 (57) Abstract:

A method of and a device for folding over and pressing a fibrous sheet (2) to produce a panel-shaped building element (3) having two large faces (30). The device (1) comprises a press roll (16) that moves in a closed loop around the fibrous sheet (2) to first fold one half (24) of the fibrous sheet (2) over the other half (23) and then press the combined two halves (23, 24) to form the building element (3). Preferably, a sequence of fibrous sheets (1) is continuously fed through the device (1), and the device (1) continuously reciprocates to move together with each of the sheets during the folding and pressing thereof.
