comprising heteroatoms such as oxygen, nitrogen, sulfur and halogens. The aliphatic radicals may be chosen, for example, from alkyl, alkoxy, \( C_2-C_6 \) polyoxyalkylene, alkylamide, \( (C12-C22) \) alkylamido \( (C_2-C_6) \) alkyl, \( (C12-C22) \) alkylacetate and hydroxyalkyl radicals; and aromatic radicals such as aryl and alkylaryl; and \( X^- \) is chosen from halides, phosphates, acetates, lactates, \( (C_2-C_6) \) alkyl sulfates and alkyl- or alkylaryl-sulfonates; quaternary ammonium salts of imidazoline, for instance those of formula (II) below:

\[
\begin{align*}
\left[ R_6 \begin{array}{c}
\text{CH}_2\text{CH}_2\text{N}\left(\text{R}_0\right)\text{CO}\text{-}R_5 \\
\text{N} \\
\text{R}_7 \\
\end{array}\right]^{-} \\
\end{align*}
\]

wherein:

\( R_5 \) is chosen from alkenyl and alkyl radicals comprising from 8 to 30 carbon atoms, for example fatty acid derivatives of tallow or of coconut;
\( R_6 \) is chosen from hydrogen, \( C_1-C_4 \) alkyl radicals, and alkenyl and-alkyl radicals comprising from 8 to 30 carbon atoms;
\( R_7 \) is chosen from \( C_1-C_4 \) alkyl radicals;
\( R_8 \) is chosen from hydrogen and \( C_1-C_4 \) alkyl radicals; and
\( X^- \) is chosen from halides, phosphates, acetates, lactates, alkyl sulfates, alkyl sulfonates, and alkylaryl sulfonates. In one embodiment, \( R_8 \) and \( R_5 \) are, for example, a mixture of radicals chosen from alkenyl and alkyl radicals comprising from 12 to 21 carbon atoms, such as fatty acid derivatives of tallow, \( R_8 \) is methyl and \( R_5 \) is hydrogen. Examples of such products include, but are not limited to, Quaternium-27 (CTFA 1997) and Quaternium-83 (CTFA 1997), which are sold under the names "Rewoquat®" W75, W90, W75PG and W75HPG by the company Witco; diquaternary ammonium salts of formula (III) :

\[
\begin{align*}
\left[ R_1 \begin{array}{c}
\text{N}
\end{array}\right]^{-} \\
\left[ R_2 \begin{array}{c}
\text{N}
\end{array}\right]^{-}
\end{align*}
\]
wherein:

- \( R_9 \) is chosen from aliphatic radicals comprising from 16 to 30 carbon atoms;
- \( R_{10} \) is chosen from hydrogen or alkyl radicals comprising from 1 to 4 carbon atoms or a group \((R_1a) (R_17a) (R_1g) N^+ (CH_2)_3\);
- \( R_{11}, R_{12}, R_{13}, R_{14}, R_{15}, R_{16}, R_{17a}, \) and \( R_{18a} \), which may be identical or different, are chosen from hydrogen and alkyl radicals comprising from 1 to 4 carbon atoms; and
- \( X^- \) is chosen from halides, acetates, phosphates, nitrates, ethyl sulfates, and methyl sulfates. An example of one such diquaternary ammonium salt is propanetallowdiammonium dichloride; and quaternary ammonium salts comprising at least one ester function, such as those of formula (IV) below:

\[
\begin{align*}
\text{O} & \quad (\text{C}_6\text{H}_{25}\text{O})_2\text{R}_{25} \\
\text{R}_{24}-\text{C}- (\text{O}-\text{CrH}_{2}(\text{OH})\text{r}1)y & \quad \text{N}^+ (\text{CtH}_{2}(\text{OH})\text{t}1-\text{O})x \quad \text{R}_{23} \quad X^- \\
\text{R}_{22} & 
\end{align*}
\]

wherein:

- \( R_{22} \) is chosen from \( \text{C}_1-\text{C}_6 \) alkyl radicals and \( \text{C}_1-\text{C}_6 \) hydroxyalkyl and dihydroxyalkyl radicals;
- \( R_{23} \) is chosen from:
  - the radical blow:

\[
\begin{align*}
\text{O} & \\
\text{R}_{26}-\text{C} & \\
\text{R}_{28} & \\
\end{align*}
\]

linear and branched, saturated and unsaturated \( \text{C}_1-\text{C}_{22} \) hydrocarbon-based radicals \( R_{27}, \) and hydrogen,

