(54) Title: COMPOUNDS AND METHODS FOR INDUCING CHONDROGENESIS

(57) Abstract: Described herein are compounds and compositions for the amelioration of arthritis or joint injuries by inducing mesenchymal stem cells into chondrocytes.

COMPOUNDS AND METHODS FOR INDUCING CHONDROGENESIS

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] This application claims the benefit of U.S. Application No. 61/794,094, filed March 15, 2014, which is hereby incorporated by reference in its entirety.

FIELD OF INVENTION

[0002] The present invention relates to compounds, compositions, preparations and their use for inducing chondrogenesis and for the treatment of arthritis or joint injury.

BACKGROUND OF THE INVENTION

[0003] Osteoarthritis (OA) represents the most common musculoskeletal disorder. Approximately 40 million Americans are currently affected and this number is predicted to increase to 60 million within the next twenty years as a result of the aging population and an increase in life expectancy, making it the fourth leading cause of disability. OA is characterized by a slow degenerative breakdown of the joint including both the articular cartilage (containing the cells and matrix which produce lubrication and cushioning for the joint) and the subchondral bone underlying the articular cartilage. Current OA therapies include pain relief with oral NSAIDs or selective cyclooxygenase 2 (COX-2) inhibitors, intra-articular (IA) injection with agents such as corticorsteroids and hyaluronan, and surgical approaches.

[0004] Mesenchymal stem cells (MSCs) are present in adult articular cartilage and upon isolation can be programmed in vitro to undergo differentiation to chondrocytes and other mesenchymal cell lineages. In part it is regulated by growth factors (TGF s, BMPs), serum conditions and cell-cell contact.

SUMMARY OF THE INVENTION

INCORPORATION BY REFERENCE

[0064] All publications, patents, and patent applications mentioned in this specification are herein incorporated by reference to the same extent as if each individual publication, patent, or patent application was specifically and individually indicated to be incorporated by reference.

DETAILED DESCRIPTION OF THE INVENTION

[0065] Osteoarthritis (OA) is characterized by progressive breakdown of articular cartilage, and ultimately leads to functional failure of synovial joints [Reginster, J.Y. and N.G. Khaltaev, *Introduction and WHO perspective on the global burden of musculoskeletal conditions.* Rheumatology (Oxford), 2002. 41 Supp 1: p. 1-2]. OA is mediated by several pathogenic mechanisms including enzymatic degradation of extracellular matrix, deficient new matrix formation, cell death, and abnormal activation and hypertrophic differentiation of cartilage cells [Goldring, M.B. and S.R. Goldring, *Articular cartilage and subchondral bone in the pathogenesis of osteoarthritis.* Ann N Y Acad Sci, 2010. 1192(1): p. 230-7]. The only current therapeutic options for OA are pain management and surgical intervention [Hunter, D.J., *Pharmacologic therapy for osteoarthritis-the era of disease modification.* Nat Rev Rheumatol, 2011. 7(1): p. 13-22].

[0066] Mesenchymal stem cells (MSCs), residing in bone marrow and most adult tissues, are capable of self-renewal and differentiation into a variety of cell lineages including chondrocytes, osteoblasts and adipocytes [Pittenger, M.F., et al., *Multilineage potential of adult human mesenchymal stem cells.* Science, 1999. **284**(5411): p. 143-7]. Recent studies found that adult articular cartilage contains MSCs (approximately 3% of the cells) that are capable of multi-lineage differentiation. In OA cartilage, the number of these cells approximately doubles. These resident stem cells still retain the capability to differentiate into chondrocytes and thus the capacity to repair the damaged cartilage [Grogan, S.P., et al., *Mesenchymal progenitor cell markers in human articular cartilage: normal distribution and changes in osteoarthritis.* Arthritis Res Ther, 2009. **11**(3): p. R85;

Koelling, S., et al., *Migratory chondrogenic progenitor cells from repair tissue during the later stages of human osteoarthritis.* Cell Stem Cell, 2009. **4**(4): p. 324-35].

[0067] The present invention is based, in part, on the discovery that the compounds of the present invention stimulate chondrocyte differentiation in mesenchymal stem cells. Accordingly, the present invention provides for methods of induction of mesenchymal stem cell differentiation into chondrocytes. Further, the present invention provides for administration of compounds and compositions of the present invention to prevent or ameliorate arthritis or joint injury by administrating the compound or composition into a joint, the vertebrae, vertebral disc or systemically.

Definitions

[0068] In the following description, certain specific details are set forth in order to provide a thorough understanding of various embodiments. However, one skilled in the art will understand that the invention may be practiced without these details. In other instances, well-known structures have not been shown or described in detail to avoid unnecessarily obscuring descriptions of the embodiments. Unless the context requires otherwise, throughout the specification and claims which follow, the word "comprise" and variations thereof, such as, "comprises" and "comprising" are to be construed in an open, inclusive sense, that is, as "including, but not limited to." Further, headings provided herein are for convenience only and do not interpret the scope or meaning of the claimed invention.

[0069] Reference throughout this specification to "one embodiment" or "an embodiment" means that a particular feature, structure or characteristic described in connection with the embodiment is included in at least one embodiment. Thus, the appearances of the phrases "in one embodiment" or "in an embodiment" in various places throughout this specification are not necessarily all referring to the same embodiment. Furthermore, the particular features, structures, or characteristics may be combined in any suitable manner in one or more embodiments. Also, as used in this specification and the appended claims, the singular forms "a," "an," and "the" include plural referents unless the content clearly dictates otherwise. It should also be noted that the term "or" is generally employed in its sense including "and/or" unless the content clearly dictates otherwise.

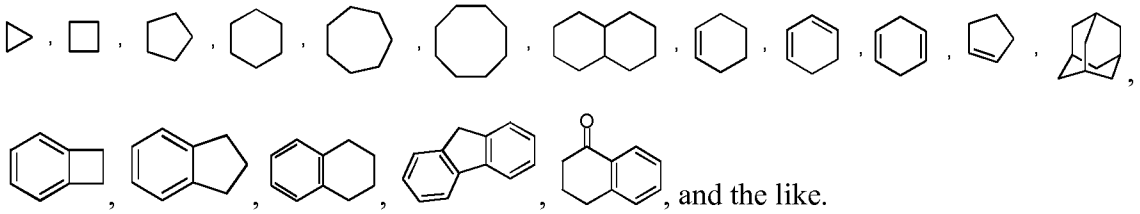
Polycyclic cycloalkyls or carbocycles include, for example, adamantyl, norbornyl, decalinyl, bicyclo[3.3.0]octane, bicyclo[4.3.0]nonane, cis-decalin,

trans-decalin, bicyclo[2.1.1]hexane, bicyclo[2.2.1]heptane, bicyclo[2.2.2]octane, bicyclo[3.2.2]nonane, and bicyclo[3.3.2]decane, and 7,7-dimethyl-bicyclo[2.2.1]heptanyl. Unless otherwise stated specifically in the specification, a cycloalkyl or carbocycle group may be optionally substituted. Illustrative examples of cycloalkyl groups include, but are not limited to, the following moieties:



, and the like.

[0083] "Fused" refers to any ring structure described herein which is fused to an existing ring structure. When the fused ring is a heterocyclyl ring or a heteroaryl ring, any carbon atom on the existing ring structure which becomes part of the fused heterocyclyl ring or the fused heteroaryl ring may be replaced with a nitrogen atom.

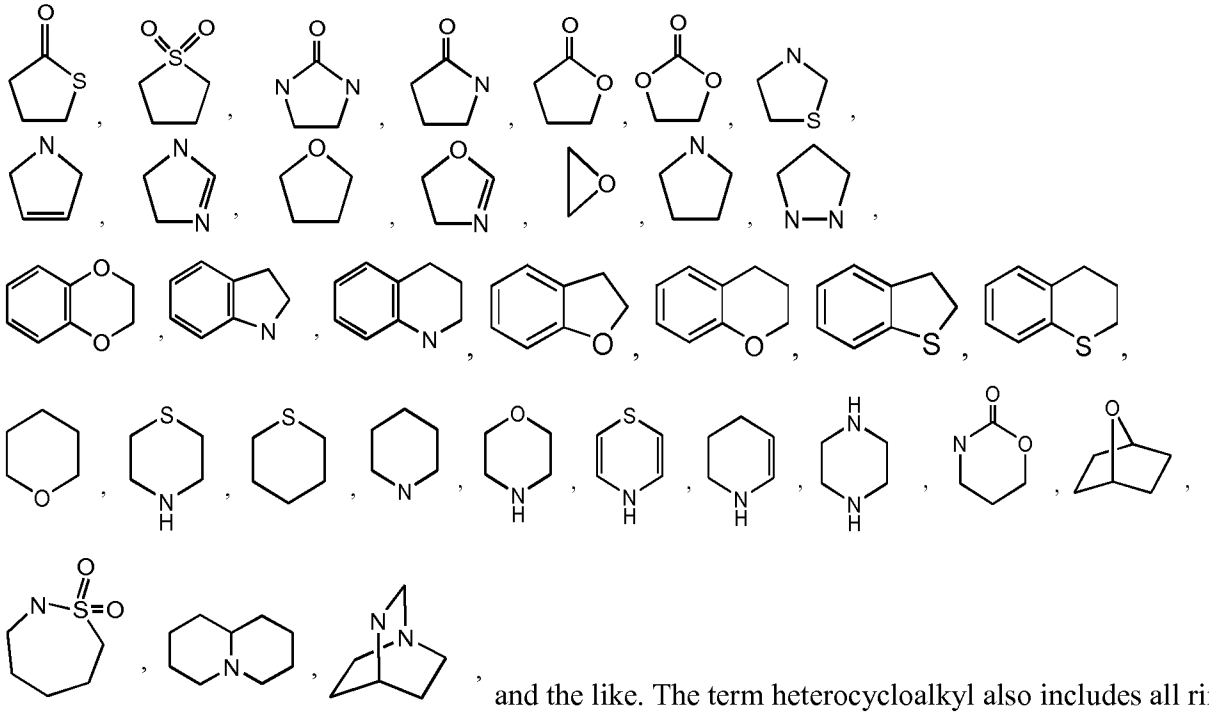
[0084] "Halo" or "halogen" refers to bromo, chloro, fluoro or iodo.

