A cementitious mixture comprises a hydraulic cement; greater than about 10% by weight of a pozzolanic cement replacement selected from fly ash, slag, natural pozzolans, and mixtures thereof, based on the weight of said hydraulic cement and cement replacement; and a compatibilizing admixture, wherein the compatibilizing admixture comprises a compatibilizing derivatized polycarboxylate polymer dispersant capable of acting as a water reducer, in combination with an accelerator. The derivatized polycarboxylate dispersant, alone or in combination with other derivatized polycarboxylate dispersants, is a polymer comprising units derived from at least one of a substituted carboxylic acid monomer and a substituted ethylenically unsaturated monomer, at least one of an N-polyoxyalkylene maleimide and a condensation product of an unsubstituted carboxylic acid monomer and an alkoxy-polyoxyalkylene primary amine substituted carboxylic acid monomer, and optionally including an unsaturated hydrocarbon. The derivatized polycarboxylate dispersant provides for a longer shelf life dispersant, improved dispersability of cementitious mixtures, water reduction in cementitious mixtures, and is an effective dispersant in high pozzolan replaced cementitious mixtures.

HIGH POZZOLAN CEMENT MIXTURES

FIELD OF THE INVENTION

The present invention is directed to cementitious mixtures containing pozzolanic cement replacement materials. More particularly, the present invention is directed to cementitious mixtures containing high percentages of pozzolan cement replacement, and compatibilizing admixtures therefor.

BACKGROUND OF THE INVENTION

Over the years, the use of cementitious materials as a partial replacement for portland cement in concrete has become an increasingly attractive alternative to portland cement alone. The desire to increase the use of fly ash, blast furnace slag, and natural pozzolanic cement in concrete mixtures can be attributed to several factors. These include cement shortages, economic advantages of portland cement replacement, improvements in permeability of the concrete product, and lower heats of hydration.

The growth in the use of higher amounts of pozzolanic cement replacements, such as fly ash, in concrete has been impaired by the potential incompatibility exhibited by these materials, especially when used at high percentages, in combination with water-reducing admixtures. Water-reducing admixtures are desirable because they decrease the amount of water required in the preparation of the cementitious mixtures, and to increase the strength of the resulting concrete. However, the incompatibility of the pozzolan replacement materials with water-reducing admixtures can result in the significant retardation of the initial and final setting of the concrete containing both these materials.

Despite the cost and performance advantages of fly ash, slag, calcined clay, and natural pozzolans as partial replacements of portland cement in concrete, there are practical limitations to the amount at which they can be used in the cementitious mixture. Using these materials at higher levels, such as above about 10 to 15 weight
percent based on the weight of the portland cement, can result in the retarded setting
time of the concrete of up to several hours, and perhaps longer, depending upon the
ambient temperature. This incompatibility puts a burden of increased costs and time on
the end user which is unacceptable.

While it is known to use set time accelerator admixtures in concrete mixtures,
these accelerator admixtures have been ineffective in solving the compatibility problem
that exists in high pozzolan replacement/portland cement mixtures, particularly when
used with water-reducing admixtures, so that set time is not able to be decreased to an
acceptable level. The use of accelerator admixtures with water reducers, such as
naphthalene sulfonates, lignin and substituted lignins, melamine and the like, has been
ineffective in producing an acceptable high pozzolanic replacement-containing
hydraulic cement-based cementitious mixture with normal setting characteristics and an
acceptable resulting concrete.

U.S. Patent Nos. 4,373,956 and 4,473,405 disclose various admixture
compositions for incorporation into hydraulic cement mixes to accelerate the rate of
hardening and setting. U.S. Patent No. 4,337,094 discloses combinations of additives
which can be used to accelerate the setting time of portland type cements. These
additives, when used in cementitious mixtures containing portland cement and high
proportions of pozzolan cement replacements, as well as a water reducer, cannot
compensate for the retardation of setting time induced in the mixtures by the cement
replacement and water reducer, and thus do not acceptably accelerate the mixture to
setting.

U.S. Patent No. 5,556,458 discloses a cementitious composition containing a
high percentage of fly ash and hydraulic cement, but in which a fly ash containing a
particular calcium oxide content is required and a water-reducing admixture is not
present. The composition is useful for quick setting repair mortar type products.