- \( R_{25} \) is chosen from:
  - the radical below:

\[
\begin{align*}
\text{O} & \\
\text{R}_{28} & \\
\end{align*}
\]

linear and branched, saturated and unsaturated \( \text{C}_1-\text{C}_6 \) hydrocarbon-based radicals \( R_{29}, \) and hydrogen,
\( R_{24}, R_{25}, \text{ and } R_{14} \), which may be identical or different, are chosen from linear and branched, saturated and unsaturated, \( C_1-C_{21} \), hydrocarbon-based radicals; 
\( x, s, \text{ and } t \), which may be identical or different, are chosen from integers ranging from 2 to 6; each of \( r_1 \) and \( t_1 \), which may be identical or different, is 0 or 1, and \( r_2 + r_1 = 2r \) and \( t_1 + 2t = 2t \); 
y is chosen from integers ranging from 1 to 10; 
x and \( z \), which may be identical or different, are chosen from integers ranging from 0 to 10; 
\( X^- \) is chosen from simple and complex, organic and inorganic anions; with the proviso that the sum \( x+y+z \) ranges from 1 to 15, that when \( x \) is 0, \( R_3^3 \) denotes \( R_3^{27} \), and that when \( z \) is 0, \( R_3^{25} \) denotes \( R_2^9 \). \( R_{22} \) may be chosen from linear and branched alkyl radicals. In one embodiment, \( R_{22} \) is chosen from linear alkyl radicals. In another embodiment, \( R_{22} \) is chosen from methyl, ethyl, hydroxyethyl, and dihydroxypropyl radicals, for example methyl and ethyl radicals. In one embodiment, the sum \( x+y+z \) ranges from 1 to 10. When \( R_{23} \) is a hydrocarbon-based radical \( R_{21} \), it may be long and comprise from 12 to 22 carbon atoms, or short and comprise from 1 to 3 carbon atoms. When \( R_{23} \) is a hydrocarbon-based radical \( R_{29} \), it may comprise, for example, from 1 to 3 carbon atoms. By way of a non-limiting example, in one embodiment, \( R_{44}, R_{36}, \text{ and } R_{33}, \) which may be identical or different, are chosen from linear and branched, saturated and unsaturated, \( C_{11}-C_{21} \) hydrocarbon-based radicals, for example from linear and branched, saturated and unsaturated \( C_n-C_{21} \) alkyl and alkenyl radicals. In another embodiment, \( x \) and \( z \), which may be identical or different, are 0 or 1. In one embodiment, \( y \) is equal to 1. In another embodiment, \( r, s, \text{ and } t \), which may be identical or different, are equal to 2 or 3, for example equal to 2. The anion \( X^- \) may be chosen from, for example, halides, such as chloride, bromide, and iodide; and \( C_1-C_4 \) alkyl sulfates, such as methyl sulfate. However, methanesulfonate, phosphate, nitrate, tosylate, an anion derived from an organic acid, such as acetate and lactate, and any other anion that is compatible with the ammonium comprising an ester function, are other non-limiting examples of anions that may be used according to the invention. In one embodiment, the anion \( X^- \) is chosen from chloride and methyl sulfate.

In another embodiment, the ammonium salts of formula (IV) may be used, wherein: 
\( R_{22} \) is chosen from methyl and ethyl radicals, 
x and \( y \) are equal to 1; 
z is equal to 0 or 1; 
r, s, and \( t \) are equal to 2;
R_{23} is chosen from:
the radical below:

\[
\begin{align*}
R_{26} & \quad \text{O} \\
& \quad \text{C} \\
\end{align*}
\]
methyl, ethyl, and C_{14}-C_{22} hydrocarbon-based radicals, hydrogen;

R_{25} is chosen from:
the radical below:

\[
\begin{align*}
R_{28} & \quad \text{O} \\
& \quad \text{C} \\
\end{align*}
\]
and hydrogen;

R_{4}, R_{6}, and R_{8}, which may be identical or different, are chosen from linear and branched, saturated and unsaturated, C_{3}-C_{7} hydrocarbon-based radicals, for example from linear and branched, saturated and unsaturated, C_{13}-C_{7} alkyl and alkenyl radicals.

In one embodiment, the hydrocarbon-based radicals are linear.

Non-limiting examples of compounds of formula (IV) that may be mentioned include salts, for example chloride and methyl sulfate, of diacyloxyethyl-dimethylammonium, of diacyloxyethyl-hydroxyethyl-methylamm- onium, of monoacyloxyethyl-dihydroxyethyl-methylammonium, of triacyloxyethyl-methylammonium, of monoacyloxyethyl-hydroxyethyl-dimethyl- ammonium, and mixtures thereof. In one embodiment, the acyl radicals may comprise from 14 to 18 carbon atoms, and may be derived, for example, from a plant oil, for instance palm oil and sunflower oil. When the compound comprises several acyl radicals, these radicals may be identical or different.

These products may be obtained, for example, by direct esterification of optionally oxyalkylated triethanolamine, triisopropanolamine, alkyldiethanolamine or alkyldiisopropanolamine onto fatty acids or onto mixtures of fatty acids of plant or animal origin, or by transesterification of the methyl esters thereof. This esterification may be followed by a quaternization using an alkylating agent chosen from alkyl halides, for example methyl and ethyl halides; dialkyl sulfates, for example dimethyl and diethyl sulfates; methyl methanesulf onate; methyl para-toluene sul fonate; glycol chlorohydrin; and glycerol chlorohydrin.