[0085] "Haloalkyl" refers to an alkyl radical, as defined above, that is substituted by one or more halo radicals, as defined above, *e.g.*, trifluoromethyl, difluoromethyl, fluoromethyl, trichloromethyl, 2,2,2-trifluoroethyl, 1,2-difluoroethyl, 3-bromo-2-fluoropropyl, 1,2-dibromoethyl, and the like. Unless stated otherwise specifically in the specification, a haloalkyl group may be optionally substituted.

[0086] "Haloalkoxy" similarly refers to a radical of the formula $-OR_a$ where R_a is a haloalkyl radical as defined. Unless stated otherwise specifically in the specification, a haloalkoxy group may be optionally substituted as described below.

[0087] "Heterocycloalkyl" or "heterocyclyl" or "heterocyclic ring" or "heterocycle" refers to a stable 3- to 24-membered non-aromatic ring radical comprising 2 to 23 carbon atoms and from one to 8 heteroatoms selected from the group consisting of nitrogen, oxygen, phosphorous and sulfur. Unless stated otherwise specifically in the specification, the heterocyclyl radical may be a monocyclic, bicyclic, tricyclic or tetracyclic ring system, which may include fused or bridged ring systems; and the nitrogen, carbon or sulfur atoms in the heterocyclyl radical may be optionally oxidized; the nitrogen atom may be optionally quaternized; and the heterocyclyl radical may be partially or fully saturated. Examples of such heterocyclyl radicals include, but are not limited to, azetidinyl, dioxolanyl, thienyl[1,3]dithianyl, decahydroisoquinolyl, imidazolinyl, imidazolidinyl, isothiazolidinyl, isoxazolidinyl, morpholinyl, octahydroindolyl, octahydroisoindolyl, 2-oxopiperazinyl, 2-oxopiperidinyl, 2-oxopyrrolidinyl, oxazolidinyl, piperidinyl, piperazinyl, 4-piperidonyl, pyrrolidinyl, pyrazolidinyl, quinuclidinyl, thiazolidinyl, tetrahydrofuryl, trithianyl, tetrahydropyranyl, thiomorpholinyl, thiamorpholinyl, 1-oxo-thiomorpholinyl, 1,1-dioxo-thiomorpholinyl, 12-crown-4, 15-crown-5, 18-crown-6, 21-crown-7, aza-18-crown-6,

diaza-18-crown-6, aza-21-crown-7, and diaza-21-crown-7. Unless stated otherwise specifically in the specification, a heterocyclyl group may be optionally substituted. Illustrative examples of heterocycloalkyl groups, also referred to as non-aromatic heterocycles, include:



and the like. The term heterocycloalkyl also includes all ring forms of the carbohydrates, including but not limited to the monosaccharides, the disaccharides and the oligosaccharides. Unless otherwise noted, heterocycloalkyls have from 2 to 10 carbons in the ring. It is understood that when referring to the number of carbon atoms in a heterocycloalkyl, the number of carbon atoms in the heterocycloalkyl is not the same as the total number of atoms (including the heteroatoms) that make up the heterocycloalkyl (i.e. skeletal atoms of the heterocycloalkyl ring). Unless stated otherwise specifically in the specification, a heterocycloalkyl group may be optionally substituted.

[0088] "Heteroaryl" refers to a 5- to 14-membered ring system radical comprising hydrogen atoms, one to thirteen carbon atoms, one to six heteroatoms selected from the group consisting of nitrogen, oxygen, phosphorous and sulfur, and at least one aromatic ring. For purposes of this invention, the heteroaryl radical may be a monocyclic, bicyclic, tricyclic or tetracyclic ring system, which may include fused or bridged ring systems; and the nitrogen, carbon or sulfur atoms in the heteroaryl radical may be optionally oxidized; the nitrogen atom may be optionally quaternized. Examples include, but are not limited to, azepinyl, acridinyl, benzimidazolyl, benzothiazolyl, benzindolyl, benzodioxolyl, benzofuranyl, benzooxazolyl, benzothiazolyl, benzothiadiazolyl, benzo[*b*][1,4]dioxepinyl, 1,4-benzodioxanyl, benzonaphthofuranyl, benzoxazolyl, benzodioxolyl, benzodioxinyl, benzopyranyl, benzopyranonyl, benzofuranyl, benzofuranonyl, benzothienyl (benzothiophenyl), benzotriazolyl, benzo[4,6]imidazo[1,2-a]pyridinyl, carbazolyl, cinnolinyl, dibenzofuranyl, dibenzothiophenyl, furanyl, furanonyl, isothiazolyl, imidazolyl, indazolyl, indolyl, indazolyl, isoindolyl, indolinyl, isoindolinyl, isoquinolyl, indolizinyl, isoxazolyl, naphthyridinyl,

oxadiazolyl, 2-oxoazepinyl, oxazolyl, oxiranyl, 1-oxidopyridinyl, 1-oxidopyrimidinyl, 1-oxidopyrazinyl, 1-oxidopyridazinyl, 1-phenyl-1*H*-pyrrolyl, phenazinyl, phenothiazinyl, phenoxazinyl, phthalazinyl, pteridinyl, purinyl, pyrrolyl, pyrazolyl, pyridinyl, pyrazinyl, pyrimidinyl, pyridazinyl, quinazolinyl, quinoxalinyl, quinolinyl, quinuclidinyl, isoquinolinyl, tetrahydroquinolinyl, thiazolyl, thiadiazolyl, triazolyl, tetrazolyl, triazinyl, and thiophenyl (*i.e.*, thienyl). Unless stated otherwise specifically in the specification, a heteroaryl group may be optionally substituted.

[0089] All the above groups may be either substituted or unsubstituted. The term "substituted" as used herein means any of the above groups (*e.g.* alkyl, alkylene, alkoxy, aryl, cycloalkyl, haloalkyl, heterocyclyl and/or heteroaryl) may be further functionalized wherein at least one hydrogen atom is replaced by a bond to a non-hydrogen atom substituent. Unless stated specifically in the specification, a substituted group may include one or more substituents selected from: oxo, amino, $-CO_2H$, nitrile, nitro, hydroxyl, thiooxy, alkyl, alkylene, alkoxy, aryl, cycloalkyl, heterocyclyl, heteroaryl, dialkylamines, arylamines, alkylarylamines, diarylamines, trialkylammonium ($-N^+R_3$), N-oxides, imides, and enamines; a silicon atom in groups such as trialkylsilyl groups, dialkylarylsilyl groups, alkyldiarylsilyl groups, triarylsilyl groups, perfluoroalkyl or perfluoroalkoxy, for example, trifluoromethyl or trifluoromethoxy. "Substituted" also means any of the above groups in which one or more hydrogen atoms are replaced by a higher-order bond (*e.g.*, a double- or triple-bond) to a heteroatom such as oxygen in oxo, carbonyl, carboxyl, and ester groups; and nitrogen in groups such as imines, oximes, hydrazones, and nitriles. For example, "substituted" includes any of the above groups in which one or more hydrogen atoms are replaced with $-NH_2$, $-NR_gC(=O)NR_gR_h$, $-NR_gC(=O)OR_h$, $-NR_gSO_2R_h$, $-OC(=O)NR_gR_h$, $-OR_g$, $-SR_g$, $-SOR_g$, $-SO_2R_g$, $-OSO_2R_g$, $-SO_2OR_g$, $=NSO_2R_g$, and $-SO_2NR_gR_h$. In the foregoing, R_g and R_h are the same or different and independently hydrogen, alkyl, alkoxy, alkylamino, thioalkyl, aryl, aralkyl, cycloalkyl, cycloalkylalkyl, haloalkyl, heterocyclyl, *N*-heterocyclyl, heterocyclylalkyl, heteroaryl, *N*-heteroaryl and/or heteroarylalkyl. In addition, each of the foregoing substituents may also be optionally substituted with one or more of the above substituents. Furthermore, any of the above groups may be substituted to include one or more internal oxygen, sulfur, or nitrogen atoms. For example, an alkyl group may be substituted with one or more internal oxygen atoms to form an ether or polyether group. Similarily, an alkyl group may be substituted with one or more internal sulfur atoms to form a thioether, disulfide, etc.

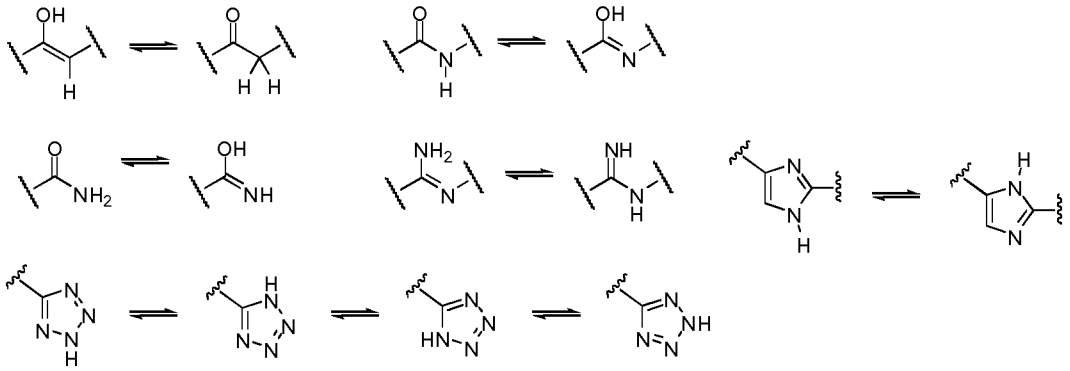
[0090] The term "optional" or "optionally" means that the subsequently described event or circumstance may or may not occur, and that the description includes instances where said event or circumstance occurs and instances in which it does not. For example, "optionally substituted alkyl" means either "alkyl" or "substituted alkyl" as defined above. Further, an optionally substituted group may be un-substituted (e.g., $-CH_2CH_3$), fully substituted (e.g., $-CF_2CF_3$), mono-substituted (e.g., $-CH_2CH_2F$) or substituted at a level anywhere in-between fully substituted and mono-substituted

(e.g., $-CH_2CHF_2$, $-CH_2CF_3$, $-CF_2CH_3$, $-CFHCHF_2$, etc). It will be understood by those skilled in the art with respect to any group containing one or more substituents that such groups are not intended to introduce any substitution or substitution patterns (e.g., substituted alkyl includes optionally substituted cycloalkyl groups, which in turn are defined as including optionally substituted alkyl groups, potentially ad infinitum) that are sterically impractical and/or synthetically non-feasible. Thus, any substituents described should generally be understood as having a maximum molecular weight of about 1,000 daltons, and more typically, up to about 500 daltons.