What is required by the industry, however, is a cementitious mixture capable of
forming concrete which contains a significant percentage of cement replacement
material (to replace a portion of the hydraulic cement, such as portland cement) for performance and cost considerations, and water-reducing admixtures to decrease water usage and increase compressive strength, the components in such cementitious mixtures being compatible and which mixtures set in an industry-acceptable time period.

U.S. Patent No. 5,158,996 and patent publication EP 0 753 488, both of which are hereby incorporated by reference herein, disclose polymer additives useful as additives, such as dispersants, for cement mixtures, but their use with high pozzolan replacement/portland cement mixtures has not previously been considered.

It is therefore an object of the invention to provide a cementitious mixture which contains a significant proportion of pozzolan cement replacement materials for hydraulic cement, such as portland cement, as well as water-reducing materials, which have acceptable or improved compressive strength.

It is another object of the invention to provide a cementitious mixture which contains a significant proportion of pozzolan cement replacement materials for hydraulic cement, such as portland cement, as well as water-reducing materials, which set in an industry-acceptable time period.

It is another object of the invention to provide a method for preparing a cementitious material which contains a significant proportion of pozzolan cement replacement materials for hydraulic cement, such as portland cement, as well as water-reducing materials, which have acceptable or improved compressive strength and which set in an industry-acceptable time period.

It is another object of the invention to provide a compatibilizing admixture for cementitious mixtures which contain a significant proportion of pozzolan cement replacement materials for hydraulic cement, such as portland cement, which admixtures provide water-reducing means for imparting acceptable or improved compressive strength, and set-accelerating means for inducing the mixture to set in an industry-acceptable time period.
SUMMARY OF THE INVENTION

The present invention is directed to a compatibilizing admixture for cementitious mixtures containing hydraulic cement and greater than about 10 percent pozzolanic cement replacement by weight of the portland cement and cement replacement, comprising a derivatized polycarboxylate dispersant which is a polymer comprising units derived from at least one of a substituted carboxylic acid monomer and a substituted ethylenically-unsaturated monomer, at least one of an N-polyoxyalkylene maleimide and a condensation product of an unsubstituted carboxylic acid monomer and an alkoxypolyoxyalkylene primary amine-substituted carboxylic acid monomer, and optionally including an unsaturated hydrocarbon, in combination with a set accelerator for concrete. The derivatized polycarboxylate dispersant preferably has the general structure shown below:

Where:
D = a component selected from the group consisting of the structure d1, the structure d2, and mixtures thereof;
X = H, CH₃, C₂-C₆ alkyl, phenyl, substituted phenyl such as p-methyl phenyl, sulfonated phenyl;
Y = H, -COOM;
R = H, CH₃;
Z = H, -SO_2M, -PO_3M, -COOM, -OR_3, -COOR_3, -CH_2OR_3, -CONHR_3,
-CONHC(CH_3)_2 CH_2SO_3M, -COO(CHR_4)_n OH where n=2 to 6;
R_1, R_2, R_3, R_5 are each independently -(CH_2CHRO)_m R_4 random copolymer of
oxyethylene units and oxypropylene units where m=10 to 500 and wherein the
amount of oxyethylene in the random copolymer is from 60% to 100% and the
amount of oxypropylene in the random copolymer is from 0% to 40%;
R_4 = H, methyl, C_2-C_6 alkyl;
M = H, alkali metal, alkaline earth metal, ammonia, amine, substituted amine such
as triethanolamine, methyl, C_2-C_6 alkyl;
a = 0 to 0.8, preferably 0 to 0.6, and most preferably 0 to 0.5;
b = 0.2 to 0.99, preferably 0.3 to 0.99, and most preferably 0.4 to 0.99;
c = 0 to 0.5, preferably 0 to 0.3, and most preferably 0 to 0.1;
d = 0 to 0.5, preferably 0 to 0.3, and most preferably 0 to 0.1; and
wherein a, b, c, and d represent the mole fraction of each unit and the sum of
a, b, c, and d is 1.0, and wherein at least one of c and d is greater than 0.

The pozzolan cement replacement for a portion of the portland cement,
according to the present invention, includes at least one of fly ash (such as Class C fly
ash and Class F fly ash), blast furnace slag, calcined clay, and natural pozzolans.
"Natural pozzolans" is a term of art used in the cementitious formulation industry and is
well known to those of ordinary skill in the art to mean those pozzolans that are
naturally-occurring as opposed to blast furnace slag or fly ash, which are produced by
man-made processes. Naturally-occurring pozzolans include volcanic tuffs and
pumices, trasses, diatomaceous earths, opaline cherts, and some shales. Preferably, up
to 50 percent of the portland cement in the cementitious product is replaced by the
pozzolanic cement replacement material.