Such compounds are sold, for example, under the names Dehyquart® by the company Cognis, Stepanquat® by the company Stepan,
Noxamium® by the company Ceca, and "Rewoquat® WE 18" by the company Rewo-Goldschmidt.

The compositions according to the invention may comprise, for example, a mixture of quaternary ammonium mono-, di- and triester salts with a weight majority of diester salts.

Other non-limiting examples of ammonium salts that may be used in the compositions according to the invention include the ammonium salts comprising at least one ester function described in U.S. Pat. Nos. 4,874,554 and 4,137,180.

Among the quaternary ammonium salts mentioned above that may be used in compositions according to the invention include, but are not limited to, those corresponding to formula (I), for example tetraalkylammonium chlorides, for instance dialkylldimethylammonion and alkyltrimethylammonium chlorides in which the alkyl radical comprises from about 12 to 22 carbon atoms, such as behenyltrimethylammonium, distearyldimethylammonium, cetyltrimethylammonium and benzylidimethyls tearylmonium chloride; palmitylamidopropyltrimethylammonium chloride; and stearamidopropylidimethyl (myristyl acetate) ammonium chloride, sold under the name "Ceraphyl® 70" by the company Van Dyk.

According to one embodiment, the cationic surfactant that may be used in the compositions of the invention is chosen from quaternary ammonium salts, for example from behenyltrimethylammonium chloride, cetyltrimethylammonium chloride, Quaternium-83, Quaternium-87, Quaternium-22, behenylamidopropyl-2, 3-dihydroxypropyltrimethylammonium chloride, palmitylamidopropyltrimethylammonium chloride, and stearamidopropylidimethylamine.

(Nonionic Surfactants)

The nonionic surfactants are compounds well known in themselves (see, e.g., in this regard, "Handbook of Surfactants" by M. R. Porter, Blackie & Son publishers (Glasgow and London), 1991, pp. 116-178). Thus, they can, for example, be chosen from alcohols, alpha-diols, alkylphenols and esters of fatty acids that are polyethoxylated, polypropoxylated or polyglycerolated and have at least one fatty chain comprising, for example, from 8 to 18 carbon atoms, it being possible for the number of ethylene oxide or propylene oxide groups to range from 2 to 50, and for the number of glycerol groups to range from 2 to 30. Maltose derivatives may also be mentioned. Non-limiting mention may also
be made of copolymers of ethylene oxide and/or of propylene oxide; condensates of ethylene oxide and/or of propylene oxide with fatty alcohols; polyethoxylated fatty amides comprising, for example, from 2 to 30 mol of ethylene oxide; polyglycerolated fatty amides comprising, for example, from 1 to 5 glycerol groups, such as from 1.5 to 4; ethoxylated fatty acid esters of sorbitan comprising from 2 to 30 mol of ethylene oxide; ethoxylated oils from plant origin; fatty acid esters of sucrose; fatty acid esters of polyethylene glycol; fatty acid mono or diesters of glycerol; (C6-C24) alkylpolyglycosides; N-(C6-C24)alkylglucamine derivatives, amine oxides such as (C10-C14) alkylamine oxides or N-(C10-C14) acylaminopropylmorpholine oxides; and mixtures thereof.

The nonionic surfactants may preferably be chosen from monooxoyalkylenated or polyoxoyalkylenated, monoglycerolated or polyglycerolated nonionic surfactants. The oxyalkylene units are more particularly oxyethylene or oxypropylene units, or a combination thereof, preferably oxyethylene units.

Examples of oxyalkylenated nonionic surfactants that may be mentioned include:
- oxyalkylenated (C8-C14) alkylphenols,
- saturated or unsaturated, linear or branched, oxyalkylenated C8-C30 alcohols,
- saturated or unsaturated, linear or branched, oxyalkylenated C8-C30 amides,
- esters of saturated or unsaturated, linear or branched, C8-C30 acids and of polyethylene glycols,
- polyoxoyalkylenated esters of saturated or unsaturated, linear or branched, C9-C30 acids and of sorbitol,
- saturated or unsaturated, oxyalkylenated plant oils,
- condensates of ethylene oxide and/or of propylene oxide, inter alia, alone or as mixtures.

The surfactants contain a number of moles of ethylene oxide and/or of propylene oxide of between 1 and 100 and preferably between 2 and 50. Advantageously, the nonionic surfactants do not comprise any oxypropylene units.

In accordance with one preferred embodiment of the invention, the oxyalkylenated nonionic surfactants are chosen from oxyethylenated C8-C30 alcohols or ethoxylated fatty esters.