[0091] An "effective amount" or "therapeutically effective amount" refers to an amount of a compound administered to a mammalian subject, either as a single dose or as part of a series of doses, which is effective to produce a desired therapeutic effect.

[0092] "Treatment" of an individual (e.g. a mammal, such as a human) or a cell is any type of intervention used in an attempt to alter the natural course of the individual or cell. In some embodiments, treatment includes administration of a pharmaceutical composition, subsequent to the initiation of a pathologic event or contact with an etiologic agent and includes stabilization of the condition (e.g., condition does not worsen) or alleviation of the condition. In other embodiments, treatment also includes prophylactic treatment (e.g., administration of a composition described herein when an individual is suspected to be suffering from a bacterial infection).

[0093] A "tautomer" refers to a proton shift from one atom of a molecule to another atom of the same molecule. The compounds presented herein may exist as tautomers. Tautomers are compounds that are interconvertible by migration of a hydrogen atom, accompanied by a switch of a single bond and adjacent double bond. In bonding arrangements where tautomerization is possible, a chemical equilibrium of the tautomers will exist. All tautomeric forms of the compounds disclosed herein are contemplated. The exact ratio of the tautomers depends on several factors, including temperature, solvent, and pH. Some examples of tautomeric interconversions include:



[0094] A "metabolite" of a compound disclosed herein is a derivative of that compound that is formed when the compound is metabolized. The term "active metabolite" refers to a biologically active derivative of a compound that is formed when the compound is metabolized. The term "metabolized," as used herein, refers to the sum of the processes (including, but not limited to, hydrolysis reactions and reactions catalyzed by enzymes, such as, oxidation reactions) by which a

particular substance is changed by an organism. Thus, enzymes may produce specific structural alterations to a compound. For example, cytochrome P450 catalyzes a variety of oxidative and reductive reactions while uridine diphosphate glucuronyl transferases catalyze the transfer of an activated glucuronic-acid molecule to aromatic alcohols, aliphatic alcohols, carboxylic acids, amines and free sulfhydryl groups. Further information on metabolism may be obtained from The Pharmacological Basis of Therapeutics, 9th Edition, McGraw-Hill (1996). Metabolites of the compounds disclosed herein can be identified either by administration of compounds to a host and analysis of tissue samples from the host, or by incubation of compounds with hepatic cells in vitro and analysis of the resulting compounds. Both methods are well known in the art. In some embodiments, metabolites of a compound are formed by oxidative processes and correspond to the corresponding hydroxy-containing compound. In some embodimets, a compound is metabolized to pharmacologically active metabolites.

[00165] In some embodiments, the mammal does not have, but is at increased risk for, arthritis or joint injury.

[00166] It is contemplated that the compounds, compositions, and methods of the present invention may be used to ameliorate any type of arthritis or joint injury. It is further contemplated that the compounds, compositions, and methods of the present invention may be used to ameliorate various cartilagenous disorders. In some embodiments, the compounds and compositions of the present invention are administered to prevent arthritis or joint injury, for example where there is a genetic or family history of arthritis or joint injury or prior or during joint surgery or other circumstances where there is an increased risk of arthritis or joint injury. Exemplary conditions or disorders to be treated or prevented with the compounds, compositions, and methods of the invention, include, but are not limited to systemic rheumatoid arthritis, juvenile chronic arthritis, osteoarthritis, degenerative disc disease, spondyloarthropathies, and systemic sclerosis (scleroderma). In some embodiments of the invention, the compounds, compositions, and methods of the present invention may be used to treat osteoarthritis. In some embodiments, the arthritis can be osteoarthritis, trauma arthritis, degenerative disc disease, dupuytren disease, or tendon disease.

[00167] In some embodiments, the compounds, compositions, and methods of the present invention provide a method for stimulating chondrocyte proliferation and cartilage production in cartilagenous tissues that have been damaged due to traumatic injury or chondropathy. Traumatic injury can include, but is not limited to, blunt trauma to the joint, or damage to ligaments such as tearing the anterior cruciate ligament, medial collateral ligament, or a meniscal tear. Examples of tissues that exhibit articulated surfaces, and thus are particularly susceptible to treatment include, but are not limited to, spine, shoulder, elbow, wrist, joints of the fingers, hip, knee, ankle, and the joints of the feet. Examples of diseases that may benefit from treatment include osteoarthritis, rheumatoid arthritis, other autoimmune diseases, or osteochondritis dessicans. In addition, cartilage malformation is often seen in forms of dwarfism in humans suggesting that the compounds, compositions, and methods would be useful in these patients.

[00168] It is contemplated that the compounds, compositions, and methods of the present invention may be used to treat a mammal. As used herein a "mammal" refers to any mammal classified as a mammal, including humans, domestic and farm animals, and zoo, sports or pet animals, such as cattle (e.g. cows), horses, dogs, sheep, pigs, rabbits, goats, cats, etc. In some embodiments, the mammal can be a human, a dog, a cat, or a horse. In some embodiments of the invention, the mammal is a human. In some embodiments, the mammal is a dog, a cat, or a horse. In some embodiments, the mammal is cattle, sheep, pig, goat, or rabbit. In some embodiments, the mammal is a domesticated animal or livestock. In further embodiments, the domesticated animal or livestock is a dog, cat, or horse. In some embodiments, the mammal is a companion animal. As used herein, "companion animal" refers to dog, cat, rodent, and rabbit. In some embodiments, the mammal is a companion animal or livestock. In some embodiments, the mammal is livestock.

[00169] The compounds of the present invention are also useful for inducing differentiation of mesenchymal stem cells (MSCs) into chondrocytes. In some embodiments, the present invention provides a method of inducing differentiation of mesenchymal stem cells into chondrocytes, the method including contacting mesenchymal stem cells with a sufficient amount of a compound of the present invention, thereby inducing differentiation of the stem cells into chondrocytes.

[00170] MSCs are multipotent stem cells that can differentiate into several different types of cells including, but not limited to, osteoblasts, chondrocytes and adipocytes. Differentiation is the process by which a specialized cell type is formed from a less specialized cell type, for example, a chondrocyte from a MSC. In some embodiments, the method is performed *in vitro*. In some embodiments, the method is performed *in vivo* in a mammal and the stem cells are present in the mammal. In certain embodiments, the mammal is a human, a dog, a cat, or a horse. In certain embodiments, the mammal is a human. In certain embodiments, the mammal is a dog, a cat, or a horse.

[00171] Inducing differentiation of MSCs into chondrocytes can be accomplished using any suitable amount of a compound of the present invention. In some embodiments, the compound of the present invention can be present in an amount from about 0.1 mg to about 10000 mg, e.g., 1.0 mg to 1000 mg, e.g., 10 mg to 500 mg, according to the particular application and potency of the active component. In some embodiments, the compound of the present invention can be present in a concentration of 0.1 μM – 100 μM in an intra-articular injection to the knee.

Assays for identifying compounds

[00172] The compounds of the present invention were identified using a variety of assays. The initial screen identified compounds that stimulated human mesenchymal stem cells (hMSCs) to develop into chondrocyte nodules. Additional assays were performed to determine toxicity and specificity of chondrocyte differentiation.

Isomers

[00189] In some embodiments, the compounds described herein exist as geometric isomers. In some embodiments, the compounds described herein possess one or more double bonds. The compounds presented herein include all cis, trans, syn, anti, entgegen (E), and zusammen (Z) isomers as well as the corresponding mixtures thereof. In some situations, compounds exist as tautomers. The compounds described herein include all possible tautomers within the formulas described herein. In some situations, the compounds described herein possess one or more chiral centers and each center exists in the R configuration, or S confirguration. The compounds described herein include all diastereomeric, enantiomeric, and epimeric forms as well as the corresponding mixtures thereof. In additional embodiments of the compounds and methods provided herein, mixtures of enantiomers and/or diastereoisomers, resulting from a single preparative step, combination, or interconversion are useful for the applications described herein. In some embodiments, the compounds described herein are prepared as their individual stereoisomers by reacting a racemic mixture of the compound with an optically active resolving agent to form a pair of diastereoisomeric compounds, separating the diastereomers and recovering the optically pure enantiomers. In some embodiments, dissociable complexes are preferred (e.g., crystalline diastereomeric salts). [00198] In some embodiments, the compounds described herein exist as solvates. The invention provides for methods of treating diseases by administering such solvates. The invention further provides for methods of treating diseases by administering such solvates as pharmaceutical compositions.

[00199] Solvates contain either stoichiometric or non-stoichiometric amounts of a solvent, and, in some embodiments, are formed during the process of crystallization with pharmaceutically acceptable solvents such as water, ethanol, and the like. By way of example only, hydrates of the compounds described herein can be conveniently prepared by recrystallization from an aqueous/organic solvent mixture, using organic solvents including, but not limited to, dioxane, tetrahydrofuran or methanol. In addition, the compounds provided herein can exist in unsolvated as well as solvated forms. In general, the solvated forms are considered equivalent to the unsolvated forms for the purposes of the compounds and methods provided herein.

Polymorphs

[00200] In some embodiments, the compounds described herein exist as polymorphs. The invention provides for methods of treating diseases by administering such polymorphs. The invention further provides for methods of treating diseases by administering such polymorphs as pharmaceutical compositions.

[00201] Thus, the compounds described herein include all their crystalline forms, known as polymorphs. Polymorphs include the different crystal packing arrangements of the same elemental composition of a compound. In certain instances, polymorphs have different X-ray diffraction patterns, infrared spectra, melting points, density, hardness, crystal shape, optical and electrical

properties, stability, and solubility. In certain instances, various factors such as the recrystallization solvent, rate of crystallization, and storage temperature cause a single crystal form to dominate.

Prodrugs

[00202] In some embodiments, the compounds described herein exist in prodrug form. The invention provides for methods of treating diseases by administering such prodrugs. The invention further provides for methods of treating diseases by administering such prodrugs as pharmaceutical compositions.