The present invention further provides a method for preparing a cementitious
material comprising mixing a hydraulic cement with a pozzolanic cement replacement
selected from fly ash, slag, natural pozzolans, and mixtures thereof, and a
compatibilizing admixture, wherein the compatibilizing admixture comprises the
above-described derivatized polycarboxylate water-reducing dispersant, in combination
with an accelerator for concrete. In one embodiment, the method uses a compatibilizing admixture which comprises a derivatized polycarboxylate dispersant comprising a polymer of the general structure shown below:

where:

\( D = \) a component selected from the group consisting of the structure d1, the structure d2, and mixtures thereof;

\( X = \) H, CH\(_3\), C\(_2\)-C\(_6\) alkyl, phenyl, substituted phenyl such as p-methyl phenyl, sulfonated phenyl;

\( Y = \) H, -COOM;

\( R = \) H, CH\(_3\);

\( Z = \) H, -SO\(_3\)M, -PO\(_3\)M, -COOM, -OR\(_3\), -COOR\(_3\), -CH\(_2\)OR\(_3\), -CONHR\(_3\),

-CONH(CH\(_3\))\(_2\) CH\(_2\)SO\(_3\)M, -COO(CHR\(_4\))\(_n\)OH where \( n = 2 \) to 6;

\( R_1, R_2, R_3, R_5 \) are each independently -(CH\(_2\)CHRO)\(_m\)R\(_4\) random copolymer of oxyethylene units and oxypropylene units where \( m = 10 \) to 500 and wherein the amount of oxyethylene in the random copolymer is from 60% to 100% and the amount of oxypropylene in the random copolymer is from 0% to 40%;

\( R_4 = \) H, methyl, C\(_2\)-C\(_6\) alkyl;

\( M = \) H, alkali metal, alkaline earth metal, ammonia, amine, substituted amine such as triethanolamine, methyl, C\(_2\)-C\(_6\) alkyl;
a = 0 to 0.8, preferably 0 to 0.6, and most preferably 0 to 0.5;
b = 0.2 to 0.99, preferably 0.3 to 0.99, and most preferably 0.4 to 0.99;
c = 0 to 0.5, preferably 0 to 0.3, and most preferably 0 to 0.1;
d = 0 to 0.5, preferably 0 to 0.3, and most preferably 0 to 0.1; and

wherein a, b, c, and d represent the mole fraction of each unit and the sum of a, b, c, and d is 1.0, and wherein at least one of c and d is greater than 0.

The present invention further comprises a compatibilizing admixture for cementitious mixtures containing hydraulic cement and greater than about 10 percent pozzolanic cement replacement based on total weight of the cement and cement replacement, comprising the above-described derivatized polycarboxylate water reducing dispersant, in combination with an accelerator for concrete. In one embodiment, the compatibilizing admixture comprises a derivatized polycarboxylate dispersant comprising a polymer of the general structure shown below:

\[
\text{Structure Image}
\]

where:

D = a component selected from the group consisting of the structure d1, the structure d2, and mixtures thereof;

X = H, CH₃, C₂-C₆ alkyl, phenyl, substituted phenyl such as p-methyl phenyl, sulfonated phenyl;
Y = H, -COOM;
R = H, CH₃;
Z = H, -SO₃M, -PO₃M, -COOM, -OR₃, -COOR₃, -CH₂OR₃, -CONHR₃,
    -CONHC(CH₃)₂ CH₃SO₃M, -COO(CHR₄)ₙOH where n=2 to 6;
R₁, R₂, R₃ are each independently -(CH₂CHRO)ₙR₄ random copolymer of
oxyethylene units and oxypropylene units where m=10 to 500 and wherein the
amount of oxyethylene in the random copolymer is from 60% to 100% and the
amount of oxypropylene in the random copolymer is from 0% to 40%;
R₄ = H, methyl, C₂-C₆ alkyl;
M = H, alkali metal, alkaline earth metal, ammonia, amine, substituted amine such
    as triethanolamine, methyl, C₂-C₆ alkyl;
a = 0 to 0.8, preferably 0 to 0.6, and most preferably 0 to 0.5;
b = 0.2 to 0.99, preferably 0.3 to 0.99, and most preferably 0.4 to 0.99;
c = 0 to 0.5, preferably 0 to 0.3, and most preferably 0 to 0.1;
d = 0 to 0.5, preferably 0 to 0.3, and most preferably 0 to 0.1; and
wherein a, b, c, and d represent the mole fraction of each unit and the sum of
a, b, c, and d is 1.0, and wherein at least one of c and d is greater than 0.