Examples of ethoxylated fatty alcohols (or C8-C30 alcohols) that may be mentioned include the adducts of ethylene oxide with lauryl alcohol, especially those containing from 9 to 50 oxyethylene groups and more particularly those containing from 10
to 12 oxyethylene groups (Laureth-10 to Laureth-12, as the CTFA names); the adducts of ethylene oxide with behenyl alcohol, especially those containing from 9 to 50 oxyethylene groups (Beheneth-9 to Beheneth-50, as the CTFA names); the adducts of ethylene oxide with cetearyl alcohol (mixture of cetyl alcohol and stearyl alcohol), especially those containing from 10 to 30 oxyethylene groups (Ceteareth-10 to Ceteareth-30, as the CTFA names); the adducts of ethylene oxide with cetyl alcohol, especially those containing from 10 to 30 oxyethylene groups (Ceteth-10 to Ceteth-30, as the CTFA names); the adducts of ethylene oxide with stearyl alcohol, especially those containing from 10 to 30 oxyethylene groups (Steareth-10 to Steareth-30, as the CTFA names); the adducts of ethylene oxide with isostearyl alcohol, especially those containing from 10 to 50 oxyethylene groups (Isosteareth-10 to Isosteareth-50, as the CTFA names); and mixtures thereof.

Examples of ethoxylated fatty esters that may be mentioned include the adducts of ethylene oxide with esters of lauric acid, palmitic acid, stearic acid or behenic acid, and mixtures thereof, especially those containing from 9 to 50 oxyethylene groups, such as PEG-9 to PEG-50 laurate (as the CTFA names: PEG-9 laurate to PEG-50 laurate); PEG-9 to PEG-50 palmitate (as the CTFA names: PEG-9 palmitate to PEG-50 palmitate); PEG-9 to PEG-50 stearate (as the CTFA names: PEG-9 stearate to PEG-50 stearate); PEG-9 to PEG-50 palmitostearate; PEG-9 to PEG-50 behenate (as the CTFA names: PEG-9 behenate to PEG-50 behenate); and mixtures thereof.

Mixtures of these oxyethylenated derivatives of fatty alcohols and of fatty esters may also be used.

According to one preferred embodiment of the invention, the cosmetic composition according to the present invention comprises at least one ethoxylated fatty alcohol.

As examples of monoglycerolated or polyglycerolated nonionic surfactants, monoglycerolated or polyglycerolated \( \text{C}_8-\text{C}_{40} \) alcohols are preferably used.

In particular, the monoglycerolated or polyglycerolated \( \text{C}_8-\text{C}_{40} \) alcohols correspond to the following formula:

\[
RO- [\text{CH}_2-\text{CH} (\text{CH}_2\text{OH}) -0]_m \cdot \text{H} \quad \text{or} \quad RO- [\text{CH} (\text{CH}_2\text{OH})-\text{CH}_20]_m \cdot \text{H}
\]

in which \( R \) represents a linear or branched \( \text{C}_8-\text{C}_{40} \) and preferably \( \text{C}_8-\text{C}_{30} \) alkyl or alkenyl radical, and \( m \) represents a number ranging from 1 to 30 and preferably from 1 to 10.
As examples of compounds that are suitable in the context of the invention, mention may be made of lauryl alcohol containing 4 mol of glycerol (INCI name: Polyglyceryl-4 Lauryl Ether), lauryl alcohol containing 1.5 mol of glycerol, oleyl alcohol containing 4 mol of glycerol (INCI name: Polyglyceryl-4 Oleyl Ether), oleyl alcohol containing 2 mol of glycerol (INCI name: Polyglyceryl-2 Oleyl Ether), cetearyl alcohol containing 2 mol of glycerol, cetearyl alcohol containing 6 mol of glycerol, oleocetyl alcohol containing 6 mol of glycerol, and octadecanol containing 6 mol of glycerol.

The alcohol may represent a mixture of alcohols in the same way that the value of m represents a statistical value, which means that, in a commercial product, several species of polyglycerolated fatty alcohol may coexist in the form of a mixture.

Among the monoglycerolated or polyglycerolated alcohols, it is more particularly preferred to use the C₈/C₁₀ alcohol containing 1 mol of glycerol, the C₁₀/C₁₂ alcohol containing 1 mol of glycerol and the C₁₂ alcohol containing 1.5 mol of glycerol.

Preferably, the nonionic surfactant may be a nonionic surfactant with an HLB from 8 to 18. The HLB is the ratio between the hydrophilic part and the lipophilic part in the molecule. This term HLB is well known to those skilled in the art and is described in "The HLB system. A time-saving guide to emulsifier selection" (published by ICI Americas Inc., 1984).

According to one embodiment of the present invention, the amount of the additional surfactant (s) may range from 0.1 to 20% by weight, preferably from 0.5 to 15% by weight, and more preferably from 1 to 10% by weight, relative to the total weight of the cosmetic composition according to the present invention.

