ABSTRACT

A method is provided for preserving the integrity of stretchy polymer fibres.

- 1 -

CARE COMPOSITION**FIELD OF INVENTION**

This invention relates to the treatment of cured polymers
5 that are used in textiles.

BACKGROUND OF INVENTION

The use of polymer fibers in clothing is ubiquitous. The use
of polybutadiene binders in the clothing industry is
10 widespread to permit the printing of images on clothing. The
use of natural rubber (a natural polymer) is also found in
the waistband of many garments.

Elastane is a commonly used man-made fibre that is used on
15 its own or in mixture with natural fibres for the
manufacture of clothing. Elastane fibres, better known under
their trade names, Lycra and Dorlastan, are widely
commercially available. Elastane was invented in 1937 in
Germany and has properties not found in nature, the most
20 important being an extraordinary elasticity. The majority of
contour fitting swimming costumes contain elastane.

Elastane fibres can be stretched from four to seven times
their length, reverting to their original length when the
25 tension is relaxed. Elastane has the highest stretch tension
of all textile raw materials. Two per cent elastane is
enough to make trousers, for instance, retain their shape.
For body-shaped silhouette and high stretch capacity, i.e.
in swimwear, corsetry or sportswear, 15 to 40% elastane is
30 used. Elastane fibres provide a high degree of comfort
combined with great freedom of movement. In woven and

- 2 -

knitted fabrics elastane increases shape retention and accelerates crease recovery.

The aforementioned polymers are also susceptible to degradation. One apparent aspect to their degradation of these polymer containing garments is that that when failure occurs it occurs over a relatively short period of time in the garments lifetime. Another example of failure is where the print binder degrades such that flaking and cracking of the print occurs of because of degradation of the binder.

Aggravating factors that contribute to the loss of integrity of these polymers are, for example, hypochlorites, ozone, sunlight (ultraviolet light), singlet and triplet oxygen.

The fact that many swimming pools contain hypochlorite results in the diminished lifetime of many a swimming costume. The loss of integrity of the elastane in swimming costumes often results in unwanted wobbling and drooping of wobbly bits.

SUMMARY OF INVENTION

The present invention concerns a method of treating polymers. The present invention has particular utility in treating polymers which are elastomeric. In this regard, an elastomer is defined as a polymer that is capable of being stretched to at least twice its original rest length whilst remaining within its elastic limit, i.e., without undergoing plastic deformation.

30

- 3 -

The present invention provides use of a composition for increasing the integrity lifetime of an apolar cured elastomeric polymer substrate, the use by applying to the apolar cured elastomeric polymer substrate an antioxidant in an aqueous medium, wherein the apolar substrate forms part or whole of a textile garment (an article of clothing).

By providing a method of treating a garment that consists of or comprises a stretchy polymer the user may choose to treat the garment repeatedly during its lifetime thereby maintaining the garment. This provides an advantage over mere treatment of the polymer before manufacture into a garment. In addition, the present method inhibits the yellowing of the polymer substrates.

The present invention also extends to a commercial package together with instructions for its use.

DETAILED DESCRIPTION OF THE INVENTION

20 ANTIOXIDANT

The level of the antioxidant in an aqueous solution is 0.01 to 1000 ppm, preferably 0.1 to 100 ppm, most preferably 0.1 to 50 ppm. This level is achieved by dosing an aqueous medium with a composition comprising the antioxidant such that a unit dose provides the desired level in the aqueous medium.

Anti-oxidants are substances as described in Kirk-Othmers (Vol 3, pg 424) and in Uhlmans Encyclopedia (Vol 3, pg 91) and CRC Press Oxidation Inhibition in Organic Materials Vols

- 4 -

I and II, Eds. Jan Pospisil and Peter P. Klemchuk: ISBN 0-8493-4767-X and 0-8493-4768-8.

5 log P is the octanol/water partition coefficient and can be used to measure the hydrophobicity of a molecule. The C Log P values were calculated using daylight software (PCModels version 4.8) available from Daylight Chemical Information Systems, Inc. Sheraton House - Castle Park - Cambridge, UK CB3 0AX.

10

One class of anti-oxidants suitable for use in the present invention is alkylated phenols having the general formula:

15 wherein R is C1-C22 linear or branched alkyl, preferably methyl or branched C3-C6 alkyl; C3-C6 alkoxy, preferably methoxy; R₁ is a C3-C6 branched alkyl, preferably tert-butyl; x is 1 or 2. Hindered phenolic compounds are preferred as antioxidant.

