ELBOW TREATMENT DEVICE

Alice A. Bergholt, Addison, Ill.

Application September 26, 1955, Serial No. 536,503

3 Claims. (Cl. 128—57)

My invention relates to a device detachably mounted on a chair in a beauty shop for resting an arm of a customer and at the same time providing means for treatment of her elbow.

Among the objects of my invention is to provide a device which will enable a customer to have her elbows treated in a beauty shop even while she is waiting for her hair to dry; to supply a device for resting the arms of a customer and permitting treatment of her roughened elbows; to create an elbow treatment and an arm resting member detachably mounted to a chair in a beauty parlor.

My invention also contemplates such other objects, advantages and capabilities as will later more fully appear and which are inherently possessed by my invention.

While I have shown in the accompanying drawings a preferred form of my invention, yet I which it understood that the same is susceptible of modification and change without departing from the spirit of my invention.

Referring to the drawings, Fig. 1 is a front elevational view showing a part of my device; Fig. 2 is an enlarged front elevational view of my elbow treatment device; Fig. 3 is a side elevational view of the same; Fig. 4 is a sectional view on line 4—4 of Fig. 2; Fig. 5 is a top plan view; Fig. 6 is a top plan view with the arm and container removed; Fig. 7 is a detailed sectional view of the container and ball; and Fig. 8 is a top plan view of the container and ball.

The embodiment selected to illustrate my invention comprises a body member or platform **10** having a pair of spaced U-shaped clamps **11** for fitting over the arm of a chair. Each clamp **11** is screw threaded to receive a screw threaded bolt **12** for holding the clamp on the chair. Slidably mounted on said platform **10** is a slidable member **13**. A retaining portion **14** of said platform **10** is adapted for holding the slidable member **13** against accidental displacement. Removably mounted on said slidable member **13** is a cup **15**. Within said cup is removably held my liquid or salve solution for treating roughened elbows. A soft ball or pad **16** of sponge rubber or other soft porous material is rotatably mounted in cup **15** and held therein by cap **17** removably screw threaded to cup **15**. Pivotally attached to platform **10** is a horse shoe shaped arm rest **18**, divided to permit the elbow to pass therethrough to cup **16**.

In use of my device let us say that a customer in a beauty shop, has just had her hair washed. She is seated under a dryer. Ordinarily this time spent is a loss to the beauty parlor, because the customer usually reads. With my device this time may be used. Many women have roughened elbows. My device may be attached to the chair in which the woman is seated by clamps **11**. The woman's arm rests on arm rest **18** and her elbow contacts ball **17** and moves it around. If ball **17** is not used, the woman's elbow is positioned in the solution or salve in cup **15**. The treatment continues while her hair is drying and the woman receives an elbow smoothing treatment, and the beauty shop another chargeable operation.

Having thus described my invention, I claim:

1. An elbow treatment device comprising a body member, clamping means attached to said body member for attaching the device to the arm of a chair, a slidable member slidably mounted on said body member, a container removably mounted on said slidable member and adapted to hold elbow treating means, an arm rest pivotally attached to said body member and adapted to receive the arm of a user and permit the elbow of the user to contact the treating means in the container.

2. An elbow treatment device comprising a platform, a pair of spaced clamping members attached to said platform and adapted to removably engage the arm of a chair, a slidable member slidably mounted on said platform, a cup removably mounted on said slidable member and adapted to hold elbow treating liquid or salve, an arm rest hingedly attached at one end to said platform and adapted to lift up above said platform, said arm rest having a pair of side portions upon which the arm of a user may be rested and having an opening through which the arm of the user may extend to the liquid or salve in the cup.

3. An elbow treatment device comprising a platform, a pair of spaced clamping members attached to said platform and adapted to removably engage the arm of a chair, a slidable member slidably mounted on said platform, a cup removably mounted on said slidable member and adapted to hold elbow treating medicine, a soft member removably positioned in said cup, an arm rest hingedly attached at one end to said platform and adapted to lift up above said platform, said arm rest having a pair of side portions upon which the arm of a user may be rested and having an opening through which the arm of the user may extend to move the soft member for receiving medicine from the cup.
