Technical field

This disclosure relates generally to balloons for performing medical procedures, such as angioplasty and, more particularly, to a medical balloon having a coextruded radiopaque portion.

Background of the Invention

Balloons are routinely used to resolve or address flow restrictions or perhaps even complete blockages in tubular areas of the body, such as arteries or veins. In many clinical situations, the restrictions are caused by hard solids, such as calcified plaque, and require the use of high pressures to compact such blockages. Commercially available balloons employ complex technology to achieve high pressure requirements without sacrificing the profile of the balloon. Besides high pressure requirements, the balloons should also be resistant to puncture, easy to track and push, and present a low profile, especially when used for angioplasty.

In clinical practice, angioplasty balloons are expanded from a deflated, folded state to an expanded state within a vessel to treat a target area, such as a portion of the circumferential inner wall I of a blood vessel V, as shown in Figures 1 and 2. The inflation of a balloon 12 with wall 28 is traditionally completed using an X-ray contrast agent CM along dimension DX to provide better visibility under X-ray or other form of radiography R during the interventional procedure, as illustrated in Figures 3 and 3a (which shows the intensity measured by a fluoroscope detector plate, FDP). Typically, a 70/30 percent mixture of contrast agent and saline is used to inflate the balloon during an angioplasty procedure.

In general, a desirable goal is to reduce inflation and deflation times required for balloons without sacrificing the profile of the balloons, especially for large volume balloons (which can require up to two minutes of inflation/deflation times with the contrast agent). Because of its relatively high viscosity, it would also be desirable to eliminate, or at least reduce the amount of, the contrast agent used in inflation/deflation of the balloons. The use of contrast agent prolongs the inflation/deflation times and also poses the risk of iodine exposure to patients sensitive to iodine. In this regard, a non-radiopaque substance could be used in lieu of the contrast agent, such as for example saline or carbon dioxide, but such substances are invisible during X-ray imaging, and thus do not enhance visibility.

Furthermore, the physician performing the angioplasty procedure should be able to locate the position of the uninflated balloon with accuracy, so that the balloon will be properly positioned once inflated.
This is conventionally accomplished by attaching marker bands on the catheter shaft in the region corresponding to the balloon working surface. This "working surface" is the surface along the portion of the balloon that is used to achieve the desired treatment effect, such as contacting the calcified plaque (which surface in the case of a balloon having conical or tapering sections at the proximal and distal ends is typically co-extensive with a generally cylindrical barrel section).

Misalignment of the marker bands during placement along the shaft sometimes results in their failure to correspond precisely to the extent of the working surface, as is shown in Figure 4 (note misalignment amount X between each interior marker band M carried by shaft S and working surface W of balloon 12, which also typically includes a radiopaque tip P at the distal end). Even upon exercising great care to position the markers properly on the underlying shaft in alignment with anticipated boundaries of the working surface when the balloon is inflated, there remains a tendency for mismatch due to several possible factors. One such factor may be the tolerance stack-ups arising as a consequence of the affixation of the balloon to the distal end of the catheter shaft. The balloon also has a tendency to grow in the longitudinal direction when inflated, especially with large and particularly long balloons. Another factor is the tendency of the portion of the catheter shaft within the balloon to bend or flex during inflation. This may lead to misalignment between radiopaque markers fixed to the shaft and the working surface.

Whatever the cause, the resulting misalignment may prevent the clinician from accurately identifying the location of the working surface of the balloon during an interventional procedure. This may lead to a geographic misplacement, or "miss," of the intended contact between the target area T and the working surface W of the balloon 12 (see Figure 2). It is especially desirable to avoid such an outcome when the balloon is designed to deliver a payload (such as a drug, stent, or both) or a working element to a specified location within the vasculature, since a miss may prolong the procedure (such as, for example, by requiring redeployment of the balloon 12 or the use of another balloon catheter in the case of a drug coated balloon).

Upon deflation, the balloon may also be subject to a phenomenon known as "pancaking." In this condition, the balloon 12 folds down upon itself to a flattened state, as shown in Figure 5. This situation may cause the balloon to be viewed through fluoroscopy as perhaps still being in the inflated condition, since the full width of the balloon may still be perceived. This can give the clinician the false perception that the balloon remains inflated, when in fact it is not.

Accordingly, the need is identified for a balloon for which the working surface may be identified during an interventional procedure with enhanced precision. The solution would take into account the possible mismatch between fixed locations on the catheter shaft and the balloon to define the working surface, and would operate independent of the position of the portion of the catheter shaft within the balloon. The improved identification may also allow for the better detection of the false perception of deflation caused by pancaking. Overall, procedural efficiency would be enhanced without remarkably increasing cost or
complexity, and in a manner that can be applied to many existing catheter technologies without extensive modification.

**Summary of the Invention**

An object of the disclosure is to provide a balloon having a coextruded radiopaque portion.

**Brief Description of the Drawings**

Figures 1-9 are illustrative of the background of the invention;
Figure 10 illustrates a first embodiment according to the disclosure;
Figure 11 illustrates a second embodiment according to the disclosure;
Figures 12 and 12a are cross-sectional views of certain embodiments;
Figure 13 illustrates a third embodiment according to the disclosure;
Figure 14 illustrates a fourth embodiment according to the disclosure;
Figure 15 illustrates the embodiment of Figure 14 in a folded condition;
Figure 16 illustrates a fifth embodiment according to the disclosure;
Figures 17 and 18 illustrate a sixth embodiment according to the disclosure;
Figure 19 illustrates a manufacturing technique;
Figures 20-23 illustrate various embodiments according to the disclosure; and
Figures 24-28 illustrate other embodiments according to the disclosure.

**Modes for Carrying Out the Invention**

The description provided below and in regard to the figures applies to all embodiments unless noted otherwise, and features common to each embodiment are similarly shown and numbered.

Provided is a catheter 10 having a distal portion 11 with a balloon 12 mounted on a catheter tube 14. Referring to Figures 6, 7, and 8, the balloon 12 has an intermediate section 16, or "barrel," and end sections 18, 20. In one embodiment, the end sections 18, 20 reduce in diameter to join the intermediate section 16 to the catheter tube 14 (and thus sections 18, 20 are generally termed cones or cone sections). The balloon 12 is sealed at balloon ends (proximal end 15a and distal end 15b) on the cone sections 18, 20 to allow the inflation of the balloon 12 via one or more inflation lumens 17 extending within catheter tube 14 and communicating with the interior of the balloon 12.

The catheter tube 14 also includes an elongated, tubular shaft 24 forming a guidewire lumen 23 that directs the guidewire 26 through the catheter 10, and along the distal end of which the balloon 12 may be located. As illustrated in Figure 8, this guidewire 26 may extend through the proximal end of the catheter 10 and a first port 25 of a connector 27 into the lumen 23 to achieve an "over the wire" (OTW) arrangement, but could also be provided in a "rapid exchange" (RX) configuration, in which the guidewire 26 exits a lateral opening 14a closer to the distal end (see Figure 9) or else is fed through the tip distally of the balloon 12 (not shown). A second port 29 may also be associated with catheter 10, such as by way of connector 27, for
introducing a fluid (e.g., saline, a contrast agent, or both) into the interior compartment of the balloon 12 via the inflation lumen.

