(54) Titre : DERIVES D'AZETIDINE ET DE CYCLOBUTANE EN TANT QU'INHIBITEURS DE JANUS KINASE (JAK)
(55) Title: AZETIDINE AND CYCLOBUTANE DERIVATIVES AS JAK INHIBITORS

(57) Abrégé/Abstract:
The method includes the steps of performing in-vitro, intestinal and/or expressed enzyme assays with selected ethnobotanical substances, for both humans and a variety of animal species, to produce an array of resulting chemical entities, such as metabolites, for the human and the animals. Comparisons are then made between the chemical entities from the human in-vitro studies and the animal in-vitro studies to determine the closest match. The animal with the closest match is then used for an in-vitro study. If a match is present between the animal in-vivo results and the human in-vitro results, the matched chemical entity is isolated or synthesized and then further tested to determine the suitability of the matched chemical entity as a treatment drug.
Title: AZETIDINE AND CYCLOBUTANE DERIVATIVES AS JAK INHIBITORS

If a match is present between the animal in-vivo results and the human in-vitro results, the matched chemical entity is isolated or synthesized and then further tested to determine the suitability of the matched chemical entity as a treatment drug.
AZETIDINE AND CYCLOBUTANE DERIVATIVES AS JAK INHIBITORS

FIELD OF THE INVENTION

The present invention relates to azetidine and cyclobutane derivatives, as well as their compositions and methods of use and preparation, which are JAK inhibitors useful in the treatment of JAK-associated diseases including, for example, inflammatory and autoimmune disorders, as well as cancer.

BACKGROUND OF THE INVENTION

Protein kinases (PKs) are a group of enzymes that regulate diverse, important biological processes including cell growth, survival and differentiation, organ formation and morphogenesis, neovascularization, tissue repair and regeneration, among others. Protein kinases exert their physiological functions through catalyzing the phosphorylation of proteins (or substrates) and thereby modulating the cellular activities of the substrates in various biological contexts. In addition to the functions in normal tissues/organs, many protein kinases also play more specialized roles in a host of human diseases including cancer. A subset of protein kinases (also referred to as oncogenic protein kinases), when dysregulated, can cause tumor formation and growth, and further contribute to tumor maintenance and progression. Thus far, oncogenic protein kinases represent one of the largest and most attractive groups of protein targets for cancer intervention and drug development.

The Janus Kinase (JAK) family plays a role in the cytokine-dependent regulation of proliferation and function of cells involved in immune response. Currently, there are four known mammalian JAK family members: JAK1 (also known as Janus kinase-1), JAK2 (also known as Janus kinase-2), JAK3 (also known as Janus kinase, leukocyte; JAKL; L-JAK and Janus kinase-3) and TYK2 (also known as protein-tyrosine kinase 2). The JAK proteins range in size from 120 to 140 kDa and comprise seven conserved JAK homology (JH) domains; one of these is a functional catalytic kinase domain, and another is a pseudokinase domain potentially serving a regulatory function and/or serving as a docking site for STATs.

Blocking signal transduction at the level of the JAK kinases holds promise for developing treatments for inflammatory diseases, autoimmune diseases, myeloproliferative
diseases, and human cancers, to name a few. Inhibition of the JAK kinases is also envisioned to have therapeutic benefits in patients suffering from skin immune disorders such as psoriasis, and skin sensitization. Accordingly, inhibitors of Janus kinases or related kinases are widely sought and several publications report effective classes of compounds. For example, certain JAK inhibitors, including pyrrolopyridine and pyrrolopyrimidines, are reported in U.S. Ser. No. 11/637,545, filed December 12, 2006.

Thus, new or improved agents which inhibit kinases such as Janus kinases are continually needed for developing new and more effective pharmaceuticals to treat cancer and other diseases. The compounds and processes described herein are directed toward these needs and other ends.

SUMMARY OF THE INVENTION

The present invention provides, inter alia, JAK inhibitors of Formulas I, II, III, and IV:

or pharmaceutically acceptable salts thereof, wherein constituent members are defined below.
The present invention further provides pharmaceutical compositions comprising a compound of Formula I, II, III, or IV, or a pharmaceutically acceptable salt thereof, and at least one pharmaceutically acceptable carrier.

The present invention further provides methods of treating any of the various JAK-associated diseases and disorders named herein by administering to a patient a therapeutically effective amount of a compound of Formula I, II, III, or IV, or a pharmaceutically acceptable salt of the same.

The present invention further provides compounds of Formulas I, II, III, and IV, or pharmaceutically acceptable salts thereof, for use in therapy.

The present invention further provides use of the compounds of Formulas I, II, III, and IV, or pharmaceutically acceptable salts thereof, for the production of a medicament for use in therapy.

The present invention further provides methods for the preparation of the compounds of Formulas I, II, III, and IV.

**DETAILED DESCRIPTION**

The present invention provides, *inter alia*, JAK inhibitors of Formula I:

![Chemical Structure](image)

or pharmaceutically acceptable salts thereof, wherein:

- L is SO₂ or CO₂;
- R¹ is C₁₋₆ alkyl, C₃₋₇ cycloalkyl, phenyl, 5- or 6-membered heteroaryl, indolyl, NR²R³, or OR⁴, wherein said alkyl, cycloalkyl, phenyl, or heteroaryl is optionally substituted with 1, 2, or 3 substituents independently selected from F, CN, and C₁₋₄ alkyl;
- R² and R³ are independently selected from H, C₁₋₄ alkyl, and phenyl; and
- R⁴ is C₁₋₆ alkyl, phenyl, or benzyl.
In some embodiments, when L is SO₂, then R¹ is other than OR⁴.

In some embodiments, when L is SO₂, then R¹ is C₁₋₆ alkyl, C₃₋₇ cycloalkyl, phenyl, 5- or 6-membered heteroaryl, or NR²R³, wherein said alkyl, cycloalkyl, phenyl, or heteroaryl is optionally substituted with 1, 2, or 3 substituents independently selected from F and C₁₋₄ alkyl.

In some embodiments, when L is CO, then R¹ is C₃₋₇ cycloalkyl, phenyl, 5- or 6-membered heteroaryl, indolyl, NR²R³, or OR⁴, wherein said cycloalkyl, phenyl, or heteroaryl is optionally substituted with 1, 2, or 3 substituents independently selected from CN and C₁₋₄ alkyl.

In some embodiments, L is SO₂.

In some embodiments, L is CO.

In some embodiments, R¹ is methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl, 2-methylprop-1-yl, 1-methylprop-1-yl, each optionally substituted with 1, 2, or 3 F.

In some embodiments, R¹ is C₁₋₄ alkyl.

In some embodiments, R¹ is ethyl.

In some embodiments, R¹ is C₃₋₇ cycloalkyl optionally substituted by C₁₋₄ alkyl.

In some embodiments, R¹ is phenyl optionally substituted with F, methyl, or CN.

In some embodiments, R¹ is 5-membered heteroaryl selected from thiényl, pyrazolyl, pyrrolyl, 1,2,4-oxadiazolyl, and isoxazolyl, each optionally substituted with C₁₋₄ alkyl.

In some embodiments, R¹ is pyridinyl.

In some embodiments, R¹ is NR²R³ or OR⁴.

In some embodiments, L is SO₂ and R¹ is C₁₋₆ alkyl.

The present invention further provides compounds of Formula II:

\[
\text{II}
\]

or pharmaceutically acceptable salts thereof, wherein:
R⁵ and R⁶ are independently selected from H, F, CN, OH, C₃₋₄ alkyl, benzyloxy, C₂₋₈ dialkylaminosulfonyl, and 5-membered heteroaryl, wherein said alkyl is optionally substituted by 1, 2, or 3 substituents selected from F, OH, CN, and C₁₋₄ alkoxy, and wherein said 5-membered heteroaryl is optionally substituted with C₁₋₄ alkyl.

In some embodiments, when one of R⁵ and R⁶ is OH, then the other of R⁵ and R⁶ is other than CN or F.

In some embodiments, one of R⁵ and R⁶ is H and the other is selected from H, F, CN, OH, C₁₋₄ alkyl, benzyloxy, C₂₋₈ dialkylaminosulfonyl, and 5-membered heteroaryl, wherein said alkyl is optionally substituted by 1, 2, or 3 substituents selected from F, OH, CN, and C₁₋₄ alkoxy, and wherein said 5-membered heteroaryl is optionally substituted with C₁₋₄ alkyl.

In some embodiments, R⁵ and R⁶ are independently selected from H, F, CN, OH, and methyl.

In some embodiments, R⁵ and R⁶ are independently selected from H and CN.

The present invention further provides a compound of Formula III or IV:

![Diagram of compounds III and IV](image)

or a pharmaceutically acceptable salt thereof, wherein:

L is SO₂ or CO₂;

R¹ is C₁₋₄ alkyl, C₃₋₇ cycloalkyl, phenyl, 5- or 6-membered heteroaryl, indolyl, NR₂R₃, or OR⁴, wherein said alkyl, cycloalkyl, phenyl, or heteroaryl is optionally substituted with 1, 2, or 3 substituents independently selected from F, CN, and C₁₋₄ alkyl;

R² and R³ are independently selected from H, C₁₋₄ alkyl, and phenyl; and

R⁴ is C₁₋₄ alkyl, phenyl, or benzyl;

wherein when L is SO₂, R¹ is other than OR⁴.

In some embodiments, L is SO₂.
In some embodiments, L is CO.
In some embodiments, R₁ is methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl, 2-methylprop-1-yl, 1-methylprop-1-yl, each optionally substituted with 1, 2, or 3 F.
In some embodiments, R₁ is C₁₋₄ alkyl.

In some embodiments, R₁ is ethyl.
In some embodiments, R₁ is C₃₋₅ cycloalkyl optionally substituted by C₁₋₄ alkyl.
In some embodiments, R₁ is phenyl optionally substituted with F, methyl, or CN.
In some embodiments, R₁ is 5-membered heteroaryl selected from thiophenyl, pyrazolyl, pyrrolyl, 1,2,4-oxadiazolyl, and isoxazolyl, each optionally substituted with C₁₋₄ alkyl.

In some embodiments, R₁ is pyridinyl.
In some embodiments, R₁ is NR²R³ or OR⁴.
In some embodiments, L is SO₂ and R₁ is C₁₋₆ alkyl.

At various places in the present specification, substituents of compounds of the invention are disclosed in groups or in ranges. It is specifically intended that the invention include each and every individual subcombination of the members of such groups and ranges. For example, the term “C₁₋₆ alkyl” is specifically intended to individually disclose methyl, ethyl, C₃ alkyl, C₄ alkyl, C₅ alkyl, and C₆ alkyl.

It is further appreciated that certain features of the invention, which are, for clarity, described in the context of separate embodiments, can also be provided in combination in a single embodiment. Conversely, various features of the invention which are, for brevity, described in the context of a single embodiment, can also be provided separately or in any suitable subcombination.

As used herein, the term “alkyl” is meant to refer to a saturated hydrocarbon group which is straight-chained or branched. Example alkyl groups include methyl (Me), ethyl (Et), propyl (e.g., n-propyl and isopropyl), butyl (e.g., n-butyl, isobutyl, sec-butyl, t-butyl), pentyl (e.g., n-pentyl, isopentyl, sec-pentyl, neopentyl), and the like. An alkyl group can contain from 1 to about 20, from 2 to about 20, from 1 to about 10, from 1 to about 8, from 1 to about 6, from 1 to about 4, or from 1 to about 3 carbon atoms. A linking alkyl group is referred to herein as “alkylene.”

As used herein, “cycloalkyl” refers to non-aromatic cyclic hydrocarbons including cyclized alkyl, alkenyl, and alkynyl groups. Cycloalkyl groups can include mono- or polycyclic (e.g., having 2, 3 or 4 fused rings) groups and spirocycles. Ring-forming carbon atoms of a cycloalkyl group can be optionally substituted by oxo or sulfido. Cycloalkyl
groups also include cycloalkyldienes. Example cycloalkyl groups include cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, cyclopentenyl, cyclohexenyl, cyclohexadienyl, cycloheptatrienyl, norbornyl, norpinyl, norcaranyl, adamantyl, and the like. In some embodiments, the cycloalkyl group is cyclopropyl. Also included in the definition of cycloalkyl are moieties that have one or more aromatic rings fused (i.e., having a bond in common with) to the cycloalkyl ring, for example, benzo or thiényl derivatives of cyclopentane, cyclopentene, cyclohexane, and the like. A cycloalkyl group containing a fused aromatic ring can be attached through any ring-forming atom including a ring-forming atom of the fused aromatic ring.

As used herein, “heteroaryl” refers to an aromatic heterocycle having at least one heteroatom ring member such as sulfur, oxygen, or nitrogen. Heteroaryl groups include monocyclic and polycyclic (e.g., having 2, 3 or 4 fused rings) systems. Examples of heteroaryl groups include without limitation, pyridyl, pyrimidinyl, pyrazinyl, pyridazinyl, triazinyl, furyl, quinolyl, isoquinolyl, thienyl, imidazolyl, thiazolyl, indolyl, pyrrol, oxazolyl, benzofuryl, benzothienyl, benzothiazolyl, isoazolyl, pyrazolyl, triazolyl, tetrazolyl, indazolyl, 1,2,4-thiadiazolyl, isothiazolyl, benzothienyl, purinyl, carbazolyl, benzimidazolyl, indoliny, and the like. In some embodiments, the heteroaryl is pyridinyl. In some embodiments, the heteroaryl is thienyl, pyrazolyl, pyrrolyl, 1,2,4-oxadiazolyl, or isoazolyl. In some embodiments, the heteroaryl is indolyl. In some embodiments, any ring-forming N in a heteroaryl moiety can be substituted by oxo. In some embodiments, the heteroaryl group has from 1 to about 20 carbon atoms, and in further embodiments from about 3 to about 20 carbon atoms. In some embodiments, the heteroaryl group contains 3 to about 14, 4 to about 14, 3 to about 7, or 5 to 6 ring-forming atoms. In some embodiments, the heteroaryl group has 1 to about 4, 1 to about 3, or 1 to 2 heteroatoms.

As used herein, “benzyloxy” refers to −O-benzyl.

As used herein, “dialkylaminosulfonyl” refers to −SO₂-N(alkyl)₂.

The compounds described herein can be asymmetric (e.g., having one or more stereocenters). All stereoisomers, such as enantiomers and diastereomers, are intended unless otherwise indicated. Compounds of the present invention that contain asymmetrically substituted carbon atoms can be isolated in optically active or racemic forms. Methods on how to prepare optically active forms from optically active starting materials are known in the art, such as by resolution of racemic mixtures or by stereoselective synthesis. Many geometric isomers of olefins, C≡N double bonds, and the like can also be present in the compounds described herein, and all such stable isomers are contemplated in the present
invention. Cis and trans geometric isomers of the compounds of the present invention are described and may be isolated as a mixture of isomers or as separated isomeric forms. Where a compound capable of stereoisomerism or geometric isomerism is designated in its structure or name without reference to specific R/S or cis/trans configurations, it is intended that all such isomers are contemplated.

Resolution of racemic mixtures of compounds can be carried out by any of numerous methods known in the art. An example method includes fractional recrystallization using a chiral resolving acid which is an optically active, salt-forming organic acid. Suitable resolving agents for fractional recrystallization methods are, for example, optically active acids, such as the D and L forms of tartaric acid, diacetyltartaric acid, dibenzoyltartaric acid, mandelic acid, malic acid, lactic acid or the various optically active camphorsulfonic acids such as β-camphorsulfonic acid. Other resolving agents suitable for fractional crystallization methods include stereoisomerically pure forms of α-methylbenzylamine (e.g., S and R forms, or diastereomerically pure forms), 2-phenylglycinol, norephedrine, ephedrine, N-methylephedrine, cyclohexylethylamine, 1,2-diaminocyclohexane, and the like.

Resolution of racemic mixtures can also be carried out by elution on a column packed with an optically active resolving agent (e.g., dinitrobenzoylephphylglycine). Suitable elution solvent composition can be determined by one skilled in the art.

Compounds of the invention also include tautomeric forms. Tautomeric forms result from the swapping of a single bond with an adjacent double bond together with the concomitant migration of a proton. Tautomeric forms include prototropic tautomers which are isomeric protonation states having the same empirical formula and total charge. Example prototropic tautomers include ketone – enol pairs, amide - imidic acid pairs, lactam – lactim pairs, amide - imidic acid pairs, enamine – imine pairs, and annular forms where a proton can occupy two or more positions of a heterocyclic system, for example, 1H- and 3H-imidazole, 1H-, 2H- and 4H- 1,2,4-triazole, 1H- and 2H- isoindole, and 1H- and 2H-pyrazole. Tautomeric forms can be in equilibrium or sterically locked into one form by appropriate substitution.

Compounds of the invention further include hydrates and solvates, as well as anhydrous and non-solvated forms.

The term, “compound,” as used herein is meant to include all stereoisomers, geometric isomers, tautomers, and isotopes of the structures depicted.
All compounds, and pharmaceutically acceptable salts thereof, can be found together with other substances such as water and solvents (e.g. hydrates and solvates) or can be isolated.

Compounds of the invention can also include all isotopes of atoms occurring in the intermediates or final compounds. Isotopes include those atoms having the same atomic number but different mass numbers. For example, isotopes of hydrogen include tritium and deuterium.

In some embodiments, the compounds of the invention, and salts thereof, are substantially isolated. By "substantially isolated" is meant that the compound is at least partially or substantially separated from the environment in which it was formed or detected. Partial separation can include, for example, a composition enriched in the compound of the invention. Substantial separation can include compositions containing at least about 50%, at least about 60%, at least about 70%, at least about 80%, at least about 90%, at least about 95%, at least about 97%, or at least about 99% by weight of the compound of the invention, or salt thereof. Methods for isolating compounds and their salts are routine in the art.

The phrase "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio.

The expressions, "ambient temperature" and "room temperature," as used herein, are understood in the art, and refer generally to a temperature, e.g. a reaction temperature, that is about the temperature of the room in which the reaction is carried out, for example, a temperature from about 20 °C to about 30 °C.

The present invention also includes pharmaceutically acceptable salts of the compounds described herein. As used herein, "pharmaceutically acceptable salts" refers to derivatives of the disclosed compounds wherein the parent compound is modified by converting an existing acid or base moiety to its salt form. Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic residues such as amines; alkali or organic salts of acidic residues such as carboxylic acids; and the like. The pharmaceutically acceptable salts of the present invention include the conventional non-toxic salts of the parent compound formed, for example, from non-toxic inorganic or organic acids. The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound which contains a basic or acidic moiety by
conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile (ACN) are preferred. Lists of suitable salts are found in Remington's Pharmaceutical Sciences, 17th ed., Mack Publishing Company, Easton, Pa., 1985, p. 1418 and Journal of Pharmaceutical Science, 66, 2 (1977).

Synthesis

Compounds of the invention, including salts thereof, can be prepared using known organic synthesis techniques and can be synthesized according to any of numerous possible synthetic routes.

The reactions for preparing compounds of the invention can be carried out in suitable solvents which can be readily selected by one of skill in the art of organic synthesis. Suitable solvents can be substantially non-reactive with the starting materials (reactants), the intermediates, or products at the temperatures at which the reactions are carried out, e.g., temperatures which can range from the solvent's freezing temperature to the solvent's boiling temperature. A given reaction can be carried out in one solvent or a mixture of more than one solvent. Depending on the particular reaction step, suitable solvents for a particular reaction step can be selected by the skilled artisan.

Preparation of compounds of the invention can involve the protection and deprotection of various chemical groups. The need for protection and deprotection, and the selection of appropriate protecting groups, can be readily determined by one skilled in the art. The chemistry of protecting groups can be found, for example, in T. W. Greene and P. G. M. Wuts, Protective Groups in Organic Synthesis, 3rd Ed., Wiley & Sons, Inc., New York (1999).

Reactions can be monitored according to any suitable method known in the art. For example, product formation can be monitored by spectroscopic means, such as nuclear magnetic resonance spectroscopy (e.g., $^1$H or $^{13}$C), infrared spectroscopy, spectrophotometry (e.g., UV-visible), mass spectrometry, or by chromatographic methods such as high performance liquid chromatography (HPLC) or thin layer chromatography (TLC).