DETAILED DESCRIPTION OF THE INVENTION

The present invention is directed to a compatibilizing admixture for
ceamentitious mixtures containing hydraulic portland cement and greater than about 10
percent pozzolanic cement replacement by weight of the portland cement and cement
replacement, comprising a derivatized polycarboxylate dispersant which is a polymer
comprising units derived from at least one of a substituted carboxylic acid monomer
and a substituted ethylenically unsaturated monomer, at least one of an N-
polyoxyalkylene maleimide and a condensation product of an unsubstituted
 carboxylic acid monomer and an alkoxypolyoxyalkylene primary amine-substituted
carboxylic acid monomer, and optionally including an unsaturated hydrocarbon, in
combination with a set accelerator for concrete. The derivatized polycarboxylate
dispersant preferably has the general structure shown below:
where:

D = a component selected from the group consisting of the structure d1, the structure d2, and mixtures thereof;

X = H, CH₃, C₂-C₆ alkyl, phenyl, substituted phenyl such as p-methyl phenyl, sulfonated phenyl;

Y = H, -COOM;

R = H, CH₃;

Z = H, -SO₂M, -PO₂M, -COOM, -OR₃, -COOR₃, -CH₂OR₃, -CONHR₃, -CONH(CH₃)₂, CH₂SO₃M, -COO(CHR₄)ₙOH where n=2 to 6;

R₁, R₂, R₃ are each independently -(CH₂CHRO)ₘR₄ random copolymer of oxyethylene units and oxypropylene units where m=10 to 500 and wherein the amount of oxyethylene in the random copolymer is from 60% to 100% and the amount of oxypropylene in the random copolymer is from 0% to 40%;

R₄ = H, methyl, C₂-C₆ alkyl;

M = H, alkali metal, alkaline earth metal, ammonia, amine, substituted amine such as triethanolamine, methyl, C₂-C₆ alkyl;

a = 0 to 0.8, preferably 0 to 0.6, and most preferably 0 to 0.5;

b = 0.2 to 0.99, preferably 0.3 to 0.99, and most preferably 0.4 to 0.99;

c = 0 to 0.5, preferably 0 to 0.3, and most preferably 0 to 0.1;

d = 0 to 0.5, preferably 0 to 0.3, and most preferably 0 to 0.1; and
wherein a, b, c, and d represent the mole fraction of each unit and the sum of a, b, c, and d is 1.0, and wherein at least one of c and d is greater than 0.

Representative monomers for use in this invention for the "a" component include, but are not limited to, styrene, ethylene, propylene, or sulfonated styrene. Representative monomers for use in this invention for the "b" component include, but are not limited to, acrylic acid, methacrylic acid, about C₁ to about C₆ alkyl esters of acrylic acid, about C₁ to about C₆ alkyl esters of methacrylic acid, alkoxypolyoxyalkylene esters of (meth)acrylic acid, aryloxypropoxyalkylene esters of (meth)acrylic acid, maleic acid, vinyl sulfonic acid, methoxypolyoxyalkylene vinyl ether, methoxypolyoxyalkylene allyl ether, alkoxypropoxyalkylene vinyl ether, alkoxypropoxyalkylene vinyl ether, alkoxypropoxyalkylene allyl ether and alkoxypropoxyalkylene alkyl ether. The alkoxy polyoxyalkylene moieties of the above monomers are random copolymers of oxyethylene units and oxypropylene units wherein the amount of oxyethylene in the random copolymer is from about 60% to 100% and the amount of oxypropylene in the random copolymer is from 0% to about 40%. Preferably, the number average molecular weight if from about 200 to about 5,000 with a carbon chain size of about C₅ to about C₁₅.