[00203] Prodrugs are generally drug precursors that, following administration to an individual and subsequent absorption, are converted to an active, or a more active species via some process, such as conversion by a metabolic pathway. Some prodrugs have a chemical group present on the prodrug that renders it less active and/or confers solubility or some other property to the drug. Once the chemical group has been cleaved and/or modified from the prodrug the active drug is generated. Prodrugs are often useful because, in some situations, they are easier to administer than the parent drug. They are, for instance, bioavailable by oral administration whereas the parent is not. In certain insatnces, the prodrug also has improved solubility in pharmaceutical compositions over the parent drug. An example, without limitation, of a prodrug would be a compound as described herein which is administered as an ester (the "prodrug") to facilitate transmittal across a cell membrane where water solubility is detrimental to mobility but which then is metabolically hydrolyzed to the carboxylic acid, the active entity, once inside the cell where water-solubility is beneficial. A further example of a prodrug might be a short peptide (polyamino acid) bonded to an acid group where the peptide is metabolized to reveal the active moiety. (See for example Bundgaard, "Design and Application of Prodrugs" in *A Textbook of Drug Design and Development*, Krosgaard-Larsen and Bundgaard, Ed., 1991, Chapter 5, 113-191, which is incorporated herein by reference).

[00204] In some embodiments, prodrugs are designed as reversible drug derivatives, for use as modifiers to enhance drug transport to site-specific tissues. The design of prodrugs to date has been to increase the effective water solubility of the therapeutic compound for targeting to regions where water is the principal solvent.

[00205] In some embodiments, prodrugs are C_1-C_6 alkyl esters of the compounds disclosed herein.

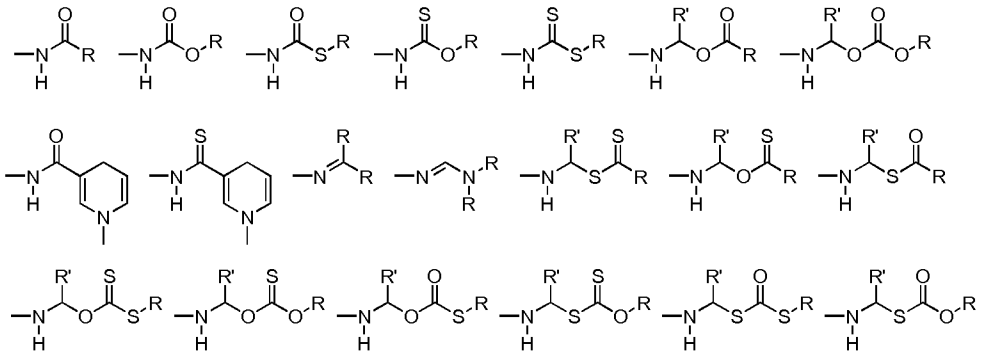
[00206] Additionally, prodrug derivatives of compounds described herein can be prepared by methods described herein are otherwise known in the art (for further details see Saulnier *et al.*, *Bioorganic and Medicinal Chemistry Letters*, **1994**, *4*, 1985). By way of example only, appropriate prodrugs can be prepared by reacting a non-derivatized compound with a suitable carbamylating agent, such as, but not limited to, 1,1-acyloxyalkylcarbanochloridate, *para*-nitrophenyl carbonate, or the like. Prodrug forms of the herein described compounds, wherein the prodrug is metabolized *in vivo* to produce a derivative as set forth herein are included within the scope of the claims. Indeed, some of the herein-described compounds are prodrugs for another derivative or active compound.

[00207] In some embodiments, prodrugs include compounds wherein an amino acid residue, or a polypeptide chain of two or more (e. g., two, three or four) amino acid residues is covalently joined through an amide or ester bond to a free amino, hydroxy or carboxylic acid group of compounds of the present invention. The amino acid residues include but are not limited to the 20 naturally occurring amino acids and also includes 4-hydroxyproline, hydroxylysine, demosine, isodemosine, 3-methylhistidine, norvaline, beta-alanine, gamma-aminobutyric acid, cirtulline, homocysteine, homoserine, ornithine and methionine sulfone. In other embodiments, prodrugs include compounds wherein a nucleic acid residue, or an oligonucleotide of two or more (e. g., two, three or four) nucleic acid residues is covalently joined to a compound of the present invention.

[00208] Pharmaceutically acceptable prodrugs of the compounds described herein also include, but are not limited to, esters, carbonates, thiocarbonates, N-acyl derivatives, N-acyloxyalkyl derivatives, quaternary derivatives of tertiary amines, N-Mannich bases, Schiff bases, amino acid conjugates, phosphate esters, metal salts and sulfonate esters. Compounds having free amino, amido, hydroxy or carboxylic groups can be converted into prodrugs. For instance, free carboxyl groups can be derivatized as amides or alkyl esters. In certain instances, all of these prodrug moieties incorporate groups including but not limited to ether, amine and carboxylic acid functionalities.

[00209] Hydroxy prodrugs include esters, such as though not limited to, acyloxyalkyl (e.g. acyloxymethyl, acyloxyethyl) esters, alkoxycarbonyloxyalkyl esters, alkyl esters, aryl esters, phosphate esters, sulfonate esters, sulfate esters and disulfide containing esters; ethers, amides, carbamates, hemisuccinates, dimethylaminoacetates and phosphoryloxymethyloxycarbonyls, as outlined in *Advanced Drug Delivery Reviews* **1996**, *19*, 115.

[00210] Amine derived prodrugs include, but are not limited to the following groups and combinations of groups:



as well as sulfonamides and phosphonamides.

[00211] In certain instances, sites on any aromatic ring portions are susceptible to various metabolic reactions, therefore incorporation of appropriate substituents on the aromatic ring structures, can reduce, minimize or eliminate this metabolic pathway.

Metabolites

[00212] In some embodiments, compounds described herein are susceptible to various metabolic reactions. Therefore, in some embodiments, incorporation of appropriate substituents into the structure will reduce, minimize, or eliminate a metabolic pathway. In specific embodiments, the appropriate substituent to decrease or eliminate the susceptibility of an aromatic ring to metabolic reactions is, by way of example only, a halogen, or an alkyl group.

[00213] In additional or further embodiments, the compounds described herein are metabolized upon administration to an organism in need to produce a metabolite that is then used to produce a desired effect, including a desired therapeutic effect.

EXAMPLE 1: Human chondrocyte differentiation assay

[00278] Human MSCs (50,000) were plated into each well of a 96-well plate and cultured overnight. Compounds (in DMSO solution) were added to the cells at a final concentration of 1 μM, and the cells were cultured for 7 days at 5% CO_2, 37°C. The cells were fixed with 10% formalin solution at room temperature for 10 min, and immunostained using antibodies specific for type II collagen (Abcam), Sox9 (Santa Cruz) and cartilage oligomeric matrix protein (COMP, Santa Cruz), and fluorescently labeled secondary antibodies (Li-Cor). The total intensity of the staining was measured using Oddyssey CLx imaging system (Li-Cor). Vehicle (DMSO) was used as control to determine the basal level of chondrocyte differentiation. Compounds exhibiting 30% or higher increase in staining intensity compared to vehicle control were selected as active hits. Representative data are shown in Table 1 [A: >50% increase in staining intensity compared to vehicle control; B: 30-50% increase in staining intensity compared to vehicle control].

EXAMPLE 2: Cell viability assay

[00279] Human MSCs, chondrocytes, osteoblasts and synoviocytes are plated into 384-well plates at 10,000 cells per well. Compounds are added at a final concentration of 100μM. The cells are cultured for 48 h. Cell viability is analyzed by Cell Titer-Glo (Promega) assay using EnVision plate reader (PerkinElmer). Apoptosis activity is analyzed by Caspase 3/7-Glo (Promega) assay using EnVision plate reader (PerkinElmer).

EXAMPLE 3: PK study via intra-articular injection in rats

[00280] A 30μl-compound solution (100 μM in PBS containing 0.1% DMSO) is injected into the articular space of the right knee of each rat. The animals are bled at 1, 3, 4, 6, 7, 8, 9, and 10 hours post-injection. The animals are terminated at 2 or 12 hours post-dose. Plasma and joint lavage of the injected knees are collected. The quantities of the injected compounds are analyzed using LCMS.

EXAMPLE 4: Rat medial meniscal tear (MMT) osteoarthritis (OA) model

[00281] The medial meniscus of the right knee of each animal is surgically torn to induce OA. Dosing of the compound solutions (30 μl of 100 μM in PBS containing 0.1% DMSO) is begun 7 days post-surgery at one dose per week for three weeks. Body weights and gait deficits are monitored weekly right before dosing. Animals are terminated at day 28 post-surgery. The joints of the operated knees are processed and histochemically stained for cartilage, and the cartilage is evaluated.

[00282] Following 4-6 days in 5% formic acid decalcifier, the operated joints are cut into two approximately equal halves in the frontal plane and embedded in paraffin. Three sections are cut from each operated right knee (g1-8) at approximately 200 μm steps and stained with toluidine blue. Left knees of group 1 and right knees from group 9 have a single section prepared and stained with toluidine blue.

[00283] All three sections of each operated knee are analyzed microscopically. The worst-case scenario for the two halves on each slide is determined for general cartilage degeneration, proteoglycan loss, collagen damage, and osteophyte formation. The values for each parameter are then averaged across the three sections to determine overall subjective scores.

[00284] In addition, for some parameters (noted below), regional differences across the tibial plateau are taken into consideration by dividing each section into three zones (1-outside, 2-middle, 3-inside). In the surgical OA model, the outside (z1) and middle (z2) thirds are most severely affected, and milder changes are present on the inside third (z3). When zones are scored individually, scores are assigned based on percent area of the zone affected. Zone areas are delineated using an ocular micrometer.