Balloon 12 may include a single or multi-layered balloon wall 28 forming the interior for receiving the inflation fluid. The balloon 12 may be a non-compliant balloon having a balloon wall 28 that maintains its size and shape in one or more directions when the balloon is inflated. Examples of non-compliant balloons may be found in U.S. Pat. No. 6,746,425 and Publication Nos. US 2006/0085022, US 2006/0085023 and US 2006/0085024, the disclosures of which are hereby incorporated herein by reference. The balloon 12 in such case also has a pre-determined surface area that remains constant during and after inflation, also has a pre-determined length and pre-determined diameter that each, or together, remain constant during and after inflation. However, the balloon 12 could be semi-compliant or compliant instead, depending on the particular use.

In order to provide for enhanced locatability during an interventional procedure, the balloon 12 may have a radiopaque quality. In one embodiment, this radiopaque quality is provided in a manner that allows for a clinician to differentiate, with relative ease and high precision, one portion of the balloon 12 from another (such as, but not limited to, the barrel section 16 including the working surface W from the cone sections 18, 20). This helps the clinician ensure the accurate positioning of the balloon 12 and, in particular, a portion of or the entire working surface W, at a specified treatment location, which may be especially desirable in the delivery of drugs via the balloon working surface W, as outlined in more detail in the following description.

In one embodiment, and with initial reference to Figures 10 and 11, the radiopaque quality is achieved by providing strategically positioned identifiers, such as one or more at least partially radiopaque markings 30. The markings 30 are provided at one or more locations along the balloon 12 to create a defined portion as the working surface W. For example, a marking 30 may be provided extending along the balloon 12 in a longitudinal direction. For instance, the marking 30 may be provided in the form of at least one longitudinal strip 36, as shown in Figure 10. More than one strip 36 may be provided, each being spaced in the circumferential direction, either irregularly or equidistantly (e.g., two strips offset at 180 degrees, three strips offset 120 degrees from each other, four strips offset 90 degrees from each other). For example, Figure 11 may be considered a top plan view of the balloon 12 with transparency (or as it may appear under fluoroscopy) to show the presence of at least three strips (but four would appear substantially similar, if spaced apart equidistantly, with the top and bottom strips align at the twelve and six o'clock positions, respectively). As described in more detail below, the strips 36 may also be formed so as to comprise all or only a portion of the cross-sectional thickness of the balloon wall 28, as shown in Figure 12 (partial) and Figure 12a (full), and may be along an outer or inner surface of the balloon wall 28.

As may be understood by comparing Figures 10 and 11, the one or more strips 36 may extend the entire length L of the balloon 12, or may extend only over a portion of it, such as the working surface W of
the barrel section 16. With reference to Figures 13 and 14, one or more of the markings 30, such as strips 36, may also extend along all or a portion of one or both of the cone sections 18, 20. Indeed, the use of a plurality of strips, 36 such as two, three, or four or more, along one or both of cone sections 18, 20 only may allow the clinician to more readily detect the existence of pancaking, since the strips would appear to be farther apart when the balloon 12 is inflated, and closer when the balloon 12 is deflated (12') and not flattened (compare Figures 14 and 15).

In one or more of these embodiments, the balloon 12 including the radiopaque markings 30 may be formed using co-extrusion techniques. Turning to the schematic depiction in Figure 16, this may be achieved by using an extrusion apparatus 100 including a first die 101 with one or more ports corresponding to the desired number of radiopaque strips 36 in the balloon 12, and a second, adjacent die 102 with ports for providing the carrier material, together arranged to form a tubular coextruded structure. For example, in the case where six ports are provided in the first die 101, the co-extrusion process would form six radiopaque portions 104 in a tubular parison 106, as shown in Figures 17 and 18. The material between the radiopaque portions 104 is the non-radiopaque carrier material 108, which in the illustrated embodiment completely encloses and encases the embedded radiopaque portions 104.

In any case, the parison 106 with the one or more radiopaque portions may be cut to any desired length. The cut parison 106 may then be placed into a mold cavity 150 (such as by separating two mating mold portions) and expanded, such as by blow molding under heat and pressure (Figure 19). The result is the finished, at least partially radiopaque balloon 12 having markings 30, with a shape (e.g., with cone sections 18, 20, and barrel section 16) conforming to the interior contour of the mold cavity (which in the case of only one co-extruded radiopaque portion in the parison, may have the appearance when molded of the balloon 12 in Figure 10).

In another embodiment, a tube 200 may be formed via coextrusion having one or more radiopaque portions 202, as shown in Figure 20 and previously described. This tube 200 may then be bonded to non-radiopaque tubes 204, such as by welding, to create a tubular parison 206 (Figure 21) that is at least partially radiopaque. This parison 206 may then be expanded to form the corresponding balloon 12, such as by blow molding. In the case of a parison 206 having three or four radiopaque portions 204, the resulting expanded balloon 12 (taking into account elongation) may have the appearance of the Figure 11 embodiment, with the working surface W delineated by the resulting strips 36.

An alternative is to provide two tubes 302a, 302b (which may be portions of tube 300), and connect these to the opposed ends of a tube 300 having no added radiopacifier, to create a parison 306 (Figures 22 and 23). Upon being expanded, this parison 306 could form an embodiment of the balloon 12 similar to the one shown in Figure 13. As should be appreciated, the Figure 13 embodiment could also be formed in a similar manner by bonding the tube 300 to a single, co-extruded tube 302a or 302b having a radiopacifier (which, if tube 302a or 302b had three or more radiopaque portions, could be used to create the Figure 14 embodiment).
The balloon 12 with the radiopaque quality may also be formed by coextruding a radiopaque material with a non-radiopaque material together in an overlapping manner to create a multi-layered parison. For example, as shown in Figure 24, a parison 400 may be created by coextruding one or more layers of a radiopaque material 402 with a material 404 without any added radiopacifier. This could be done to form a balloon 12 that is entirely radiopaque along the length L (such as by blow molding the parison 400), or one that is partially radiopaque. For example, as shown in Figure 25, the multi-layered parison 400 could be attached to tubes 406, 408 having no added radiopacifier. The bonded tubes 400, 406, 408 may then be expanded in a mold to create a balloon 12 having a radiopaque quality extending along the working surface W only (Figure 26). Likewise, a tube without any added radiopacifier could be bonded to one or two sections formed as in Figure 24 and blown to create a balloon 12 with the radiopaque markings along one or both of the cone sections 18, 20 (Figure 26a).