20

Another class of anti-oxidants suitable for use in the present invention is a benzofuran or benzopyran derivative having the formula:

- 5 -

wherein R1 and R2 are each independently alkyl or R1 and R2
 can be taken together to form a C5-C6 cyclic hydrocarbyl
 5 moiety; B is absent or CH₂; R4 is C1-C6 alkyl; R5 is
 hydrogen or -C(O)R3 wherein R3 is hydrogen or C1-C19 alkyl;
 R6 is C1-C6 alkyl; R7 is hydrogen or C1-C6 alkyl; X is -
 CH₂OH, or -CH₂A wherein A is a nitrogen comprising unit,
 phenyl, or substituted phenyl. Preferred nitrogen comprising
 10 A units include amino, pyrrolidino, piperidino, morpholino,
 piperazino, and mixtures thereof.

Other suitable antioxidants are found as follows. A
 derivative of α-tocopherol, beta-tocopherol, gamma-
 15 tocopherol, delta-tocopherol, and alkyl esters of gallic
 acid, especially octyl gallate and dodecyl gallate.

Another example of suitable antioxidants are the class of
 hindered amine light stabilisers (HALS), particularly those
 20 based 2,2,6,6-tetramethylpiperidines.

Non-limiting examples of anti-oxidants suitable for use in
 the present invention include phenols *inter alia* 2,6-di-
 tert-butylphenol, 2,6-di-tert-butyl-4-methylphenol,
 25 mixtures of 2 and 3- tert-butyl-4-methoxyphenol.

- 6 -

The presence of an alkyl chain(s) substituent on the antioxidant serves to control the C log P and bring it into the required range.

- 5 Mixtures of antioxidants may be use and in particular mixtures that have synergic antioxidant effects as found in, for example, W002/072746.

Hydroperoxide Decomposing Antioxidants

- 10 Hydroperoxide Decomposing Antioxidants (HADs) are compounds that cause the degradation of hydroperoxides. Examples of HADs are found in the organic compounds of sulphur and trivalent phosphorous which are commercialised for stabilising compositions and are widely used in combination
15 with phenolic antioxidants. Zinc Dialkyl Dithio phosphate (ZDDP) is an example of a HAD that is used widely in the automotive oil industry. Generally phosphites decompose hydroperoxides at substantially lower temperatures than sulphides. Triphenylphosphine, a HAD, is a widely recognised
20 reductant for hydroperoxides and functions well at ambient temperatures. Hindered amine light stabilisers (HALS) also function as HADs and is an example of a class of preferred HADs for use with the present invention. A review of HADs are found in: J. Pospíšil, P. P. Klemchuk (Eds) Oxidation
25 inhibition in organic materials, Vol. I. CRC Press 1990, pp. 38 to 47. It is preferred that the bleaching composition of the present invention comprises one or more HADs, in particular triphenylphosphine, and most preferably in conjunction with a non-HAD antioxidant.

- 7 -

THE SUNSCREEN

The use of a sunscreen is applicable to the reduction in incident radiation from the sun and incandescent light. The sunscreen serves to further protect to polymer. The
5 sunscreens used herein are photostable.

Protection against solar radiation can be achieved with UVA and UVB absorbing materials with high extinction coefficients. These compounds are commonly called
10 sunscreens. However, the use of such materials is preferably limited for protection against UV radiation with a wavelength of 400nm or below as compounds with the whole or part of their spectra above 400nm will be coloured.

15 It is preferred that the sunscreen has a C log P value in the range from 1.5 to 8.5.

It is preferred that the sunscreen or sunscreen mixture is present at levels in the aqueous solution in the range from
20 0.01 to 1000 ppm, preferably 0.1 to 100 ppm, most preferably 0.1 to 50 ppm. This level is achieved by dosing an aqueous medium with a composition comprising the sunscreen such that a unit dose provides the desired level in the aqueous medium.

25

In the context of this invention a sunscreen is described as any material which absorbs UVA or UVB radiation. It is preferred that the sunscreens have a molar extinction coefficient (ϵ) of greater than $2000 \text{ mol}^{-1} \text{ cm}^{-1}$ at 300 nm,
30 most preferably $5000 \text{ mol}^{-1} \text{ cm}^{-1}$ at 300 nm. Further it is preferred that the extinction coefficient of the sunscreen

- 8 -

is less than $100 \text{ mol}^{-1} \text{ cm}^{-1}$ at any single wavelength in the range from 400 nm at 750 nm.

