To all whom it may concern:

Be it known that I, Edward B. T. Schumacher, a citizen of the United States of America, residing at Detroit, in the county of Wayne and State of Michigan, have invented certain new and useful Improvements in Combined Tobacco-Can, Ash-Trays, and Cigar-Holders, of which the following is a specification, reference being had therein to the accompanying drawings.

The invention relates to tobacco cans, and it is the object of the invention to obtain a construction which may be used as an ash tray and cigar holder, as hereinafter set forth.

In the drawings: Figure 1 is a side elevation of the device; Fig. 2 is a plan view thereof; and Fig. 3 is a vertical central section.

A is the body of the can or holder, which is preferably of cylindrical form, being provided at its lower end with a suitable ornamental base B, and at its upper end with a bead C against which the cover of the can seats.

D is the can cover having a depending cylindrical flange E for telescopically engaging the upper end of the body A and resting upon the bead C. The top of this cover is formed with a centrally depressed concave portion G surrounded by the raised annular portion H, which latter has the rounded portion I merging into the flange E.

J are curved depressions in the raised portion H which extend radially, and are of dimensions suitable for receiving a cigar.

In use, the cover D has an ornamental appearance, and at the same time in addition to its function as a closure for the can may be used as an ash tray and cigar holder. Thus cigars laid in the grooves J with their lighted ends extending inward will drop the ash into the concave depression G.

What I claim as my invention is:

1. The combination with a tobacco container, of a cover therefor, provided with a depending flange for telescopically engaging the container, the central portion of said cover being depressed to form an ash receptacle, and a wide marginal portion being formed between said depressed portion and flange, said marginal portion of the cover being formed with a radial depression extending from the periphery of the cover to said central depression.

2. The combination with a tobacco container, of a cover therefor having a depending annular flange for telescopically engaging the container, the juncture of the top and flange of the cover being rounded, the central portion of the cover being depressed to form an ash receptacle, and a wide marginal portion being formed between said depressed portion and flange, said marginal portion being formed with a radial depression extending from the periphery to the central depression of the cover.

In testimony whereof I affix my signature in presence of two witnesses.

Edward B. T. Schumacher.

Witnesses:

Wm. J. Belknap,
Phyllis Coburn.