[00285] The following parameters are measured and/or scored:

[00286] General cartilage degeneration includes the important parameters of chondrocyte death/loss, proteoglycan loss, and collagen loss or fibrillation. Cartilage degeneration in the tibia is scored none to severe (numerical values 0-5) for each zone using the following criteria:

- 0 = no degeneration
- 1 = minimal degeneration, within the zone 5-10% of the matrix appears non viable as a result of significant chondrocyte loss (greater than 50% of normal cell density). PG loss is usually present in these areas of cell loss and collagen matrix loss may be present.
- 2 = mild degeneration, within the zone 11-25% of the matrix appears non viable as a result of significant chondrocyte loss (greater than 50% of normal cell density). PG loss is usually present in these areas of cell loss and collagen matrix loss may be present.
- 3 = moderate degeneration, within the zone 26-50% of the matrix appears non viable as a result of significant chondrocyte loss (greater than 50% of normal cell density). PG loss is usually present in these areas of cell loss and collagen matrix loss may be present.
- 4 = marked degeneration, within the zone 51-75% of the matrix appears non viable as a result of significant chondrocyte loss (greater than 50% of normal cell density). PG loss is usually present in these areas of cell loss and collagen matrix loss may be present.
- 5 = severe degeneration, within the zone 76-100% of the matrix appears non viable as a result of significant chondrocyte loss (greater than 50% of normal cell density). PG loss is usually present in these areas of cell loss and collagen matrix loss may be present.

In some cases, image analysis may be used to determine the exact % of matrix viability and/or loss in each zone or in selected zones so that absolute % rather than scores (0-5) can be compared. A 3-zone sum for cartilage degeneration is calculated in addition to expressing the data for each zone.

[00287] The same process is applied to evaluation of the femoral cartilage with the exception that lesions are not analyzed based on zones since the lesions are not generally distributed over the surface in a zonal pattern. The total width of the load-bearing surface (approximately 2000 μm for the femur) is determined and the above criteria is applied to the most severely affected 1/3, 2/3 or 3/3. For example, if 1/3 of the total area (lesion may be in the center of the plateau covering about 667 μm) has minimal degeneration (5-10% of total area has loss of chondrocytes and/or matrix), a score of 1 is assigned. If that minimal degeneration extends over the entire surface (3/3) then the score is 3. If the entire femoral cartilage is absent as a result of severe diffuse degeneration, then the score is 15.

[00288] In addition to this overall cartilage degeneration score, collagen matrix damage is scored separately in order to identify more specific effects of agents. Collagen damage across the medial tibial plateau (most severely affected section of the two halves) is quantified by measuring the total width of the following:

- Any damage (fibrillation ranging from superficial to full thickness loss).

- Severe damage (total or near total loss of collagen to tidemark, >90% thickness)
- Marked damage (extends through 61-90% of the cartilage thickness)
- Moderate damage (extends thru 31-60% of the cartilage thickness)
- Mild damage (extends through 11-30% of the cartilage thickness)
- Minimal damage (very superficial, affecting upper 10% only)

[00289] In addition to the above subjective general cartilage scoring, two cartilage degeneration width measurements are taken:

- Total Tibial Cartilage Degeneration Width (μm) is a micrometer measurement of total extent of tibial plateau affected by any type of degeneration (cell loss, proteoglycan loss or collagen damage). This measurement extends from the origination of the osteophyte with adjacent cartilage degeneration (outside 1/3) across the surface to the point where tangential layer and underlying cartilage appear histologically normal.
- Substantial Cartilage Degeneration Width (μm) reflects areas of tibial cartilage degeneration in which both chondrocyte and proteoglycan loss extend through greater than 50% of the cartilage thickness. In general, the collagen damage is mild (25% depth) or greater for this parameter but chondrocyte and proteoglycan loss extend to at least 50% or greater of the cartilage depth.

[00290] A micrometer depth of any type of lesion (both chondrocyte and proteoglycan loss, but may have good retention of collagenous matrix and no fibrillation), expressed as a ratio of depth of changed area vs. depth to tidemark, is taken in the area of greatest lesion severity in each of the three zones across the tibial surface at the midpoint of the zone. This measurement is the most critical analysis of any type of microscopic change present. The denominator can serve as an average measure of cartilage thickness in each of the three zones for comparison of anabolics when measures are taken at the midpoint of the zone.

[00291] Scoring of the osteophytes and categorization into small, medium and large is done with an ocular micrometer. Marginal zone proliferative changes have to be >200 μm in order to be measured and designated as osteophytes. Scores are assigned to the largest osteophyte in each section (typically found in the tibia) according to the following criteria:

- 1 = small up to 299 μm
- 2 = moderate 300-399 μm
- 3 = large 400-499 μm
- 4 = very large 500-599
- 5 = very large ≥600

The actual osteophyte measurement (tidemark to furthest distance point extending toward synovium) is also recorded.

[00292] The femoral cartilage degeneration score and the three-zone sum of the tibial cartilage degeneration scores (mean of three levels) are summed to create a total cartilage degeneration score. The mean osteophyte score for each joint is added to this value to produce a total joint score.

Image analysis

[00293] In order to quantify and compare the cartilage matrix preservation, cartilage area measurements are taken from the most severely affected section of each animal. Photomicrographs are taken with a CoolSNAP-Pro microscope camera and loaded into ImagePro Plus software. The following measurements are taken from tracings of these photomicrographs, four per page, which are included in the report:

- Total area from the tidemark to the surface (or projected surface in degenerated areas) over 9 cm (photomicrograph) of the tibial plateau, measured from the inner edge of the osteophyte
- Area of non-viable matrix (cartilage with less than 50% chondrocytes, proteoglycan, and intact collagen) and no matrix within the total area
- Area of no matrix within the total area

The area of non-viable matrix is subtracted from the total area to get the area of viable matrix, and the area of no matrix is subtracted from the total area to get the area of any matrix (collagen matrix with or without chondrocytes and proteoglycan). These two values are then compared back to the total area to derive the percent viable matrix area and the percent any matrix area, which are compared between groups. Five left knees from the vehicle group are included in this process as normal controls. This process may be used to analyze the entire surface or selected zones depending on lesion severity and apparent treatment effects.

[00294] Synovial reaction, if abnormal, is described (should be mainly fibrosis) and characterized with respect to inflammation type and degree but is not included in the OA score.

[00295] Damage to the calcified cartilage layer and subchondral bone (worst case scenario for all sections) is scored using the following criteria:

- 0 = No changes
- 1 = Increased basophilia at tidemark, no fragmentation of tidemark, no marrow changes or if present minimal and focal
- 2 = Increased basophilia at tidemark, minimal to mild focal fragmentation of calcified cartilage of tidemark, mesenchymal change in marrow involves 1/4 of total area but generally is restricted to subchondral region under lesion
- 3 = Increased basophilia at tidemark, mild to marked focal or multifocal fragmentation of calcified cartilage (multifocal), mesenchymal change in marrow is up to 3/4 of total area, areas of marrow chondrogenesis may be evident but no major collapse of articular cartilage into epiphyseal bone (definite depression in surface)

- 4 = Increased basophilia at tidemark, marked to severe fragmentation of calcified cartilage, marrow mesenchymal change involves up to 3/4 of area and articular cartilage has collapsed into the epiphysis to a depth of 250 μm or less from tidemark (see definite depression in surface cartilage)
- 5 = Increased basophilia at tidemark, marked to severe fragmentation of calcified cartilage, marrow mesenchymal change involves up to 3/4 of area and articular cartilage has collapsed into the epiphysis to a depth of greater than 250 μm from tidemark

In addition, measurements are made of the thickness of the medial synovial/collateral ligament repair in a non-tangential area of the section.

[00296] Growth plate thickness is measured in all knees on medial and lateral sides (2 measures/joint) at the approximate midpoint of the medial and lateral physis (assuming a non tangential area of the section).

EXAMPLE 5: Extraction and Quantitation of Chondrogenesis Compounds in Joint and Plasma Rat Samples

[00297] LC-MS/MS analysis for Chondrogenesis compounds were performed using an API 3000 equipped with an Agilent 1100 HPLC and a Leap Technologies autosampler. A HPLC Phenomenex 5 micron, 100 A Luna C18 (2) analytical column with dimensions of 2.0 x 50 mm (Part No. 00B-4252-B0) at a temperature of 30 C, flow rate of 0.6 mL/min, injection volume of 10 uL, and a 6.0 min run time was used. Mobile phase A1 was 0.1% formic acid in water and Mobile phase B1 was 0.1% formic acid in acetonitrile. The gradient was 90% A1/10% B1 at time 0; 90% A1/10% B1 at time 1.0 min; 10% A1/90% B1 at time 2.0 min; 10% A1/90% B1 at time 4.0 min; 90% A1/10% B1 at time 4.10 min; 90% A1/10% B1 at time 6.0 min. Analytes and internal standard quantitation were performed using Multiple Reaction Monitoring (MRM) quantitation method. Listed below are specific methods used to dose and measure exposure in plasma and the observed concentration in joint extract.

[00298] **Rat Plasma Samples**: Calibration standard curve was prepared by serial dilution of a concentrated, spike solution of the compound in control rat plasma. Calibration standards and rat plasma samples were prepared via protein precipitation by adding aliquots of Acetonitrile and internal standard to each aliquot of standards and samples. Following vortex mixing and centrifugation, aliquots of the supernatants from each standards and samples were diluted with formic acid in water, mixed and injected. All plasma samples collected after IA dosing (starting at t = 0, 0.5, 1, 2, 4, and 6h) indicated no systemic exposure for any of the compounds listed in Table 2.

[00299] **Rat Knee Joint Samples**: Calibration standard curve was prepared by serial dilution of a concentrated, spike solution of the compound in internal standard diluents. Internal standard diluent was prepared by dissolving the internal standard compound at a certain concentration in acetonitrile. Rat knee joint samples for each time points were individually crushed and transferred into each

centrifuge tube and added 1.0-mL of internal standard diluent. Each centrifuge tube was vortexed and centrifuged for 30 minutes. From each tube, supernatant was removed and injected onto the column for analysis. In addition, plasma samples were obtained by retro-orbital bleeds into heparin coated tubes and stored at -80C and later processed by analogy to the protocol described above for rat plasma samples.

[00300] Compound administration and tissue processing: 30 μL of 100 μM compound solution (PBS with 0.1% DMSO) was injected into the intra-articular space of the right hinder knee of each animal. The animals were euthanized at indicated time points (0 hr, 0.5 hr, 1 hr, 2 hr, 4 hr and 6hr). Four animals were used for each timepoint. The injected knee joints were harvested, flash freeze in liquid nitrogen. The whole joints were grounded into powder while frozen, mixed with 1 mL internal standard-containing acetonitrile, incubated at 4 °C overnight, vortexed and centrifuged for 30 min. The supernatant from each sample was analyzed using LC-MS/MS. Data shown in Table 2 indicates the observed concentration in knee extract. ND = Not determined.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US14/26722

Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☒ Claims Nos.: 23-26, 39-42, 46-51, 56-57, 60-65, 74-88
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.