The International Commission on Illumination (CIE) in 1970 defined the UV wavelength subdivisions as:-

5

UVA	315-400nm
UVB	280-315nm
UVC	100-280nm

- 10 Preferably the sunscreen absorbs light at a wavelength from about 280-400nm.

Suitable sunscreens are described in: CRC Press Oxidation Inhibition in Organic Materials Vols I and II, Eds. Jan

- 15 Pospisil and Peter P. Klemchuk: ISBN 0-8493-4767-X and 0-8493-4768 and Sunscreens: Development, Evaluation, and Regulatory Aspects Second Edition edited by Nicholas J. Lowe, Nadim A. Shaath and Madhu A. Pathak ISBN: 0824793064.

- 20 Typical examples of sunscreens that may be employed in the present invention are: cinnamates, hydroxybenzophenones, alpha-cyanoacrylates, oxanilides, phenylsalicylates, and 2-hydroxyphenylbenzotriazoles.

- 25 Examples of typical sunscreens but not meant to be exclusive are:

BALANCE CARRIERS AND ADJUNCT INGREDIENTS

25 These may be surfactants, builders, foam agents, anti-foam agents, solvents, and enzymes. The use and amounts of these components are such that the bleaching composition performs depending upon economics, environmental factors and use of the bleaching composition.

30 The composition may comprise a surfactant and optionally other conventional detergent ingredients. The composition

- 10 -

may also comprise an enzymatic detergent composition which comprises from 0.1 - 50 % by weight, based on the total detergent composition, of one or more surfactants. This surfactant system may in turn comprise 0 - 95 % by weight of one or more anionic surfactants and 5 to 100 % by weight of one or more nonionic surfactants. The surfactant system may additionally contain amphoteric or zwitterionic detergent compounds, but this is not normally desired owing to their relatively high cost. The enzymatic detergent composition according to the invention will generally be used as a dilution in water of about 0.05 to 2%.

It is preferred that the bleaching composition comprises between 2 to 60 wt % of a surfactant. In general, the nonionic and anionic surfactants of the surfactant system may be chosen from the surfactants described "Surface Active Agents" Vol. 1, by Schwartz & Perry, Interscience 1949, Vol. 2 by Schwartz, Perry & Berch, Interscience 1958, in the current edition of "McCutcheon's Emulsifiers and Detergents" published by Manufacturing Confectioners Company or in "Tenside-Taschenbuch", H. Stache, 2nd Edn., Carl Hauser Verlag, 1981.

Suitable nonionic detergent compounds which may be used include, in particular, the reaction products of compounds having a hydrophobic group and a reactive hydrogen atom, for example, aliphatic alcohols, acids, amides or alkyl phenols with alkylene oxides, especially ethylene oxide either alone or with propylene oxide. Specific nonionic detergent compounds are C₆-C₂₂ alkyl phenol-ethylene oxide condensates, generally 5 to 25 EO, i.e. 5 to 25 units of ethylene oxide

- 11 -

per molecule, and the condensation products of aliphatic C₈-C₁₈ primary or secondary linear or branched alcohols with ethylene oxide, generally 5 to 40 EO.

- 5 Suitable anionic detergent compounds which may be used are usually water-soluble alkali metal salts of organic sulphates and sulphonates having alkyl radicals containing from about 8 to about 22 carbon atoms, the term alkyl being used to include the alkyl portion of higher acyl radicals.
- 10 Examples of suitable synthetic anionic detergent compounds are sodium and potassium alkyl sulphates, especially those obtained by sulphating higher C₈-C₁₈ alcohols, produced for example from tallow or coconut oil, sodium and potassium alkyl C₉-C₂₀ benzene sulphonates, particularly sodium linear
- 15 secondary alkyl C₁₀-C₁₅ benzene sulphonates; and sodium alkyl glyceryl ether sulphates, especially those ethers of the higher alcohols derived from tallow or coconut oil and synthetic alcohols derived from petroleum. The preferred anionic detergent compounds are sodium C₁₁-C₁₅ alkyl benzene
- 20 sulphonates and sodium C₁₂-C₁₈ alkyl sulphates. Also applicable are surfactants such as those described in EP-A-328 177 (Unilever), which show resistance to salting-out, the alkyl polyglycoside surfactants described in EP-A-070 074, and alkyl monoglycosides.
- 25 Preferred surfactant systems are mixtures of anionic with nonionic detergent active materials, in particular the groups and examples of anionic and nonionic surfactants pointed out in EP-A-346 995 (Unilever). Especially preferred
- 30 is surfactant system that is a mixture of an alkali metal

- 12 -

salt of a C₁₆-C₁₈ primary alcohol sulphate together with a C₁₂-C₁₅ primary alcohol 3-7 EO ethoxylate.