The present invention provides a method of forming a compound of Formula I as shown below in Schemes 1, 2, and 3. Accordingly, in step (i) of Scheme 1, the compound of Formula I is prepared by a method comprising treating a compound of Formula Ia:
to remove the R\textsuperscript{7} moiety; wherein:

- L is SO\textsubscript{2} or CO;

- R\textsuperscript{1} is C\textsubscript{1-6} alkyl, C\textsubscript{3-7} cycloalkyl, phenyl, 5- or 6-membered heteroaryl, indolyl, NR\textsuperscript{2}R\textsuperscript{3}, or OR\textsuperscript{4}, wherein the alkyl, cycloalkyl, phenyl, or heteroaryl is optionally substituted with 1, 2, or 3 substituents independently selected from F, CN, and C\textsubscript{1-4} alkyl;

- R\textsuperscript{2} and R\textsuperscript{3} are independently selected from H, C\textsubscript{1-4} alkyl, and phenyl;

- R\textsuperscript{4} is C\textsubscript{1-6} alkyl, phenyl, or benzyl; and

- R\textsuperscript{7} is a protecting group;

wherein when L is SO\textsubscript{2}, R\textsuperscript{1} is other than OR\textsuperscript{4}.

Appropriate R\textsuperscript{7} protecting groups include, but are not limited to the protecting groups for amines delineated in Wuts and Greene, Protective Groups in Organic Synthesis, 4th ed., John Wiley & Sons: New Jersey, pages 696-887 (and, in particular, pages 872-887) (2007).

In some embodiments, the protecting group for the R\textsuperscript{7} group is one which is stable to conditions for removing the R\textsuperscript{10} protecting group in step (vi) of Scheme 2. In some embodiments, the protecting group for the R\textsuperscript{7} group is one which is stable to conditions for removing the R\textsuperscript{5} protecting group in step (iv) of Scheme 1. In some embodiments, R\textsuperscript{7} is a group which is resistant to room temperature acidic conditions. In some embodiments, the R\textsuperscript{7} is a group which is not removed in 1 to 5 N hydrochloric acid at room temperature, at a temperature from about 10 °C to about 40 °C, at a temperature from about 15 °C to about 40 °C, or at a temperature from about 15 °C to about 30 °C. In some embodiments, R\textsuperscript{7} is benzylxycarbonyl (Cbz), 2,2,2-trichloroethoxycarbonyl (Troc), 2-(trimethylsilyl)ethoxycarbonyl (Teoc), 2-(4-trifluoromethyl)phenylsulfonyl)ethoxycarbonyl (Tsc), t-butoxycarbonyl (BOC), 1-adamantylxycarbonyl (Adoc), 2-adamantylcarbonyl (2-Adoc), 2,4-dimethylpent-3-yloxyxycarbonyl (Doc), cyclohexylxycarbonyl (Hoc), 1,1-dimethyl-2,2,2-...
trichloroethoxycarbonyl (TcBOC), vinyl, 2-chloroethyl, 2-phenylsulfonylethyl, allyl, benzyl, 2-nitrobenzyl, 4-nitrobenzyl, diphenyl-4-pyridylmethyl, N',N'-dimethylhydrazinyl, methoxymethyl, t-butoxymethyl (Bum), benzylxoxymethyl (BOM), or 2-tetrahydropyranyl (THP). In some embodiments, R' is 2-(trimethylsilyl)ethoxymethyl (SEM). In some embodiments, R' is N-pivaloxyoxymethyl (POM).

Treatment of the compound of Formula Ia to remove the R' group can be accomplished by methods known in the art for the removal of particular protecting groups for amines, such as those in Wuts and Greene, Protective Groups in Organic Synthesis, 4th ed., John Wiley & Sons: New Jersey, pages 696-887 (and, in particular, pages 872-887) (2007).

For example, in some embodiments, the R' group is removed by treating with fluoride ion (e.g., treating with tetrabutylammonium fluoride), hydrochloric acid, pyridinium p-toluenesulfonic acid (PPTS), or a Lewis acid (e.g., lithium tetrafluoroborate). In some embodiments, the treating comprises treating with lithium tetrafluoroborate, followed by treating with ammonium hydroxide (e.g., when R' is 2-(trimethylsilyl)ethoxymethyl). In some embodiments, the treating comprises treating with base (e.g., R' is N-pivaloxyoxymethyl). In some embodiments, the base is an alkali metal hydroxide. In some embodiments, the base is sodium hydroxide. In some embodiments, the treating comprises treating with sodium hydroxide or ammonia in a solvent such as methanol or water.

In some embodiments, to deprotect the SEM-protection group, a mild, two stage protocol is employed. The SEM-protected substrate of Formula Ia is treated with lithium tetrafluoroborate (LiBF₄) or trifluoroborate etherate in aqueous acetonitrile at ambient or elevated temperature (in some embodiments, at about 80 °C) for ten to twenty hours. The resulting corresponding hydroxyoxymethyl intermediate is then subsequently treated with aqueous ammonium hydroxide (NH₄OH) at room temperature to provide the compound of Formula I.

In some embodiments, for the POM-deprotection, an aqueous sodium hydroxide (NaOH) or lithium hydroxide (LiOH) solution is used. Thus, a suspension of the POM-protected compound of Formula Ia, is treated with a 1 N aqueous sodium hydroxide solution at room temperature for two to three hours. The desired product of Formula I can be obtained after the typical acid-base work-up.
Scheme 1

Scheme 2

5

In step (ii), the compound of Formula la is formed by a method comprising reacting a compound of Formula lb:

10
with a compound of Formula lc:

```
N=NH
\[\text{R'}\]
```

Ic

to form the compound of Formula la.

Step (ii) of Scheme 1 is a Michael addition reaction between the compound of Formula Ib and the compound of Formula lc. The Michael addition may be promoted by a Michael addition catalyst, such as base. In some embodiments, the Michael addition catalyst is a tetraalkylammonium halide, tetraalkylammonium hydride, guanidine, amidine, hydroxide, alkoxide, silicate, alkali metal phosphate, oxide, tertiary amine, alkali metal carbonate, alkali metal bicarbonate, alkali metal hydrogen phosphate, phosphate, or alkali metal salt of a carboxylic acid. In some embodiments, the Michael addition catalyst is tetramethyl guanidine, 1,8-diazabicyclo[5.4.0]undec-7-ene, 1,5-diazabicyclo[4.3.0]non-5-ene, 1,4-diazabicyclo[2.2.2]octane, tert-butyl ammonium hydride, sodium hydride, potassium hydroxide, sodium methoxide, sodium ethoxide, tripotassium phosphate, sodium silicate, calcium oxide, triethylamine, sodium carbonate, potassium carbonate, sodium bicarbonate, potassium bicarbonate, potassium hydrogen phosphate, triphenyl phosphine, triethyl phosphine, potassium acetate, or potassium acrylate. In some embodiments, the Michael addition catalyst is 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU). In some embodiments, a stoichiometric or a catalytic amount of base is used to facilitate the Michael addition reaction.

In some embodiments, the reaction is conducted in an organic solvent, such as acetonitrile or dimethylacetamide, at room temperature for two to six hours. Under the optimized reaction conditions, the desired Michael adduct, the compound of Formula la, may be obtained in high yield and purity.

Alternatively, the compound of Formula la can be formed by the process shown in step (iii) of Scheme 1. Accordingly, the compound of Formula la is formed by a method comprising reacting a compound of Formula ld:
with a compound of formula $R^8$-$L$-$R^1$ to form the compound of Formula 1a; wherein $R^8$ is a leaving group.

In some embodiments, $R^8$ is any good leaving group known in the art. In some embodiments, $R^8$ is halogen or $C_{1-4}$ alkoxy. In some embodiments, $R^8$ is chloro.

In some embodiments, the reacting of the compound of Formula 1d with the compound of formula $R^8$-$L$-$R^1$ is performed in the presence of a base. In some embodiments, the base is a tertiary amine, such as triethylamine, diisopropylethylamine, N-methylmorpholine, and the like. In some embodiments, the base is diisopropylethylamine.

In step (iv) of Scheme 1, the compound of Formula 1d is formed by a method comprising treating a compound of Formula 1e:

To remove the $R^9$ group thereby forming the compound of Formula 1d; wherein $R^9$ is a protecting group.

$R^9$ is a protecting group which can be selectively removed under conditions which do not displace the $R^7$ protecting group. In some embodiments, the $R^9$ is a protecting group which can be removed under acidic
conditions at room temperature, at a temperature from about 15 °C to about 40 °C, or at a
temperature from about 15 °C to about 30 °C. In some embodiments, R⁴ is C₁₋₆
alkoxycarbonyl. In some embodiments, R⁵ is tert-butoxycarbonyl. As used herein,
"alkoxycarbonyl" refers to a group of formula -C(=O)O-alkyl.
5   Treatment of the compound of Formula Ie to remove the R⁴ group can be
accomplished by methods known in the art for the removal of particular protecting groups for
amines, such as those in Wuts and Greene, Protective Groups in Organic Synthesis, 4th ed.,
Appropriate treatment conditions do
10 not displace the R² protecting group. In some embodiments, the treating comprises subjecting
the compound of Formula Ie to acidic conditions at room temperature, at a temperature from
about 15 °C to about 40 °C, or at a temperature from about 15 °C to about 30 °C. In some
embodiments, the treating of the compound of Formula Ie comprises treating with
hydrochloric acid in 1,4-dioxane.
15 In step (v) of Scheme 1, the compound of Formula Ia ie is formed by a method
comprising reacting a compound of Formula Ib:

\[
\text{Ib}
\]

with a compound of Formula If:

\[
\text{If}
\]

to form the compound of Formula Ie.

20 Step (v) of Scheme 1 is a Michael addition reaction between the compound of
Formula Ib and the compound of Formula If. The Michael addition may be promoted by a
Michael addition catalyst, such as base. In some embodiments, the Michael addition catalyst
is a tetraalkylammonium halide, tetraalkylammonium hydroxide, guanidine, amidine,
hydroxide, alkoxide, silicate, alkali metal phosphate, oxide, tertiary amine, alkali metal
carbonate, alkali metal bicarbonate, alkali metal hydrogen phosphate, phosphine, or alkali
metal salt of a carboxylic acid. In some embodiments, the Michael addition catalyst is

16
tetramethyl guanidine, 1,8-diazabicyclo(5.4.0)undec-7-ene, 1,5-diazabicyclo(4.3.0)non-5-ene, 
1,4-diazabicyclo(2.2.2)octane, tert-butyl ammonium hydroxide, sodium hydroxide, potassium 
hydroxide, sodium methoxide, sodium ethoxide, tripotassium phosphate, sodium silicate, 
calcium oxide, triethylamine, sodium carbonate, potassium carbonate, sodium bicarbonate, 
potassium bicarbonate, potassium hydrogen phosphate, triphenyl phosphine, triethyl 
phosphine, potassium acetate, or potassium acrylate. In some embodiments, the Michael 
addition catalyst is 1,8-diazabicyclo(5.4.0)undec-7-ene (DBU). In some embodiments, a 
stoichiometric or a catalytical amount of base is used to facilitate the Michael addition 
reaction.

In some embodiments, the reaction is conducted in an organic solvent, such as 
acetonitrile or dimethylacetamide, at room temperature for two to six hours. Under the 
optimized reaction conditions, the desired Michael adduct, the compound of Formula 1a, may 
be obtained in high yield and purity.

In step (vi) of Scheme 2, the compound of Formula Ig is formed by a method 
comprising treating a compound of Formula Ig:

![Chemical Structure](image)

Ig

to remove the R¹⁰ group thereby forming the compound of Formula Ib; wherein R¹⁰ is a 
protecting group.

Appropriate R¹⁰ protecting groups include, but are not limited to the protecting groups 
for amines delineated in Wuts and Greene, Protective Groups in Organic Synthesis, 4th ed., 
R¹⁰ is a protecting group which can 
be selectively removed under conditions which do not displace the R⁷ protecting group. In 
some embodiments, the R¹⁰ is a protecting group which can be removed under acidic 
conditions at room temperature, at a temperature from about 15 °C to about 40 °C, or at a 
temperature from about 15 °C to about 30 °C. In some embodiments, R¹⁰ is a group which is 
deprotected under room temperature acidic conditions. In some embodiments, R¹⁰ is 1- 
(ethoxy)ethyl, tri(C₁₋₄ alkyl)silyl (e.g., t-butyldimethylsilyl or triisopropylsilyl), p-
methoxybenzyl (PMB), triphenylmethyl (Tr), diphenylmethyl, hydroxymethyl, methoxymethyl (MOM), diethoxymethyl, or t-butyldimethylsilyl)methyl. In some embodiments, R\(^{10}\) is 1-(ethoxy)ethyl.

Treatment of the compound of Formula \(1g\) to remove the R\(^{10}\) group can be accomplished by methods known in the art for the removal of particular protecting groups for amines, such as those in Wuts and Greene, Protective Groups in Organic Synthesis, 4th ed., John Wiley & Sons: New Jersey, pages 696-887 (and, in particular, pages 872-887) (2007). In some embodiments, the treating comprises treating the compound of Formula \(1g\) under acidic conditions (e.g., hydrochloric acid or trifluoroacetic acid) at room temperature, at a temperature from about 15 °C to about 40 °C, or at a temperature from about 15 °C to about 30 °C. In some embodiments, the treating comprises treating the compound of Formula \(1g\) with an aqueous solution of from about 1 N to about 5 N hydrochloric acid at a temperature of from about 10 °C to about 30 °C.

In step (vii) of Scheme 2, the compound of Formula \(1g\) is formed by a method comprising reacting a compound of Formula \(1h\):

\[
\begin{align*}
\text{Ih} & \quad \text{R'} & \quad \text{X} & \quad \text{N} & \quad \text{I} \quad \text{R''}
\end{align*}
\]

with a compound of Formula \(1i\):

\[
\begin{align*}
\text{II} & \quad \text{R''} & \quad \text{R'} & \quad \text{O} & \quad \text{N} & \quad \text{R'''} & \quad \text{R''''}
\end{align*}
\]

in the presence of a palladium catalyst and a base to form the compound of Formula \(1g\); wherein:

- X is a tosylate group, a triflate group, iodo, chloro, or bromo; and
- R\(^a\) and R\(^b\) are each independently H or C\(_{1-6}\) alkyl; or
- R\(^a\) and R\(^b\), together with the oxygen atoms to which they are attached and the boron atom, form a 5- to 6-membered heterocyclic ring, which is optionally substituted with 1, 2, 3, or 4 C\(_{1-4}\) alkyl groups.

Step (vii) is a Suzuki coupling reaction, which can be initiated using a number of palladium(0) and palladium(II) catalysts and performed under conditions known in the art.

In some embodiments, the palladium catalyst is Pd(PPh₃)₄ and Pd(dppf)Cl₂. In some embodiments, the palladium catalyst is tetrakis(triphenylphosphine)palladium(0) or tetrakis(tri(o-tolyl)phosphine)palladium(0). In some embodiments, the palladium catalyst is tetrakis(triphenylphosphine)palladium(0).

In some embodiments, the palladium catalyst loading is from about 1 x 10⁻⁴ to about 0.1 equivalents. In some embodiments, the palladium catalyst loading is from about 0.0010 to about 0.0015 equivalents. In some embodiments, the stoichiometric ratio of the compound of Formula Ia to the compound of Formula II is from about 1 to about 1.05, or from about to 1 to about 1.35. In some embodiments, the solvent for step (vii) comprises water and an organic solvent. In some embodiments, the organic solvent is 1,4-dioxane, 1-butanol, 1,2-dimethoxyethane (DME), 2-propanol, toluene or ethanol, or a combination thereof. In some embodiments, the organic solvent comprises a combination of 1-butanol and DME.

In some embodiments, the base is an inorganic base. In some embodiments, the base is an organic base. In some embodiments, the base is an alkali metal carbonate or an alkali metal hydrogen carbonate. In some embodiments, the base is potassium carbonate (K₂CO₃). In some embodiments, two to five equivalents of base (e.g., K₂CO₃) are used. In some embodiments, two to five equivalents of base (e.g., NaHCO₃) are used.

In some embodiments, the Suzuki coupling reaction is conducted at a temperature of about 80 to about 100 °C. In some embodiments, the reaction is carried out for two to twelve hours.

In some embodiments, R¹ and R², together with the oxygen atoms to which they are attached and the boron atom, form the moiety:

\[
\begin{align*}
\text{O} & \quad \text{B} \\
\text{O} & \quad \text{X} \quad \text{O} \\
\end{align*}
\]

In some embodiments, X is chloro, bromo, or iodo. In some embodiments, X is chloro.

In step (viii) of Scheme 2, the compound of Formula Ia is formed by protecting a compound of Formula Ia:

\[
\text{It}
\]
with a R⁷ group.

The R⁷ group is chosen as described above. In some embodiments, R⁷ is 2-(trimethylsilyl)ethoxymethyl. In some embodiments, R⁷ is N-pivaloyloxymethyl.

Addition of the R⁷ protecting groups can be added by methods known in the art for attachment of protecting groups for amines (e.g., Wuts and Green referred to above). For example, the indole nitrogen can be deprotonated with a base (e.g., with sodium hydride (NaH)) in an organic solvent (e.g., THF, 1,4-dioxane, 1,2-dimethoxyethane (DME), or N,N-dimethylacetamide (DMAC)) at low temperature (e.g., from about 0 to about 5 °C) before being treated with an electrophile, such as trimethylsilylthoxymethyl chloride (SEM-Cl) or pivaloyloxymethyl chloride (POM-Cl). The SEM- or POM-protected 4-chloro-7H-pyrrolo[2,3-d]pyrimidine can then isolated or in-situ generated as the starting materials for subsequent Suzuki reaction with or without further purification.

The compound of Formula Ic can be formed by the methods shown in Scheme 3 below. Accordingly, in step (ix) of Scheme 3, the compound of Formula Ic is formed by a method comprising reacting the compound of Formula Ik:

\[
\text{Ik} \quad \text{HN} \quad \text{CN}
\]

or salt thereof, with a compound of formula R⁸-L-R¹ in the presence of a base to form the compound of Formula Ic; wherein R⁸ is a leaving group.

The R⁸ group can be any appropriate leaving group known in the art for adding a sulfonyl or carbonyl containing moiety. In some embodiments, R⁸ is halogen or C₁₋₄ alkoxy. In some embodiments, R⁸ is chloro, bromo, or iodo. In some embodiments, R⁸ is chloro.

In some embodiments, the base is a tertiary amine, such as triethylamine, diisopropylethylamine, N-methylmorpholine, and the like. In some embodiments, the base is diisopropylethylamine. In some embodiments, the salt of the compound of Formula Ik is the hydrochloride salt.

A compound of Formula If can be formed by protecting the amino group of a compound of Formula Ik with an appropriate R⁹ group by methods known in the art (e.g., Wuts and Green above). Alternatively, a compound of Formula Im may be used in place of the compound of Formula If.

In step (x) of Scheme 3, the compound of Formula Ik is formed by a method comprising treating a compound of Formula Im:
to remove the -C(=O)OR\textsuperscript{11} moiety thereby forming the compound of Formula I\textsubscript{k}; wherein R\textsuperscript{11} is is C\textsubscript{1,6} alkoxy carbonyl.

In some embodiments, R\textsuperscript{11} is tert-butoxycarbonyl (BOC). In some embodiments, the treating of the compound of Formula I\textsubscript{m} comprises any method known in the art for removing an alkoxy carbonyl group from an amine (e.g., a BOC group) (see e.g., Wuts and Greene, Protective Groups in Organic Synthesis, 4th ed., John Wiley & Sons: New Jersey, pages 696-887 (and, in particular, pages 872-887) (2007)).

In some embodiments, the treating of the compound of Formula I\textsubscript{m} comprises treating with aqueous hydrochloric acid.

In step (xi) of Scheme 3, the compound of Formula I\textsubscript{m} is formed by a method comprising reacting a compound of Formula I\textsubscript{n}:

\[
\text{Scheme 3}
\]
with a Wittig-type reagent containing a cyanomethyl or cyanomethyl ylide group to form the compound of Formula Ia.

Exemplative Wittig-type reagents containing a cyanomethyl or cyanomethyl ylide group include, but are not limited to, compounds of general formula (R'O)2P(=O)-L-R1, R"3P(+)-L(-)-R1, R"2P(=O)-L-R1, and (R'N)2P(=O)-L-R1, wherein R' is C1-6 alkoxy or optionally substituted phenyl; R" is optionally substituted phenyl; L is -CH2- or -CH=; and R1 is cyano. In some embodiments, the Wittig-type reagent is diethyl cyanomethyl phosphate. In some embodiments, the reacting of the compound of Formula Ia with the Wittig-type reagent in the presence of a base. In some embodiments, the base is a strong base. In some embodiments, the base is potassium t-butoxide, sodium t-butoxide, sodium hydride, sodium ethoxide, sodium hydroxide, potassium carbonate, or sodium carbonate. In some embodiments, the base is an alkali metal alkoxide. In some embodiments, the base is an alkali metal t-butoxide. In some embodiments, the olefination of the azetidine ketone of Formula Ia with a Wittig reagent is conducted in an organic solvent, such as THF, under the influence a base, such as potassium tert-butoxide, at a temperature from about 0 to about 5°C.