Components "c" and "d" can be formed from a second reaction from the grafting of the side chains onto the polymer backbone such as a polyacrylate or maleic polymer. The reaction to form component "c" and/or "d" is related to the temperature of the grafting reaction. If the temperature is high enough, the succinimide components "c" and "d" are formed. Component "c" is formed from a single monomer which is a component "b" with Y as COOH and Z as CONHR₃. A condensation reaction occurs wherein water condenses and the ring closes to form component "c".

Component "d" is formed by a condensation involving two monomers such as acrylic acid (component "b" with Y as COOH and Z as H) and an acrylic acid derivatized with an alkoxypropoxyalkylene primary amine, that is a component "b" with Y as H and Z as CONHR₃. A condensation reaction occurs wherein water
condenses and the ring closes to form component "d1" or "d2". Component "d2" is formed by a head-to-head reaction of the two monomers. Component "d1" is formed by a head-to-tail reaction of the two monomers.

The optional alkali metal (M) component in the dispersant of the present invention is preferably lithium, sodium, or potassium. The optional alkaline earth metal (also M) component in the dispersant of the present invention is preferably magnesium or calcium.

It has been found that the incorporation of amide or imide linkages between the copolymer, such as styrene-maleic main chain polymer, and the alkoxy polyoxyalkylene side chain can improve the chemical and performance stability of graft polymer solutions. Incorporation of nitrogen-based linkages between main chain and side chain stabilizes side chain degrafting that slowly occurs with maleic mono ester linkages during solution storage, thus increasing the shelf life of the polycarboxylate dispersant. Improved solution stability leads to better long term performance behavior from aged polymer solutions, better dispersability of cement from aged solutions, and better maintenance of cement in a dispersed state.

In one embodiment, the present invention is an additive formulation, or an admixture, for incorporation in hydraulic cement mixtures, such as concretes, mortars and grouts, containing portland cement and pozzolanic cement replacement. By "portland cement" is meant all cementitious compositions which have a high content of tricalcium silicate, and thus includes portland cement and those cements which are chemically similar or analogous to portland type cement, the specification for which is set forth in ASTM specification C-150-80.

Pozzolanic replacement materials for hydraulic, or portland-type, cement which can be used in high proportion according to the present invention include fly ash (either or both Class C and Class F), blast furnace slag, calcined clay, and natural pozzolan materials. These replacement materials can be used in a proportion, based on the weight of the hydraulic cement and the cement replacement, of greater than 10 weight
percent, preferably greater than 15 weight percent, and most preferably greater than 20 weight percent. It is most preferred, however, that the cementitious mix contain at least 50 weight percent portland cement, based upon the total weight of portland cement and pozzolanic replacement material, combined.

As discussed above, the addition of high proportions of the pozzolanic material to the cementitious mixture in combination with a conventional water-reducing admixture (which water-reducing admixture increases compressive strength), results in a significant retarding of the setting time for the cementitious mixture.

The present invention provides a novel compatibilizing admixture for the high pozzolanic replacement material-containing hydraulic cement, as well as a novel cementitious mixture containing the pozzolanic replacement and the compatibilizing admixture, and a method for preparing the cementitious mixture. The compatibilizing admixture of the present invention significantly reduces, and in many instances eliminates the retardation of concrete containing high proportions of pozzolanic replacement materials for the hydraulic, or portland type, cement.

The present invention includes a cementitious mixture comprising a hydraulic cement; greater than about 10% by weight of a pozzolanic cement replacement selected from fly ash, slag, natural pozzolans, and mixtures thereof based on the total of said hydraulic cement and cement replacement; and a compatibilizing admixture, wherein the compatibilizing admixture comprises the derivatized polycarboxylate water-reducing dispersant, described above, in combination with an accelerator for concrete.

The preferred amount of pozzolanic cement replacement material will be at least 10% by weight, but more preferably, will be greater than about 15% by weight based on the total weight of hydraulic cement and cement replacement material if fly ash (such as Class C fly ash and Class F fly ash) or calcined clay is utilized as said cement replacement material; at least about 25% by weight based on the total weight of hydraulic cement and cement replacement material when slag is utilized as said cement replacement material; and at least about 24% by weight based on the total weight of
hydraulic cement and cement replacement material when natural pozzolans are utilized as said cement replacement material.

While the use of the derivatized polycarboxylate polymer dispersants with conventional accelerators, including calcium chloride, is effective to overcome the set time-retarding effects of the high pozzolan content cementitious mixture, the present invention is particularly effective in that the use of chloride-containing accelerators can be avoided, thus avoiding corrosion problems often associated with them.