☐ The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.

☐ No protest accompanied the payment of additional search fees.

相关申请的交叉引用

[0001] 本申请要求 2014 年 3 月 15 日提交的美国申请号 61/794,094 的权益，该申请通过引用整体并入本文。

技术领域

[0002] 本发明涉及化合物、组合物、制品及其用于诱导软骨形成以及用于治疗关节炎或关节损伤的用途。

背景技术

[0003] 骨关节炎 (OA) 是最常见的肌骨病症。大约 4 千万美国人目前患该病，并且由于人口老化和预期寿命延长，这一数字预计将在下一个二十年内增加至 6 千万，使其成为失能的第四大原因。OA 的特征在于关节的缓慢退化性分解，该关节包括关节软骨（含有为关节产生润滑和缓冲的细胞和基质）和处于关节软骨下方的软骨下骨。目前的 OA 疗法包括通过口服 NSAID 或选择性环加氧酶 2(COX-2) 抑制剂、关节内 (IA) 注射诸如皮质类固醇和透明质酸等药剂以及手术方法缓解疼痛。

[0004] 间充质干细胞 (MSC) 存在于成年关节软骨中，并且在分离后可以在体外程序化，以分化为软骨细胞和其他间充质细胞谱系。部分地，它通过生长因子 (TGF、BMP)、血清条件和细胞 - 细胞接触来调节。

具体实施方式

[0065] 骨关节炎 (OA) 的特征在于关节软骨的进行性分解，并最终导致滑膜关节的功能障 碍 [Reginster, J.Y. 和 N.G.Khaltaev, Introduction and WHO perspective on the global burden of musculoskeletal conditions. Rheumatology(Oxford), 2002. 41Supp

1:p.1-2]。OA 由数种发病机理介导,包括胞外基质的酶降解、缺陷的新基质形成、细胞死亡以及软骨细胞的异常活化和肥大性分化 [Goldring,M.B. 和 S.R.Goldring,Articular cartilage and subchondral bone in the pathogenesis of osteoarthritis.Ann N Y Acad Sci,2010.1192(1):p.230-7]。目前对于 OA 仅有的治疗选择是疼痛处置和手术干预 [Hunter,D.J.,Pharmacologic therapy for osteoarthritis-the era of disease modification.Nat Rev Rheumatol,2011.7(1):p.13-22]。

[0066] 存在于骨髓和大多数成体组织中的间充质干细胞 (MSC) 能够自我更新并分化为多种细胞谱系,包括软骨细胞、成骨细胞和脂肪细胞 [Pittenger,M.F. 等 人 ,Multilineage potential of adult human mesenchymal stem cells. Science,1999.284(5411):p.143-7]。最近的研究发现,成体关节软骨含有能够多谱系分化的 MSC(细胞的大约 3 %)。在 OA 软骨中,这些细胞的数目大致加倍。这些存在的干细胞仍然保留分化成软骨细胞的能力,因此保留修复受损的软骨的能力 [Grogan,S.P. 等 人 ,Mesenchymal progenitor cell markers in human articular cartilage:normal distribution and changes in osteoarthritis.Arthritis Res Ther,2009.11(3):p.R85 ;Koelling,S. 等人,Migratory chondrogenic progenitor cells from repair tissue during the later stages of human osteoarthritis.Cell Stem Cell,2009.4(4):p.324-35]。

[0067] 本发明部分地基于以下发现 :本发明的化合物刺激间充质干细胞中的软骨细胞分化。因此,本发明提供了诱导间充质干细胞分化为软骨细胞的方法。进一步地,本发明提供了通过向关节、脊椎、椎间盘内或全身性地施用本发明的化合物或组合物,施用本发明的化合物和组合物以预防或改善关节炎或关节损伤。

[0089] 上述所有基团可以是取代的或未取代的。如本文所使用的术语“取代的”指任何上述基团 (例如，烷基、亚烷基、烷氧基、芳基、环烷基、卤代烷基、杂环基和 / 或杂芳基) 可进一步被官能化，其中至少一个氢原子被连接非氢原子取代基的键所替代。除非在说明书中具体说明，被取代的基团可包括选自以下的一个或多个取代基：氧代、氨基、$-CO_2H$、腈、硝基、羟基、硫代氧基 (thiooxy)、烷基、亚烷基、烷氧基、芳基、环烷基、杂环基、杂芳基、二烷基胺、芳基胺、烷基芳基胺、二芳基胺、三烷基铵 ($-N^+R_3$)、N- 氧化物、酰亚胺和烯胺；在诸如三烷基甲硅烷基、二烷基芳基甲硅烷基、烷基二芳基甲硅烷基、三芳基甲硅烷基的基团中的硅原子，全氟烷基或全氟烷氧基，例如三氟甲基或三氟甲氧基。“取代的”还指其中一个或多个氢原子被连接杂原子的更高级的键 (例如，双键或三键) 所替代的任何上述基团，所述杂原子例如为在氧代、羰基、羧基和酯基团中的氧，和在诸如亚胺、肟、腙和腈的基团中的氮。例如，“取代的”包括其中一个或多个氢原子被 $-NH_2$、$-NR_gC(=O)NR_gR_h$、$-NR_gC(=O)OR_h$、$-NR_gSO_2R_h$、$-OC(=O)NR_gR_h$、$-OR_g$、$-SR_g$、$-SOR_g$、$-SO_2R_g$、$-OSO_2R_g$、$-SO_2OR_g$、$=NSO_2R_g$ 和 $-SO_2NR_gR_h$ 所替代的上述任何基团。在上文中，R_g 和 R_h 相同或不同，并且独立地为氢、烷基、烷氧基、烷基氨基、硫代烷基、芳基、芳烷基、环烷基、环烷基烷基、卤代烷基、杂环基、N- 杂环基、杂环基烷基、杂芳基、N- 杂芳基和 / 或杂芳基烷基。此外，上述取代基中的每一个还可任选地被一个或多个上述取代基所取代。此外，任何上述基团均可被取代，以包括一个或多个内部氧、硫或氮原子。例如，烷基可被一个或多个内部氧原子所取代，以形成醚或聚醚基团。相似地，烷基可被一个或多个内部硫原子所取代，以形成硫醚、二硫化物等。

[0090] 术语“任选的”或“任选地”意指随后描述的事件或情况可能发生或可能不发生，并且该描述包括其中所述事件或情况发生的情形和所述事件或情况不发生的情形。例如，“任选取代的烷基”意指如上所定义的“烷基”或“被取代的烷基”。此外，任选取代的基团可

以是未取代的（例如，$-CH_2CH_3$）、完全取代的（例如，$-CF_2CF_3$）、单取代的（例如，$-CH_2CH_2F$），或以在完全取代和单取代之间的任一水平被取代的（例如，$-CH_2CHF_2$、$-CH_2CF_3$、$-CF_2CH_3$、$-CFHCHF_2$等）。本领域技术人员将会理解，对于含有一个或多个取代基的任何基团，这些基团并不旨在引入在空间上不能实现的和/或在合成上不可行的任何取代或取代模式（例如，被取代的烷基包括任选取代的环烷基，而该环烷基反过来又被定义为包括任选取代的烷基，如此可能无限循环）。因此，所述的任何取代基一般应理解为具有约 1,000 道尔顿，并且更典型地，高达约 500 道尔顿的最大分子量。

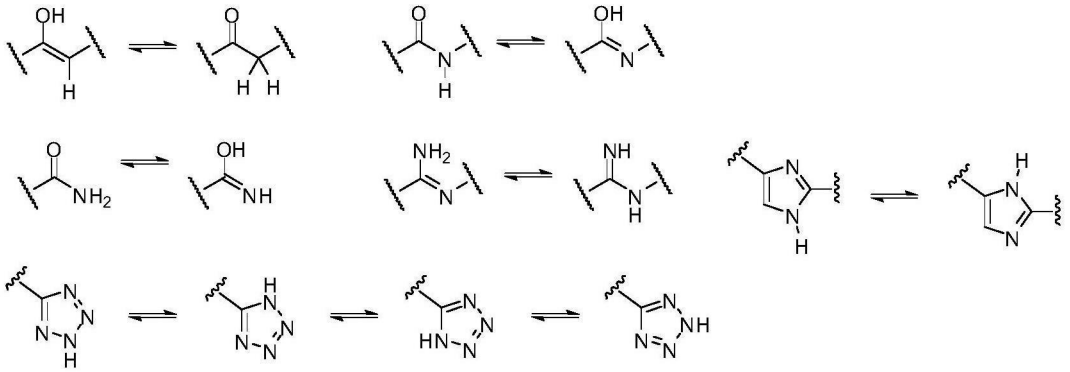
[0093] “互变异构体”指从分子的一个原子到同一分子的另一个原子的质子转移。本文提供的化合物可作为互变异构体存在。互变异构体为通过氢原子的迁移（伴随单键和相邻双键的转换）可相互转化的化合物。在可能发生互变异构的键合排列中，将存在互变异构体的化学平衡。考虑了本文所公开的化合物的所有互变异构形式。互变异构体的确切比例取决于若干因素，包括温度、溶剂和 pH。互变异构体相互转化的一些实例包括：



[0094] 本文所公开的化合物的“代谢物”为当化合物被代谢时所形成的该化合物的衍生物。术语“活性代谢物”指化合物被代谢时所形成的该化合物的生物活性衍生物。如本文所使用的，术语“代谢”指通过其使特定物质被生物体所改变的过程（包括但不限于，水解反应和由酶催化的反应，如氧化反应）的总和。因此，酶可产生化合物的特定结构改变。例如，细胞色素 P450 催化多种氧化和还原反应，而尿苷二磷酸葡糖醛酸基转移酶催化活化的葡糖醛酸分子转变为芳香醇、脂肪族醇、羧酸、胺和游离巯基。关于代谢的进一步信息可从 The Pharmacological Basis of Therapeutics, 第九版，McGraw-Hill(1996) 中获得。本文所公开的化合物的代谢物可通过以下方法来鉴定：将化合物施用于宿主并对来自该宿主的组织样品进行分析，或将化合物与肝细胞在体外温育并对所得化合物进行分析。这两种方法都是本领域公知的。在一些实施方案中，化合物的代谢物通过氧化过程形成，并对应于相应的含羟基化合物。在一些实施方案中，化合物被代谢成药理活性代谢物。