The azetidinones of Formula Ia can be prepared by a modified procedure reported by Gaertner (J. Org. Chem., 1967, 32, 2972) (see e.g., steps (xii) to (xiv)). In one embodiment, the "one-part" formation of the corresponding carbamate protected azetidinols of Formula Ia from the compounds of Formula Ib under the catalytic hydrogenolysis conditions in the presence an electrophile, such as di-tert-butyl dicarbonate, simplifies the process to prepare the protected azetidinols compared to other modified procedures (Zhengming, Chen et al, WO 00/63168). TEMPO-catalyzed oxidation of the protected azetidinols of Formula Ia to the corresponding ketones of Formula Ib provides almost quantitative yield under the mild reaction conditions. As the di-functionalized compounds, N-protected azetidinones of Formula Ia are very useful synthetic intermediates for the preparation of complex organic molecules.
Accordingly, in step (xii) of Scheme 3, the compound of Formula In is formed by a method comprising treating a compound of Formula Io:

\[
\text{Io}
\]

with an oxidizing agent component to form the compound of Formula In.

As used herein, the term "oxidizing agent component" refers to one or more oxidizing agents known in the art for oxidizing a secondary alcohol to a ketone (see, e.g., Carey and Sundberg, Advanced Organic Chemistry, Part B: Reactions and Synthesis, 4th ed., Kluwer Academic/Plenum Publishers: New York, pages 747-757).

In some embodiments, the oxidizing agent component comprises a transition-metal oxidant, including, but not limited to, a chromium (VI) reagent (e.g., a Collins reagent, pyridinium dichromate (PDC), or pyridinium chlorochromate (PCC)), potassium permanganate, manganese(IV) dioxide, a ruthenium (II) reagent (e.g., RuCl\(_3\)(p-cymene)\(_2\)), ruthenium tetroxide, or a combination of a manganese(IV) dioxide, a ruthenium (II) reagent and benzoquinone; DMSO and an electrophilic reagent such as a carbodiimide reagent (e.g., dicyclohexylcarbodiimide), acetic anhydride, trifluoroacetic anhydride, oxalyl chloride, or sulfur trioxide; dimethyl sulfide and N-chlorosuccinimide; DMSO and chlorine; or a Dess-Martin reagent. In some embodiments, the oxidizing agent component comprises 2,2,6,6-tetramethylpiperidine-1-oxyl (TEMPO) and a stoichiometric oxidant (e.g., sodium hypochlorite or N-chlorosuccinimide (NCS)). In some embodiments, the oxidizing agent component comprises TEMPO and sodium hypochlorite.

In step (xiii) of Scheme 3, the compound of Formula Ip is formed by a method comprising reacting a compound of Formula Ip:

\[
\text{Ip}
\]

with a compound of Formula Iq:
under catalytic hydrogenation conditions to form the compound of Formula Ia.

In some embodiments, the catalytic hydrogenation conditions comprises hydrogen gas and a palladium on carbon catalyst.

In step (xiv) of Scheme 3, the compound of Formula Ip is prepared by a method comprising the steps of:

(a) reacting a compound of Formula Ir:

\[
\begin{array}{c}
\text{Ir} \\
\text{NH}_2
\end{array}
\]

with a compound of Formula Is:

\[
\begin{array}{c}
\text{X}_1
\end{array}
\]

to form the halide salt of the compound of Formula Ip; and

(b) treating the salt of the compound of Formula Ip with a base to form the compound of Formula Ip;

wherein \(X_1\) is halogen.

In some embodiments, \(X_1\) is chloro.

The present invention further provides a method of forming a compound of Formula I comprising:

(a) reacting a compound of Formula Ih:

\[
\begin{array}{c}
\text{Ih}
\end{array}
\]

with a compound of formula:

\[
\begin{array}{c}
\text{R}_7
\end{array}
\]

in the presence of tetrakis(triphenylphosphine)palladium(0) and an alkali metal carbonate or alkali metal hydrogen carbonate base to form a compound of Formula Ig:
(b) treating the compound of Formula Ig to remove the R^{10} group to form a
compound of Formula Ib:

(c) reacting the compound of Formula Ib with a compound of Formula Ic:

in the presence of a catalytic or stoichiometric amount of 1,8-diazabicyclo(5.4.0)undec-7-ene
to form the compound of Formula Ia:

(d) treating the compound of Formula Ia to remove the R^7 moiety to form a
compound of Formula I:
wherein:

L is SO₂;

R¹ is C₁₋₆ alkyl;

R² is 2-(trimethylsilyl)ethoxyethyl or 2-pivaloyloxymethyl;

R¹₀ is 1-(ethoxy)ethyl; and

X is chloro.

The present invention further provides a method of forming a compound of Formula I comprising:

(a) reacting a compound of Formula Ih:

\[
\text{Ih}
\]

with a compound of formula:

\[
\text{Ig}
\]

in the presence of tetrakis(triphenylphosphine)palladium(0) and an alkali metal carbonate base to form a compound of Formula Ig:
(b) treating the compound of Formula Ig to remove the R\textsuperscript{10} group to form a compound of Formula Ib:

\[
\text{Ib}
\]

(c) reacting a compound of Formula Ib:

\[
\text{Ib}
\]

with a compound of Formula If:

\[
\text{If}
\]

in the presence of a catalytic or stoichiometric amount of 1,8-diazabicyclo(5.4.0)undec-7-ene to form a compound of Formula Ie:

\[
\text{Ie}
\]

(d) treating the compound of Formula Ie to remove the R\textsuperscript{9} group thereby forming a compound of Formula Id:
(e) reacting the compound of Formula Id with a compound of formula \( R^8-L-R^1 \) to form a compound of Formula Ia:

(f) treating the compound of Formula Ia to remove the \( R^7 \) moiety to form a compound of Formula I:

wherein:
- \( L \) is SO₂;
- \( R^1 \) is C₁₋₆ alkyl;
- \( R^7 \) is 2-(trimethylsilyl)ethoxyethyl or 2-pivaloyloxymethyl;
- \( R^8 \) is chloro;
R^g^ is tert-butoxycarbonyl;
R^1u^ is 1-(ethoxy)ethyl; and
X is chloro.

The methods may be used to produce any of the compounds described in the
embodiments herein, or combinations thereof, or any of the compounds of the examples. The
present invention provides any combination of the individual methods for forming
compounds of Formula I, compounds of Formula Ia, etc. The present invention further
provides any of the intermediates above, or salts thereof.

In some embodiments, the compound of Formula I produced by the methods, or
combination thereof, is {1-(Ethylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-
pyrazol-1-yl]azetidin-3-yl}acetonitrile. The present invention further provides each of the
corresponding intermediates of Formula Ia, Ib, Ic, etc., for producing {1-(Ethylsulfonyl)-3-[4-
(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile.

In some embodiments, the methods further comprise reacting the compound of
Formula I with phosphoric acid to form the phosphate salt. The phosphoric acid salt of the
compound of Formula I may be produced by treating a solution of the corresponding free
base in an organic solvent, such as ethanol (EtOH), with a solution of phosphoric acid in an
organic solvent, such as ethanol, at room temperature or at an elevated temperature (e.g.,
from about 60 to about 70 °C). The produced crude phosphate salt may then be further
purified by recrystallization or re-slurry in an organic solvent or a mixed organic solvent
system.

In some embodiments, the compound produced by the method is {1-(ethylsulfonyl)-3-
[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile phosphoric
acid salt.

In some embodiments, the compounds of Formulas I, II, III, and IV can be prepared
according to the synthetic procedures described below in the Example section.

Methods

Compounds of the invention can modulate activity of one or more Janus kinases
(JAKs). The term “modulate” is meant to refer to an ability to increase or decrease the
activity of one or more members of the JAK family of kinases. Accordingly, compounds of
the invention can be used in methods of modulating a JAK by contacting the JAK with any
one or more of the compounds or compositions described herein. In some embodiments,
compounds of the present invention can act as inhibitors of one or more JAKs. In further
 embodiments, the compounds of the invention can be used to modulate activity of a JAK in an individual in need of modulation of the receptor by administering a modulating amount of a compound of Formula I, II, III, or IV.

JAKs to which the present compounds bind and/or modulate include any member of the JAK family. In some embodiments, the JAK is JAK1, JAK2, JAK3 or TYK2. In some embodiments, the JAK is JAK1 or JAK2. In some embodiments, the JAK is JAK2. In some embodiments, the JAK is JAK3.

Another aspect of the present invention pertains to methods of treating a JAK-associated disease or disorder in an individual (e.g., patient) by administering to the individual in need of such treatment a therapeutically effective amount or dose of a compound of the present invention or a pharmaceutical composition thereof. A JAK-associated disease can include any disease, disorder or condition that is directly or indirectly linked to expression or activity of the JAK, including overexpression and/or abnormal activity levels. A JAK-associated disease can also include any disease, disorder or condition that can be prevented, ameliorated, or cured by modulating JAK activity.

Examples of JAK-associated diseases include diseases involving the immune system including, for example, organ transplant rejection (e.g., allograft rejection and graft versus host disease).

Further examples of JAK-associated diseases include autoimmune diseases such as multiple sclerosis, rheumatoid arthritis, juvenile arthritis, psoriatic arthritis, type I diabetes, lupus, psoriasis, inflammatory bowel disease, ulcerative colitis, Crohn’s disease, myasthenia gravis, immunoglobulin nephropathies, autoimmune thyroid disorders, and the like. In some embodiments, the autoimmune disease is an autoimmune bullous skin disorder such as pemphigus vulgaris (PV) or bullous pemphigoid (BP).

Further examples of JAK-associated diseases include allergic conditions such as asthma, food allergies, atopic dermatitis and rhinitis. Further examples of JAK-associated diseases include viral diseases such as Epstein Barr Virus (EBV), Hepatitis B, Hepatitis C, HIV, HTLV I, Varicella-Zoster Virus (VZV) and Human Papilloma Virus (HPV).

Further examples of JAK-associated diseases or conditions include skin disorders such as psoriasis (for example, psoriasis vulgaris), atopic dermatitis, skin rash, skin irritation, skin sensitization (e.g., contact dermatitis or allergic contact dermatitis). For example, certain substances including some pharmaceuticals when topically applied can cause skin sensitization. In some embodiments, co-administration or sequential administration of at least one JAK inhibitor of the invention together with the agent causing unwanted
sensitization can be helpful in treating such unwanted sensitization or dermatitis. In some embodiments, the skin disorder is treated by topical administration of at least one JAK inhibitor of the invention.

In further embodiments, the JAK-associated disease is cancer including those characterized by solid tumors (e.g., prostate cancer, renal cancer, hepatic cancer, pancreatic cancer, gastric cancer, breast cancer, lung cancer, cancers of the head and neck, thyroid cancer, glioblastoma, Kaposi’s sarcoma, Castleman’s disease, melanoma etc.), hematological cancers (e.g., lymphoma, leukemia such as acute lymphoblastic leukemia, acute myelogenous leukemia (AML) or multiple myeloma), and skin cancer such as cutaneous T-cell lymphoma (CTCL) and cutaneous B-cell lymphoma. Example cutaneous T-cell lymphomas include Sezary syndrome and mycosis fungoides.

JAK-associated diseases can further include those characterized by expression of a mutant JAK2 such as those having at least one mutation in the pseudo-kinase domain (e.g., JAK2V617F).

JAK-associated diseases can further include myeloproliferative disorders (MPDs) such as polycythemia vera (PV), essential thrombocythemia (ET), myelofibrosis with myeloid metaplasia (MMM), chronic myelogenous leukemia (CML), chronic myelomonocytic leukemia (CMML), hypereosinophilic syndrome (HES), systemic mast cell disease (SMCD), and the like. In some embodiments, the myeloproliferative disorder is primary myelofibrosis (PMF) or post polycythemia vera/essential thrombocythemia myelofibrosis (Post-PV/ET MF).

Further JAK-associated diseases include inflammation and inflammatory diseases. Example inflammatory diseases include inflammatory diseases of the eye (e.g., iritis, uveitis, scleritis, conjunctivitis, or related disease), inflammatory diseases of the respiratory tract (e.g., the upper respiratory tract including the nose and sinuses such as rhinitis or sinusitis or the lower respiratory tract including bronchitis, chronic obstructive pulmonary disease, and the like), inflammatory myopathy such as myocarditis, and other inflammatory diseases.

The JAK inhibitors described herein can further be used to treat ischemia reperfusion injuries or a disease or condition related to an inflammatory ischemic event such as stroke or cardiac arrest. The JAK inhibitors described herein can further be used to treat anorexia, cachexia, or fatigue such as that resulting from or associated with cancer. The JAK inhibitors described herein can further be used to treat restenosis, sclerodermitis, or fibrosis. The JAK inhibitors described herein can further be used to treat conditions associated with hypoxia or astrogliosis such as, for example, diabetic retinopathy, cancer, or neurodegeneration. See,

The JAK inhibitors described herein can further be used to treat other inflammatory diseases such as systemic inflammatory response syndrome (SIRS) and septic shock.

The JAK inhibitors described herein can further be used to treat gout and increased prostate size due to, e.g., benign prostatic hypertrophy or benign prostatic hyperplasia.

The JAK inhibitors described herein, as well as other JAK inhibitors capable of influencing IL-6/STAT3 signalling, can further be used to treat inflammation-associated proliferative diseases. Inflammation has been shown to be linked to the development of certain types of cancers. For example, patients suffering from inflammatory bowel disease such as ulcerative colitis have been shown to have a much higher risk of developing colorectal cancer. These types of inflammation-linked cancers have been termed colitis-associated cancer (CAC). Several studies have shown that the IL-6/STAT3 signaling is involved in promoting CAC. For example, mice deficient in STAT3 intestinal epithelial cells had decreased tumor size and incidence in an animal model of CAC. Bromberg, et al., “Inflammation and cancer: IL-6 and STAT3 complete the link”, *Cancer Cell*, 15:79-80 (2009). Similar results were obtained with IL-6 deficient mice, which developed fewer and smaller adenomas than wild-type mice. Grivennikov, et al., “IL-6 and STAT3 are required for survival of intestinal epithelial cells and the development of colitis-associated cancer”, *Cancer Cell*, 15:103-111 (2009). See also, Bollrath, et al., “gp130-Mediated STAT3 activation in enterocytes regulates cell survival and cell-cycle progression during colitis-associated tumorigenesis”, *Cancer Cell*, 15:91-102 (2009); and Kortylewski, et al., “Regulation of the IL-23 and IL-12 balance by Stat3 signaling in the tumor microenvironment”, *Cancer Cell*, 15:114-123 (2009).

Accordingly, in some embodiments, JAK inhibitors of the invention and those which influence IL-6/STAT3 signaling, can be used to treat inflammation-associated cancers. In some embodiments, the cancer is associated with inflammatory bowel disease. In some embodiments, the inflammatory bowel disease is ulcerative colitis. In some embodiments, the inflammatory bowel disease is Crohn’s disease. In some embodiments, the inflammation-associated cancer is colitis-associated cancer. In some embodiments, the inflammation-associated cancer is colon cancer or colorectal cancer. In some embodiments, the cancer is gastric cancer, gastrointestinal carcinoid tumor, gastrointestinal stromal tumor (GIST), adenocarcinoma, small intestine cancer, or rectal cancer. In addition to the compounds

JAK inhibitors can be tested in animal models for potential efficacy in treating inflammation-associated cancers. For example, CAC can be induced in treated (e.g., with JAK inhibitors) or untreated mice by the method summarized in Grivennikov, et al., “IL-6 and STAT3 are required for survival of intestinal epithelial cells and the development of colitis-associated cancer”, Cancer Cell, 15:103-111 (2009). Progression of the disease can be followed by measuring body weight and monitoring for signs of rectal bleeding and diarrhea. After sacrifice of the animals, portions of the distal colon are removed for analysis.

In some embodiments, the JAK inhibitors described herein can further be used to treat a dry eye disorder. As used herein, “dry eye disorder” is intended to encompass the disease states summarized in a recent official report of the Dry Eye Workshop (DEWS), which defined dry eye as “a multifactorial disease of the tears and ocular surface that results in symptoms of discomfort, visual disturbance, and tear film instability with potential damage to the ocular surface. It is accompanied by increased osmolarity of the tear film and inflammation of the ocular surface.” Lemp, “The Definition and Classification of Dry Eye Disease: Report of the Definition and Classification Subcommittee of the International Dry Eye Workshop”, The Ocular Surface, 5(2), 75-92 April 2007.

Dry eye is also sometimes referred to as keratoconjunctivitis sicca. In some embodiments, the treatment of the dry eye disorder involves ameliorating a particular symptom of dry eye disorder, such as eye discomfort, visual disturbance, tear film instability, tear hyperosmolarity, and inflammation of the ocular surface.

As summarized in the DEWS report, dry eye can be classified into two different classes: aqueous tear-deficient dry eye and evaporative dry eye, which in turn encompass various subclasses. Accordingly, in some embodiments, the dry eye disorder is aqueous tear-deficient dry eye (ADDE). In further embodiments, the dry eye disorder is evaporative dry eye. In further embodiments, the dry eye disorder is selected from any of the subclasses of ADDE or evaporative dry eye disorder, or appropriate combinations thereof. As noted by the author of the DEWS report, however, the various classes and subclasses are not mutually exclusive. Hence, dry eye can occur via different mechanism in different subclasses or a dry eye disease state originating in one subclass can lead to events that cause dry eye by a mechanism in another subclass.
The first class of dry eye, aqueous tear-deficient dry eye (ADDE), is also known as
tear deficient dry eye and lacrimal tear deficiency. In ADDE, dry eye is believed to be due to
a failure of lacrimal tear secretion. While not wishing to be bound by any theory, it is
believed that dryness results from reduced lacrimal tear secretion and volume, causing tear
hyperosmolality. Tear film hyperosmolality can cause hyperosmolality of the ocular surface
epithelial cells, stimulating inflammatory events involving various kinases and signaling
pathways.

Two subclasses of ADDE are Sjogren syndrome dry eye (SSDE), where the lacrimal
glands are targeted by an autoimmune process, and non-Sjogren syndrome dry eye (NSSDE)
. Accordingly, in some embodiments, the eye disorder is SSDE. In other embodiments, dry
eye disorder is non-Sjogren syndrome dry eye. In SSDE, it is believed that activated T-cells
can infiltrate the lacrimal glands, causing cell death of acinar and ductular cells and
hyposcretion of tears. The effects of locally released cytokines or circulating antibodies can
amplify the effects of hyposcretion. The two major forms of SSDE are primary and
secondary forms. Primary SS can occur in combination with dry mouth (xerostomia).
Secondary SSDE occurs with the symptoms of primary SSDE together with an autoimmune
connective disease such as rheumatoid arthritis (RA), systemic lupus erythematosis,
polyarteritis nodosa, Wegener's granulomatosis, systemic sclerosis, primary biliary sclerosis,
or mixed connective tissue disease. Diagnostic criteria for each of these connective diseases
is known in the art. Further, primary SSDE may be associated with systemic manifestations
of disease which may involve the lungs, kidneys, liver, blood vessels and joints.

In NSSDE, the systemic autoimmune characteristics of Sjogren syndrome dry eye are
excluded. Forms of NSSDE include primary lacrimal gland deficiencies (including age-
related dry eye, congenital alacrima, and familial dysautonomia), secondary lacrimal
deficiencies (including inflammatory infiltration of the lacrimal gland by sarcoid
granulomata, lymphomatous cells, and AIDS related T-cells; that associated with graft vs.
host disease; and that resulting from lacrimal gland ablation or lacrimal gland denervation),
obstruction of the lacrimal gland ducts (including that caused by cicatrizinger conjunctivitis
including trachoma, cicatrical pemphigoid and mucous membrane pemphigoid, erythema
multiforme, and chemical or thermal burns), and reflex hyposcretion (including reflex
sensory block, such as that associated with contact lens wear, diabetes mellitus, and
neurotrophic keratitis, and reflex motor block, including that associated with VII cranial
nerve damage, multiple neuromatosis, and exposure to systemic drugs such as antihistamines,
beta blockers, antispasmodics, diuretics, tricyclic antidepressants, selective serotonin reuptake inhibitors, and other psychotropic drugs).