In any case, the forming may be done by coextruding the radiopaque-enhanced and non-radiopaque-enhanced materials together in a continuous fashion, as described previously, or an intermittent fashion (such as to provide the strip 36 along the portions of the tube continuously formed to create the cone sections or barrel section of the finished balloon). As noted above with respect to Figures 12 and 12a, strategically selecting the thickness of the coextruded materials may allow for a more precise control of the radiopacity of the strips 36 (e.g., a thicker strip would include more radiopacifier and be more readily discernable). Likewise, such control may be achieved by adjusting the relative amount of radiopacifier in the corresponding material for providing the strips 36 during the co-extrusion process.

Balloons 12 that carry one or more surface elements, such as a payload (drug, stent, or both) or a working implement (cutter, focused force wire, or the like) into the vasculature may also benefit from the foregoing description of marking techniques. For example, as shown in Figure 10, a balloon 12 including a defined working surface W, such as by providing radiopaque markings 30 at the transitions between the barrel section 16 and cone sections 18, 20, may include a portion coated with such a drug D, such as one designed for achieving a desired therapeutic effect when applied to the interior of the vessel. The radiopaque marking 30 may also correspond to the location of the drug D on the balloon 12, such as along the entire working surface W or only a portion of it. The drug D may be applied to the inflated balloon as part of the manufacturing process, and prior to folding for insertion in the vasculature. The clinician may thus with the benefit of a fluoroscope determine the precise positioning of the working surface W prior to inflating the balloon 12 in the vasculature to deliver the drug D to the desired location and provide the desired treatment regimen.

In a further embodiment, a balloon may be formed of a multi-layered structure, such as by coextrusion of a parison 500, so as to provide an outer layer 502 that is radiopaque (Figure 27, cross sectional view), which may extend the full length of the parison (and thus form a balloon 12 that is radiopaque in its entirety) or along only a portion of the balloon. The balloon 12 when inflated may then be etched (by
solvent, acid, laser, or other material removal process) in a regular or irregular pattern 504 to remove a portion of the outer layer 502, such as along all or a portion of the working surface W. As shown in Figure 28, drug D may then be applied to the etched pattern 504, either along the etched portion or the un-etched portion, such as by spraying, painting, coating, or the like. In either case, the extent of the portion of the balloon 12 including the drug D is readily determinable under fluoroscopy during the procedure, as the remaining radiopaque portions permit easy identification for delivery.

Examples of radiopaque materials include, but are not limited to, thermoplastic films including finely divided tungsten, tantalum, bismuth, bismuth trioxide, bismuth oxychloride, bismuth subcarbonate, other bismuth compounds, barium sulfate, tin, silver, silver compounds, rare earth oxides, and many other substances commonly used for X-ray absorption. The polymer used for making these films may be any polymeric material which can be loaded with radiopacifier and formed into a sufficiently thin film. Examples of polymers include thermoplastic and thermoset polymers. Some examples of thermoplastic polymers include, but are not limited to, polyurethanes, polyamides (nylon 11, nylon 12), polyether-polyamide copolymers such as PEBAX, polyethylene terephthalate or other polyesters, polyvinyl acetate, polyvinyl chloride, and many other thermoplastic materials useful for making films. Some examples of thermoset polymers include, but are not limited to, crosslinked polyurethanes, polyureas, epoxies, acrylics, silicones, and many other thermoset materials that can be formed into thin structures, including films.

Any adjacent material, such as the carrier or a layer, may be formed of a compatible material to that used to form the radiopaque portion. This avoids the need for additional processing or the inclusion of a compatibilizer, tie layer or the like. In one embodiment, the radiopaque material comprises expanded polytetrafluoroethylene (ePTFE), which in the form of a strip 36 corresponding to the working surface W may stretch along with the inflation of the balloon 12 and retract on deflation.

The subject matter of each of the paragraphs below citing a balloon or a catheter can be part of a balloon or a catheter respectively that is cited in any of the other paragraphs:

1.1 A balloon catheter, comprising: an elongated, tubular shaft extending in a longitudinal direction, said shaft having a proximal end and a distal end; and an inflatable balloon supported along the distal end of the shaft, the balloon when inflated including first and second spaced conical end sections and a working surface between the conical sections, the balloon further including at least one radiopaque marking identifying the transition from the conical end section to the working surface.

1.2 The catheter of paragraph 1.1, wherein the at least one radiopaque marking comprises a first radiopaque marking at a first transition between the first conical end section and the working surface, and further including a second radiopaque marking at a second transition between the second conical end section and the working surface.

1.3 The catheter of any of the foregoing paragraphs, wherein the at least one marking comprises a strip.
1.4 The catheter of any of the foregoing paragraphs, further including a plurality of radiopaque markings in the form of strips.

1.5 The catheter of paragraph 1.4, wherein the strips extend at least partially in a longitudinal direction between the first and second conical end sections.

1.6 The catheter of paragraphs 1.4 or 1.5, wherein the strips comprise annular bands.

1.7 The catheter of any of the foregoing paragraphs, wherein at least two spaced radiopaque markings are provided on each conical end section, including one adjacent a distal portion and a proximal portion of each conical end section.

1.8 The catheter of any of the foregoing paragraphs, wherein the balloon includes a barrel section between the first and second conical end sections, and further including a plurality of radiopaque markings on the barrel section.

1.9 The catheter of any of the foregoing paragraphs, wherein the marking comprises a first pattern on the conical end sections and further including a second, different pattern on the working surface.

1.10 The catheter of any of the foregoing paragraphs, wherein the at least one marking is selected from the group consisting of a pattern, a strip, a brand, a logo, a letter, a number, a word, or combinations thereof.

1.11 The catheter of any of the foregoing paragraphs, wherein the identifier comprises a scale.

1.12 The catheter of any of the foregoing paragraphs, wherein the balloon includes a drug.

1.13 The catheter of paragraph 1.12, wherein the drug corresponds to the location of the radiopaque marking.

1.14 The catheter of paragraph 1.12, wherein the drug corresponds to other than the location of the radiopaque marking.

1.15 The catheter of paragraph 1.12, wherein the radiopaque marking comprises the drug formulated to include a radiopacifier.

1.16 A balloon having a drug carried on a working surface of the balloon wall and a radiopaque identifier identifying the location of the drug on the balloon.

1.17 The balloon of paragraph 1.16, wherein the radiopaque identifier comprises a radiopaque material mixed with a formulation comprising the drug.

1.18 The balloon of paragraph 1.16, wherein the working surface is along a barrel section of the balloon, and the radiopaque identifier is on one or both cone sections of the balloon.

2.1 A balloon catheter, comprising: an elongated, tubular shaft extending in a longitudinal direction, said shaft having a proximal end and a distal end; and an inflatable balloon supported along the distal end of the shaft, the balloon when inflated including a generally cylindrical barrel section forming a working surface, and generally conical end sections that do not form a part of the working surface, the balloon further including at least one radiopaque identifier for indicating the relative position of the working surface, said
identifier being provided on at least one of the conical end sections of the balloon so as to define the extent of the working surface.