Preferably, the accelerator according to the present invention comprises at least one of
a) a nitrate salt of an alkali metal, alkaline earth metal, or aluminum;
b) a nitrite salt of an alkali metal, alkaline earth metal, or aluminum;
c) a thiocyanate of an alkali metal, alkaline earth metal, or aluminum;
d) an alkanolamine;
e) a thiosulfate of an alkali metal, alkaline earth metal, or aluminum;
f) a hydroxide of an alkali metal, alkaline earth metal, or aluminum;
g) a carboxylic acid salt of an alkali metal, alkaline earth metal, or aluminum;
h) a polyhydroxyalkylamine; or,
i) a halide salt of an alkali metal or alkaline earth metal.

The salts of nitric acid have the general formula $M(NO_3)_a$ where $M$ is an alkali metal, or an alkaline earth metal or aluminum, and where $a$ is 1 for alkali metal salts, 2 for alkaline earth salts, and 3 for aluminum salts. Preferred are nitric acid salts of Na, K, Mg, Ca and Al.

Nitrite salts have the general formula $M(NO_2)_a$ where $M$ is an alkali metal, or an alkaline earth metal or aluminum, and where $a$ is 1 for alkali metal salts, 2 for alkaline earth salts, and 3 for aluminum salts. Preferred are nitric acid salts of Na, K, Mg, Ca and Al.
The salts of the thiocyanic acid have the general formula \( M(\text{SCN})_b \), where \( M \) is an alkali metal, or an alkaline earth metal, or aluminum, and where \( b \) is 1 for alkali metal salts, 2 for alkaline earth salts and 3 for aluminum salts. These salts are variously known as sulfocyanates, sulfocyanides, rhodanates or rhodanide salts. Preferred are thiocyanic acid salts of Na, K, Mg, Ca and Al.

Alkanolamine is a generic term for a group of compounds in which trivalent nitrogen is attached directly to a carbon atom of an alkyl alcohol. A representative formula is \( \text{N}[(\text{CH}_2)_c\text{CH}_2\text{OH}]_e \), where \( c \) is 3-6, \( d \) is 1 to about 5 and \( e \) is 1 to about 3. Examples include, but are not limited to, monoethanolamine, diethanolamine and triethanolamine.

The thiosulfate salts have the general formula \( M_f(\text{S}_2\text{O}_3)_g \) where \( M \) is alkali metal or an alkaline earth metal or aluminum, and \( f \) is 1 or 2 and \( g \) is 1, 2 or 3, depending on the valencies of the \( M \) metal elements as discussed above. Preferred are thiosulfate acid salts of Na, K, Mg, Ca and Al.

The carboxylic acid salts have the general formula \( \text{RCOOM} \) wherein \( R \) is H or \( \text{C}_1 \) to about \( \text{C}_{10} \) alkyl, and \( M \) is alkali metal or an alkaline earth metal or aluminum. Preferred are carboxylic acid salts of Na, K, Mg, Ca and Al. A preferred carboxylic acid salt is calcium formate.

A preferred polyhydroxylalkylamine has the general formula

\[
\begin{align*}
\text{H} & \quad \text{H} \\
\text{OCH}_2\text{CH}_2 & \quad \text{CH}_2\text{CH}_2\text{O} \\
\text{H} & \quad \text{H} \\
\text{OCH}_2\text{CH}_2 & \quad \text{NCH}_2\text{CH}_2\text{N} \\
\text{H} & \quad \text{H} \\
\text{OCH}_2\text{CH}_2 & \quad \text{CH}_2\text{CH}_2\text{O} \\
\text{H} & \quad \text{H} \\
\end{align*}
\]

wherein \( h \) is 1 to 3, \( i \) is 1 to 3, \( j \) is 1 to 3, and \( k \) is 0 to 3. Preferred is tetrahydroxyethylethylene diamine.
A conventional chloride-containing accelerator may be used in combination with the polycarboxylate dispersant to form a compatibilizing admixture according to the present invention, for product applications in which corrosion of reinforcing steel is not an issue, for example, in concrete block production.

The halide salt of an alkali metal or an alkaline earth metal has the general formula $M(\text{Halide})_x$ where $M$ is an alkali metal or an alkaline earth metal, and where $x$ is 1 for alkali metal salts and 2 for alkaline earth salts. Preferred metals are Na, K, Mg, and Ca. Preferred halides are F, Cl, Br, and I.