The second major class of dry eye disorder is evaporative dry eye, which is caused by excessive water loss from the exposed ocular surface in the presence of normal lacrimal secretory function. Intrinsic causes of evaporative dry eye include Meibomian gland dysfunction (MGD) (including that caused by a reduced number of glands due to congenital deficiency acquired-MGD; MGD associated with dystichiasis, dystichiasis lymphedema syndrome, and metaplasia; hypersecretory MGD associated with Meibomian seborrhea, hypersecretory MGD associated with retinoid therapy, primary and secondary obstructive MGD, focal or diffuse obstructive MGD, simple or cicatricial obstructive MGD, atrophic or inflammatory obstructive MGD; Simple MGD primary or secondary to anterior blepharitis, acne rosacea, seborrheic dermatitis, ectodactyly syndrome, Turner syndrome, systemic toxicity from 13-cis retinoic acid, polychlorinated biphenyls, and epinephrine; and cicatricial MGD primary or secondary to chemical burns, pemphigoid, acne rosacea, erythema multiforms, VKC and AKC), disorders of the lid aperture and lid/globe congruity or dynamic (such as that occurring with craniosenosis, endocrine and other forms of proptosis, myopia, and after plastic surgery on the lids), and low blink rate (including that caused by an extrapyramidal disorder such as Parkinson’s disease). Extrinsic causes of evaporative dry eye include ocular surface disorders (including xerophthalmia caused by vitamin A deficiency; and that associated with topical drugs and preservatives such as topical anesthetia and benzalkonium chloride), contact lens wear, ocular surface disease (including allergic eye disease), allergic conjunctivitis (including aseasonal allergic conjunctivitis, vernal keratoconjunctivitis, and atopic keratoconjunctivitis), and the use of anti-histamines.

These include, but are not limited to: (1) symptom questionnaires (e.g., Begley, et al., “Use of the dry eye questionnaire to measure symptoms of ocular irritation in patients with aqueous tear deficient dry eye”, Cornea, 2002;21:664-70); (2) staining of the ocular surface to check for surface damage (e.g., Rose Bengal or fluorescein staining or other staining method such as those techniques summarized in Barr et al., “Corneal scarring in the Collaborative Longitudinal Evaluation of Keratoconus (CLEK) Study: baseline prevalence
“Fluorometry in contact lens research: The next step”, Optom Vis Sci 1998; 75:316-322; Pearce, “An improved fluorophotometric method for tear turnover assessment”, Optom Vis Sci 2001; 78:30-36), and combinations of these diagnostic tests.

These methods can also be used to assess the clinical efficacy of the compounds described herein in treating dry eye disorders.

In a further aspect, the present invention provides a method of treating conjunctivitis, uveitis (including chronic uveitis), chorioiditis, retinitis, cyclitis, scleritis, episcleritis, or iritis; treating inflammation or pain related to corneal transplant, LASIK (laser assisted in situ keratomileusis), photorefractive keratectomy, or LASEK (laser assisted sub-epithelial keratomileusis); inhibiting loss of visual acuity related to corneal transplant, LASIK, photorefractive keratectomy, or LASEK; or inhibiting transplant rejection in a patient in need thereof, comprising administering to the patient a therapeutically effective amount of a compound of Formula I, or pharmaceutically acceptable salt or N-oxide thereof. In some embodiments, the compound, or pharmaceutically acceptable salt or N-oxide thereof, is administered preoperatively to a patient about to undergo a procedure selected from corneal transplant, LASIK, photorefractive keratectomy, and LASEK. In some embodiments, the compound, or pharmaceutically acceptable salt or N-oxide thereof, suppresses or lessens inflammation or pain during and after the procedure. In some embodiments, the compound, or pharmaceutically acceptable salt or N-oxide thereof, is administered about 1 day to about 2 days prior to the procedure. In some embodiments, the compound, or pharmaceutically acceptable salt or N-oxide thereof, is administered postoperatively to a patient who has undergone a procedure selected from corneal transplant, LASIK, photorefractive keratectomy, and LASEK. In some embodiments, inhibiting loss of visual acuity means lessening the loss of visual acuity. In some embodiments, the postoperative or preoperative treatment lessens the amount of scarring and fibrous deposits following the procedure. In some embodiments, inhibiting loss of visual acuity means that the patient retains visual acuity. In some embodiments, inhibiting transplant rejection means that the compound, or pharmaceutically acceptable salt or N-oxide thereof, is immunosuppressive, thereby preventing total rejection of the corneal transplant.

As used herein, the term “contacting” refers to the bringing together of indicated moieties in an in vitro system or an in vivo system. For example, “contacting” a JAK with a compound of the invention includes the administration of a compound of the present invention to an individual or patient, such as a human, having a JAK, as well as, for example,
introducing a compound of the invention into a sample containing a cellular or purified preparation containing the JAK.

As used herein, the term "individual" or "patient," used interchangeably, refers to any animal, including mammals, preferably mice, rats, other rodents, rabbits, dogs, cats, swine, cattle, sheep, horses, or primates, and most preferably humans.

As used herein, the phrase "therapeutically effective amount" refers to the amount of active compound or pharmaceutical agent that elicits the biological or medicinal response that is being sought in a tissue, system, animal, individual or human by a researcher, veterinarian, medical doctor or other clinician.

As used herein, the term "treating" or "treatment" refers to one or more of (1) preventing the disease; for example, preventing a disease, condition or disorder in an individual who may be predisposed to the disease, condition or disorder but does not yet experience or display the pathology or symptomatology of the disease; (2) inhibiting the disease; for example, inhibiting a disease, condition or disorder in an individual who is experiencing or displaying the pathology or symptomatology of the disease, condition or disorder; and (3) ameliorating the disease; for example, ameliorating a disease, condition or disorder in an individual who is experiencing or displaying the pathology or symptomatology of the disease, condition or disorder (i.e., reversing the pathology and/or symptomatology) such as decreasing the severity of disease.

Combination Therapies

One or more additional pharmaceutical agents such as, for example, chemotherapeutics, anti-inflammatory agents, steroids, immunosuppressants, as well as Bcr-Abl, Flt-3, RAF and FAK kinase inhibitors such as, for example, those described in WO 2006/056399, or other agents can be used in combination with the compounds of the present invention for treatment of JAK-associated diseases, disorders or conditions. The one or more additional pharmaceutical agents can be administered to a patient simultaneously or sequentially.

Example chemotherapeutic include proteosome inhibitors (e.g., bortezomib), thalidomide, revlimid, and DNA-damaging agents such as melphalan, doxorubicin, cyclophosphamide, vincristine, etoposide, carmustine, and the like.

Example steroids include corticosteroids such as dexamethasone or prednisone.
Example Bcr-Abl inhibitors include the compounds, and pharmaceutically acceptable salts thereof, of the genera and species disclosed in U.S. Pat. No. 5,521,184, WO 04/005281, and U.S. Ser. No. 60/578,491.

Example suitable Flt-3 inhibitors include compounds, and their pharmaceutically acceptable salts, as disclosed in WO 03/037347, WO 03/099771, and WO 04/046120.

Example suitable RAF inhibitors include compounds, and their pharmaceutically acceptable salts, as disclosed in WO 00/09495 and WO 05/028444.

Example suitable FAK inhibitors include compounds, and their pharmaceutically acceptable salts, as disclosed in WO 04/080980, WO 04/056786, WO 03/024967, WO 01/064655, WO 00/053595, and WO 01/014402.

In some embodiments, one or more of the compounds of the invention can be used in combination with one or more other kinase inhibitors including imatinib, particularly for treating patients resistant to imatinib or other kinase inhibitors.

In some embodiments, one or more JAK inhibitors of the invention can be used in combination with a chemotherapeutic in the treatment of cancer, such as multiple myeloma, and may improve the treatment response as compared to the response to the chemotherapeutic agent alone, without exacerbation of its toxic effects. Examples of additional pharmaceutical agents used in the treatment of multiple myeloma, for example, can include, without limitation, melphalan, melphalan plus prednisone [MP], doxorubicin, dexamethasone, and Velcade (bortezomib). Further additional agents used in the treatment of multiple myeloma include Bcr-Abl, Flt-3, RAF and FAK kinase inhibitors. Additive or synergistic effects are desirable outcomes of combining a JAK inhibitor of the present invention with an additional agent. Furthermore, resistance of multiple myeloma cells to agents such as dexamethasone may be reversible upon treatment with a JAK inhibitor of the present invention. The agents can be combined with the present compounds in a single or continuous dosage form, or the agents can be administered simultaneously or sequentially as separate dosage forms.

In some embodiments, a corticosteroid such as dexamethasone is administered to a patient in combination with at least one JAK inhibitor where the dexamethasone is administered intermittently as opposed to continuously.

In some further embodiments, combinations of one or more JAK inhibitors of the invention with other therapeutic agents can be administered to a patient prior to, during, and/or after a bone marrow transplant or stem cell transplant.
In some embodiments, at least one additional therapeutic agent can be used in connection with treatment of dry eye disorders and other disorders of the eye. In some embodiments, the additional therapeutic agent is fluocinolone acetonide (Retisert®), or rimexolone (AL-2178, Vexol, Alcon). In some embodiments, the additional therapeutic agent is cyclosporine (Restasis®). In some embodiments, the additional therapeutic agent is a corticosteroid. In some embodiments, the corticosteroid is triamcinolone, dexamethasone, fluocinolone, cortisone, prednisolone, or flumetholone.

In some embodiments, the additional therapeutic agent is selected from Dehydrex™ (Holies Labs), Civamide (Opko), sodium hyaluronate (Vismed, Lantibio/TRB Chemedia), cyclosporine (ST-603, Sirion Therapeutics), ARG101(T) (testosterone, Argentis), AGR1012(P) (Argentis), ecabet sodium (Senju-Ista), gefarnate (Santen), 15-(s)-hydroxyeicosatetraenoic acid (15(S)-HETE), cevimeline, doxycycline (ALTY-0501, Alacritry), minocycline, iDestrin™ (NP50301, Nascent Pharmaceuticals), cyclosporine A (Nova22007, Novagali), oxytetracycline (Duramycin, MOL11901, Lantibio), CF101 (2S,3S,4R,5R)-3,4-dihydroxy-5-{[(3-iodophenyl)methylamino]purin-9-yl}-N-m ethyl-oxolane-2-carbamyl, Can-Fite Biopharma), voclosporin (LX212 or LX214, Lux Biosciences), ARG103 (Agentis), RX-10045 (synthetic resolvin analog, Resolvyx), DY115 (Dyanmis Therapeutics), rivoglitazone (DE011, Daichi Sanko), TB4 (RegeneRx), OPH-01 (Ophthalmis Monaco), PCS101 (Pericor Science), REV1-31 (Evolutec), Lacritin (Senju), rebamipide (Otsuka-Novartis), OT-551 (Othera), PAI-2 (University of Pennsylvania and Temple University), pilocarpine, tacrolimus, pimecrolimus (AMS981, Novartis), loteprednol etabonate, rituximab, diquafoisol tetrasodium (INS365, Inspire), KLS-0611 (Kissei Pharmaceuticals), dehydroepiandrosterone, anakinra, efalizumab, mycophenolate sodium, etanercept (Embrel®), hydroxychloroquine, NGX267 (TorreyPines Therapeutics), or thalidomide.

In some embodiments, the additional therapeutic agent is an anti-angiogenic agent, cholinergic agonist, TRP-1 receptor modulator, a calcium channel blocker, a mucin secretagogue, MUC1 stimulant, a calcineurin inhibitor, a corticosteroid, a P2Y2 receptor agonist, a muscarinic receptor agonist, another JAK inhibitor, Bcr-Abl kinase inhibitor, Fli-3 kinase inhibitor, RAF kinase inhibitor, and FAK kinase inhibitor such as, for example, those described in WO 2006/056399. In some embodiments, the additional therapeutic agent is a tetracycline derivative (e.g., minocycline or doxycycline).

In some embodiments, the additional therapeutic agent(s) are demulcent eye drops (also known as “artificial tears”), which include, but are not limited to, compositions containing polyvinylalcohol, hydroxypropyl methylcellulose, glycerin, polyethylene glycol.
Artificial tears can help in the treatment dry eye by compensating for reduced moistening and lubricating capacity of the tear film. In some embodiments, the additional therapeutic agent is a mucolytic drug, such as N-acetylcysteine, which can interact with the mucoproteins and, therefore, to decrease the viscosity of the tear film.

In some embodiments, the additional therapeutic agent includes an antibiotic, antiviral, antifungal, anesthetic, anti-inflammatory agents including steroidal and non-steroidal anti-inflammatories, and anti-allergic agents. Examples of suitable medicaments include aminoglycosides such as amikacin, gentamicin, tobramycin, streptomycin, netilmicin, and kanamycin; fluoroquinolones such as ciprofloxacin, norfloxacin, ofloxacin, trovafloxacin, lomefloxacin, levofloxacin, and enoxacin; naphthyridine; sulfonamides; polymyxin; chloramphenicol; neomycin; paramomomycin; colistimethate; bacitracin; vancomycin; tetracyclines; rifampin and its derivatives ("rifampins"); cycloserine; beta-lactams; cephalosporins; amphotericins; fluconazole; fluycytosine; natamycin; miconazole; ketoconazole; corticosteroids; diclofenac; flurbiprofen; ketorolac; suprofen; comolyn; lodoxamide; levocabastin; naphazoling; antazoline; pheniramimane; or azalide antibiotic.

Pharmaceutical Formulations and Dosage Forms

When employed as pharmaceuticals, the compounds of the invention can be administered in the form of pharmaceutical compositions. These compositions can be prepared in a manner well known in the pharmaceutical art, and can be administered by a variety of routes, depending upon whether local or systemic treatment is desired and upon the area to be treated. Administration may be topical (including transdermal, epidermal, ophthalmic and to mucous membranes including intranasal, vaginal and rectal delivery), pulmonary (e.g., by inhalation or insufflation of powders or aerosols, including by nebulizer; intratracheal or intranasal), oral or parenteral. Parenteral administration includes intravenous, intraarterial, subcutaneous, intraperitoneal intramuscular or injection or infusion; or intracranial, e.g., intrathecal or intraventricular, administration. Parenteral administration can be in the form of a single bolus dose, or may be, for example, by a continuous perfusion pump. Pharmaceutical compositions and formulations for topical administration may include transdermal patches, ointments, lotions, creams, gels, drops, suppositories, sprays, liquids and powders. Conventional pharmaceutical carriers, aqueous, powder or oily bases, thickeners and the like may be necessary or desirable. Coated condoms, gloves and the like may also be useful.
This invention also includes pharmaceutical compositions which contain, as the active ingredient, one or more of the compounds of the invention above in combination with one or more pharmaceutically acceptable carriers (excipients). In making the compositions of the invention, the active ingredient is typically mixed with an excipient, diluted by an excipient or enclosed within such a carrier in the form of, for example, a capsule, sachet, paper, or other container. When the excipient serves as a diluent, it can be a solid, semi-solid, or liquid material, which acts as a vehicle, carrier or medium for the active ingredient. Thus, the compositions can be in the form of tablets, pills, powders, lozenges, sachets, cachets, elixirs, suspensions, emulsions, solutions, syrups, aerosols (as a solid or in a liquid medium), ointments containing, for example, up to 10% by weight of the active compound, soft and hard gelatin capsules, suppositories, sterile injectable solutions, and sterile packaged powders.

In preparing a formulation, the active compound can be milled to provide the appropriate particle size prior to combining with the other ingredients. If the active compound is substantially insoluble, it can be milled to a particle size of less than 200 mesh. If the active compound is substantially water soluble, the particle size can be adjusted by milling to provide a substantially uniform distribution in the formulation, e.g. about 40 mesh.

The compounds of the invention may be milled using known milling procedures such as wet milling to obtain a particle size appropriate for tablet formation and for other formulation types. Finely divided (nanoparticulate) preparations of the compounds of the invention can be prepared by processes known in the art, for example see International Patent Application No. WO 2002/000196.

Some examples of suitable excipients include lactose, dextrose, sucrose, sorbitol, mannitol, starches, gum acacia, calcium phosphate, alginates, tragacanth, gelatin, calcium silicate, microcrystalline cellulose, polyvinylpyrrolidone, cellulose, water, syrup, and methyl cellulose. The formulations can additionally include: lubricating agents such as talc, magnesium stearate, and mineral oil; wetting agents; emulsifying and suspending agents; preserving agents such as methyl- and propylhydroxy-benzoates; sweetening agents; and flavoring agents. The compositions of the invention can be formulated so as to provide quick, sustained or delayed release of the active ingredient after administration to the patient by employing procedures known in the art.

The compositions can be formulated in a unit dosage form, each dosage containing from about 5 to about 1000 mg (1 g), more usually about 100 to about 500 mg, of the active ingredient. The term "unit dosage forms" refers to physically discrete units suitable as unitary
dosages for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical excipient.

The active compound can be effective over a wide dosage range and is generally administered in a pharmaceutically effective amount. It will be understood, however, that the amount of the compound actually administered will usually be determined by a physician, according to the relevant circumstances, including the condition to be treated, the chosen route of administration, the actual compound administered, the age, weight, and response of the individual patient, the severity of the patient's symptoms, and the like.

For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical excipient to form a solid preformulation composition containing a homogeneous mixture of a compound of the present invention. When referring to these preformulation compositions as homogeneous, the active ingredient is typically dispersed evenly throughout the composition so that the composition can be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid preformulation is then subdivided into unit dosage forms of the type described above containing from, for example, about 0.1 to about 1000 mg of the active ingredient of the present invention.

The tablets or pills of the present invention can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permit the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetaryl alcohol, and cellulose acetate.

The liquid forms in which the compounds and compositions of the present invention can be incorporated for administration orally or by injection include aqueous solutions, suitably flavored syrups, aqueous or oil suspensions, and flavored emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil, or peanut oil, as well as elixirs and similar pharmaceutical vehicles.

Compositions for inhalation or insufflation include solutions and suspensions in pharmaceutically acceptable, aqueous or organic solvents, or mixtures thereof, and powders.
The liquid or solid compositions may contain suitable pharmaceutically acceptable excipients as described supra. In some embodiments, the compositions are administered by the oral or nasal respiratory route for local or systemic effect. Compositions in can be nebulized by use of inert gases. Nebulized solutions may be breathed directly from the nebulizing device or the nebulizing device can be attached to a face mask, tent, or intermittent positive pressure breathing machine. Solution, suspension, or powder compositions can be administered orally or nasally from devices which deliver the formulation in an appropriate manner.

The amount of compound or composition administered to a patient will vary depending upon what is being administered, the purpose of the administration, such as prophylaxis or therapy, the state of the patient, the manner of administration, and the like. In therapeutic applications, compositions can be administered to a patient already suffering from a disease in an amount sufficient to cure or at least partially arrest the symptoms of the disease and its complications. Effective doses will depend on the disease condition being treated as well as by the judgment of the attending clinician depending upon factors such as the severity of the disease, the age, weight and general condition of the patient, and the like.

The compositions administered to a patient can be in the form of pharmaceutical compositions described above. These compositions can be sterilized by conventional sterilization techniques, or may be sterile filtered. Aqueous solutions can be packaged for use as is, or lyophilized, the lyophilized preparation being combined with a sterile aqueous carrier prior to administration. The pH of the compound preparations typically will be between 3 and 11, more preferably from 5 to 9 and most preferably from 7 to 8. It will be understood that use of certain of the foregoing excipients, carriers, or stabilizers will result in the formation of pharmaceutical salts.

The therapeutic dosage of the compounds of the present invention can vary according to, for example, the particular use for which the treatment is made, the manner of administration of the compound, the health and condition of the patient, and the judgment of the prescribing physician. The proportion or concentration of a compound of the invention in a pharmaceutical composition can vary depending upon a number of factors including dosage, chemical characteristics (e.g., hydrophobicity), and the route of administration. For example, the compounds of the invention can be provided in an aqueous physiological buffer solution containing about 0.1 to about 10% w/v of the compound for parenteral administration. Some typical dose ranges are from about 1 μg/kg to about 1 g/kg of body weight per day. In some embodiments, the dose range is from about 0.01 mg/kg to about 100
mg/kg of body weight per day. The dosage is likely to depend on such variables as the type and extent of progression of the disease or disorder, the overall health status of the particular patient, the relative biological efficacy of the compound selected, formulation of the excipient, and its route of administration. Effective doses can be extrapolated from dose-response curves derived from in vitro or animal model test systems.