2.2 The catheter of paragraph 2.1, wherein the identifier comprises a marking.

2.3 The catheter of paragraph 2.1 or 2.2, wherein a first marking is provided at a first transition between the first conical section end section and the working surface and a second marking is provided at a second transition between the second end section and the working surface,

2.4 The catheter of paragraph 2.2 or 2.3, wherein the marking comprises a strip.

2.5 The catheter of any of the foregoing paragraphs, wherein the identifier comprises a longitudinal strip extending between an end of the balloon and the barrel section.

2.6 The catheter of any of the foregoing paragraphs, further including a plurality of identifiers.

2.7 The catheter of paragraph 2.6, wherein each of the plurality of identifiers comprises a longitudinally extending strip.

2.8 The catheter of paragraph 2.6 or 2.7, wherein the identifiers comprise annular bands.

2.9 The catheter of paragraph 2.6 or paragraph 2.8 as dependent on paragraph 2.6, wherein the identifiers comprise longitudinally extending strips.

2.10 The catheter of any of the foregoing paragraphs 2.1 to 2.9, wherein at least two spaced radiopaque identifiers are provided on each end section.

2.11 The catheter of any of the foregoing paragraphs 2.1 to 2.10, further including at least one radiopaque identifier on the barrel section.

2.12 The catheter of any of the foregoing paragraphs 2.1 to 2.11, wherein the identifier is a first identifier comprising a first pattern, and further including a second identifier comprising a second, different pattern.

2.13 The catheter of any of the foregoing paragraphs 2.1 to 2.12, wherein the identifier includes at least one letter or number.

2.14 The catheter of any of the foregoing paragraphs 2.1 to 2.13, wherein the identifier comprises a logo.

2.15 The catheter of any of the foregoing paragraphs 2.1 to 2.14, wherein the identifier comprises a scale.

2.16 The catheter of any of the foregoing paragraphs 2.1 to 2.15, further including a drug on the balloon.

3.1 An inflatable balloon for use in connection with a catheter, comprising: an inflatable body including a working surface extending in a longitudinal direction between a first end and a second end, the body having at least one radiopaque identifier provided along the body for identifying at least a first end of the working surface, the radiopaque identifier having a first radiographic quality for identifying the location of the first end of the working surface and a second radiographic quality at a location other than at the first end of the working surface.

3.2 The balloon of paragraph 3.1, wherein the second radiographic quality is provided for identifying the second end of the working surface.
3.3 The catheter of paragraph 3.2, wherein the first radiographic quality and the second radiographic quality are substantially the same.
3.4 The balloon of paragraph 3.1, wherein the radiopaque identifier comprises a marking.
3.5 The balloon of paragraph 3.1, wherein the radiopaque identifier follows a generally helical path from the first end to the second end of the working surface.
3.6 The balloon of paragraph 3.1, wherein the identifier comprises a plurality of helical identifiers extending along the working surface.
3.7 The balloon of paragraph 3.1, wherein the identifier comprises a radiopaque filament.
3.8 The balloon of paragraph 3.7, wherein the filament is wound helically along at least a portion of the working surface of the balloon.
3.9 The balloon of any of the foregoing paragraphs 3.1 to 3.8, further including a drug on the balloon.
3.16 A balloon for use in connection with a catheter, comprising: a body having an outer surface and at least one winding extending along the outer surface of the balloon, said balloon having a radiopaque quality.
3.17 The balloon of paragraph 3.16, wherein the winding comprises a radiopaque filament.
3.18 The balloon of any of the foregoing paragraphs, wherein the radiopaque identifier comprises a helical pattern or a diamond pattern.
3.19 A catheter including the balloon of any of the foregoing paragraphs.
3.20 An inflatable balloon for use in connection with a catheter comprising a radiopaque identifier comprising a helical pattern or a diamond pattern.
4.1 A balloon catheter for use in connection with a guidewire, comprising: an elongated, tubular shaft extending in a longitudinal direction, said shaft having a proximal end and a distal end; an inflatable balloon supported along the distal end of the shaft, the balloon when inflated including first and second spaced ends and a working surface between the ends; and at least one wire including at least a radiopaque portion for identifying the location of working surface of the balloon.
4.2 The catheter of paragraph 4.1, wherein said wire comprises a material having a shape memory for adjusting between a first state and a second state.
4.3 The catheter of paragraph 4.1 or 4.2, wherein the at least one wire extends generally in the longitudinal direction.
4.4 The catheter of any of the foregoing paragraphs 4.1 to 4.3, wherein the radiopaque portion is elongated.
4.5 The catheter of any of the foregoing paragraphs 4.1 to 4.4, wherein the wire at least partially comprises a polymer.
4.6 The catheter of any of the foregoing paragraphs 4.1 to 4.5, wherein the at least one wire is at least partially elastic.
4.7 The catheter of any of the foregoing paragraphs 4.1 to 4.6, comprising: a plurality of wires extending generally in the longitudinal direction, at least one of the wires including at least a radiopaque portion for identifying the location of working surface of the balloon.

4.8 The catheter of any of the foregoing paragraphs 4.1 to 4.7, wherein at least one wire extends along an outer surface of the balloon.

4.9 The catheter of any of the foregoing paragraphs 4.1 to 4.8, wherein at least one wire extends along an inner surface of the balloon.

4.10 The catheter of any of the foregoing paragraphs 4.1 to 4.9, wherein at least one wire extends from the first end to the second end of the balloon.

4.11 The catheter of any of the foregoing paragraphs 4.1 to 4.10, wherein the radiopaque portion of at least one wire extends along a portion of the balloon corresponding to the working surface.

4.12 The catheter of any of the foregoing paragraphs 4.1 to 4.11, wherein the radiopaque portion of at least one wire extends along other than along the portion of the balloon corresponding to the working surface.

4.13 The catheter of paragraph 4.7 or any of paragraphs 4.8 to 4.12 as dependent on paragraph 4.7, wherein the wires are spaced substantially equidistantly around a circumference of the balloon.

4.14 The catheter of any of the foregoing paragraphs 4.1 to 4.13, wherein the wire includes a compliant or semi-compliant portion.

4.15 The catheter of any of the foregoing paragraphs 4.1 to 4.14, wherein at least one end of the at least partially radiopaque wire is attached to a bond connecting the balloon to the shaft.

4.16 The catheter of any of the foregoing paragraphs 4.1 to 4.15, further including a drug provided on the balloon.

4.17 The catheter of any of the foregoing paragraphs 4.1 to 4.16, wherein at least one wire at least partially comprises a material having a shape memory for adjusting between a first state and a second state.

