COMBINATION SLEEVE AND MITTEN

Max Wohl, Morris Cohen, and Irving J. Roitman,
Chicago, Ill.

Application May 24, 1941, Serial No. 394,978

5 Claims. (Cl. 2—270)

This invention relates to a combined sleeve and mitten for garments.

One of the objects of this invention is the provision of a mitten or glove which will be permanently attached to the sleeve of a garment so that it cannot be lost by the wearer of the garment.

Another object of this invention is the provision of a mitten or glove of the foregoing character which when not in use may be very readily disposed of by folding same in the sleeve of the garment without causing the garment to appear unsightly.

A further object of this invention is the provision of a combined sleeve and mitten which is serviceable and attractive in appearance.

With these and other objects in view, the invention consists in certain novel features of construction, combination and arrangement of parts to be more fully described and claimed.

Referring to the drawing in which like reference characters indicate like parts:

Fig. 1 is a perspective view of an embodiment of my invention showing the mitten in position for use.

Fig. 2 is another perspective view showing the mitten in the first step of folding same into the sleeve.

Fig. 3 is another perspective view showing, in dotted lines, the mitten folded back into the sleeve, and having parts broken away to show details of construction.

Fig. 4 is an elevational view showing the mitten in position for use, and having parts broken away to show in section details of construction.

Referring to the drawing wherein is shown a preferred embodiment of our invention, the numeral 5 indicates, generally, a garment sleeve to which is connected a mitten indicated, generally, by the numeral 7. It is to be understood that the term "mitten" is to include a glove or any form of hand covering.

The sleeve 5 is of conventional or approved design and is comprised of top and under sections 8 and 9 respectively. The under section 9 terminates at the cuff line 10, while the top section 8 has a continuation which forms the back 11 of the mitten. While this integral construction is preferable, it will be understood that the top section and the continuation may be formed of separate pieces joined as by a line of stitching. Secured to the marginal edges of the back 11 is a complementary member 12 which with the member 11 forms an envelope to receive the hand of a wearer. The mitten 7 is not connected with the sleeve 5 over its whole circumference, but only along the top section 8 of the sleeve. The mitten and the under section 9 of the sleeve are disconnected and an opening 14 is formed therebetween, the opening extending circumferentially over the under section of the sleeve.

An opening 15 is provided in the top section 8 of the sleeve proximate to the cuff line 10a and extends circumferentially thereover. A flap 16 connected to the upper marginal edge of the opening 15 is provided with a buttonhole 17 and is secured in position by a button 19 carried on the top section 8. A lining 20 is secured interiorly of the sleeve at the cuff line and at the lower marginal edge 21 of the opening 15 and forms with the top section 8, a pocket 22 arranged to accommodate the mitten 7, as will be hereinafter described.

When it is desired to wear the garment without using the mittens, each of the mittens may be folded back along the cuff line 10a, shown by the dotted line in Figure 2, and tucked into the pocket 22 through the opening 15. The pocket 22 extends to a length greater than that of the mitten 7 so that the mitten can lie therein without requiring the same to be folded. A button 19' is provided on the face 12 of the mitten and is engageable with a buttonhole 17 when the mitten is accommodated in the pocket 22. This serves to retain the mitten in out of use position and eliminates the danger of the mitten being pulled out of the pocket. When the mitten is in folded back position, as shown in Figure 3, the marginal edge 24 of the face of the mitten lies substantially contiguous to the cuff line 10a, and a very neat and attractive appearance is presented without any bulge or deformation of the sleeve.

While a mitten is shown in the drawing, it will be understood that a glove having a pocket for each finger or any other suitable hand covering may be used.

We claim:

1. An article of the character described comprising a sleeve and a mitten connected thereto on a portion of its circumference, a pocket formed on the inside of the sleeve adjacent to the side on which the sleeve is joined with the mitten, said sleeve having a transverse opening extending across said sleeve and communicating with said pocket, and a closure flap for said opening, said mitten when not in use being adapted to be folded back and to be received in said pocket, and fastening means on said mitten en-

gaging said flap for maintaining said mitten in said pocket.

2. An article of the character described comprising a sleeve and a mitten connected thereto on a portion of its circumference, a pocket formed on the inside of the sleeve adjacent to the side on which the sleeve is joined to the mitten, said sleeve having a transverse opening above the lower edge of said sleeve and said opening communicating with said pocket, said mitten when out of use being adapted to be folded back and to be received in said pocket, and means for maintaining said mitten in said pocket with the marginal edge of the face of the mitten exposed and substantially contiguous with the lower edge of the sleeve.

3. An article of the character described comprising a sleeve formed of top and under sections, the said top section having a continuation forming the back of a mitten adapted to receive the hand of a wearer, a pocket formed on the inside of the sleeve adjacent the top section, said top section having an opening extending substantially across the width thereof and communicating with said pocket, a closure flap for said opening, said mitten when out of use being adapted to be folded back and to be inserted through said opening and to be received in said pocket, and flap engaging means on the face of said mitten for maintaining said mitten in said pocket.

4. An article of the character described comprising a sleeve and a mitten connected thereto, said sleeve being formed of top and under sections and having a lining forming with said top section a pocket, the said top section having a continuation forming the back of said mitten, and having an opening therein communicating with said pocket, a closure flap for said opening, complementary disengageable fastening means carried on said flap and on the face of said mitten, said mitten when out of use being adapted to be folded back and to be received in said pocket with the said flap overlying a portion of the face of said mitten and disengageably secured thereto.

5. An article of the character described comprising a sleeve and a mitten connected thereto, said sleeve being formed of top and under sections and having a lining forming with said top section a pocket, a transverse opening extending across the top section above the lower edge of said sleeve and communicating with said pocket, a closure flap for said transverse opening, said mitten when out of use being adapted to be folded back and to be received in said pocket with the marginal edge of the face of the mitten substantially contiguous with the lower edge of the sleeve and the said flap locking said mitten out of use.