多晶型物

[0200] 在一些实施方案中，本文所述的化合物以多晶型物的形式存在。本发明提供通过施用此类多晶型物来治疗疾病的方法。本发明进一步提供通过以药物组合物形式施用此类多晶型物来治疗疾病的方法。

[0201] 因此，本文所述的化合物包括其所有结晶形式，称为多晶型物。多晶型物包括化合物的具有相同元素组成的不同晶体堆积排列。在某些情况下，多晶型物具有不同的X-射线衍射图案、红外光谱、熔点、密度、硬度、晶体形状、光学和电学性质、稳定性和溶解度。在某些情况下，诸如再结晶溶剂、结晶速率和储存温度等各种因素使单一晶体形式占优势。

前药

[0202] 在一些实施方案中，本文所述的化合物以前药的形式存在。本发明提供通过施用此类前药来治疗疾病的方法。本发明进一步提供以药物组合物形式施用此类前药来治疗疾病的方法。

[0203] 前药一般为药物前体，其在施用于个体且随后吸收后经由诸如通过代谢途径转化的某一过程转化为具有活性或活性更强的物质。一些前药在前药上具有使其活性较低和/或赋予药物溶解性或一些其他性质的化学基团。一旦化学基团从前药上裂解和/或修饰，即产生活性药物。因为在一些情况下前药比母体药物更易于施用，前药通常为可用的。例如，它们可通过口服施用而可生物利用，而母体药物则不能。在某些情况下，前药在药物组合物中也具有比母体药物改善的溶解度。前药的一个实例是但不限于如本文所述的化合

物，其以酯的形式（“前药”）施用以促进跨过其中水溶性对移动性不利的细胞膜输送，但其随后一旦在水溶性有利的细胞内部则代谢水解成羧酸（活性实体）。前药的另一实例可以是与酸基团键合的短肽（聚氨基酸），其中该肽经代谢以显露活性部分。（参见例如 Bundgaard，“Design and Application of Prodrugs”，A Textbook of Drug Design and Development，Krosgaard-Larsen 和 Bundgaard 编，1991，第 5 章，113-191，其通过引用并入本文）。

[0204] 在一些实施方案中，前药被设计成可逆性药物衍生物，以用作提高药物向位点特异性组织输送的调节剂。迄今为止，前药的设计是为了提高靶向以水为主要溶剂的区域的治疗性化合物的有效水溶性。

[0205] 在一些实施方案中，前药是本文公开的化合物的 C_1-C_6烷基酯。

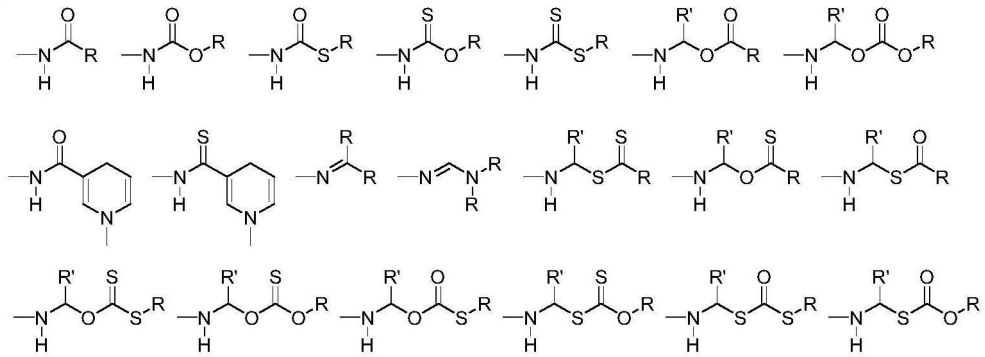
[0206] 另外，本文所述化合物的前药衍生物可通过本文所述或本领域已知的方法制备（关于更多细节，请参见 Saulnier 等人，Bioorganic and Medicinal Chemistry Letters，1994，4，1985）。仅举例而言，可通过使未衍生化的化合物与诸如但不限于氯甲酸 1，1- 酰氧基烷基酯、碳酸对硝基苯基酯等合适的氨基甲酰化试剂反应来制备适当的前药。本文所述化合物的前药形式（其中前药在体内代谢产生如本文所述的衍生物）包括在权利要求书的范围内。实际上，一些本文所述的化合物为另一衍生物或活性化合物的前药。

[0207] 在一些实施方案中，前药包括其中氨基酸残基或具有两个或两个以上（例如 2、3 或 4 个）氨基酸残基的多肽链经由酰胺键或酯键共价连接至本发明化合物的游离氨基、羟基或羧酸基团的化合物。氨基酸残基包括但不限于 20 种天然存在的氨基酸，并且也包括 4- 羟基脯氨酸、羟赖氨酸、锁链赖氨酸 (demosine)、异锁链赖氨酸、3- 甲基组氨酸、正缬氨酸、β - 丙氨酸、γ - 氨基丁酸、瓜氨酸、高半胱氨酸、高丝氨酸、鸟氨酸和甲硫氨酸砜。在其他实施方案中，前药包括其中核酸残基或具有两个或两个以上（例如 2、3 或 4 个）核酸残基的寡核苷酸共价连接至本发明化合物的化合物。

[0208] 本文所述化合物的药学上可接受的前药也包括但不限于酯、碳酸酯、硫代碳酸酯、N- 酰基衍生物、N- 酰氧基烷基衍生物、叔胺的季铵化衍生物、N- 曼尼希碱、席夫碱、氨基酸偶联物、磷酸酯、金属盐和磺酸酯。具有游离氨基、酰胺基、羟基或羧基的化合物可转化为前药。例如，游离羧基可衍生为酰胺或烷基酯。在某些情况下，所有这些前药部分中引入包括但不限于醚、胺和羧酸官能团的基团。

[0209] 羟基前药包括酯，诸如但不限于酰氧基烷基（例如酰氧基甲基、酰氧基乙基）酯、烷氧基羰氧基烷基酯、烷基酯、芳基酯、磷酸酯、磺酸酯、硫酸酯和含有二硫化物的酯；醚、酰胺、氨基甲酸酯、半琥珀酸酯、二甲基氨基乙酸酯和磷酰基氧基甲氧基羰基，如 Advanced Drug Delivery Reviews 1996，19，115 中所概述的。

[0210] 胺衍生的前药包括但不限于以下基团和基团的组合：



以及磺酰胺和磷酰胺。

[0211] 在某些情形下，在任何芳香环部分上的位点易发生各种代谢反应，因此在芳香环结构上并入合适的取代基可减少、最小化或消除该代谢途径。

实施例 2：细胞活力试验

[0279] 以每孔 10,000 个细胞的密度将人 MSC、软骨细胞、成骨细胞和滑膜细胞接种到

384 孔板中。以 100μM 的终浓度加入化合物。将细胞培养 48h。使用 EnVision 读板仪 (PerkinElmer) 通过 Cell Titer-Glo(Promega) 试验分析细胞活力。使用 EnVision 读板仪 (PerkinElmer) 通过胱天蛋白酶 3/7-Glo(Promega) 试验分析凋亡活性。

实施例 3 :在大鼠中经由关节内注射的 PK 研究

[0280] 将 30μl 化合物溶液 (100μM,在含有 0.1% DMSO 的 PBS 中) 注射到每只大鼠的右膝的关节间隙内。动物在注射后 1、3、4、6、7、8、9 和 10 小时放血。给药后 2 或 12 小时处死动物。收集所注射的膝的血浆和关节灌洗液。使用 LCMS 分析所注射的化合物的量。

实施例 4 :大鼠内侧半月板撕裂 (MMT) 骨关节炎 (OA) 模型

[0281] 经手术撕裂每只动物的右膝的内侧半月板以诱发 OA。化合物溶液 (30μl, 100μM,在含有 0.1% DMSO 的 PBS 中) 的给药在手术后 7 天开始,每周一次剂量,持续三周。就在给药前每周监测体重和步态缺陷。在手术后第 28 天处死动物。对经手术的膝关节进行处理,并对软骨进行组织化学染色,并评价软骨。

[0282] 在 5% 甲酸脱钙剂中 4-6 天后,将经手术的关节沿额面切成两个大致相等的半部并在石蜡中包埋。以大约 200μm 的步级从每个经手术的右膝 (g1-8) 切成三个切片,并用甲苯胺蓝染色。第 1 组的左膝和第 9 组的右膝制备单一切片并用甲苯胺蓝染色。

[0283] 通过显微术分析每个经手术的膝的所有三个切片。针对总体软骨退化、蛋白聚糖损失、胶原损伤和骨赘形成,确定对于每一个载片上的两个半部而言最坏的情形。然后将每个参数的值在三个切片之间进行平均,以确定整体主观得分。

[0284] 另外,对于一些参数 (以下指出),通过将每个切片分成三个区带 (1- 外部,2- 中部,3- 内部) 考虑跨胫骨坪的区域性差异。在手术 OA 模型中,外部 (z1) 和中部 (z2) 各三分之一受到最严重的影响,而在内部三分之一 (z3) 上存在较轻的变化。当单独对区带进行评分时,基于受影响区带的面积百分比分配得分。使用目镜测微计描绘区带面积。

[0285] 对以下参数进行测量和 / 或评分 :

[0286] 总体软骨退化包括软骨细胞死亡 / 损失、蛋白聚糖损失和胶原损失或纤颤 (fibrillation) 的重要参数。对于每个区带,使用以下标准将胫骨中的软骨退化评分为从无到重度的 (数值 0-5) :

• 0 = 无退化

• 1 = 最小的退化,在该区带内,5-10% 的基质由于显著的软骨细胞损失 (大于正常细胞密度的 50%) 而呈现为非存活的。PG 损失通常存在于细胞损失的这些区域中,且可能存在胶原基质损失。

•2 = 轻度退化,在该区带内,11-25% 的基质由于显著的软骨细胞损失 (大于正常细胞密度的 50%) 而呈现为非存活的。PG 损失通常存在于细胞损失的这些区域中,且可能存在胶原基质损失。

•3 = 中度退化,在该区带内,26-50% 的基质由于显著的软骨细胞损失 (大于正常细胞密度的 50%) 而呈现为非存活的。PG 损失通常存在于细胞损失的这些区域中,且可能存在胶原基质损失。