The cosmetic composition according to the present invention may also comprise an effective amount of other agents, known previously elsewhere in oxidation dyeing, such as various common adjuvants, for instance ammonia, sequestering agents such as EDTA and etidronic acid, UV screening agents, silicones other than those mentioned before such as organomodified silicones (such as with amine groups), preserving agents, ceramides, pseudoceramides, vitamins or provitamins, for instance panthenol, opacifiers, and so on.
The form of the cosmetic composition according to the present invention is not particularly limited, and may take various forms such as an O/W emulsion, a W/O emulsion, a multiple emulsion or the like. The form of an O/W emulsion is preferable.

The pH of the cosmetic composition according to the present invention applied to the keratin fibers may be generally, for example, from 4 to 12. It can range from 6 to 12, preferably 7 to 11, and may be adjusted to the desired value using at least one acidifying agent that is well known in the prior art.

The acidifying agents can be, for example, mineral or organic acids, for instance hydrochloric acid, orthophosphoric acid, carboxylic acids, for instance tartaric acid, citric acid, lactic acid, or sulphonic acids.

The viscosity of the cosmetic composition according to the present invention is not particularly limited. The viscosity can be measured at 25°C with viscosimeters or rheometers preferably with coneplan geometry. Preferably, the viscosity of the cosmetic composition according to the invention can range, for example, from 1 to 2000 Pa.s, and preferably from 1 to 1000 Pa.s at 25°C with a shear rate of 1s⁻¹.

The composition according to the invention may also comprise a propellant. For the purposes of the invention, the term "propellant" means any compound that is gaseous at a temperature of 20°C and at atmospheric pressure, and that can be stored under pressure in liquid or gaseous form in an aerosol container.

The propellant may be chosen from optionally halogenated volatile hydrocarbons, such as n-butane, propane, isobutane, pentane or a halogenated hydrocarbon, and mixtures thereof. Carbon dioxide, nitrous oxide, dimethyl ether (DME), nitrogen or compressed air may also be used as propellant. Mixtures of propellants may also be used. Dimethyl ether and/or non-halogenated volatile hydrocarbons are preferably used.

The propellant(s) may be present in the composition in a content of between 1% and 15%, preferably between 2% and 10% and more preferably between 3% and 8% by weight relative to the total weight of the composition.

The cosmetic composition according to the present invention can be prepared by mixing the essential components (a) to (f), together with the above optional component(s), if necessary.
More particularly, the cosmetic composition according to the present invention is a ready-to-use composition. For the purposes of the present invention, the expression "ready-to-use" composition is defined herein as a composition to be applied immediately to keratin fibers such as hair. The "ready-to-use" composition may be prepared by, for example, mixing or shaking the essential components (a) to (f), and any optional component (s), if necessary prior to the application on the keratin fibers.

The cosmetic composition according to the present invention may be formulated into a multi-compartment system or kit comprising at least a first compartment and a second compartment, in which the first compartment comprises at least one non-volatile alkaline agent (component (d)) and optionally at least one coloring substance (direct dyes and/or oxidation dyes (component (g)) and the second compartment comprises at least one oxidizing agent (component (e)); the other essential components (a), (b), (c) and (f) and any optional component (s) being present, separately or not, in at least one of the first and second compartments or in other (s); the amount of fatty material (s) (component (a)) in the composition obtained by mixing the compartments being of 20% by weight or more, relative to the total weight of the composition.

The multi-compartment system may be equipped with a means for mixing and/or applying the above compositions such as a valve and a nozzle.

The composition in the form of a mousse according to the present invention can be formed from air, inert gas or a mixture thereof with the previously described composition.

According to a specifically preferred embodiment, the composition according to the present invention has the form of a temporary foam produced just before use.

According to this embodiment, the composition can be packaged in a foam dispenser. It can involve either products referred to as "aerosols" dispensed from a pressurized container by means of a propellant gas and thus forming a foam at the time of their dispensing, or compositions dispensed from a container by means of a mechanical pump connected to a dispensing head where the passage of the composition through the dispensing head transforms it into a foam in the area of the outlet orifice of such a head at the latest.
According to a first variant, the dispenser can be an aerosol furthermore containing the composition according to the present invention, generally divided into two parts: one with the oxidizing agent (s) and the other with the alkaline agent (s) and optionally the coloring substance (s) and a propellant gas. In such a configuration, generally the two parts are stored separately, each in a pressurized container. Thus the propellant gases selected for each of the containers can be adapted to the part of the composition with which it is mixed.

The propellant gas which can be used may be chosen among the previously mentioned gases and in particular among carbon dioxide, nitrogen, nitrogen oxide, dimethyl ether, volatile hydrocarbons such as butane, isobutane, propane and pentane, and mixtures thereof.

In practice, for this variant, aerosol packaging can be used with a single container which has two pouches inside it. The dispensing head is such that what is sprayed in foam form is the composition according to the present invention, meaning the mixture of the composition with the oxidizing agent (s) and the composition with the oxidation coloring substance (s).

According to another embodiment, the composition can be in a "pump bottle" type foam dispenser. These dispensers include a dispensing head for delivering the composition, a pump and a plunger tube for transferring the composition from the container, into the head, for dispensing the product. The foam is formed by forcing the composition to pass through a material including a porous substance such as a sintered material, a filtering grid of plastic or metal, or similar structures.