4.18 The catheter of paragraph 4.2 or 4.17, wherein the shape memory material comprises NiTiNOL.

5.1 A balloon catheter adapted for use with a guidewire, comprising: an elongated, tubular shaft extending in a longitudinal direction, said shaft having a proximal end and a distal end; an inflatable balloon supported along the distal end of the shaft, the balloon when inflated including first and second spaced ends and a working surface between the ends; and an insert located within the interior compartment of the balloon, the insert including at least a radiopaque portion separate from the shaft.

5.2 The catheter of paragraph 5.1, wherein the insert is adapted for moving relative to the shaft.

5.3 The catheter of paragraph 5.1 or 5.2, wherein the insert extends from a first end of the balloon to one end of the working surface.

5.4 The catheter of any of the foregoing paragraphs 5.1 to 5.3, wherein the insert comprises a tube made at least partially of a radiopaque material.
5.5 The catheter of any of the foregoing paragraphs 5.1 to 5.4, wherein the insert comprises at least one finger.

5.6 The catheter of paragraph 5.5, wherein the finger includes a radiopaque end portion.

5.7 The catheter of any of the foregoing paragraphs 5.1 to 5.6, wherein the insert comprises a plurality of fingers adapted for moving from a retracted condition to an expanded condition when the balloon is inflated.

5.8 The catheter of any of the foregoing paragraphs 5.1 to 5.7, further including a retractable sheath at least partially covering the insert.

5.9 The catheter of any of the foregoing paragraphs 5.1 to 5.8, wherein the insert comprises a wire.

5.10 The catheter of paragraph 5.9, wherein the wire includes a radiopaque portion corresponding to the working surface.

5.11 The catheter of paragraph 5.10, wherein the wire extends from the first end to the second end of the balloon, and the radiopaque portion comprises an intermediate portion of the wire.

5.12 The catheter of paragraph 5.10 or 5.11, wherein the wire extends from the first end to the second end of the balloon, and the radiopaque portion comprises an end portion of the wire.

5.13 The catheter of any of the foregoing paragraphs 5.1 to 5.12, wherein at least one end of the insert is connected at a location where the balloon connects to the tubular shaft.

5.14 The catheter of any of the foregoing paragraphs 5.1 to 5.13, wherein the insert comprises an annular band.

5.15 The catheter of any of the foregoing paragraphs 5.1 to 5.14, wherein the insert includes perforations.

5.16 The catheter of any of the foregoing paragraphs 5.1 to 5.15, wherein the insert comprises a material having a shape memory.

5.17 The catheter of any of the foregoing paragraphs 5.1 to 5.16, further including a drug on the balloon.

6.1 A parison for being blow molded into a medical balloon for a catheter, comprising: a first tubular layer having a functional modification; and a second tubular layer adapted for bonding with the first tubular layer to form the blow molded balloon.

6.2 The parison of paragraph 6.1, wherein the first layer is external to the second layer.

6.3 The parison of paragraph 6.1, wherein the first layer is internal to the second layer.

6.4 The parison of any of the foregoing paragraphs, wherein the functional modification comprises a radiopaque strip.

6.5 The parison of paragraph 6.4, wherein the strip comprises a circumferential band.

6.6 The parison of paragraph 6.4 or 6.5, wherein the strip extends between a first end and a second end of the first layer.

6.7 The parison of any of the foregoing paragraphs, wherein the first tubular layer is spaced from the second tubular layer.
6.8 The parison of any of the foregoing paragraphs, wherein the functional modification is selected from the group consisting of an added radiopacifier, a surface pattern, an etching, one or more perforations, and combinations of the foregoing.

6.9 A medical balloon formed by the parison of any of the foregoing paragraphs, comprising: a tubular, inflatable body comprising a wall, the body including first and second generally conical ends and a generally cylindrical barrel section between the generally conical ends and providing a working surface.

6.10 The balloon of paragraph 6.9, wherein the first layer extends from the first end to the second end of the balloon.

6.11 The balloon of paragraph 6.9, wherein the first layer extends along only the working surface.

6.12 The balloon of any of paragraphs 6.9 to 6.11, wherein the first layer extends along an entire circumference of a portion of the wall.

6.13 The balloon of any of paragraphs 6.9 to 6.12, wherein the first layer extends along the full circumference of the wall.

6.14 The balloon of any of paragraphs 6.9 to 6.13, wherein the wall includes first and second spaced shoulders, and wherein the first layer is positioned between the shoulders.

6.15 The balloon of any of paragraphs 6.9 to 6.14, wherein the first and second layers both extend from a first end to a second end of the balloon.

6.16 The balloon of any of paragraphs 6.9 to 6.15, further comprising an at least partially radiopaque tube positioned over the barrel section and extending substantially along the working surface.

6.17 The balloon of paragraph 6.16, further including first and second shoulders adjacent the proximal and distal ends of the radiopaque tube.

6.18 The balloon of paragraph 6.16 or 6.17, wherein the entire tube is radiopaque.

7.1 A balloon catheter, comprising: an elongated, tubular shaft having a proximal end and a distal end; and a balloon positioned along the distal end of the shaft, a portion of a wall of the balloon partially comprising a coextruded radiopaque material.

7.2 The catheter of paragraph 7.1, wherein the radiopaque portion comprises at least one strip extending along a working surface of the balloon.

7.3 The catheter of paragraph 7.1 or 7.2, wherein the radiopaque portion comprises at least one strip extending along a full length surface of the balloon.

7.4 The catheter of any of paragraphs 7.1 to 7.3, wherein the radiopaque portion comprises at least one strip extending along a first cone section of the balloon.

7.5 The catheter of paragraph 7.4, wherein the radiopaque portion comprises at least one strip extending along a second cone section of the balloon.