The cementitious mixture may additionally contain water in an amount sufficient to effect hydraulic setting of the cement and aggregate mixture. The cementitious mixture may also contain an additional material such as silica fume or metakaolin. The term “aggregate” includes both fine aggregate such as sand and coarse aggregate such as gravel, as is common in the art. The proportion of fine and coarse aggregate will vary depending on the desired properties of the mortar or concrete. The amount of water generally should be enough to effect hydraulic setting of the cement component and to provide a desired degree of workability to the mix before hardening.

In the practice of the present invention, the compatibilizing admixture components described above are incorporated into hydraulic cement mixes in amounts sufficient to compatibilize the pozzolanic replacement material and the hydraulic cement, to accelerate the rate of hardening and setting of the mixes and to reduce water to increase compressive strength after hardening, thereby enhancing overall durability of the product. The admixture is preferably incorporated into the mix as an aqueous solution comprising a portion of the water used in mixing the hydraulic cement, pozzolanic replacement material, aggregate, and any additional additives. The amount of the derivatized polycarboxylate dispersant and accelerator in the compatibilizing admixture is generally present in an amount of about 0.09 to about 2 parts per 100 parts by weight of hydraulic cement and cement replacement. Representative admixture formulations are set forth in Table 1A, below. (Percentages are by weight.)

It will be obvious to those of average skill in the art that the cementitious mixture described herein may contain other additives or ingredients, and should not be limited to the above formulation. Cement additives that can be added include, but are not limited to, air-entraining agents, air-detraying agents, foaming agents, defoaming
agents, corrosion inhibitors, shrinkage-reducing agents, pigments, and mixtures thereof.

The present invention achieves the objects of the invention. A cementitious mixture is provided which contains a significant proportion of pozzolan cement replacement materials for hydraulic cement, such as portland cement, as well as water reducing materials, which have acceptable or improved compressive strength, and which set in an industry-acceptable time period. A method is provided for preparing a cementitious material which contains a significant proportion of pozzolan cement replacement materials for hydraulic cement, such as portland cement, as well as water-reducing materials, which have acceptable or improved compressive strength and which set in an industry-acceptable time period. The objects are achieved through the inventive compatibilizing admixture for cementitious mixtures which contain a significant proportion of pozzolan cement replacement.

The compatibilizing admixture acts as a mid-range water reducer (permitting a reduction of mix water of from about 5% to about 15%). Compressive strength and durability of the resulting product are improved. Significant replacement of hydraulic cement by pozzolanic materials is achieved, with setting times for the cementitious mixture containing the replacement, such as both Class C and Class F fly ash, equivalent to or less than set times for conventional mixtures without the replacement materials. Set times of the inventive cementitious mixtures are significantly accelerated over untreated concrete containing high amounts of fly ash, blast furnace slag or pozzolanic cement.

It should be appreciated that the present invention is not limited to the specific embodiments described above, but includes variations, modifications and equivalent embodiments defined by the following claims.
CLAIMS

1. A compatibilizing admixture for cementitious mixtures containing hydraulic portland cement and greater than about 10 percent pozzolanic cement replacement by weight of the portland cement and cement replacement, comprising a derivatized polycarboxylate dispersant which is a polymer comprising units derived from at least one of a substituted carboxylic acid monomer and a substituted ethylenically unsaturated monomer, at least one of an N-polyoxyalkylene maleimide and a condensation product of an unsubstituted carboxylic acid monomer and an alkoxy(polyoxyalkylene primary amine substituted carboxylic acid monomer, and optionally including an unsaturated hydrocarbon, in combination with an accelerator for concrete.

2. The admixture of claim 1, wherein the compatibilizing admixture is chloride-free.

3. The admixture of claim 1, wherein the accelerator comprises at least one of
   a. a nitrate salt of an alkali metal, alkaline earth metal, or aluminum;
   b. a nitrite salt of an alkali metal, alkaline earth metal, or aluminum;
   c. a thiocyanate of an alkali metal, alkaline earth metal, or aluminum;
   d. an alkanolamine;
   e. a thiosulphate of an alkali metal, alkaline earth metal, or aluminum;
   f. a hydroxide of an alkali metal, alkaline earth metal, or aluminum;
   g. a carboxylic acid salt of an alkali metal, alkaline earth metal, or aluminum;
   h. a polyhydroxylalkylamine; or,
   i. a halide salt of an alkali metal or alkaline earth metal.