The nonionic detergent is preferably present in amounts greater than 10%, e.g. 25-90% by weight of the surfactant system. Anionic surfactants can be present for example in amounts in the range from about 5% to about 40% by weight of the surfactant system.

Cationic Compound

10 When the present invention is used as a fabric conditioner it needs to contain a cationic compound.

Most preferred are quaternary ammonium compounds.

15 It is advantageous if the quaternary ammonium compound is a quaternary ammonium compound having at least one C₁₂-C₂₂ alkyl chain.

It is preferred if the quaternary ammonium compound has the following formula:

20

in which R¹ is a C₁₂ to C₂₂ alkyl or alkenyl chain; R², R³ and R⁴ are independently selected from C₁-C₄ alkyl chains and X⁻ is a compatible anion. A preferred compound of this type is

30

- 13 -

the quaternary ammonium compound cetyl trimethyl quaternary ammonium bromide.

A second class of materials for use with the present
 5 invention are the quaternary ammonium compound having the following formula:

in which R^1 and R^2 are indepently selected from C_{12} to C_{22}
 15 alkyl or alkenyl chain; R^3 and R^4 are independently selected from C_1 - C_4 alkyl chains and X^- is a compatible anion.

A detergent composition according to claim 1 in which the ratio of (ii) cationic material to (iv) anionic surfactant is at least 2:1.

20

Other suitable quaternary ammonium compounds are disclosed in EP 0 239 910 (Procter and Gamble).

It is preferred if the ratio of cationic to nonionic
 25 surfactant is from 1:100 to 50:50, more preferably 1:50 to 20:50.

The cationic compound may be present from 0.02 wt% to 20 wt% of the total weight of the composition.

30

- 14 -

Preferably the cationic compound may be present from 0.05 wt% to 15 wt%, a more preferred composition range is from 0.2 wt% to 5 wt%, and most preferably the composition range is from 0.4 wt% to 2.5 wt% of the total weight of the composition.

If the product is a liquid it is preferred if the level of cationic surfactant is from 0.05wt% to 10wt% of the total weight of the composition. Preferably the cationic compound may be present from 0.2 wt% to 5 wt%, and most preferably from 0.4 wt% to 2.5 wt% of the total weight of the composition.

If the product is a solid it is preferred if the level of cationic surfactant is 0.05 wt% to 15 wt% of the total weight of the composition. A more preferred composition range is from 0.2 wt% to 10 wt%, and the most preferred composition range is from 0.9 wt% to 3.0 wt% of the total weight of the composition.

20

EXPERIMENTAL

Antioxidants were initially dissolved in an ethanol solution in order to air their dissolution in the aqueous medium. A stock wash solution was prepared using sodium dodecyl sulphate (SDS), pH 10 buffer, demin water.

UV-Visible spectra of the wash solution was recorded. Aliquots of each ethanol solution were added to individual portions of the wash solution drop wise with stirring to maintain dissolution of the antioxidants.

- 15 -

UV-Visible spectra of the resulting mixtures were recorded. Pieces of test cloth (100% elastane) were added to the wash solutions containing the antioxidants and were agitated for 30 mins. UV-Visible spectra of the final mixtures were recorded and the amount of antioxidant/sunscreen determined.

COMPOSITIONS

10 Ethanol/Antioxidant Solutions

Each selected antioxidant (0.12g) was dissolved in ethanol to a total volume of 50 ml.

Wash Solution

15 SDS (sodium dodecyl sulphate) was selected as the surfactant because it does not absorb in the UV Visible region of the spectrum. To mimic a 2 g/l formulation, 0.8g SDS (20% of formulation being surfactant) was added to a 2 l volumetric flask and made up to 2 l with demin water and pH 10 carbonate buffer (at similar level to SDS).

Wash Solution Containing Antioxidant

25:1 Liquor to cloth ratio chosen for the wash experiments
12.5g of wash solution added to a 120 ml glass bottle
200 ul of ethanol/antioxidant solution added to the wash solution to generate a 20 ppm solution with respect to the antioxidant.