7.6 The catheter of any of paragraphs 7.1 to 7.5, wherein the balloon includes a plurality of radiopaque portions.
7.7 The catheter of paragraph 7.6, wherein each of the plurality of radiopaque portions comprises a longitudinal strip.
7.8 The catheter of paragraph 7.7, wherein the strips extend at least along a working surface of the balloon.
7.9 The catheter of any of paragraphs 7.6 to 7.8, wherein the plurality of radiopaque portions are spaced apart in a circumferential direction.
7.10 The catheter of any of the foregoing paragraphs 7.1 to 7.9, wherein the balloon includes a barrel section and conical sections at each end of the barrel section, and wherein the radiopaque portion is provided on the barrel section.
7.11 The catheter of any of the foregoing paragraphs 7.1 to 7.10, wherein the balloon includes a barrel section and conical sections at each end of the barrel section, and wherein the radiopaque portion is provided on one or both of the cone sections.
7.12 The catheter of any of the foregoing paragraphs 7.1 to 7.11, wherein the radiopaque portion comprises a layer of the balloon wall.
7.13 The catheter of paragraph 7.12, wherein the layer comprises an inner layer.
7.14 The catheter of paragraph 7.12 or 7.13, wherein the layer comprises an outer layer.
7.15 The catheter of paragraph 7.14, wherein the outer layer is etched.
7.16 The catheter of any of paragraphs 7.12 to 7.15, wherein the balloon includes a barrel section and conical sections at each end of the barrel section, and the layer extends along the entire barrel section.
7.17 The catheter of any of paragraphs 7.12 to 7.16, wherein the balloon includes a barrel section and conical sections at each end of the barrel section, and the layer extends along the entirety of one or both of the conical sections.
7.18 The catheter of any of the foregoing paragraphs 7.1 to 7.17, wherein all portions of the wall comprise coextruded radiopaque material.
7.19 The catheter of any of the foregoing paragraphs 7.1 to 7.18, further including a drug on the balloon.
7.20 The catheter of any of the foregoing paragraphs 7.1 to 7.19, wherein the radiopaque material comprises ePTFE.
8.1 A balloon catheter, comprising: a shaft extending in a longitudinal direction, said shaft having a proximal end and a distal end, and supporting at least one radiopaque identifier; an inflatable balloon supported along the distal end of the shaft, the balloon when inflated including a working surface; and an actuator for aligning at least one end of the working surface with at least one radiopaque identifier.
8.2 The catheter of paragraph 8.1, wherein the actuator includes a first position corresponding to a deflated state of the balloon and a second position corresponding to the inflated state of the balloon.
8.3 The catheter of paragraph 8.1 or 8.2, wherein the actuator comprises a spring.
8.4 The catheter of any of the foregoing paragraphs 8.1 to 8.3, wherein the spring comprises a leaf spring.

8.5 The catheter of any of the foregoing paragraphs 8.1 to 8.4, wherein the actuator comprises a plurality of springs spaced circumferentially about the catheter.

8.6 The catheter of any of the foregoing paragraphs 8.1 to 8.5, wherein a first portion of the actuator is fixed to the balloon and a second portion of the actuator is adapted for movement relative to the shaft.

8.7 The catheter of paragraph 8.6, wherein the first portion of the actuator is captured between two layers on the wall of the balloon.

8.8 The catheter of paragraph 8.6 or 8.7, wherein the shaft includes a channel for at least partially receiving the second portion of the actuator.

8.9 The catheter of any of the foregoing paragraphs 8.1 to 8.8, further including a stop for stopping the movement of the actuator.

8.10 The catheter of any of the foregoing paragraphs 8.1 to 8.9, wherein the radiopaque identifier comprises a marker attached to the shaft.

8.11 The catheter of any of the foregoing paragraphs 8.1 to 8.10, wherein the radiopaque identifier comprises an insert positioned within the interior compartment of the balloon.

8.12 The catheter of any of the foregoing paragraphs 8.1 to 8.11, wherein the actuator is a first actuator for aligning a distal end of the working surface with the radiopaque identifier, and further including a second actuator for aligning a proximal end of the working surface with the radiopaque identifier.

8.13 The catheter of paragraph 8.12, wherein each of the first and second actuators comprise a plurality of springs.

8.14 The catheter of any of the foregoing paragraphs, wherein the radiopaque identifier comprises a first marking and a second marking, and wherein the actuator is a first actuator for aligning a distal end of the working surface with the first marking, and further including a second actuator for aligning a proximal end of the working surface with the second marking.

8.15 The balloon catheter of any of the foregoing paragraphs 8.1 to 8.14, comprising: a shaft extending in a longitudinal direction, said shaft having a proximal end and a distal end, and supporting first and second radiopaque identifiers; a first actuator for aligning a first end of the working surface with the first radiopaque marking; and a second actuator for aligning a second end of the working surface with the second radiopaque identifier.

8.16 The balloon catheter of any of the foregoing paragraphs 8.1 to 8.15, comprising: a shaft for carrying the balloon, the shaft including at least one channel formed in an outer portion of a wall of the shaft; and an actuator having a first end connected to the balloon and a second end at least partially positioned in the channel.
8.17 The balloon catheter of any of the foregoing paragraphs 8.1 to 8.16, comprising: a shaft for carrying the balloon, the shaft including a plurality of channels formed in an outer portion of the wall of the shaft.

8.18 The catheter of paragraph 8.17, further including an actuator having a first end connected to the balloon and a second end positioned in at least one of the channels.

8.19 The catheter of any of the foregoing paragraphs 8.1 to 8.8, comprising: a spring connected to a wall of the balloon.

8.20 The catheter of paragraph 8.19, wherein the spring is at least partially radiopaque.

8.21 The catheter of paragraph 8.19 or 8.20, wherein the spring is connected to a conical section of the wall of the balloon.

8.22 The balloon catheter of any of the foregoing paragraphs 8.1 to 8.21, wherein the balloon includes a drug.

9.1 A balloon catheter for use with a guidewire, comprising: an elongated, tubular shaft extending in a longitudinal direction, said shaft having a proximal end and a distal end; an inflatable balloon connected to the distal end of the shaft, the balloon including a working surface; a radiopaque identifier for identifying the working surface; and a receiver adjacent the proximal end of the shaft and adapted for allowing the shaft to move relative to the receiver in at least the longitudinal direction.

9.2 The catheter of paragraph 9.1, wherein the shaft carries a stop, and the receiver further includes a recess for receiving the stop, said recess having a dimension in the longitudinal direction that is greater than a corresponding dimension of the stop.

9.3 The catheter of paragraph 9.2, further including a tube for supplying an inflation fluid to inflate the balloon, said tube being connected to the receiver and generally coaxial with the shaft, and wherein the stop forms a seal with the recess to prevent the inflation fluid from passing around the shaft.

9.4 The catheter of paragraph 9.3, wherein the seal comprises an O-ring arranged coaxially with the shaft.

9.5 The catheter of paragraph 9.1, wherein the radiopaque identifier is separate from the shaft.

9.6 The catheter of paragraph 9.5, wherein the radiopaque identifier comprises an insert positioned within the interior compartment of the balloon.

9.7 The catheter of paragraph 9.6, wherein the insert comprises a tubular sleeve arranged coaxially with the shaft.

9.8 The catheter of paragraph 9.6, wherein the insert comprises a first insert at a proximal end of the balloon and a second insert at a distal end of the balloon.

9.9 The catheter of paragraph 9.1, further including a guidewire for positioning in the shaft.

9.10 A hub for a balloon catheter having an elongated, tubular shaft extending in a longitudinal direction, said shaft having a proximal end and a distal end, and an inflatable balloon connected to the distal end of the shaft for being inflated by an inflation fluid, comprising: a body including a receiver for receiving a proximal
portion of the shaft and adapted for allowing the shaft to move relative to the receiver in at least the longitudinal direction; and a stop for restraining the movement of the shaft relative to the body in the longitudinal direction.

9.11 The hub of paragraph 9.10, wherein the body includes a guidewire port arranged in communication with the receiver, and further including an inflation port for introducing the inflation fluid for inflating the balloon.