In some embodiments, the compound of the invention, or pharmaceutically acceptable salt thereof, is administered as an ophthalmic composition. Accordingly, in some embodiments, the methods comprise administration of the compound, or pharmaceutically acceptable salt thereof, and an ophthalmically acceptable carrier. In some embodiments, the ophthalmic composition is a liquid composition, semi-solid composition, insert, film, microparticles or nanoparticle.

In some embodiments, the ophthalmic composition is a liquid composition. In some embodiments, the ophthalmic composition is a semi-solid composition. In some embodiments, the ophthalmic composition is an topical composition. The topical compositions include, but are not limited to liquid and semi-solid compositions. In some embodiments, the ophthalmic composition is a topical composition. In some embodiments, the topical composition comprises aqueous solution, an aqueous suspension, an ointment or a gel. In some embodiments, the ophthalmic composition is topically applied to the front of the eye, under the upper eyelid, on the lower eyelid and in the cul-de-sac. In some embodiments, the ophthalmic composition is sterilized. The sterilization can be accomplished by known techniques like sterilizing filtration of the solution or by heating of the solution in the ampoule ready for use. The ophthalmic compositions of the invention can further contain pharmaceutical excipients suitable for the preparation of ophthalmic formulations. Examples of such excipients are preserving agents, buffering agents, chelating agents, antioxidant agents and salts for regulating the osmotic pressure.

As used herein, the term “ophthalmically acceptable carrier” refers to any material that can contain and release the compound, or pharmaceutically acceptable salt or N-oxide thereof, and that is compatible with the eye. In some embodiments, the ophthalmically acceptable carrier is water or an aqueous solution or suspension, but also includes oils such as those used to make ointments and polymer matrices such as used in ocular inserts. In some embodiments, the composition may be an aqueous suspension comprising the compound, or pharmaceutically acceptable salt or N-oxide thereof. Liquid ophthalmic compositions, including both ointments and suspensions, may have a viscosity that is suited for the selected
route of administration. In some embodiments, the ophthalmic composition has a viscosity in
the range of from about 1,000 to about 30,000 centipoise.

In some embodiments, the liquid composition further comprises a polymer. These polymers may be used to improve the bioavailability, raise viscosity, or reduce drainage from
the eye for a liquid formulation. In some embodiments, the polymers include, but are not
limited to, those described in Wagh, et al., “Polymers used in ocular dosage form and drug

In some embodiments, the polymer is sodium hyaluronate, chitosan, a cyclodextrin (e.g., hydroxypropyl β-cyclodextrin), polygalacturonic acid, xylglucan, xanthan gum, gellan gum, a thioner, a poly(ortho ester) (e.g., as described in Einmahl, Adv.
Drug Deliv. Rev. 53:45-73 (2001)), or a tamarind seed polysaccharide (e.g., as described in Ghelardi, et al., Antimicrob. Agents
Chemother. 48:3396-3401 (2004)).

In some embodiments, the ophthalmic compositions may further comprise one or
more of surfactants, adjuvants, buffers, antioxidants, tonicity adjusters, preservatives (e.g.,
EDTA, BAK (benzalkonium chloride), sodium chlorite, sodium perborate, polyquaterium-1),
thickeners or viscosity modifiers (e.g., carboxymethyl cellulose, hydroxyethyl cellulose,
polyvinyl alcohol, polyethylene glycol, glycol 400, propylene glycol hydroxymethyl
cellulose, hydroxpropyl-guar, hyaluronic acid, and hydroxypropyl cellulose) and the like.

Additives in the formulation may include, but are not limited to, sodium chloride, sodium
bicarbonate, sorbic acid, methyl paraben, propyl paraben, chlorhexidine, castor oil, and
sodium perborate.

Aqueous ophthalmic compositions (solutions or suspensions) generally do not contain
physiologically or ophthalmically harmful constituents. In some embodiments, purified or
deionized water is used in the composition. The pH may be adjusted by adding any
physiologically and ophthalmically acceptable pH adjusting acids, bases or buffers to within
the range of about 5.0 to 8.5. Ophthalmically acceptable examples of acids include acetic,
boric, citric, lactic, phosphoric, hydrochloric, and the like, and examples of bases include
sodium hydroxide, sodium phosphate, sodium borate, sodium citrate, sodium acetate, sodium
lactate, tromethamine, trishydroxymethylamino-methane, and the like. Salts and buffers
include citrate/dextrose, sodium bicarbonate, ammonium chloride and mixtures of the
aforementioned acids and bases.
In some embodiments, the osmotic pressure of the ophthalmic composition may be from about 10 milliosmolar (mOsM) to about 400 mOsM, or from 260 to about 340 mOsM. In some embodiments, the osmotic pressure can be adjusted by using appropriate amounts of physiologically and ophthalmically acceptable salts or excipients. In further embodiments, sodium chloride may be used to approximate physiologic fluid. In other embodiments, the composition comprises sodium chloride ranging from about 0.01% to about 1% by weight, or from about 0.05% to about 0.45% by weight, based on the total weight of the composition. Equivalent amounts of one or more salts made up of cations such as potassium, ammonium and the like and anions such as chloride, citrate, ascorbate, borate, phosphate, bicarbonate, sulfate, thiocarbonate, bisulfate, sodium bisulfate, ammonium sulfate, and the like can also be used in addition to or instead of sodium chloride to achieve osmolalities within the above stated range. Similarly, a sugar such as mannitol, dextrose, sorbitol, glucose and the like can also be used to adjust osmolality.

In some embodiments, the methods involve forming or supplying a depot of the therapeutic agent in contact with the external surface of the eye. A depot refers to a source of therapeutic agent that is not rapidly removed by tears or other eye clearance mechanisms. This allows for continued, sustained high concentrations of therapeutic agent be present in the fluid on the external surface of the eye by a single application. Without wishing to be bound by any theory, it is believed that absorption and penetration may be dependent on both the dissolved drug concentration and the contact duration of the external tissue with the drug containing fluid. As the drug is removed by clearance of the ocular fluid and/or absorption into the eye tissue, more drug is provided, e.g. dissolved, into the replenished ocular fluid from the depot. Accordingly, the use of a depot may more easily facilitate loading of the ocular tissue for more insoluble therapeutic agents. In some embodiments, the depot can remain for up to eight hours or more. In some embodiments, the ophthalmic depot forms includes, but is not limited to, aqueous polymeric suspensions, ointments, and solid inserts.

In some embodiments, a semi-solid composition is a liquid formulation which increases in viscosity upon application to the eye, usually because of a polymer in the liquid formulation. This viscosity increase may be triggered by a change in temperature, pH, or electrolyte concentration. In some embodiments, the polymer include, but are not limited to, those described for semi-solid dosage forms in Wagh, et al., "Polymers used in ocular dosage form and drug delivery systems", Asian J. Pharm., pages 12-17 (Jan. 2008).

In some embodiments, the polymer is celluloseacetophthalate, polyacrylic acid, gellan gum, hyaluronase, chitosan, salts of alginic
acid (e.g., sodium alginate), or a block copolymer of ethylene oxide and propylene oxide (e.g., Pluronic®, BASF; poloxamer). In some embodiment, the polyacrylic acid is crosslinked acrylic acid (e.g., Carbopol®). In some embodiments, the semi-solid composition comprises a mixture of carbopol and a block copolymer of ethylene oxide and propylene oxide; a mixture of methyl cellulose and hydroxyethyl cellulose; or a mixture of polyethylene glycol and a block copolymer of ethylene oxide and propylene oxide.

In some embodiments, the ophthalmic composition is an ointment or gel. In some embodiment, the ophthalmic composition is an oil-based delivery vehicle. In some embodiments, the composition comprises a petroleum or lanolin base to which is added the active ingredient, usually as 0.1 to 2%, and excipients. Common bases may include, but are not limited to, mineral oil, petrolatum and combinations thereof. In some embodiments, the ointment is applied as a ribbon onto the lower eyelid.

In some embodiment, the ophthalmic composition is an ophthalmic insert. In some embodiments, the ophthalmic insert is biologically inert, soft, bio-erodible, viscoelastic, stable to sterilization after exposure to therapeutic agents, resistant to infections from air borne bacteria, bio-erodible, biocompatible, and/or viscoelastic. In some embodiments, the insert comprises an ophthalmically acceptable matrix, e.g., a polymer matrix. The matrix is typically a polymer and the therapeutic agent is generally dispersed therein or bonded to the polymer matrix. In some embodiments, the therapeutic agent may slowly released from the matrix through dissolution or hydrolysis of the covalent bond. In some embodiments, the polymer is bioerodible (soluble) and the dissolution rate thereof can control the release rate of the therapeutic agent dispersed therein. In another form, the polymer matrix is a biodegradable polymer that breaks down such as by hydrolysis to thereby release the therapeutic agent bonded thereto or dispersed therein. In further embodiments, the matrix and therapeutic agent can be surrounded with an additional polymeric coating to further control release. In some embodiments, the insert comprises a biodegradable polymer such as polycaprolactone (PCL), an ethylene/vinyl acetate copolymer (EVA), polyalkyl cyanoacrylate, polyurethane, a nylon, or poly (dl-lactide-co-glycolide) (PLGA), or a copolymer of any of these. In some embodiments, the therapeutic agent is dispersed into the matrix material or dispersed amongst the monomer composition used to make the matrix material prior to polymerization. In some embodiments, the amount of therapeutic agent is from about 0.1 to about 50%, or from about 2 to about 20%. In further embodiments, the biodegradable or bioerodible polymer matrix is used so that the spent insert does not have to
be removed. As the biodegradable or bioerodible polymer is degraded or dissolved, the therapeutic agent is released.

In further embodiments, the ophthalmic insert comprises a polymer, including, but are not limited to, those described in Wagh, et al., "Polymers used in ocular dosage form and drug delivery systems", *Asian J. Pharm.*, pages 12-17 (Jan. 2008).

In some embodiments, the insert comprises a polymer selected from polyvinylpyrrolidone (PVP), an acrylate or methacrylate polymer or copolymer (e.g., Eudragit® family of polymers from Rohm or Degussa), hydroxymethyl cellulose, polyacrylic acid, polyamidoamine dendrimers, poly(dimethyl siloxane), polyethylene oxide, poly(lactide-co-glycolide), poly(2-hydroxyethylmethacrylate), poly(vinyl alcohol), or poly(propylene fumarate). In some embodiments, the insert comprises Gelfoam® R. In some embodiments, the insert is a polycrylic acid of 450 kDa-cysteine conjugate.

In some embodiments, the ophthalmic composition is a ophthalmic film. Polymers suitable for such films include, but are not limited to, those described in Wagh, et al., "Polymers used in ocular dosage form and drug delivery systems", *Asian J. Pharm.*, pages 12-17 (Jan. 2008). In some embodiments, the film is a soft-contact lense, such as ones made from copolymers of N,N-diethylacrylamide and methacrylic acid crosslinked with ethyleneglycol dimethacrylate.

In some embodiments, the insert comprises a core comprising the therapeutic agent and an outer tube (see e.g., U.S. Patent Pub. No. 20040009222).

In some embodiments, the outer tube may be permeable, semi-permeable, or impermeable to the drug. In some embodiments, the drug core may include a polymer matrix which does not significantly affect the release rate of the drug. In some embodiments, the outer tube, the polymer matrix of the drug core, or both may be bioerodible. In some embodiments, the co-extruded product can be segmented into drug delivery devices. In some embodiments, the devices may be left uncoated so that their respective ends are open, or the devices may be coated with, for example, a layer that is permeable to the therapeutic agent, semi-permeable to the therapeutic agent, or bioerodible. In certain embodiments, the therapeutic agent and at least one polymer are admixed in powder form. In some embodiments, the insert is formed by forwarding a polymeric material to a first extrusion device, forwarding an therapeutic agent to a second extrusion device, co-extruding a mass including the polymeric material and the therapeutic agent, and forming the mass into at least one co-extruded drug delivery device which comprises a core including the therapeutic agent and an outer layer including the polymeric material. In certain
embodiments, the therapeutic agent forwarded to the second extrusion device is in admixture with at least one polymer. In certain embodiments, the therapeutic agent and at least one polymer are admixed in powder form. In certain embodiments, this act includes forwarding more than one drug to the second extrusion device. In certain embodiments, the polymeric material is one of impermeable, semi-permeable, or permeable to the therapeutic agent. The polymeric material may be bioerodible and/or radiation curable. In latter instances, the insert may be irradiated.

In certain embodiments, the insert is in a tubular form, and may be segmented into a plurality of shorter products. In certain embodiments, the insert further comprises a coating of the plurality of shorter products with one or more layers including at least one of a layer that is permeable to the therapeutic agent, a layer that is semi-permeable to the therapeutic agent, and a layer that is bioerodible. The polymeric material may include any biocompatible polymer, such as polycaprolactone (PCL), an ethylene/vinyl acetate copolymer (EVA), polyalkyl cyanoacrylate, polyurethane, a nylon, or poly (dl-lactide-co-glycolide) (PLGA), or a copolymer of any of these.

In some embodiments, the insert comprises a therapeutically effective amount of at least one therapeutic agent coated by or dispersed in a polymer matrix, wherein the therapeutic agent is in granular or particulate form. In some embodiments, the therapeutic agent is released from the formulation as drug from the granules dissolves into or within the matrix, diffuses through the matrix, and is released into the surrounding physiological fluid. In some embodiments, the rate of release is limited primarily by the rate of dissolution of the therapeutic agent from the granules/particles into the matrix; the steps of diffusion through the matrix and dispersion into the surrounding fluid are primarily not release-rate-limiting. In certain embodiments, the polymer matrix is non-bioerodible, while in other embodiments it is bioerodible. Exemplary non-bioerodible polymer matrices can be formed from polyurethane, polysilicone, poly(ethylene-co-vinyl acetate) (EVA), polyvinyl alcohol, and derivatives and copolymers thereof. Exemplary bioerodible polymer matrices can be formed from polyanhydride, polyactic acid, polyglycolic acid, polylactoester, polyalkylcyanoacrylate, and derivatives and copolymers thereof.

In some embodiments, the insert comprises a collagenous material. In some embodiments, the insert may be a soluble ophthalmic drug insert (SODI, e.g., a polymeric oval film that can be introduced in the upper conjunctival sac for drug delivery; an elliptical insert such as OCUSERT® (Pilocarpine ocular therapeutic system, developed by Alza Corporation) which is made of ethylene vinyl acetate; OCUFIT® (developed by Escalon
Ophthalmics Inc., Skillman, NS), which is a rod shaped silicone elastomer; Lacrisert®, a rod shaped insert made of cellulose; New Ophthalmic Drug Delivery Systems (NODS), made of poly (vinyl alcohol); and the inserts described in Fabrizio, Advanced Drug Delivery Reviews 16: 95 -106, 1998. In further embodiments, the insert can be placed, depending on the location and the mechanism used to hold the insert in position, by either the patient or the doctor. In further embodiments, the insert comprises collagen, gelatin, or a polymer, wherein the polymer is selected from polycaprolactone (PCL), an ethylene/vinyl acetate copolymer (EVA), polyalkyl cyanoacrylate, polyurethane, a nylon, poly(dl-lactide-co-glycolide) (PLGA), or a copolymer of any of the aforementioned. In some embodiments, the insert is implanted under the upper eyelid. In some embodiments, the insert is implanted in the posterior segment of the eye, in the chroidal space, or in the sclera. In some embodiments, the insert is implanted intravitreally or sub-retinally. In some embodiments, the insert is injected sub-retinally. Methods of administration and techniques for their preparation are set forth in Remington’s Pharmaceutical Sciences.

In other embodiments, the insert provides a sustained release of the therapeutic agent to the vitreous of the eye. As used herein, “sustained release” means that the composition releases the therapeutic agent over an extended period of time in a controlled fashion. In some embodiments, the insert releases the therapeutic agent at a rate such that the aqueous therapeutic agent concentration remains less than the vitreous therapeutic agent concentration during the release. In some embodiments, the aqueous therapeutic agent concentration is from about 0.002 µg/mL to about 0.01 µg/mL, or from about 0.01 µg/mL to about 0.05 µg/mL, or less than about 0.05 µg/mL. In some embodiments, the therapeutic agent is released at a rate of about 1 µg/day to about 50 µg/day, or from about 1 µg/day to about 10 µg/day. In some embodiments, the insert further comprises an additional therapeutic agent, as detailed above, e.g., fluocinolone acetonide (such as that found in the ophthalmic insert Retisert®).

In some embodiments, the ophthalmic composition comprises microspheres or nanoparticles. In some embodiment, the microspheres comprise gelatin. In some embodiments, the microspheres are injected to the posterior segment of the eye, in the chroidal space, in the sclera, intravitreally or sub-retinally. In some embodiments, the microspheres or nanoparticles comprises a polymer including, but not limited to, those described in Wagh, et al., “Polymers used in ocular dosage form and drug delivery systems”,

55

In some embodiments, the polymer is chitosan, a polycarboxylic acid such as polyacrylic acid, albumin particles, hyaluronic acid esters, polyitaconic acid, poly(butyl)cyanoacrylate, polycaprolactone, poly(isobutyl)caprolactone, poly(lactic acid-co-glycolic acid), or poly(lactic acid). In some embodiments, the microspheres or nanoparticles comprise solid lipid particles.

In some embodiments, the ophthalmic composition comprises an ion-exchange resin. In some embodiments, the ion-exchange resin is an inorganic zeolite or synthetic organic resin. In some embodiments, the ion-exchange resin includes, but is not limited to, those described in Wagh, et al., “Polymers used in ocular dosage form and drug delivery systems”, Asian J. Pharm., pages 12-17 (Jan. 2008).

In some embodiments, the ion-exchange resin is a partially neutralized polyacrylic acid.

In some embodiments, the ophthalmic composition is an aqueous polymeric suspension. In some embodiments, the therapeutic agent or a polymeric suspending agent is suspended in an aqueous medium (e.g., having the properties as described above). In some embodiment, the therapeutic agent is suspended. In some embodiments, the therapeutic agent is in solution. In further embodiments, the suspending agent serves to provide stability to the suspension, to increase the residence time of the dosage form on the eye, or to enhance the sustained release of the drug in terms of both longer release times and a more uniform release curve. Examples of polymeric suspending agents include, but are not limited to, dextrans, polyethylene glycols, polyvinylpyrrolidone, polysaccharide gels, Gelrite®, cellulose polymers like hydroxypropyl methylcellulose, and carboxy-containing polymers such as polymers or copolymers of acrylic acid, as well as other polymeric demulcents. In some embodiments, the polymeric suspending agent is a water swellable, water insoluble polymer, especially a crosslinked carboxy-containing polymer. In some embodiments, the polymeric suspending agent comprises from at least about 90% to about 99.9%, or from about 95% to about 99.9%, by weight based on the total weight of monomers present, of one or more carboxy-containing monomethylenically unsaturated monomers. In some embodiments, the carboxy-containing monomethylenically unsaturated monomer includes acrylic acid, methacrylic acid, ethacrylic acid, methylacrylic acid (crotonic acid), cis- α-methylcrotonic acid (angelic acid), trans-α-methylcrotonic acid (tiglic acid), α-butylcrotonic acid, α-phenylacrylic acid, α-benzylacrylic acid, α-cyclohexylacrylic acid, phenylacrylic acid.
(cinnamic acid), coumaric acid (o-hydroxyphenylacetate), and umbelliferone acid (p-hydroxyphenylcoumaric acid). In some embodiments, the polymers may be crosslinked by a polyfunctional crosslinking agent (e.g., a difunctional crosslinking agent). In further embodiments, the amount of crosslinking should be sufficient to form insoluble polymer particles, but not so great as to unduly interfere with sustained release of the therapeutic agent. In some embodiment, the polymers are only lightly crosslinked. In some embodiments, the crosslinking agent is contained in an amount of from about 0.01% to about 5%, or from about 0.1% to about 5.0%, or from about 0.2% to about 1%, based on the total weight of monomers present. In some embodiments, the crosslinking agents are nonpolyalkenyl polyether difunctional crosslinking monomers such as divinyl glycol, 2,3-dihydroxyhexa-1,5-diene, 2,5-dimethyl-1,5-hexadiene, divinylbenzene, N,N-diallylacrylamide, N,N-diallylmethacrylamide; polyalkenyl polyether crosslinking agents containing two or more alkenyl ether groupings per molecule, e.g., alkenyl ether groupings containing terminal H₂C=CH₂ groups, prepared by etherifying a polyhydric alcohol containing at least four carbon atoms and at least three hydroxyl groups with an alkenyl halide such as allyl bromide or the like, e.g., polyallyl sucrose, polyallyl pentaerythritol, or the like; diolefinic non-hydrotropic macromeric crosslinking agents having molecular weights of from about 400 to about 8,000, such as insoluble diacrylates and polyacrylates and methacrylates of diols and polyols, diisocyanate hydroxyalkyl acrylate or methacrylate reaction products of isocyanate terminated prepolymers derived from polyester diols, polyether diols or polysiloxane diols with hydroxyalkylmethacrylates, and the like.