•4 = 明显退化,在该区带内,51-75% 的基质由于显著的软骨细胞损失 (大于正常细胞密度的 50%) 而呈现为非存活的。PG 损失通常存在于细胞损失的这些区域中,且可能存在胶原基质损失。

• 5 ＝重度退化，在该区带内，76-100％的基质由于显著的软骨细胞损失（大于正常细胞密度的 50％）而呈现为非存活的。PG 损失通常存在于细胞损失的这些区域中，且可能存在胶原基质损失。

在一些情况下，可以使用图像分析来确定每个区带或所选的区带中确切的基质活力和 / 或损失％，以使得可以比较绝对％而不是得分 (0-5)。除了表示每个区带的数据外，还计算了软骨退化的 3 区带总和。

[0287] 相同的过程应用于对股骨软骨的评价，不同之处是不基于区带分析病变，因为病变通常不以区带模式分布在整个表面上。确定承载负荷的表面的总宽度（对于股骨为约 2000μm) 并将上述标准应用于受到最严重影响的 1/3、2/3 或 3/3。例如，如果总面积的 1/3（病变可以处于覆盖约 667μm 的坪的中心）具有最小的退化（总面积的 5-10％具有软骨细胞和 / 或基质的损失），则分配得分 1。如果该最小的退化在整个表面上延伸 (3/3)，则分配得分 3。如果整个股骨软骨由于严重的扩散退化而不存在，则得分为 15。

[0288] 除这种整体软骨退化得分外，还单独对胶原基质损伤进行了评分，以便确定药剂的更具体的影响。跨内侧胫骨坪的胶原损伤（两个半部的受到最严重影响的切片）通过测量以下的总宽度来量化：

• 任意损伤（从浅表到完全厚度损失的纤颤）

• 重度损伤（胶原全部损失或接近全部损失至潮标 (tidemark)，>90％厚度）

• 明显损伤（延伸穿过软骨厚度的 61-90％）

• 中度损伤（延伸穿过软骨厚度的 31-60％）

• 轻度损伤（延伸穿过软骨厚度的 11-30％）

• 最小损伤（极浅表，仅影响上面 10％）

[0289] 除了以上的主观总体软骨评分外，还进行了两个软骨退化宽度测量：

• 总胫骨软骨退化宽度（μm)是胫骨坪受到任何类型的退化（细胞损失、蛋白聚糖损失或胶原损伤）影响的总程度的测微计测量值。该测量从具有相邻软骨退化的骨赘的起点（外部 1/3) 跨过表面延伸到切向层和下方软骨在组织学上表现为正常处的点。

• 实质软骨退化宽度（μm)反映软骨细胞和蛋白聚糖损失都延伸穿过大于软骨厚度的 50％的胫骨软骨退化区域。通常，对于该参数，胶原损伤是轻度的 (25％深度）或更大的，但是软骨细胞和蛋白聚糖损失延伸到软骨深度的至少 50％或更大。

[0290] 任何类型的病变（软骨细胞和蛋白聚糖两者的损失，但是可具有胶原基质的良好保留且没有纤颤）的测微计深度，表示为变化的区域深度相对于至潮标的深度的比值，在区带中点处跨过胫骨表面的三个区带中每一个的最大病变严重程度的区域中获得。该测量是对存在的任何类型的微观变化的最关键分析。在区带的中点进行测量时，分母可充当三个区带中的每一个的软骨厚度的平均量度以用于比较合成代谢。

[0291] 骨赘的评分以及分类（分类为小、中和大）使用目镜测微计进行。为了能够测量并指定为骨赘，边缘区增生变化必须≥ 200μm。根据以下标准向每个切片中的最大骨赘（一般在胫骨中发现）分配得分：

• 1 ＝小，可达 299μm

• 2 ＝中度，300-399μm

• 3 ＝大，400-499μm

• 4 ＝极大，500-599

• 5 ＝极大，≥ 600

还记录了实际的骨赘测量（潮标至朝向滑膜延伸的最远距离点）。

[0292] 将股骨软骨退化得分和胫骨软骨退化得分的三区带总和（三个水平的平均值）加起来以形成总软骨退化得分。向该值增加每个关节的平均骨赘得分以产生总关节得分。

图像分析

[0293] 为了量化和比较软骨基质保持，从每只动物的受到最严重影响的切片进行软骨面积测量。用 CoolSNAP-Pro 显微照相机拍摄显微照片并加载到 ImagePro Plus 软件中。从这些显微照片的描记进行下列测量，每页四个，其包括在报告中：

• 在 9cm（显微照片）胫骨坪上从潮标到表面（或退化的区域中凸出的表面）的总面积，从骨赘的内缘测量

• 总面积内非存活基质（具有少于 50％软骨细胞、蛋白聚糖和完整胶原的软骨）和无基质的面积

• 总面积内无基质的面积

从总面积中减去非存活基质的面积以得到活基质的面积，并且从总面积中减去无基质的面积以得到任何基质（含有或不含软骨细胞和蛋白聚糖的胶原基质）的面积。这两个值然后回过来与总面积进行比较，以得出活基质面积百分比和任何基质面积百分比，它们在组间进行比较。该过程中包括来自载体组的五个左膝作为正常对照。该过程可以用来根据病变的严重程度和明显的治疗效果来分析整个表面或选择的区带。

[0294] 滑液反应如果是异常的，则在炎症类型和程度方面进行描述（应当主要是纤维化）和表征，但不包括在 OA 得分中。

[0295] 钙化的软骨层和软骨下骨的损伤（对于所有切片最坏的情形）使用以下标准来评分：

• 0 ＝无变化

• 1 ＝在潮标处增加的嗜碱性粒细胞增多，潮标无破碎，无骨髓改变或者如果存在则是最小的和局灶性的

• 2 ＝在潮标处增加的嗜碱性粒细胞增多，潮标的钙化软骨有最小到轻度的局灶性破碎，骨髓中的间质变化涉及总面积的 1/4，但通常局限于病变下的软骨下区域

•3 ＝在潮标处增加的嗜碱性粒细胞增多，钙化软骨有轻度到明显的局灶性或多灶性破碎（多灶性），骨髓中的间质变化涉及总面积的最多 3/4，骨髓软骨形成的面积可以是明显的，但关节软骨没有大量瓦解为骨骺骨（表面中明确的凹陷）

• 4 ＝在潮标处增加的嗜碱性粒细胞增多，钙化软骨有明显的到重度的破碎，骨髓间质变化涉及面积的最多3/4，且关节软骨已经瓦解为骨骺，距潮标的深度为250μm或更少（表面软骨中可见明确的凹陷）

• 5 ＝在潮标处增加的嗜碱性粒细胞增多，钙化软骨有明显的到重度的破碎，骨髓间质变化涉及面积的最多 3/4，且关节软骨已经瓦解为骨骺，距潮标的深度大于 250μm

另外，对切片的非切向区中的内侧滑液 / 侧副韧带修复的厚度进行了测量。

[0296] 所有膝在内侧和侧面上 (2 次测量 / 关节)，在内侧和侧面骨骺的近似中点处测量了生长面厚度（假定切片的非切向区）。

实施例 5 :关节和血浆大鼠样品中软骨形成化合物的提取和量化

[0297] 针对软骨形成化合物的 LC-MS/MS 分析使用配备有 Agilent 1100HPLC 和 Leap Technologies 自动进样器的 API 3000 来进行。使用 HPLC Phenomenex 5 微米,100A Luna C18(2) 分析柱,尺寸为 2.0x 50mm(货号 00B-4252-B0),温度为 30℃,流速为 0.6mL/min,注入体积为 10uL,运行时间为 6.0min。流动相 A1 为 0.1% 甲酸水溶液,流动相 B1 为 0.1% 甲酸的乙腈溶液。梯度在时间 0 时为 90% A1/10% B1 ;时间 1.0min 时为 90% A1/10% B1 ;时间 2.0min 时为 10% A1/90% B1 ;时间 4.0min 时为 10% A1/90% B1 ;时间 4.10min 时为 90% A1/10% B1 ;时间 6.0min 时为 90% A1/10% B1。分析物和内部标准的量化使用多反应监测 (Multiple Reaction Monitoring)(MRM) 定量法来进行。以下列出了用来给药并测量血浆中的暴露的具体方法以及观察到的在关节提取物中的浓度。

[0298] 大鼠血浆样品 :通过在对照大鼠血浆中连续稀释浓缩的、掺加的化合物溶液来制作校准标准曲线。通过向标准和样品的每个等分试样中添加乙腈和内部标准的等分试样经蛋白质沉淀制备校准标准和大鼠血浆样品。在涡旋混合和离心后,来自每个标准和样品的上清液的等分试样用甲酸水溶液稀释,混合并注入。在 IA 给药后采集的所有血浆样品 (在 t = 0、0.5、1、2、4 和 6h 开始) 都表明,对于表 2 中列出的任何化合物没有全身性暴露。

[0299] 大鼠膝关节样品 :通过在内部标准稀释剂中连续稀释浓缩的、掺加的化合物溶液来制作校准标准曲线。内部标准稀释剂通过将内部标准化合物以特定浓度溶解在乙腈中来制备。单独压碎每个时间点的大鼠膝关节样品并将其转移到每个离心管中,并添加 1.0-mL 内部标准稀释剂。将每个离心管涡旋并离心 30 分钟。从每个管中移取上清液并注入到柱上以供分析。另外,通过眼眶后放血到肝素涂覆的管中获得血浆样品并储存在 -80℃,稍后与以上针对大鼠血浆样品所述的方案类似地进行处理。

[0300] 化合物施用与组织处理 :将 30 μL 的 100 μM 化合物溶液 (含有 0.1% DMSO 的 PBS) 注射到每只动物的右后膝的关节内间隙中。在所示的时间点 (0hr、0.5hr、1hr、2hr、4hr 和 6hr) 对动物施以安乐死。每个时间点使用四只动物。收获经注射的膝关节,在液氮中骤冻。将整个关节在冷冻下研磨成粉末,与 1mL 含有内部标准的乙腈混合,并在 4℃下温育过夜,涡旋,并离心 30min。使用 LC-MS/MS 分析每个样品的上清液。表 2 中显示的数据表示了在膝提取物中观察到的浓度。ND = 未测定。