Such dispensers are known to a person skilled in the art and are described in the patents: US patent 3,709,437 (Wright), US patent 3,937,364 (Wright), US patent 4,022,351 (Wright), US patent 4,1147,306 (Bennett), US patent 4,184,615 (Wright), US patent 4,598,862 (Rice), US patent 4,615,467 (Grogan et al.), and US patent 5,364,031 (Tamiguchi et al.).

According to this variant, the oxidizing agent (s) is packaged in a first container having a cap, and the alkaline agent (s) and optionally the coloring substance (s) are packaged in the second container, separate from the first, and also sealed by a closing unit. The closing unit can be a pump dispensing mechanism. The composition according to the present invention is then formed before use by mixing a composition with the oxidizing agent (s) and a composition with the coloring substance (s). For this
purpose, and to limit the number of containers supplied, one of
the first or second containers has a sufficient inside volume for
receiving the entirety of both compositions therein. The mixture
of the compositions can then be homogenized by closing this
container and shaking the container. Advantageously the
container is closed directly with the dispensing head. This
dispensing head comprises a mechanical pump held in a ring
intended for assembly by clicking or screwing onto the neck of
the container which contains the mixture. The pump comprises a
pump body connected to a plunger tube in order to dispense the
entirety of the mixture. The pump also comprises a pushbutton
for actuating the pump body, such that with each actuation, a
dose of composition is aspirated from inside the plunger tube and
ejected in foam form at the dispensing head orifice.

Preferably the containers are made of a thermoplastic material,
and are made by extrusion blow molding or injection blow molding
processes. In particular, the container intended for packaging
the composition with the coloring substance (a) can be made of a
material comprising a nonzero proportion of EVOH. For example
the pump is the standard "F2-L9" model sold by the REXAM company.

According to this preferred embodiment, the purpose of the
present invention is a non-aerosol device comprising the
composition from the present invention.

The present invention also relates to a cosmetic process for
keratin fibers such as hair, comprising:
forming a foam by mixing or shaking the cosmetic composition
according to the present invention; and
applying the composition in the form of a mousse to the keratin
fibers. The mixing or shaking can be performed by any means such
as a spoon and a whisk, to aerate the cosmetic composition. In
another embodiment, the mixing or shaking is performed by using a
device dispensing a mousse, aerosol or non aerosol, such a
described before.

In one embodiment of the cosmetic process, the cosmetic
composition according to the present invention can be used in
treating (e.g., coloring or bleaching) keratin fibers such as
hair, comprising, for example, the steps of:
applying to wet or dry keratin fibers a cosmetic composition in
the form of a mousse which is either prepared by mixing or
shaking, just before the application to the keratin fibers, one
or more of the essential components (a) to (f) and the other
essential components in the cosmetic composition according to the
present invention;
leaving the cosmetic composition to act for an exposure time, ranging, for example, from approximately 1 to 60 minutes, or from approximately 5 to 45 minutes; rinsing the fibers; and optionally washing them with shampoo, rinsing them again and then drying them.

The application of the cosmetic composition may be realized at room temperature or with the use of a warming device which is able to produce a temperature ranging from 40 to 220°C, and preferably ranging from 40 to 80°C.

It should be noted that the cosmetic composition according to the present invention is in the form of a mousse. The cosmetic composition according to the present invention can provide a user with foam texture when applying it to keratin fibers, and with cream texture when spreading it on keratin fibers. Accordingly, the cosmetic composition according to the present invention can be handled easily without reduced risk of dripping off, and can provide good feeling for use.

EXAMPLES

The present invention will be described in more detail by way of examples, which however should not be construed as limiting the scope of the present invention.

Examples 1-2 and Comparative Example 1

[Preparations ]

The following compositions according to Examples 1-2 and Comparative Example 1, shown in Table 1, were prepared by mixing the components shown in Table 1. The numerical values for the amounts of the components shown in the Tables are all based on "% by weight" as active raw materials.
The bleaching ability, foaming property and cosmetic property of the compositions according to Example 1 and Comparative Example 1, and the coloring property of the composition according to Example 2, were measured and evaluated as follows.

(1) Bleaching Ability

Each composition was applied immediately after the preparation thereof onto a swatch of Japanese black hair in a weight ratio 4:1 (the composition : the hair swatch). The applied hair swatch was left for 30 minutes at 30°C. Then, it was washed out by shampoo and dried. Color of the hair swatch was then measured by Minolta CM-508d. Calculating this value in comparison with untreated black hair swatch and ΔE (between the color of the untreated original hair and the color of the bleached hair under L'a'b' system) was calculated. For the evaluation of hair bleaching ability, the following criteria was used.
Bleaching Ability Criteria

<table>
<thead>
<tr>
<th>ΔE</th>
<th>Bleaching ability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 5</td>
<td>Low</td>
</tr>
<tr>
<td>Between 5-7</td>
<td>Medium</td>
</tr>
<tr>
<td>More than 8</td>
<td>High</td>
</tr>
</tbody>
</table>

(2) Foaming Property

140 g of each composition was put into a container with a volume of 500 ml (diameter 8cm, height 12.5cm), and the container was closed with a cap. Then, the composition in the container was shaken vigorously 30 times. The cap was opened, and the foaming volume was determined by the ratio of the foam volume to the volume of the container. In other words, the foaming property was determined by the following equation: Foaming Volume (%) = Foam Volume After Shaken/Volume of Container (500 ml). For the evaluation of foaming property, following criteria was used.