4. The admixture of claim 1, wherein the derivatized polycarboxylate dispersant comprises a polymer of the general structure:
where:

\( D = \) a component selected from the group consisting of the structure d1, the structure d2, and mixtures thereof;

\( X = \) H, CH\(_3\), C\(_2\)-C\(_6\) alkyl, phenyl and substituted phenyl;

\( Y = \) H, -COOM;

\( R = \) H, CH\(_3\);

\( Z = \) H, -SO\(_3\)M, -PO\(_3\)M, -COOM, -OR\(_3\), -COOR\(_3\), -CH\(_2\)OR\(_3\), -CONHR\(_3\), -CONHCH\(_2\)CH\(_2\)SO\(_3\)M, -COO(CHR\(_4\))\(_n\)OH where \( n = 2 \) to 6;

\( R_1, R_2, R_3 \) are each independently -(CH\(_2\)CHRO\(_m\)R\(_4\) random copolymer of oxyethylene units and oxypropylene units where \( m = 10 \) to 500 and wherein the amount of oxyethylene in the random copolymer is from 60% to 100% and the amount of oxypropylene in the random copolymer is from 0% to 40%;

\( R_4 = \) H, methyl, C\(_2\) to C\(_6\) alkyl;

\( M = \) H, alkali metal, alkaline earth metal, ammonia, amine, substituted amine such as triethanolamine, methyl, C\(_2\)-C\(_6\) alkyl;

\( a = \) 0 to 0.8;

\( b = \) 0.2 to 0.99;

\( c = \) 0 to 0.5;

\( d = \) 0 to 0.5; and
wherein a, b, c, and d represent the mole fraction of each unit and the sum of a, b, c, and d is 1.0, and wherein at least one of c and d is greater than 0.

5. A cementitious mixture comprising hydraulic cement; greater than 10% by weight of a pozzolanic cement replacement selected from fly ash, slag, natural pozzolans, and mixtures thereof based on the weight of said hydraulic cement and cement replacement; and a compatibilizing admixture as in any one of claims 1 to 4, optionally including at least one of aggregate, silica fume, and metakaolin.

6. The cementitious mixture of claim 5, wherein the hydraulic cement comprises portland cement, containing at least 50% portland cement based on the weight of said hydraulic cement and cement replacement.

7. The cementitious mixture of claim 5 including greater than 15% of the cement replacement by weight of hydraulic cement and cement replacement, optionally wherein the cement replacement comprises at least one of Class C fly ash, Class F fly ash, and calcined clay.

8. The cementitious mixture of claim 5, wherein the cement replacement comprises at least one of the following: a) slag in the amount of at least 25% by weight of hydraulic cement and cement replacement and b) natural pozzolan in the amount of at least about 24% by weight of hydraulic cement and cement replacement.

9. The cementitious mixture of claim 5, wherein the derivatized polycarboxylate dispersant and accelerator in the compatibilizing admixture is present in an amount of 0.09 to 2 parts per 100 parts by weight of hydraulic cement and cement replacement.

10. A method of preparing a cementitious material comprising mixing a hydraulic cement with a pozzolanic cement replacement selected from fly ash, slag, calcined clay, natural pozzolans, and mixtures thereof, and a compatibilizing
admixture as in any one of claims 1 to 4, optionally including mixing aggregate with the cement and cement replacement, and including additionally mixing water in an amount sufficient to effect hydraulic setting of the cement, cement replacement and optional aggregate mixture.
## A. CLASSIFICATION OF SUBJECT MATTER

**IPC 7** C04B28/02  C04B24/26

According to International Patent Classification (IPC) or to both national classification and IPC.

## B. FIELDS SEARCHED

**Minimum documentation searched (classification system followed by classification symbols)**

IPC 7  C04B

**Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched**

**Electronic data base consulted during the international search (name of data base and, where practical, search terms used)**

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

* Special categories of cited documents:
  - "A" document defining the general state of the art which is not considered to be of particular relevance.
  - "E" earlier document but published on or after the international filing date.
  - "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified).
  - "C" document referring to an oral disclosure, use, exhibition or other means.
  - "P" document published prior to the international filing date but later than the priority date claimed.
  - "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention.
  - "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone.
  - "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
  - "S" document member of the same patent family.