In some embodiments, the crosslinked polymers may be made from a carboxy-containing monoothlenically unsaturated monomer or monomers as the sole monoethylenically unsaturated monomer present, together with a crosslinking agent or agents. In some embodiments, the polymers are ones in which up to about 40%, and preferably from about 0% to about 20% by weight, of the carboxy-containing monoethylenically unsaturated monomer or monomers has been replaced by one or more non-carboxyl-containing monoethylenically unsaturated monomer or monomers containing only physiologically and ophthalmically innocuous substituents, including acrylic and methacrylic acid esters such as methyl methacrylate, ethyl acrylate, butyl acrylate, 2-ethylhexylacrylate, octyl methacrylate, 2-hydroxyethylmethacrylate, 3-hydroxypropylacrylate, and the like, vinyl acetate, N-vinylpyrrolidone, and the like (see Mueller et al. U.S. Pat. No. 4,548,990 for a more extensive listing of such additional monoethylenically unsaturated
monomers). In some embodiments, the polymers include polycarbophil (Noveon AA-1), Carbopol®, and DuraSite®. In some embodiments, the crosslinked polymers are prepared by suspension or emulsion polymerizing the monomers, using conventional free radical polymerization catalysts, to a dry particle size of not more than about 50 μm in equivalent spherical diameter. In some embodiments, the average dry particle size is from about 1 to about 30 μm, or from about 3 to about 20 μm in equivalent spherical diameter. In some embodiments, the polymer particles are obtained by mechanically milling larger polymer particles. In further embodiments, such polymers will have a molecular weight from about 250,000 to about 4,000,000, and from 3,000,000,000 to 4,000,000,000. In other embodiments, the particles of crosslinked polymer are monodisperse, meaning that they have a particle size distribution such that at least about 80%, about 90% or about 95%, of the particles fall within a μm band of major particle size distribution. In further embodiments, the monodisperse particle size means that there is no more than about 20%, about 10%, or about 5% particles of a size below 1 μm. In some embodiments, the aqueous polymeric suspension comprises from about 0.05 to about 1%, from about 0.1 to about 0.5%, or from about 0.1 to about 0.5%, of the therapeutic agent and from about 0.1 to about 10%, from about 0.1 to about 10%, from about 0.5 to about 6.5%, from about 0.5 to about 2.0%, from about 0.5% to about 1.2%, from about 0.6 to about 0.9%, or from about 0.6 to about 0.8% of a polymeric suspending agent. Although referred to in the singular, it should be understood that one or more species of polymeric suspending agent can be used with the total amount falling within the stated ranges. In one embodiment, the amount of insoluble lightly crosslinked polymer particles, the pH, and the osmotic pressure can be correlated with each other and with the degree of crosslinking to give a composition having a viscosity in the range of from about 500 to about 100,000 centipoise, and preferably from about 1,000 to about 30,000 or about 1,000 to about 10,000 centipoise, as measured at room temperature (about 25° C.) using a Brookfield Digital LVT Viscometer equipped with a number 25 spindle and a 13R small sample adapter at 12 rpm. In some embodiments, the viscosity is from about 10 to about 400 centipoise, from about 10 to about 200 centipoises or from about 10 to about 25 centipoise.

In some embodiments, the aqueous polymeric suspensions may be formulated so that they retain the same or substantially the same viscosity in the eye that they had prior to administration to the eye. In some embodiments, they may be formulated so that there is increased gelation upon contact with tear fluid. For instance, when a formulation containing DuraSite® or other similar polyacrylic acid-type polymer is administered to the eye at a pH
of less than about 6.7, the polymer may swell upon contact with tear fluid since it has a higher pH (around 7). This gelation or increase in gelation may lead to entrapment of the suspended particles, thereby extending the residence time of the composition in the eye. In some embodiments, the therapeutic agent is released slowly as the suspended particles dissolve over time. In some embodiments, this delivery route increases patient comfort and increased therapeutic agent contact time with the eye tissues, thereby increasing the extent of drug absorption and duration of action of the formulation in the eye. The therapeutic agents contained in these drug delivery systems may be released from the gels at rates that depend on such factors as the drug itself and its physical form, the extent of drug loading and the pH of the system, as well as on any drug delivery adjuvants, such as ion exchange resins compatible with the ocular surface, which may also be present.

The compositions of the invention can further include one or more additional pharmaceutical agents such as a chemotherapeutic, steroid, anti-inflammatory compound, or immunosuppressant, examples of which are listed herein above.

The invention will be described in greater detail by way of specific examples. The following examples are offered for illustrative purposes, and are not intended to limit the invention in any manner. Those of skill in the art will readily recognize a variety of noncritical parameters which can be changed or modified to yield essentially the same results.

20 EXAMPLES

Example 1. {1-(ethylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl]acetonitrile trifluoroacetic acid salt

\[
\text{\begin{align*}
\text{O} & \quad \text{N} \\
\text{S} & \quad \text{\begin{align*}
\text{N} & \quad \text{\begin{align*}
\text{\begin{align*}
\text{N} & \quad \text{H}
\end{align*}}
\end{align*}}
\end{align*}}
\end{align*}}
\]
Step 1. tert-butyl 3-(cyanomethylene)azetidine-1-carboxylate

To a suspension of sodium hydride (60% dispersion in mineral oil, 0.257 g, 6.42 mmol) in tetrahydrofuran (32 mL) at 0 °C under a nitrogen atmosphere was added diethyl cyanomethylphosphonate (1.19 g, 6.72 mmol) (purchased from Aldrich). The reaction was then stirred for 45 minutes at room temperature. A solution of tert-butyl 3-oxoazetidine-1-carboxylate (1.00 g, 5.84 mmol) (purchased from Alfa Aesar) in tetrahydrofuran (8.8 mL) was introduced dropwise and the mixture was stirred for 16 hours. Brine and ethyl acetate were added and the layers separated. The aqueous layer was extracted with three portions of ethyl acetate. The combined extracts were dried over sodium sulfate, filtered and concentrated to afford product, used without further purification in Step 2 (1.12 g, 99%).

$^1$H NMR (300 MHz, CDCl$_3$): δ 5.38 (p, 1H), 4.73-4.68 (m, 2H), 4.64-4.59 (m, 2H), 1.46 (s, 9H).

Step 2. tert-butyl 3-(cyanomethyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidine-1-carboxylate

To a solution of 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidine (4.61 g, 14.6 mmol) (prepared according to the method of WO
2007/070514 in Example 65, Step 2) and tert-butyl 3-(cyanomethylene)azetidine-1-carboxylate (2.84 g, 14.6 mmol) in acetonitrile (100 mL) was added 1,8-diazabicyclo[5.4.0]undec-7-ene (2.19 mL, 14.6 mmol). The reaction was stirred at room temperature for 16 hours. The acetonitrile was removed in vacuo and the residue was dissolved in ethyl acetate. This solution was sequentially washed with 1N HCl and brine, dried over sodium sulfate, filtered and concentrated. The residue was purified by flash column chromatography, eluting with 80% ethyl acetate/hexanes to afford desired product (5.36 g, 72%).

$^1$H NMR (300 MHz, CDCl$_3$): δ 8.86 (s, 1H), 8.44 (s, 1H), 8.34 (s, 1H), 7.42 (d, 1H), 6.80 (d, 1H), 5.68 (s, 2H), 4.54 (d, 2H), 4.29 (d, 2H), 3.59-3.51 (m, 2H), 3.33 (s, 2H), 1.47 (s, 9H), 0.96-0.89 (m, 2H), -0.06 (s, 9H); LCMS (M+H)$^+$: 510.2.

Step 3. 3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile

![Chemical Structure]

To a solution of tert-butyl 3-(cyanomethylene)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidine-1-carboxylate (5.36 g, 10.5 mmol) in 1,4-dioxane (100 mL) was added 4.00 M of hydrogen chloride in 1,4-dioxane (40 mL, 160 mmol) and the mixture was stirred at room temperature for 16 hours. The reaction was poured into saturated sodium bicarbonate solution sufficient to neutralize. The product was extracted with three portions of ethyl acetate. The combined extracts were washed with brine, dried over sodium sulfate, filtered and concentrated to afford product which was used without further purification (3.0 g, 69%).

$^1$H NMR (400 MHz, CDCl$_3$): δ 8.85 (s, 1H), 8.42 (s, 1H), 8.32 (s, 1H), 7.41 (d, 1H), 6.80 (d, 1H), 5.68 (s, 2H), 4.30 (d, 2H), 3.88 (d, 2H), 3.58-3.51 (m, 2H), 3.42 (s, 2H), 0.96-0.89 (m, 2H), -0.06 (s, 9H); LCMS (M+H)$^+$: 410.2.
Step 4. 1-(ethylsulfonyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile

To a solution of 3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile (0.100 g, 0.244 mmol) in tetrahydrofuran (2 mL) containing N,N-diisopropylethylamine (0.085 mL, 0.49 mmol) was added ethanesulfonfyl chloride (0.023 mL, 0.24 mmol). After stirring for 1.5 hours, the reaction mixture was poured into dilute HCl and extracted with three portions of ethyl acetate. The combined extracts were washed with brine, dried over sodium sulfate, decanted and concentrated to afford product, used without further purification in Step 5 (111 mg, 91%).

$^1$H NMR (300 MHz, CDCl$_3$): δ 8.86 (s, 1H), 8.63 (s, 1H), 8.35 (s, 1H), 7.45 (d, 1H), 6.83 (d, 1H), 5.68 (s, 2H), 4.63 (d, 2H), 4.26 (d, 2H), 3.54 (t, 2H), 3.42 (s, 2H), 3.09 (q, 2H), 1.41 (t, 3H), 0.92 (t, 2H), -0.06 (s, 9H); LCMS (M+H)$^+$: 502.1.

Step 5. 1-(ethylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile trifluoroacetate salt

To a solution of 1-(ethylsulfonyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile (0.111 g, 0.22 mmol) in methylene chloride (3 mL) was added trifluoroacetic acid (2 mL) and the solution was stirred for 1.5 hours. The solvents were removed in vacuo and the residue was dissolved in
methanol (3 mL) and ethylenediamine (0.1 mL) was added. After stirring for 3 hours, the volume was reduced in vacuo and the product was purified by preparative-HPLC/MS, (SunFire C18 column, eluting with a gradient of MeCN/H2O containing 0.1% TFA) to afford the product as the trifluoroacetic acid salt (50 mg, 47%).

1H NMR (400 MHz, d6-dmso): δ 12.55 (br s, 1H), 9.03 (s, 1H), 8.83 (s, 1H), 8.56 (s, 1H), 7.79-7.75 (m, 1H), 7.24-7.19 (m, 1H), 4.59 (d, 2H), 4.26 (d, 2H), 3.71 (s, 2H), 3.25 (q, 2H), 1.24 (t, 3H); LCMS (M+H)+: 372.1.

Alternatively, the deprotection and sulfonylation steps could be performed in the reverse order, as in Example 2.

**Example 2. 1-(cyclopropylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile trifluoroacetic acid salt**

![Chemical Structure](image)

**Step 1. 3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile trifluoroacetic acid salt**

![Chemical Structure](image)

A solution of tert-butyl 3-(cyanomethyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidine-1-carboxylate, as prepared in Example 1, Step 2 (0.60 g, 1.2 mmol) in trifluoroacetic acid (10 mL) and methylene chloride
(40 mL) was stirred for 5 hours. The solvents were removed in vacuo and the residue stirred in a solution of methanol (40 mL) and 14.50 M of ammonium hydroxide in water (10 mL) overnight. The solvent was evaporated, the residue reconstituted in methanol and purified by preparative-HPLC/MS (SunFire C18 column, eluting with a gradient of MeCN/H2O containing 0.1% TFA) to afford the product as the trifluoroacetic acid salt (526 mg, 88%).

1H NMR (400 MHz, d6-dmso): δ 12.36 (br s, 1H), 9.37 (br s, 1H), 9.15 (br s, 1H), 9.05 (s, 1H), 8.77 (s, 1H), 8.56 (s, 1H), 7.71 (dd, 1H), 7.14 (dd, 1H), 4.75-4.65 (m, 2H), 4.48-4.39 (m, 2H), 3.74 (s, 2H); LCMS (M+H)+: 280.1.

Step 2. 1-(cyclopropylsulfanyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile trifluoroacetate salt

To 3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile bis(trifluoroacetate) (0.400 g, 0.788 mmol) in tetrahydrofuran (38 mL) and triethylamine (0.55 mL, 3.9 mmol) was added cyclopropanesulfonyl chloride (0.084 mL, 0.83 mmol). The reaction was stirred at room temperature for a few hours with periodic addition of cyclopropanesulfonyl chloride until the starting amine was consumed as evidenced by LCMS. To dissolve insolubles, methanol (0.16 mL) was added. The THF was removed in vacuo and MeOH was used to reconstitute the sample for purification by preparative-HPLC/MS (SunFire C18 column, eluting with a gradient of MeCN/H2O containing 0.1% TFA) to afford the product as the trifluoroacetate salt (193 mg, 49%).

1H NMR (300 MHz, d6-dmso): δ 12.53 (br s, 1H), 9.05 (s, 1H), 8.82 (s, 1H), 8.55 (s, 1H), 7.76 (dd, 1H), 7.21 (dd, 1H), 4.65 (d, 2H), 4.31 (d, 2H), 3.70 (s, 2H), 2.90-2.80 (m, 1H), 1.07-0.97 (m, 4H); LCMS (M+H)+: 384.1.

Example 3. 1-[(1-methylcyclopropyl)carbonyl]-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile trifluoroacetic acid salt

![Diagram](image_url)
To a solution of 1-methylcyclopropanecarboxylic acid (4.3 mg, 0.043 mmol) and N,N-diisopropylethylamine (0.018 g, 0.14 mmol) in N,N-dimethylformamide (1.5 mL) was added N,N,N',N'-tetramethyl-O-(7-azabenzotriazol-1-yl)uronium hexafluorophosphate (0.016 g, 0.043 mmol) (purchased from Aldrich). The reaction was stirred for 15 minutes followed by the addition of 3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetoneitrile bis(trifluoroacetate) salt from Example 2, Step 1 (0.014 g, 0.029 mmol). The reaction was stirred for 16 hours. The product was purified by preparative-HPLC/MS, (SunFire C18 column, eluting with a gradient of MeCN/H2O containing 0.1% TFA) to afford the product as the trifluoroacetate salt (6 mg, 45%).

1H NMR (300 MHz, d6-dmso): δ 12.82 (br s, 1H), 9.10 (s, 1H), 8.91 (s, 1H), 8.59 (s, 1H), 7.86 (s, 1H), 7.31 (s, 1H), 5.07-4.07 (br, 4H), 3.72 (s, 2H), 1.28 (s, 3H), 0.98 (s, 2H), 0.54 (s, 2H); LCMS(M+H)+: 362.2.

In some cases, a modification to Example 3 was used where THF was substituted for DMF as the solvent. In Table 1, this is indicated by modification A.

**Example 4. 1-[(1-methylcyclopropyl)sulfonyl]-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetoneitrile trifluoroacetic acid salt**

\[ \text{Step 1. 1-(cyclopropylsulfonyl)azetidin-3-ol} \]

To a solution of azetidin-3-ol hydrochloride (1.00 g, 9.13 mmol) (purchased from
Matrix) and N,N-diisopropylethylamine (4.77 mL, 27.4 mmol) in tetrahydrofuran (100 mL) at 0 °C was added cyclopropanesulfonyl chloride (0.930 mL, 9.13 mmol) and the reaction was stirred for 16 hours. Water was added and the product was extracted with ethyl acetate. The combined extracts were washed with 1N HCl, saturated sodium bicarbonate, and brine, dried over sodium sulfate, decanted and concentrated to afford a yellow oil used without further purification (1.04 g, 64%).

$^1$H NMR (300 MHz, CDCl$_3$): δ 4.61 (p, 1H), 4.14-4.07 (m, 2H), 3.93-3.86 (m, 2H), 2.69 (br s, 1H), 2.42-2.32 (m, 1H), 1.20-1.11 (m, 2H), 1.06-0.98 (m, 2H).

Step 2. 1-(cyclopropylsulfonyl)-3-[(triethylsilyl)oxy]azetidine

To a solution of 1-(cyclopropylsulfonyl)azetidin-3-ol (1.04 g, 5.87 mmol) and triethylamine (3.11 mL, 22.3 mmol) in tetrahydrofuran (20 mL) was added 4-dimethylaminopyridine (0.090 g, 0.73 mmol) followed by chlorotriethylsilane (1.00 M in THF, 8.0 mL, 8.0 mmol). The reaction was stirred at room temperature for 16 hours. To the reaction was added saturated sodium bicarbonate solution and the product was extracted with a 1:1 mix of ethyl acetate : hexanes three times. The combined organic extracts were washed with dilute HCl and brine, then dried over sodium sulfate, decanted and concentrated. Flash column chromatography, eluting with a gradient of 0-50% ethyl acetate in hexanes afforded desired product (1.0 g, 58%).

$^1$H NMR (300 MHz, CDCl$_3$): δ 4.56 (p, 1H), 4.05-3.98 (m, 2H), 3.90-3.83 (m, 2H), 2.41-2.32 (m, 1H), 1.20-1.12 (m, 2H), 1.05-0.96 (m, 2H), 0.93 (t, 9H), 0.57 (q, 6H).

Step 3. 1-[(1-methylcyclopropyl)sulfonyl]-3-[(triethylsilyl)oxy]azetidine
To a solution of 1-(cyclopropylsulfonyl)-3-[(triethylsilyloxy)azetidine (1.0 g, 3.4 mmol) in tetrahydrofuran (20 mL) at -78 °C was added 2.50 M of n-butyllithium in hexane (1.37 mL, 3.43 mmol) dropwise. After stirring at this temperature for 1 hour, methyl iodide (0.224 mL, 3.60 mmol) was added. After 30 minutes, the reaction temperature was raised to 0 °C and stirred for 50 minutes. The reaction was quenched by the addition of saturated sodium bicarbonate, followed by brine and the product was extracted with ethyl acetate. The extracts were dried over sodium sulfate, decanted and concentrated. Flash column chromatography eluting with a gradient of 0-30% ethyl acetate in hexanes afforded product (890 mg, 85%).

$^1$H NMR (300 MHz, CDCl$_3$): $\delta$ 4.57 (p, 1H), 4.00-3.94 (m, 2H), 3.92-3.86 (m, 2H), 1.49 (s, 3H), 1.35-1.29 (m, 2H), 0.93 (t, 9H), 0.73 (dt, 2H), 0.57 (q, 6H).

**Step 4. 1-[(1-methylcyclopropyl)sulfonyl]azetidin-3-ol**

A solution of 1-[(1-methylcyclopropyl)sulfonyl]-3-[(triethylsilyloxy)azetidine (0.125 g, 0.41 mmol) in tetrahydrofuran (3 mL), water (1 mL) and acetic acid (1 mL) was stirred at room temperature for four hours. The mixture was neutralized by pouring into a solution of sodium bicarbonate. The product was extracted with ethyl acetate, the extracts were washed with brine, dried over sodium sulfate, decanted and concentrated to afford product, used without further purification (64 mg, 82%).

$^1$H NMR (300 MHz, CD$_3$OD): $\delta$ 4.56-4.47 (m, 1H), 4.02-3.95 (m, 2H), 3.83-3.75 (m, 2H), 1.47 (s, 3H), 1.26-1.19 (m, 2H), 0.84-0.77 (m, 2H).

**Step 5. 1-[(1-methylcyclopropyl)sulfonyl]azetidin-3-one**
To a solution of oxalyl chloride (59 µL, 0.69 mmol) in methylene chloride (1.5 mL) at
-78 °C was added dimethyl sulfoxide (0.10 mL, 1.5 mmol) slowly dropwise. The reaction was
stirred for 15 minutes following complete addition. A solution of 1-[(1-methylcyclopropyl)-
sulfonyl]azetidin-3-ol (64 mg, 0.33 mmol) in methylene chloride (1.0 mL) was added
dropwise and the reaction mixture was stirred for 45 min at -60 °C. Triethylamine (0.28 mL,
2.0 mmol) was added dropwise and the reaction was stirred for 15 minutes and the bath was
removed and the solution allowed to warm to ambient temperature. The solvent was removed
in vacuo and ethyl acetate was added. The solution was washed sequentially with saturated
sodium bicarbonate solution, water and brine, dried over sodium sulfate, decanted and
concentrated. The crude product was used without further purification in Step 6.