Integrity Experiment 1

A 1.8g piece of 25% elastane and 75% nylon fabric was washed
 5 in 180 ml water at 293K, containing 0.4g/L SDS surfactant
 and buffered to pH 10 using a carbonate buffer. The cloth
 was then rinsed 3 times in demineralised water and dried.
 Following this the elastane part of the fabric was dissolved
 by immersing the fabric in di-methyl acetamide and the
 10 molecular weight of the polymer determined by Gel Phase

- 18 -

Chromatography. This procedure was repeated but with repeat washes. The results are shown in the table below in which the values given are the average of 2 repeat experiments.

No. of washes	Mn	PD
1	37500	1.97
2	36200	1.93
3	34500	1.85
4	29800	1.97
5	30800	2.07

5

Mn = number averaged molecular number

PD= poly dispersity

As the number of washes increases, Mn slowly decreases
10 indicating gradual damage to the polymer.

Integrity Experiment 2

The experiment of integrity experiment 1 was repeated except
after each wash the cloth was irradiated for 7.2 hours in a
15 weatherometer set to mimic 385W/m² of outside sunlight.
The results are given in the table below in which the values
given are the average of 2 repeat experiments.

No. of washes	Mn	PD
1	32500	2.32
2	30200	2.63
3	20300	4.00
4	14600	4.93
5	7030	8.91

- 19 -

As the number of wash/irradiation cycles increases the Mn decreases and PD increases, indicating strong damage to the fiber by the sunlight exposure.

5

Integrity Experiment 3

Integrity Experiment 2 was repeated except 20ppm of protection agent was added to each wash and the Chromatography only performed after 5 wash/irradiate cycles.

10 The results are given in the Table below in which the values given are the average of 2 repeat experiments.

Protection agent	Mn	PD
None	7030	8.91
Tinuvin 329	13600	4.94
Tinuvin 770	17800	5.41
Dodecyl gallate	23200	4.46

15 Tinuvin 770 [bis(2,2,6,6-tetramethyl-4-piperidinyl)sebacate] is a HALS antioxidant ex Ciba Speciality chemicals.

The sunscreen and antioxidants all reduce the damage to the polymer induced by the sunlight exposure. This is shown by a higher Mn and lower PD compared to control.

- 20 -

We Claim:

1. Use of a composition for increasing the integrity
lifetime of an apolar cured elastomeric polymer
5 substrate, the use by applying to the apolar cured
elastomeric polymer substrate an antioxidant in an
aqueous medium, wherein the apolar substrate forms part
or whole of a textile garment.
- 10 2. Use according to claim 1, wherein the antioxidant is
present in the aqueous solution in the range from 0.01
to 1000 ppm.
- 15 3. Use according to claim 1 or 2, wherein the antioxidant
is selected from:
(i) a phenolic antioxidant; and,
(ii) a hindered amine antioxidant.
- 20 4. Use according to claim 3, wherein the antioxidant is a
hindered phenol.
- 25 5. Use according to claim 3, wherein the antioxidant is
selected from the group consisting of: 2, 6-di-tert-
butyl hydroxy toluene, octylgallate, and dodecylgallate.
- 30 6. Use according to any preceding claim, wherein the
aqueous medium comprises a photostable organic sunscreen
having a C log P value of at least 1.9 and having an
extinction coefficient of greater than $2000 \text{ mol}^{-1} \text{ cm}^{-1}$ at
300 nm and an extinction coefficient of less than 100

- 21 -

$\text{mol}^{-1} \text{ cm}^{-1}$ at any single wavelength in the range from 400 nm at 750 nm.

- 5 7. Use according to any preceding claim, wherein the apolar cured polymer substrate is an elastomeric synthetic apolar cured polymer substrate.
- 10 8. Use according to any preceding claim, wherein the antioxidant has a C log P value in the range from 1.5 to 8.5.
9. Use according to any preceding claim comprising the step of drying the garment after application.
- 15 10. Use according to any preceding claim, wherein the aqueous medium comprises a fabric conditioner.
11. Use according to any one of claims 1 to 9, wherein the an aqueous medium is without a surfactant.
- 20 12. Use according to any one of claims 1 to 9, wherein the an aqueous medium comprises a surfactant.
13. Use according to any preceding claim, wherein an apolar
25 cured polymer is selected from the group consisting of: polybutadiene binder, elastane, and latex.