9.12 The hub of paragraph 9.10, wherein the receiver further includes a recess for receiving the stop, said recess having a dimension in the longitudinal direction that is greater than a corresponding dimension of the stop.

9.13 The hub of paragraph 9.12, wherein the stop forms a seal with the recess to prevent the inflation fluid from passing.

9.14 The hub of paragraph 9.10, wherein the stop comprises an O-ring.

9.15 A catheter including a guidewire shaft having a distal end connected to a balloon and at a proximal end mounted for sliding movement.

9.16 The catheter of any of the foregoing paragraphs, further including a drug on the balloon.

9.17 A catheter comprising a hub for receiving a proximal end of a guidewire shaft, the shaft being adapted to slidably move in a restrained manner relative to the hub.

10.1 A balloon catheter, comprising: an elongated tubular shaft having a proximal end and a distal end spaced apart in a longitudinal direction, the shaft along a distal portion including at least one radiopaque identifier, said distal portion being formed of a material resistant to elongation in the longitudinal direction; and an inflatable, non-compliant balloon extending over the distal portion of the shaft.

10.2 The catheter according to paragraph 10.1, wherein the balloon includes a generally cylindrical barrel section positioned between generally conical sections, said barrel section including a working surface having at least one edge aligned with the radiopaque identifier.

10.3 The catheter according to paragraph 10.2, wherein the radiopaque identifier comprises a first marker positioned at the at least one edge of the working surface, and further including a second marker positioned at the opposite edge of the working surface in the longitudinal direction.

10.4 The catheter according to paragraph 10.2, wherein each marker comprises a radiopaque band swaged to the distal portion of the shaft.

10.5 The catheter according to paragraph 10.1, wherein the distal portion of the shaft comprises a tube adapted for guiding a guidewire from a proximal end of the balloon to a distal end of the balloon.

10.6 The catheter according to paragraph 10.1, wherein at least the distal portion of the shaft comprises steel.

10.7 The catheter according to paragraph 10.1, wherein the shaft comprises steel.

10.8 The catheter according to paragraphs 10.6 or 10.7, wherein the steel shaft comprises a stainless steel.
10.9 The catheter according to paragraphs 10.7 or 10.8, wherein the steel shaft includes a spiral cut along a portion other than the distal portion covered by the balloon.

10.10 The catheter according to paragraphs 10.7 or 10.8, wherein the steel shaft comprises a polymer layer.

10.11 The catheter according to paragraph 10.10, wherein the polymer layer comprises an outer layer of the shaft.

10.12 The catheter according to paragraph 10.1, wherein the distal portion of the shaft comprises a polymer shaft including a braid or mesh.

10.13 The catheter according to paragraph 10.1, wherein the balloon includes a generally cylindrical barrel section positioned between generally conical sections, the distal portion of the shaft extending from a first end of a first conical section to a second end of a second conical section.

10.14 The catheter according to paragraph 10.1, wherein the non-compliant balloon comprises one or more inelastic fibers.

10.15 The catheter according to paragraph 10.1, wherein the non-compliant balloon comprises polyethylene terephthalate.

10.16 The catheter of any of the foregoing paragraphs 10.1 to 10.15, further including a drug on the balloon.

11.1 A balloon catheter, comprising: a shaft extending in a longitudinal direction and adapted for expanding from a compressed condition to an expanded condition in the longitudinal direction, the shaft supporting at least one radiopaque identifier; and an inflatable balloon positioned along the shaft, the balloon when inflated including a working surface for aligning with the radiopaque identifier in at least the expanded condition of the shaft.

11.2 The catheter of paragraph 11.1, wherein the expandable shaft comprises a first portion connected in tandem to an expandable element.

11.3 The catheter of paragraphs 11.1 or 11.2, wherein the expandable element comprises a spring.

11.4 The catheter of paragraph 11.3, wherein the spring comprises a coil spring.

11.5 The catheter of paragraphs 11.3 or 11.4, wherein the spring comprises a tension coil spring.

11.6 The catheter of paragraph 11.2, wherein the expandable element comprises a bellows.

11.7 The catheter of paragraph 11.2, wherein the expandable element comprises a fiber matrix.

11.8 The catheter of paragraph 11.7, further including a spring associated with the fiber matrix.

11.9 The catheter of any of paragraphs 11.2-11.8, wherein the expandable element is inside an interior compartment of the balloon.

11.10 The catheter of any of paragraphs 11.2-11.8, wherein the expandable element is outside an interior compartment of the balloon.

11.11 The catheter of any of paragraphs 11.2-11.10, wherein the expandable element connects to one end of the balloon.
11.12 The catheter of any of paragraphs 11.2-11.10, wherein the expandable element connects the first portion of the shaft to a second portion of the shaft.

11.13 The catheter of any of the foregoing paragraphs 11.1 to 11.12, wherein the shaft comprises an inflation lumen for delivering an inflation fluid to the balloon.

11.14 The catheter of any of the foregoing paragraphs 11.1 to 11.13, wherein the expandable shaft in at least a partially expanded condition a port for delivering the inflation fluid to the balloon, said port being closed when the shaft is in a non-expanded condition.

11.15 The catheter of any of the foregoing paragraphs 11.1 to 11.14, wherein the expandable shaft comprises a first expandable element connecting a first portion of the shaft to a second portion of the shaft, and further including a second expandable element connecting the second portion of the shaft to a third portion of the shaft.

11.16 The catheter of paragraph 11.15, wherein the first and second expandable elements comprise first and second coil springs.

11.17 The catheter of paragraph 11.16, wherein the first and second coil springs have different spring constants.

11.18 The catheter of any of the foregoing paragraphs 11.1 to 11.17, wherein the radiopaque identifier comprises a pair of spaced radiopaque markers, one positioned in alignment with a first end of the working surface and another positioned at a second end of the working surface.

11.19 The catheter of any of paragraphs 11.15-11.18, wherein the first and second expandable elements comprise a radiopaque material.

11.20 The catheter of any of the foregoing paragraphs 11.1 to 11.19, wherein the radiopaque identifier comprises a spring.

11.21 The catheter of paragraph 11.2, wherein the expandable element comprises a spring having a variable spring constant.

11.22 The catheter of any of the foregoing paragraphs 11.1 to 11.21, wherein the shaft comprises a guidewire lumen.

11.23 The catheter of any of the foregoing paragraphs 11.1 to 11.22, further including a passage adjacent the tip for receiving a guidewire external to the balloon.

11.24 The catheter of paragraph 11.2, wherein the first portion is adjacent a distal end of the shaft.

11.25 A balloon catheter, comprising: a shaft; a balloon; and an expandable element adapted for expanding in the longitudinal direction connecting the shaft to the balloon.

11.26 The catheter of paragraph 11.25, wherein the expandable element is selected from the group consisting of a spring, a bellows, a fiber matrix, or combinations of the foregoing.