1H NMR (300 MHz, CDCl3): δ 4.07 (d, 2H), 3.93 (d, 2H), 1.58 (s, 3H), 1.44-1.38 (m, 2H),
0.87 (dt, 2H).

Step 6. 1-[(1-methylcyclopropyl)sulfonyl]azetidin-3-ylideneacetonitrile

To a mixture of sodium hydride (60% dispersion in mineral oil, 17 mg, 0.42 mmol) in
tetrahydrofuran (2 mL) at 0 °C was added diethyl cyanomethylphosphonate (70 µL, 0.43
mmol) dropwise. The mixture was then allowed to reach room temperature and stir for a
further 45 minutes. A solution of 1-[(1-methylcyclopropyl)sulfonyl]azetidin-3-one (prepared
in Step 5) in tetrahydrofuran (1.0 mL) was added and the mixture was allowed to stir at
ambient temperature for 16 hours. Into the reaction was added water and solid NaCl, and
the product was extracted with three portions of ethyl acetate. The combined extracts were dried
over sodium sulfate, decanted and concentrated to afford product (71 mg, 100%), used
without further purification in Step 7.

1H NMR (300 MHz, CDCl3): δ 5.44-5.39 (m, 1H), 4.76-4.71 (m, 2H), 4.69-4.64 (m, 2H),
1.49 (s, 3H), 1.36-1.30 (m, 2H), 0.80 (dt, 2H).
Step 7. 1-[(1-methylcyclopropyl)sulfonyl]-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile

To a solution of 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidine (0.108 g, 0.344 mmol) and 1-[(1-methylcyclopropyl)sulfonyl]azetidin-3-ylideneacetonitrile (71 mg, 0.33 mmol) in acetonitrile (3 mL) was added 1,8-diazabicyclo[5.4.0]undec-7-ene (51 µL, 0.34 mmol). After a reaction time of 1.5 hours, the acetonitrile was removed in vacuo and the residue was partitioned between ethyl acetate and 1N HCl. The layers were separated and the organic layer was washed with brine, dried over sodium sulfate, filtered and concentrated. Flash column chromatography, eluting with a gradient of 0-80% ethyl acetate in hexanes afforded product (135 mg, 77%).

$^1$H NMR (300 MHz, CDCl$_3$): $\delta$ 8.86 (s, 1H), 8.46 (s, 1H), 8.35 (s, 1H), 7.42 (d, 1H), 6.80 (d, 1H), 5.68 (s, 2H), 4.62 (d, 2H), 4.22 (d, 2H), 3.59-3.50 (m, 2H), 3.42 (s, 2H), 1.55 (s, 3H), 1.42-1.36 (m, 2H), 0.96-0.89 (m, 2H), 0.85 (dt, 2H), -0.06 (s, 9H); LCMS (M+H)$^+$: 528.1.

Step 8. 1-[(1-methylcyclopropyl)sulfonyl]-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile trifluoroacetic acid salt

A solution of 1-[(1-methylcyclopropyl)sulfonyl]-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile (44 mg, 0.083 mmol) in methylene chloride (10 mL) and trifluoroacetic acid (5
mL) was stirred for 2 hours. The solvents were removed in vacuo. The residue was stirred with 14.50 M of ammonium hydroxide solution (3 mL) in methanol (10 mL) for 16 hours. Solvents were removed in vacuo and the residue was purified by preparative HPLC-MS (SunFire C18 column, eluting with a gradient of H2O and MeCN containing 0.1% TFA) to afford product as the trifluoroacetate salt (0.02 g, 50%).

1H NMR (300 MHz, d6-dmso): δ 12.56 (br s, 1H), 9.03 (s, 1H), 8.83 (s, 1H), 8.55 (s, 1H), 7.77 (dd, 1H), 7.21 (dd, 1H), 4.58 (d, 2H), 4.23 (d, 2H), 3.71 (s, 2H), 1.46 (s, 3H), 1.22-1.16 (m, 2H), 0.93-0.87 (m, 2H); LCMS (M+H)+: 398.1.

Acid chlorides, isocyanates or chloroformates were used in place of sulfonyl chlorides in either the method of Example 1 or Example 2 to afford amides (Ex. Nos. 22, 24, 26-30 & 33 of Table 1), ureas (Ex. No. 38 of Table 1) or carbamates (Ex. Nos. 35-37 of Table 1), respectively, as products. Additionally, triethylamine and disopropylethylamine were used interchangeably. Some amides in Table 1 were prepared by an alternative method illustrated in Example 3, by coupling the amine of Example 2, Step 1 with carboxylic acids.

</table>
Where products in Table 1 are referred to as the free base, they were purified using preparative-HPLC/MS (XBridge C18 column, eluting with a gradient of MeCN/H$_2$O containing 0.15% NH$_4$OH rather than containing 0.1% TFA).

Example 39. cis-3-(cyanomethyl)-N,N-dimethyl-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanesulfonamide and trans-3-(cyanomethyl)-N,N-dimethyl-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanesulfonamide

Step 1. cis- and trans-3-(benzylxy)-N,N-dimethylcyclobutanesulfonamide

To a solution of methanesulfonamide, N,N-dimethyl- (7.45 g, 60.5 mmol) in tetrahydrofuran (190 mL) at -78 °C was added a solution of 2.50 M of n-butyllithium in
hexane (31 mL, 77.5 mmol). The reaction was stirred at -78 °C for 45 minutes, was then warmed to 0 °C and stirred for 15 minutes, then was re-cooled to -78 °C. A solution of 2-(benzyloxy)-propane-1,3-diyi bis(4-methylbenzenesulfonate) (prepared as described in Chemical Communications v. 30, pp. 3190-3192 (2006); 29.1 g, 59.3 mmol) in tetrahydrofuran (120 mL) was added dropwise, rapidly. The reaction was stirred at -78 °C for 15 minutes following complete addition, then the bath was removed and the reaction allowed to warm to ambient temperature over 1.5 hours. The solution was re-cooled to -78 °C and 2.50 M of n-butyllithium in hexane (31 mL, 77.5 mmol) was added. After 15 min, the bath was removed and the reaction again allowed to reach ambient temperature and stir for 16 hours. As the reaction was judged incomplete by TLC, it was cooled again to -78 °C and a further portion of 2.50 M of n-butyllithium in hexane (10 mL, 25 mmol) was added. Upon warming to room temperature, the reaction was quenched by the addition of water and the mixture was extracted with three portions of ethyl acetate. The combined organic extracts were washed with saturated sodium bicarbonate solution followed by brine, dried over sodium sulfate, filtered and concentrated. Flash chromatography, eluting with a gradient of 20-50% ethyl acetate in hexanes afforded desired product. The isomers were characterized separately but were recombined for the subsequent transformation as a mixture of cis and trans isomers (7.06 g, 44%).

Isomer 1: 1H NMR (400 MHz, CDCl3): δ 7.38-7.27 (m, 5H), 4.42 (s, 2H), 4.41-4.33 (m, 1H), 3.83-3.74 (m, 1H), 2.87 (s, 6H), 2.79-2.71 (m, 2H), 2.47-2.38 (m, 2H).

Isomer 2: 1H NMR (400 MHz, CDCl3): δ 7.37-7.26 (m, 5H), 4.44 (s, 2H), 4.02-3.93 (m, 1H), 3.34-3.24 (m, 1H), 2.85 (s, 6H), 2.61-2.46 (m, 4H).

Step 2. cis- and trans-3-hydroxy-N,N-dimethylcyclobutanesulfonamide

To a mixture of cis- and trans-3-(benzyloxy)-N,N-dimethylcyclobutanesulfonamide (7.06 g, 26.2 mmol) in ethanol (100 mL) was added palladium (2.8 g, 2.6 mmol) (10% on C, wet Degussa type). The mixture was degassed and shaken under 50 psi of hydrogen for 16 hours. The reaction mixture was filtered, and the palladium on carbon was rinsed with ethanol. The filtrate was concentrated to afford a white solid, used without further
purification (4.60 g, 98%).

$^1$H NMR (400 MHz, CDCl$_3$): δ 4.71-4.63 (m, 1H, minor isomer), 4.22 (p, 1H, major isomer), 3.83-3.74 (m, 1H, minor isomer), 3.37-3.27 (m, 1H, major isomer), 2.87 (s, 6H, minor isomer), 2.86 (s, 6H, major isomer), 2.85-2.77 (m, 2H, minor isomer), 2.76-2.68 (m, 2H, major isomer), 2.48-2.40 (m, 2H, major isomer), 2.40-2.32 (m, 2H, minor isomer).

Step 3. $N,N$-dimethyl-3-oxocyclobutanesulfonamide

\[
\begin{align*}
&\text{To a solution of Dess-Martin periodinane (14.3 g, 33.7 mmol) in methylene chloride} \\
&\text{(200 mL) was added cis- and trans-3-hydroxy-$N,N$-dimethylcyclobutanesulfonamide (5.75 g, 32.1 mol) in methylene chloride (200 mL). The reaction was stirred at ambient temperature} \\
&\text{for 16 hours. The volume of DCM was reduced to 100 mL in vacuo. This solution was} \\
&\text{filtered through a plug of basic alumina, rinsing with further DCM. The filtrate was} \\
&\text{evaporated. The resulting yellow sticky solid was extracted by stirring vigorously with} \\
&\text{several portions of diethyl ether in succession. The extracts were filtered through a plug of solid sodium carbonate and again filtered through another plug of basic alumina, rinsing} \\
&\text{finally with an additional small portion of ethyl acetate to afford clean product (4 g, 70%).} \\
&\text{$^1$H NMR (400 MHz, CDCl$_3$): δ 3.89-3.80 (m, 1H), 3.68-3.59 (m, 2H), 3.44-3.34 (m, 2H),} \\
&\text{2.93 (s, 6H).}
\end{align*}
\]

Step 4. cis-3-(cyanomethyl)-$N,N$-dimethyl-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanesulfonamide and trans-3-(cyanomethyl)-$N,N$-dimethyl-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanesulfonamide

A mixture of $N,N$-dimethyl-3-oxocyclobutanesulfonamide (4.0 g, 22 mmol) and (triphenylphosphoranylidene)acetonitrile (6.80 g, 22.6 mmol) in toluene (150 mL) was heated to reflux for 1 hour. The reaction solution was decanted away from insolubles and the solvent removed in vacuo to afford crude product, used without further purification in conjugate addition.

$^1$H NMR (300 MHz, CDCl$_3$): δ 5.31-5.25 (m, 1H), 3.91-3.78 (m, 1H), 3.50-3.10 (m, 4H), 2.89 (s, 6H).

To a solution of 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-
pyrrolo[2,3-d]pyrimidine (7.09 g, 22.5 mmol) and crude 3-(cyanomethylene)-N,N-dimethylcyclobutanesulfonamide (prepared above) in acetonitrile (200 mL) was added 1,8-diazabicyclo[5.4.0]undec-7-ene (3.36 mL, 22.5 mmol). The reaction was stirred for 16 hours. The crude product was purified by flash column chromatography, eluting with a gradient of 0-10% MeOH in DCM (dichloromethane). The product collected from this pre-purification was further purified using preparative-HPLC/MS (XBridge C18 column, eluting with a gradient of MeCN/H2O containing 0.15% NH4OH) to afford a mixture of isomers. The cis- and trans- isomers were separated using a portion of this mixture by the following method: Chiral Technologies Chiracel OJ column, 30 x 250 mm, 5μ packing material, eluting with 60% ethanol in hexanes at a flow rate of 14.5 mL/min and column loading of 65 mg/injection. Peak 1 so obtained was deprotected by stirring with 20% TFA/DCM for 2 hours, followed by evaporation and dissolving the residue in 4 mL MeOH to which 0.25 mL of ethylenediamine was then added. After stirring for 1 hour, the solvents were removed in vacuo, the crude product reconstituted and purified by preparative-HPLC/MS (XBridge C18 column, eluting with a gradient of MeCN/H2O containing 0.15% NH4OH) to afford cis-3-(cyanomethyl)-N,N-dimethyl-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanesulfonamide.

^1H NMR (500 MHz, d8-dmso): δ 12.10 (br s, 1H), 8.78 (s, 1H), 8.69 (s, 1H), 8.42 (s, 1H), 7.60 (d, 1H), 7.06 (d, 1H), 4.25 (p, 1H), 3.59 (s, 2H), 3.14-3.07 (m, 2H), 2.85-2.79 (m, 2H), 3.80 (s, 6H); LCMS: 386.1.

Peak 2 obtained from the separation of isomers was deprotected and purified by the same method as for Peak 1 to afford trans-3-(cyanomethyl)-N,N-dimethyl-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanesulfonamide.

^1H NMR (500 MHz, d8-dmso): δ 12.10 (br s, 1H), 8.90 (s, 1H), 8.70 (s, 1H), 8.45 (s, 1H), 7.60 (d, 1H), 7.09 (d, 1H), 4.18 (p, 1H), 3.46 (s, 2H), 3.35-3.28 (m, 2H), 2.89-2.82 (m, 2H), 2.79 (s, 6H); LCMS: 386.0.

Example 40. cis-3-isoxazol-3-yl-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetanitile and trans-3-isoxazol-3-yl-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetanitile
Step 1. diethyl 3-(benzylxy)cyclobutane-1,1-dicarboxylate

To a suspension of sodium hydride (60% dispersion in mineral oil, 4.67 g, 0.117 mol) in 1,4-dioxane (69 mL) was added diethyl malonate (17.7 mL, 0.117 mol) dropwise. The mixture was stirred for 1.5 hours at ambient temperature after complete addition. To this mixture was added [2-bromo-1-(chloromethyl)ethoxy]methylbenzene (prepared according to the procedure found in Organic Letters (2004), 6(11), pp.1853-1856; 32.0 g, 0.121 mol) dropwise and the resulting mixture was stirred for 1 hour at ambient temperature, then heated at reflux for 16 hours. The mixture was cooled briefly in an ice bath and sodium hydride (60% dispersion in mineral oil, 4.67 g, 0.117 mol) was added portionwise. The mixture was heated to reflux for a further 24 hours. Upon cooling to room temperature, the mixture was poured into pH 7 buffer and brine, and the product was extracted with three portions of ethyl acetate. The combined extracts were washed with brine, dried over sodium sulfate, decanted and concentrated. Flash column chromatography, eluting with a gradient of 5-60% ethyl acetate in hexanes afforded product (26.9 g, 75%).

$^1$H NMR (400 MHz, CDCl3): $\delta$ 7.37-7.25 (m, 5H), 4.42 (s, 2H), 4.24-4.10 (m, 5H), 2.83-2.75 (m, 2H), 2.58-2.50 (m, 2H), 1.31-1.24 (m, 6H).
Step 2. cis- and trans-3-(benzyloxy)cyclobutanecarboxylic acid

A solution of diethyl 3-(benzyloxy)cyclobutane-1,1-dicarboxylate (20.0 g, 0.0653 mol) and potassium hydroxide (18 g, 0.32 mol) in ethanol (110 mL) and water (10 mL) was heated to reflux for 2 hours. The basic mixture was washed once with diethyl ether. The ether wash was back extracted with two portions of IN NaOH. The combined aqueous layers were acidified by the addition of c.HCl and were then extracted with ethyl ether three times. The combined extracts were washed with brine, dried over sodium sulfate, decanted and concentrated to afford the intermediate diacid as a sticky yellow solid which was subsequently azeotroped with toluene. The diacid was heated neat under hyvac (<5 mm Hg) at 190 °C for 1.5 hours to effect decarboxylation to a mixture of cis- and trans- monoacids, used without further purification (13.5 g, 92%).

1H NMR (400 MHz, CDCl3): δ 7.38-7.26 (m, 10H), 4.44 (s, 2H), 4.43 (s, 2H), 4.31 (p, 1H), 4.02-3.93 (m, 1H), 3.12-3.04 (m, 1H), 2.72-2.62 (m, 1H), 2.59-2.48 (m, 4H), 2.38-2.24 (m, 4H).

Step 3. cis- and trans-3-(benzyloxy)-N-methoxy-N-methylcyclobutanecarboxamide

A mixture of 3-(benzyloxy)cyclobutanecarboxylic acid (2.50 g, 12.1 mmol), N,O-dimethylhydroxylamine hydrochloride (1.18 g, 12.1 mmol), benzotriazol-1-yloxytris(dimethylamino)phosphonium hexafluorophosphate (5.9 g, 13 mmol) (Advanced ChemTech) and triethylamine (3.7 mL, 27 mmol) in methylene chloride (80 mL) was stirred at room temperature for 16 hours. The solution was then washed with twice with water, once with brine, dried over sodium sulfate, decanted and concentrated. Flash column chromatography, eluting with a gradient of 20-50% ethyl acetate in hexanes afforded product as a mixture of cis- and trans- isomers (1.7 g, 56%).

1H NMR (400 MHz, CDCl3): δ 7.35-7.24 (m, 10H), 4.43 (s, 2H), 4.42 (s, 2H), 4.31-4.24 (m,
1H), 4.03-3.95 (m, 1H), 3.64 (s, 3H), 3.63 (s, 3H), 3.47 (br s, 1H), 3.19 (s, 3H), 3.18 (s, 3H), 2.95 (br s, 1H), 2.57-2.48 (m, 2H), 2.47-2.38 (m, 2H), 2.34-2.23 (m, 4H).

Step 4. cis- and trans-1-[3-(benzylxy)cyclobutyl]prop-2-yn-1-one

To a solution of 3-(benzylxy)-N-methoxy-N-methylcyclobutanecarboxamide (1.7 g, 6.8 mmol) in tetrahydrofuran (40 mL) at -78 °C was added 0.5 M of ethynylmagnesium bromide in tetrahydrofuran (14.3 mL, 7.15 mmol) and the reaction was allowed to warm to ambient temperature over a period of 1 hour. The reaction was quenched by the addition of satd. NH₄Cl solution and the product was extracted with ethyl acetate. The extracts were dried over sodium sulfate, decanted and concentrated to afford product used without further purification in Step 5.

1H NMR (400 MHz, CDCl₃):  δ 7.39-7.21 (m, 10H), 4.43 (s, 2H), 4.41 (s, 2H), 4.19-4.09 (m, 1H), 4.06-3.95 (m, 1H), 3.36-3.24 (m, 1H), 3.29 (s, 1H), 3.26 (s, 1H), 2.90-2.79 (m, 1H), 2.67-2.59 (m, 2H), 2.56-2.47 (m, 2H), 2.36-2.26 (m, 4H).

Step 5. cis-3-[3-(benzylxy)cyclobutyl]isoxazole and trans-3-[3-(benzylxy)cyclobutyl]isoxazole

To a solution of 1-[3-(benzylxy)cyclobutyl]prop-2-yn-1-one (prepared in Step 4) in ethanol (40 mL) was added hydroxylamine hydrochloride (0.54 g, 7.7 mmol) followed by sodium carbonate (1.48 g, 14.0 mmol). The reaction was stirred for 16 hours. The reaction
was then heated to reflux for 4 hours and cooled. Into the reaction mixture was added water and ethyl acetate. The layers were separated, and the aqueous layer was extracted with two further portions of ethyl acetate. The combined extracts were washed with brine, dried over sodium sulfate, decanted and concentrated. Flash column chromatography, eluting with a gradient of 15-50% ethyl acetate in hexanes afforded the product as a mixture of cis- and trans- isomers (520 mg, 33% over the two steps).

^1^H NMR (400 MHz, CDCl_3): δ 8.32 (dd, 1H), 8.31 (dd, 1H), 7.36-7.26 (m, 10H), 6.30 (d, 1H), 6.21 (d, 1H), 4.47 (s, 2H), 4.45 (s, 2H), 4.38-4.30 (m, 1H), 4.12-4.04 (m, 1H), 3.62-3.53 (m, 1H), 3.23-3.13 (m, 1H), 2.75-2.14 (m, 8H).

Step 6. cis- and trans-3-isoaxol-3-ylcyclobutanol

\[ \text{OH} \]
\[ \text{N} \]
\[ \text{O} \]

A mixture of cis- and trans-3-[3-(benzyloxy)cyclobutyl]isoaxazole (0.520 g, 2.27 mmol) and 20% palladium hydroxide on carbon (0.14 g, 0.20 mmol) in tetrahydrofuran (30 mL) and acetic acid (8 mL) was degassed and stirred under an atmosphere of hydrogen (provided by a balloon) for 3 hours. The mixture was filtered, neutralized by the addition of NaOH and extracted with three portions of ethyl acetate. The combined extracts were washed with brine, dried over sodium sulfate, decanted and concentrated to afford product as a mixture of cis- and trans- isomers (320 mg, 100%).