Foaming Property Criteria

<table>
<thead>
<tr>
<th>Foaming Volume</th>
<th>Foaming Property</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 60%</td>
<td>Bad</td>
</tr>
<tr>
<td>Between 60-80%</td>
<td>Medium</td>
</tr>
<tr>
<td>More than 80%</td>
<td>Good</td>
</tr>
</tbody>
</table>

(3) Cosmetic Property

Each composition was applied immediately after the preparation thereof onto the hair of a panelist. The applied hair was left for 30 minutes at 30°C. Then, it was washed with shampoo and dried. The feeling of touch on the hair before and after drying was evaluated in accordance with the following criteria.

Cosmetic Property Criteria

<table>
<thead>
<tr>
<th>Feeling of Touch</th>
<th>Cosmetic Property</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not well treated</td>
<td>Bad</td>
</tr>
<tr>
<td>Neutral</td>
<td>Medium</td>
</tr>
<tr>
<td>Well Treated</td>
<td>Good</td>
</tr>
</tbody>
</table>

The results of the evaluations are shown in Table 2 as follows.
It was found that only the composition according to Example 1 has satisfactory properties in terms of all of bleaching ability, foaming property and cosmetic property.

(4) Coloring Property

The composition according to Example 2 was applied immediately after the preparation thereof onto a swatch of Japanese bleached hair (light brown) in a weight ratio 4:1 (the composition : the hair swatch). The applied hair swatch was left for 30 minutes at 30°C. Then, it was washed out by shampoo and dried. The color of the hair swatch was checked by eye-observation.

It was found that the hair swatch was dyed to have reddish blown color.

Thus, the composition according to Example 2 was confirmed to have good coloring property.

Since the composition according to Example 2 has the same ingredients as the composition according to Example 1 has, except for oxidation dye precursors and couplers, the composition according to Example 2 should also have satisfactory properties, in terms of all of bleaching ability, foaming property and cosmetic property, which are equivalent to those for Example 1.

It was found that only the composition according to Example 1 has satisfactory properties in terms of all of bleaching ability, foaming property and cosmetic property.
CLAMs

1. A cosmetic composition for keratin fibers, in a mousse form, comprising:
   (a) at least one fatty material;
   (b) at least one amphoteric surfactant;
   (c) at least one amphoteric polymer;
   (d) at least one non-volatile alkaline agent;
   (e) at least one oxidizing agent; and
   (f) at least one foam stabilizer,
   wherein
   the amount of the (a) fatty material (s) is 20% by weight or more, preferably 30% by weight or more, and more preferably 40% by weight or more, relative to the total weight of the composition.

2. The cosmetic composition according to Claim 1, wherein the (a) fatty material is in the form of a liquid at ambient temperature and under atmospheric pressure.

3. The cosmetic composition according to Claim 1 or 2, wherein
   the (a) fatty material is selected from the group consisting of oils of animal or plant origin, synthetic glycerides, fatty esters other than animal or plant oils and synthetic glycerides, fatty alcohols, fatty acids, silicone oils, and aliphatic hydrocarbons.

4. The cosmetic composition according to any one of Claims 1 to 3, wherein the (a) fatty material is chosen from aliphatic hydrocarbons and particularly is mineral oil.

5. The cosmetic composition according to any one of Claims 1 to 4, wherein the (b) amphoteric surfactant is selected from the group consisting of betaines and amidoaminecarboxylated derivatives preferably in the group consisting of betaines.

6. The cosmetic composition according to any one of Claims 1 to 5, wherein the (b) amphoteric surfactant is selected from the group consisting of (C₈-C₄₄)alkylbetaines, (C₈-C₂₄)alkylamido (Cₙ-C₃₃)alkylbetaines, sulfobetaines, (C₈-C₄₄)alkylamido (C₁-C₈)alkylsulfobetaines, (C₈-C₂₄)-alkyl amphononoacetates, (C₈-C₄₄)alkyl amhphodiacetates, (C₈-C₂₄)alkyl amphonmonopropionates, (C₈-C₄₄)alkyl amhphodipropionates and phosphobetaines.

7. The cosmetic composition according to any one of Claims 1 to 6, wherein the amount of the (b) amphoteric surfactant (s) is
0.1 to 20% by weight, preferably 0.5 to 15% by weight, and more preferably 1 to 10% by weight, relative to the total weight of the composition.