11.27 The catheter of paragraph 11.25 or 26, wherein the expandable element comprises an encapsulated spring.
11.28 A balloon catheter comprising a balloon and an inflation lumen including an expandable element adapted for expanding in the longitudinal direction for providing a fluid to the balloon.

11.29 The catheter of any of paragraphs 11.25-11.28, wherein the expandable element comprises a radiopaque material.

11.30 The catheter of any of the foregoing paragraphs 11.1 to 11.29, further including a drug on the balloon.

12.1 A balloon catheter, comprising: an elongated, tubular shaft extending in a longitudinal direction, said shaft having a proximal end and a distal end; and a balloon having an inflation compartment formed a balloon wall including a working surface, and further including at least one chamber adjacent to the working surface adapted for receiving an identifier for identifying the location of the working surface.

12.2 The balloon catheter of paragraph 12.1, wherein the shaft includes a first lumen for supplying a fluid to the chamber.

12.3 The balloon catheter of paragraph 12.2, wherein the shaft includes a port between the first lumen and the chamber,

12.4 The balloon catheter of paragraph 12.2, wherein the shaft includes a second lumen for supplying a fluid to an interior compartment of the balloon.

12.5 The balloon catheter of paragraph 12.4, wherein the shaft includes a port between the second lumen and the interior compartment.

12.6 The balloon catheter of any of the foregoing paragraphs 12.1 to 12.5, wherein the identifier comprises a contrast agent.

12.7 The balloon catheter of any of the foregoing paragraphs 12.1 to 12.6, wherein the contrast agent comprises a material selected from the group consisting of a radiopacifier, polyvinyl acetate, cellulose, a fluid, a liquid, a solid, a powder, or combinations of the foregoing.

12.8 The balloon catheter of any of the foregoing paragraphs 12.1 to 12.7, wherein the chamber comprises a first chamber at a proximal end of the balloon, and further including a second chamber at a distal end of the balloon.

12.9 The balloon catheter of paragraph 12.8, wherein the second chamber is adapted for receiving the identifier from a lumen in the shaft in fluid communication with the first chamber via a port.

12.10 The balloon catheter of any of the foregoing paragraphs 12.1 to 12.9, wherein the chamber is generally annular.

12.11 The balloon catheter of any of the foregoing paragraphs 12.1 to 12.10, wherein the chamber is positioned between a transition from a barrel section to a conical section of the balloon and an end of the balloon.

12.12 The balloon catheter of any of the foregoing paragraphs 12.1 to 12.11, wherein the chamber is provided by a film attached to the balloon wall.
12.13 The balloon catheter of any of the foregoing paragraphs 12.1 to 12.12, wherein the chamber is embedded in the balloon wall.

12.14 The balloon catheter of any of the foregoing paragraphs 12.1 to 12.13, wherein the chamber is provided by a film extending between the balloon wall and an outer surface of the shaft.

While the disclosure presents certain embodiments to illustrate the inventive concepts, numerous modifications, alterations, and changes to the described embodiments are possible without departing from the sphere and scope of the present invention, as defined in the appended claims. For example, any ranges and numerical values provided in the various embodiments are subject to variation due to tolerances, due to variations in environmental factors and material quality, and due to modifications of the structure and shape of the balloon, and thus can be considered to be approximate and the term "approximately" means that the relevant value can, at minimum, vary because of such factors. Accordingly, it is intended that the present invention not be limited to the described embodiments, but that it has the full scope defined by the language of the following claims, and equivalents thereof.
Claims

1. A balloon catheter, comprising:
   an elongated, tubular shaft having a proximal end and a distal end; and
   a balloon positioned along the distal end of the shaft, a portion of a wall of the balloon
   partially comprising a coextruded radiopaque material.

2. The catheter of claim 1, wherein the radiopaque portion comprises at least one strip
   extending along a working surface of the balloon.

3. The catheter of claim 1 or 2, wherein the radiopaque portion comprises at least one strip
   extending along a full length surface of the balloon.

4. The catheter of any of claims 1 to 3, wherein the radiopaque portion comprises at least one strip
   extending along a first cone section of the balloon.

5. The catheter of claim 4, wherein the radiopaque portion comprises at least one strip
   extending along a second cone section of the balloon.

6. The catheter of any of claims 1 to 5, wherein the balloon includes a plurality of radiopaque
   portions.

7. The catheter of claim 6, wherein each of the plurality of radiopaque portions comprises a
   longitudinal strip.

8. The catheter of claim 7, wherein the strips extend at least along a working surface of the
   balloon.

9. The catheter of any of claims 6 to 8, wherein the plurality of radiopaque portions are spaced
   apart in a circumferential direction.

10. The catheter of any of the foregoing claims, wherein the balloon includes a barrel section and
    conical sections at each end of the barrel section, and wherein the radiopaque portion is provided on the
    barrel section.

11. The catheter of any of the foregoing claims, wherein the balloon includes a barrel section and
    conical sections at each end of the barrel section, and wherein the radiopaque portion is provided on one or
    both of the cone sections.

12. The catheter of any of the foregoing claims, wherein the radiopaque portion comprises a
    layer of the balloon wall.

13. The catheter of claim 12, wherein the layer comprises an inner layer.

14. The catheter of claim 12 or 13, wherein the layer comprises an outer layer.

15. The catheter of claim 14, wherein the outer layer is etched.

16. The catheter of any of claims 12 to 15, wherein the balloon includes a barrel section and
    conical sections at each end of the barrel section, and the layer extends along the entire barrel section.
17. The catheter of any of claims 12 to 16, wherein the balloon includes a barrel section and conical sections at each end of the barrel section, and the layer extends along the entirety of one or both of the conical sections.

18. The catheter of any of the foregoing claims, wherein all portions of the wall comprise coextruded radiopaque material.

19. The catheter of any of the foregoing claims, further including a drug on the balloon.

20. The catheter of any of the foregoing claims, wherein the radiopaque material comprises ePTFE.

21. A method of forming a balloon for a balloon catheter, comprising:

   forming a tube by coextruding a first material having a radiopacifier with a second material; and

   creating a balloon with the tube, the balloon having generally conical sections and a generally cylindrical section between the conical sections.

22. The method of claim 21, wherein the forming step comprises expanding the tube to form the balloon.

23. The method of claim 21 or 22, wherein the forming step comprises blow molding the tube.

24. The method of any of claims 21 to 23, wherein the forming step comprises bonding the conical sections to the tube, and then expanding the tube to form the balloon.

25. The method of any of claims 21 to 24, wherein the forming step comprises providing the tube with one or more longitudinally extending strips comprising the radiopacifier.

26. The method of any of claims 21 to 25, wherein the forming step comprises providing the tube with one or more longitudinally strips along the barrel section.

27. The method of any of claims 21 to 26, wherein the forming step comprises providing the tube with one or more longitudinally strips along one or both of the conical sections.