8. The cosmetic composition according to any one of Claims 1 to 7, wherein the (c) amphoteric polymer is selected from:

(1) polymers resulting from the copolymerization of at least a monomer derived from a vinyl compound carrying a carboxylic group such as more particularly acrylic acid, methacrylic acid, maleic acid, alpha-chloroacrylic acid, and from a basic monomer derived from a substituted vinyl compound containing at least one basic atom,

(2) polymers containing units which are derived from:

a) at least one monomer chosen from acrylamides or methacrylamides substituted on the nitrogen by an alkyl radical,

b) at least one acidic comonomer containing one or more reactive carboxylic groups, and

c) at least one basic comonomer such as esters with primary, secondary, tertiary and quaternary amine substituents of acrylic and methacrylic acids and the product of quaternization of dimethylaminoethyl methacrylate with dimethyl or diethyl sulphate, and more preferably selected from polymers containing a salt of dialkyldiallyl ammonium as a cationic monomer.

9. The cosmetic composition according to any one of Claims 1 to 8, wherein the amount of the (c) amphoteric polymer (s) is 0.01 to 15% by weight, preferably 0.05 to 10% by weight, and more preferably 0.1 to 5% by weight, relative to the total weight of the composition.

10. The cosmetic composition according to any one of Claims 1 to 9, wherein the (d) non-volatile alkaline agent is an inorganic alkaline agent selected from the group consisting of alkaline metal hydroxides; alkaline earth metal hydroxides; alkaline metal (hydrogeno) carbonates; alkaline earth metal (hydrogeno) carbonates; and alkaline metal metasilicates.

11. The cosmetic composition according to any one of Claims 1 to 9, wherein the (d) non-volatile alkaline agent is an organic alkaline agent selected from the group consisting of monoamines and derivatives thereof; diamines and derivatives thereof; polyamines and derivatives thereof; amino acids and derivatives thereof; oligomers of amino acids and derivatives thereof; polymers of amino acids and derivatives thereof;
urea and derivatives thereof; and guanidine and derivatives thereof.

12. The cosmetic composition according to any one of Claims 1 to 9, wherein the (d) non-volatile alkaline agent is selected from alkanolamines, preferably monoethanolamine.

13. The cosmetic composition according to any one of Claims 1 to 12, wherein the amount of the (d) non-volatile alkaline agent (e) is 0.01 to 15% by weight, preferably 0.1 to 10% by weight, and more preferably 1 to 5% by weight, relative to the total weight of the composition.

14. The cosmetic composition according to any one of Claims 1 to 13, wherein the (e) oxidizing agent is hydrogen peroxide.

15. The cosmetic composition according to any one of Claims 1 to 14, wherein the amount of the (e) oxidizing agent (f) is 0.1 to 15% by weight, preferably 0.5 to 10% by weight, and more preferably 1 to 5% by weight, relative to the total weight of the composition.

16. The cosmetic composition according to any one of Claims 1 to 15, wherein the (f) foam stabilizer is a rheology modifier selected from hydrophilic or lipophilic, organic or inorganic polymers and non-polymers, preferably chosen from organophilic clays; fumed silicas; fatty acid amides; thickening polymers such as cellulose polymers, galactomannans and derivatives thereof, gums of microbial origin, acrylic acid or acrylamidopropanesulfonic acid crosslinked homopolymers; associative polymers, and mixture thereof.

17. The cosmetic composition according to any one of Claims 1 to 16, wherein the (f) foam stabilizer is selected from cellulose polymers.

18. The cosmetic composition according to any one of Claims 1 to 17, wherein the amount of the (f) foam stabilizer (g) is 0.05 to 20% by weight, preferably 0.1 to 15% by weight, and more preferably 0.5 to 10% by weight, relative to the total weight of the composition.

19. The cosmetic composition according to any one of Claims 1 to 18, further comprising at least one coloring substance selected from the group consisting of direct dyes and oxidation dyes.
20. A cosmetic process for keratin fibers comprising a step of forming a foam by mixing or shaking the cosmetic composition according to any one of Claims 1 to 19; and applying the foam to the keratin fibers.

21. The cosmetic process according to Claim 20 using a non-aerosol device to form the foam.

22. The cosmetic process according to Claim 20 using an aerosol device to form the foam.

23. A multi-compartment system or kit comprising at least a first compartment and a second compartment, in which the first compartment comprises at least one non-volatile alkaline agent (component (d)) according to claims 10 to 12, and optionally at least one coloring substance according to claim 19, and the second compartment comprises at least one oxidizing agent (component (e)) according to claim 14; the other essential components (a), (b), (c) and (f) being present, separately or not, in at least one of the first and second compartments or in other(s); and the amount of fatty material (s) (component (a)) according to claim 1 in the composition obtained by mixing the compartments being of 20% by weight or more, preferably 30% by weight or more, and more preferably 40% by weight or more, relative to the total weight of the composition.