^1^H NMR (400 MHz, CD_3OD): δ 8.55 (dd, 1H), 8.54 (dd, 1H), 6.44 (d, 1H), 6.42 (d, 1H), 4.50-4.41 (m, 1H), 4.26-4.17 (m, 1H), 3.55-3.46 (m, 1H), 3.14-3.03 (m, 1H), 2.73-2.64 (m, 2H), 2.54-2.46 (m, 2H), 2.44-2.35 (m, 2H), 2.13-2.03 (m, 2H).

Step 7. 3-isoaxol-3-ylcyclobutanone

\[ \text{O} \]
\[ \text{N} \]
\[ \text{O} \]

3-Isaxazol-3-ylcyclobutanol (0.316 g, 2.27 mmol), as a mixture of cis- and trans-
isomers, was dissolved in methylene chloride (10 mL) and Dess-Martin periodinane (0.96 g, 2.3 mmol) was added. After stirring for 2 hours, satd. NaHCO₃ solution and brine were added, and the mixture was extracted with three portions of ethyl acetate. The combined extracts were dried over sodium sulfate, decanted and concentrated. Flash column chromatography, eluting with a gradient of 20-50% ethyl acetate in hexanes, afforded product (258 mg, 83%).

¹H NMR (400 MHz, CDCl₃): δ 8.40 (dd, 1H), 6.31 (d, 1H), 3.81-3.72 (m, 1H), 3.59-3.48 (m, 2H), 3.46-3.37 (m, 2H).

Step 8. (3-isoxazol-3-ylcyclobutylidene)acetonitrile

Sodium hydride (60% dispersion in mineral oil, 75 mg, 1.88 mmol) was added at once to a solution of diethyl cyanomethylphosphonate (0.33 mL, 2.1 mmol) in tetrahydrofuran (8 mL). After stirring for 5 minutes, a solution of 3-isoxazol-3-ylcyclobutanone (258 mg, 1.88 mmol) in tetrahydrofuran (20 mL) was added. After 2 hours reaction time, the reaction mixture was partitioned between ethyl acetate and brine and the layers separated. The aqueous layer was extracted with two further portions of ethyl acetate and the combined extracts were dried over sodium sulfate, decanted and concentrated. The residue was then azeotroped with toluene and the product was used without further purification in Step 9.

¹H NMR (400 MHz, CDCl₃): δ 8.38 (dd, 1H), 6.28 (d, 1H), 5.27 (p, 1H), 3.81-3.72 (m, 1H), 3.50-3.15 (m, 4H).

Step 9. cis-3-isoxazol-3-yl-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile and trans-3-isoxazol-3-yl-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile

To a solution of (3-isoxazol-3-ylcyclobutylidene)acetonitrile (prepared in Step 8) in acetonitrile (8 mL) was added 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidine (0.59 g, 1.9 mmol) followed by 1,8-diazabicyclo[5.4.0]undec-7-ene (280 μL, 1.9 mmol). The reaction was stirred for 72 hours. The acetonitrile was removed in
vacuo. Flash column chromatography, eluting with a gradient of 50-100% ethyl acetate in hexanes, afforded a mixture of cis- and trans- isomers. The mixture was stirred with 20% TFA/DCM (8 mL/32 mL) for 3 hours, and the excess solvents were removed **in vacuo**. The residue was stirred with ethylenediamine (2 mL) in MeOH (40 mL) for 16 hours. Solvents were again removed **in vacuo**. The mixture was purified by preparative-HPLC/MS (XBridge C18 column, mobile phases 20.5–25.5 % of MeCN/H2O containing 0.1% NH4OH). Peak 1, cis-3-isoaxazol-3-yl-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrrozol-1-yl]cyclobutylacetonitrile (185 mg, 28%), Peak 2, trans-3-isoaxazol-3-yl-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrrozol-1-yl]cyclobutylacetonitrile (85 mg, 13%).

Peak 1, (cis-): 1H NMR (400 MHz, d6-dmso): § 12.13 (br s, 1H), 8.85 (d, 1H), 8.76 (s, 1H), 8.69 (s, 1H), 8.42 (s, 1H), 7.60 (d, 1H), 7.07 (d, 1H), 6.67 (d, 1H), 3.85 (p, 1H), 3.67 (s, 2H), 3.04-2.95 (m, 2H), 2.89-2.81 (m, 2H); LCMS (M+H)+: 346.1.

Peak 2, (trans-): 1H NMR (400 MHz, d6-dmso): § 12.14 (br s, 1H), 8.94 (s, 1H), 8.89 (d, 1H), 8.71 (s, 1H), 8.47 (s, 1H), 7.62 (dd, 1H), 7.11 (dd, 1H), 6.73 (d, 1H), 3.71 (p, 1H), 3.46 (s, 2H), 3.34-3.27 (m, 2H), 2.80-2.71 (m, 2H); LCMS (M+H)+: 346.1.

**Example 41.** {cis-3-(3-methyl-1,2,4-oxadiazol-5-yl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrrozol-1-yl]cyclobutyl}acetonitrile trifluoroacetate salt and
{trans-3-(3-methyl-1,2,4-oxadiazol-5-yl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrrozol-1-yl]cyclobutyl}acetonitrile trifluoroacetic acid salt

\[
\begin{align*}
\text{TFA} & & \text{TFA} \\
\text{and}
\end{align*}
\]

**Step 1. cis- and trans-ethyl 3-(benzyl)oxy)cyclobutanecarboxylate**

85
To a solution of 3-(benzylloxy)cyclobutanecarboxylic acid (5.00 g, 24.2 mmol) (prepared as in Example 6, Step 2) in ethanol (60 mL) was added 0.08 mL c. H2SO4. The mixture was heated at gentle reflux for 48 hours. After cooling to room temperature, the solvent was evaporated in vacuo. Flash column chromatography, eluting with a gradient of 0-20% ethyl acetate in hexanes afforded desired product as a mixture of cis- and trans- isomers (3.91 g, 69%).

1H NMR (400 MHz, CDCl3): δ 7.37-7.26 (m, 10H), 4.43 (s, 2H), 4.41 (s, 2H), 4.29 (p, 1H), 4.14 (q, 2H), 4.13 (q, 2H), 3.99-3.91 (m, 1H), 3.07-2.98 (m, 1H), 2.66-2.55 (m, 1H), 2.54-2.44 (m, 4H), 2.34-2.20 (m, 4H), 1.26 (t, 3H), 1.25 (t, 3H).

Step 2. cis- and trans-ethyl 3-hydroxycyclobutanecarboxylate

To a solution of cis- and trans-ethyl 3-(benzylloxy)cyclobutanecarboxylate (3.91 g, 16.7 mmol) in ethanol (40 mL) was added palladium (10% on carbon, wet Degussa type) (270 mg, 0.25 mmol). The mixture was degassed and shaken under 50 psi of hydrogen for 16 hours. The reaction mixture was filtered and the solvent removed in vacuo to afford product as a mixture of cis- and trans- isomers used without further purification (2.40 g, 99%).

1H NMR (400 MHz, CDCl3): δ 4.60-4.52 (m, 1H), 4.22-4.12 (m, 1H), 4.14 (q, 2H), 4.13 (q, 2H), 3.04-2.96 (m, 1H), 2.64-2.51 (m, 5H), 2.25-2.11 (m, 4H), 2.02 (br s, 2H), 1.25 (t, 3H), 1.25 (t, 3H).

Step 3. ethyl 3-oxocyclobutanecarboxylate
To methylene chloride (100 mL) at -78 °C was added oxalyl chloride (1.79 mL, 21.2 mmol), followed by dimethyl sulfoxide (2.51 mL, 35.3 mmol). After 30 minutes, cis- and trans-ethyl 3-hydroxycyclobutanecarboxylate (2.68 g, 17.6 mol) in methylene chloride (46 mL) was added. The mixture was stirred for 30 minutes at -78 °C. Triethylamine (9.84 mL, 70.6 mmol) was added. The mixture was then allowed to warm to room temperature over 2 hours. Water was added to the reaction mixture, and the layers separated. The organic phase was washed sequentially with 1N HCl, water, saturated sodium bicarbonate solution, brine, dried over sodium sulfate, decanted and concentrated. The product (2.36 g, 94%) was used without further purification.

$^1$H NMR (400 MHz, CDCl$_3$): δ 4.21 (q, 2H), 3.45-3.37 (m, 2H), 3.33-3.17 (m, 3H), 1.29 (t, 3H).

**Step 4. ethyl 3-(cyanomethylene)cyclobutanecarboxylate**

To a suspension of sodium hydride (60% dispersion in mineral oil, 0.730 g, 18.3 mmol) in tetrahydrofuran (100 mL) at 0 °C was added diethyl cyanomethylphosphonate (3.22 mL, 19.9 mmol), dropwise. The cooling bath was removed and the reaction was allowed to reach room temperature and was stirred at this temperature for 45 minutes. The solution was re-cooled to 0 °C and a solution of ethyl 3-oxocyclobutanecarboxylate (2.36 g, 16.6 mmol) in tetrahydrofuran (50 mL) was introduced dropwise. After stirring for 2 hours, water and ethyl ether were added into the reaction. The layers were separated and the aqueous portion extracted with two further portions of ether. The combined extracts were washed with brine, dried over sodium sulfate, decanted and concentrated. The residue was azeotroped once with toluene to afford product, used without further purification in Step 5.

$^1$H NMR (400 MHz, CDCl$_3$): δ 5.23-5.20 (m, 1H), 4.18 (q, 2H), 3.25-3.02 (m, 5H), 1.28 (t,
Step 5. ethyl 3-[(cyanomethyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy)methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutanecarboxylate

To a solution of 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidine (5.23 g, 16.6 mmol) and ethyl 3-(cyanomethylene)cyclobutanecarboxylate (prepared in Step 4) in acetonitrile (40 mL) was added 1,8-diazabicyclo[5.4.0]undec-7-ene (2.48 mL, 16.6 mmol). The mixture was stirred for 136 hours at room temperature. The solvent was removed in vacuo. Flash column chromatography, eluting with a gradient of 50-90% ethyl acetate in hexanes afforded product as a mixture of cis- and trans- isomers (4.53 g, 52% over the two steps).

1H NMR (400 MHz, CDCl₃): δ 8.85 (s, 1H), 8.84 (s, 1H), 8.45 (s, 1H), 8.41 (s, 1H), 8.33 (s, 1H), 8.31 (s, 1H), 7.41 (d, 1H), 7.40 (d, 1H), 6.81 (d, 1H), 6.80 (d, 1H), 5.68 (s, 4H), 4.17 (q, 2H), 4.12 (q, 2H), 3.54 (t, 4H), 3.27 (s, 2H), 3.28-2.80 (m, 10H), 3.19 (s, 2H), 1.26 (t, 3H), 1.25 (t, 3H), 0.92 (t, 4H), -0.06 (s, 18H); LCMS (M+H)+: 481.1.

Step 6. {cis-3-(3-methyl-1,2,4-oxadiazol-5-yl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutyl}acetonitrile trifluoroacetate salt and {trans-3-(3-methyl-1,2,4-oxadiazol-5-yl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutyl}acetonitrile trifluoroacetate salt

To a solution of cis- and trans-ethyl 3-[(cyanomethyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy)methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutanecarboxylate (2.25 g, 3.98 mmol) in tetrahydrofuran (55 mL) and water (18 mL) was added a solution of lithium hydroxide (0.48 g, 20 mmol) in a small amount of water.
The reaction was stirred at room temperature for 4 hours. The reaction mixture was cooled in an ice bath and 1.0 HCl was added to achieve a pH of 5. The product was extracted with three portions of ethyl acetate. The extracts were dried over sodium sulfate, decanted and concentrated to afford the product as a mixture of cis- and trans- isomers, which was used without further purification. LCMS (M+H)^+: 453.1.

To a mixture of 3-(cyanomethyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutane carboxylic acid prepared above (50.0 mg, 0.11 mmol), 1-Hydroxybenzotriazole (3.0 mg, 0.022 mmol), and N-hydroxyethanimidamide (prepared according to the procedure found in J. Org. Chem., 2003, 68(19), pp. 7316-7321) (8.2 mg, 0.11 mmol) in N,N-dimethylformamide (0.5 mL) and N,N-diisopropylethylamine (96 μL, 0.55 mmol) was added O-(Benzotriazol-1-yl)-N,N,N′,N′-tetramethyluronium hexafluorophosphate (42 mg, 0.110 mmol) (Advanced ChemTech) and the mixture was stirred at room temperature for 16 hours. Additional sub-stoichiometric quantities of O-(benzotriazol-1-yl)-N,N,N′,N′-tetramethyluronium hexafluorophosphate and N-hydroxyethanimidamide were added and the reaction was continued for a further 24 hours. The reaction was then heated to 110 °C for 1 hour to complete cyclization. Into the reaction was added saturated sodium bicarbonate solution and the product was extracted with four portions of ethyl acetate. The extracts were dried over sodium sulfate, decanted and concentrated. The crude product mixture was stirred in DCM containing 20% TFA for 2 hours, and the solvents were removed in vacuo. The residue was dissolved in 1.5 mL of methanol and 0.3 mL ethylenediamine and was stirred for 2 hours. The reaction mixture was purified by preparative-HPLC/MS (SunFire C18 column, eluting with a gradient of H2O/MeCN containing 0.1% TFA), which resolved the cis- (6 mg, 10%) and trans- (5 mg, 8%) isomers and afforded each product as the trifluoroacetic acid salt.

Cis- isomer: 1H NMR (300 MHz, d6-dmso): δ 12.39 (br s, 1H), 8.86 (s, 1H), 8.77 (s, 1H), 8.48 (s, 1H), 7.86 (br s, 1H), 7.73-7.68 (m, 1H), 7.19-7.14 (m, 1H), 4.12-3.96 (m, 1H), 3.70 (s, 2H), 3.22-3.08 (m, 2H), 2.99-2.85 (m, 2H), 2.31 (s, 3H); LCMS (M+H)^+: 361.1.

Trans- isomer: 1H NMR (300 MHz, d6-dmso): δ 12.36 (br s, 1H), 8.99 (s, 1H), 8.77 (s, 1H), 8.52 (s, 1H), 7.90 (br s, 1H), 7.72-7.67 (m, 1H), 7.21-7.17 (m, 1H), 4.03-3.88 (m, 1H), 3.52 (s, 2H), 3.47-3.31 (m, 2H), 2.93-2.84 (m, 2H), 2.36 (s, 3H); LCMS (M+H)^+: 361.0.

Additional oxadiazoles were prepared according to Example 41, using different amidoximes (prepared according to the procedure found in J. Org. Chem. 2003, 68(19), pp.
7316-7321) in Step 6, and are found in Table 2.

**Example 43.** 1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)]-1H-pyrazol-1-yl)cyclobutylacetonitrile trifluoroacetic acid salt

*Step 1. cyclobutylideneacetonitrile.*

To a solution of 1.0000 M of potassium tert-butoxide in tetrahydrofuran (19.2 mL) at 0 °C was added dropwise a solution of diethyl cyanomethylphosphonate (3.26 mL, 0.0202
mol) in tetrahydrofuran (24.52 mL, 0.3023 mol). The reaction was warmed to rt and then cooled to 0 °C again. To the reaction mixture was added a solution of cyclobutanone (1.37 mL, 0.0183 mol) in tetrahydrofuran (4.90 mL, 0.0605 mol). The reaction was allowed to warm up to rt and stirred at rt overnight. After quenching with water, the mixture was extracted with EtOAc. The combined organic layers were washed with brine, dried and evaporated to dryness. The crude mixture was used directly in next step (1.30 g, 76.25%).

Step 2. 1-[(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)cyclobutylacetonitrile.

To a solution of 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidine (0.030 g, 0.000095 mol) in acetonitrile (0.60 mL, 0.011 mol) was added cyclobutylideneacetonitrile (0.0177 g, 0.000190 mol), followed by 1,8-diazabicyclo[5.4.0]undec-7-ene (0.0142 mL, 0.0000951 mol). The resulting mixture was stirred at rt overnight. After evaporation to dryness, the residue was purified on silica gel to give the desired Micheal addition product. LCMS (M+H) 409.1.

The crude residue made above was dissolved in 0.2 mL of dichloromethane and treated with 0.4 mL of TFA at rt for 30 min. After evaporation to dryness, the residue was treated with 50 μL of ethylenediamine in 1 mL of methanol at rt for 30 min. The resulting mixture was purified on RP-HPLC (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.1% TFA) to give the tilted product as TFA salt, LCMS calculated for C13H15N4(M+H)+: 279.1; Found: 279.0. 1H NMR (400 MHz, DMSO-d6): δ 12.68 (1H, br s), 8.88 (1H, s), 8.84 (1H, s), 8.51 (1H, s), 7.78 (1H, m), 7.25 (1H, m), 3.49 (2H, s), 2.78 (2H, m), 2.39 (2H, m), 2.06 (1H, m), 1.93 (1H, m) ppm.

Example 44. cis- and trans-3-(hydroxymethyl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)cyclobutylacetonitrile.

\[ \text{Step 1. diisopropyl 3,3-dimethoxycyclobutane-1,1-dicarboxylate.} \]
Diisopropyl malonate (72 g, 0.38 mol) was added dropwise, under nitrogen, to a stirred suspension of sodium hydride (17 g, 0.42 mol) in dry N,N-dimethylformamide (140 mL, 1.8 mol) at a rate such that the temperature was maintained below 70 °C. On cessation of hydrogen evolution, 1,3-dibromo-2,2-dimethoxypropane (50 g, 0.2 mol) was added in one portion and the mixture heated at 140 °C for 48 h. The cooled mixture was poured into sat. solution of ammonium chloride (300 mL), extracted with hexane. The organic layer was washed with sat. sodium bicarbonate, brine, dried over sodium sulfate, and evaporated to dryness. The residue was distilled under vacuum (oil pump) to afford the desired cyclobutane compound (31 g, 56.32%). bp 92-94°C/0.01 mm. 1H NMR (400 MHz, CDCl₃): δ 5.02 (2H, sept., J = 6.4 Hz), 3.12 (6H, s), 2.66 (4H, s), 1.11 (12H, d, J = 6.4 Hz) ppm.

Step 2. 3-oxocyclobutanecarboxylic acid.

Diisopropyl 3,3-dimethoxycyclobutane-1,1-dicarboxylate (31 g, 0.11 mol) was heated with 78 mL of 20% HCl at reflux for 60 h. After cooling, the solution was continuously extracted with ether for 18 h. The ether was removed at a reduced pressure, leaving a yellow oil, which crystallized on standing to give the titled acid (10.4 g, 84.78%).

Step 3. methyl 3-oxocyclobutanecarboxylate.

A solution of N,N'-dicyclohexylcarbodiimide (7.17 g, 0.0347 mol) in methylene chloride (8 mL, 0.1 mol) was added dropwise to a stirred mixture of 3-oxocyclobutanecarboxylic acid (3.6 g, 0.032 mol), methanol (2.6 mL, 0.063 mol) and 4-dimethylaminopyridine (3.08 g, 0.0252 mol) in methylene chloride (20 mL, 0.2 mol). The mixture was stirred at rt for 24 h, then filtered through Celite. The filtrate was washed with 0.5 M HCl and sat. sodium bicarbonate, dried and concentrated to dry. The residue was purified on silica gel, eluting with 0 to 40% EtOAc in hexane, to give the desired ester (3.26 g, 80.64%). 1H NMR (CDCl₃, 400 MHz): δ 3.78 (s, 3H), 3.43–3.20 (5H, m) ppm.

Step 4. methyl 3-(cyanomethylene)cyclobutanecarboxylate.

To a solution of 1.0000 M of potassium tert-butoxide in tetrahydrofuran (26.7 mL) at 0 °C was added dropwise a solution of diethyl cyanomethylphosphonate (4.53 mL, 0.0280 mol) in tetrahydrofuran (50 mL, 0.6 mol). The reaction was warmed to rt and then cooled at 0 °C again. To the reaction mixture was a solution of methyl 3-oxocyclobutanecarboxylate (3.26 g, 0.0254 mol) in tetrahydrofuran (20 mL, 0.3 mol). The reaction was allowed to warm
up to rt and stirred at rt overnight. After quenching with water, the mixture was extracted with ether. The combined organic layers were washed with water, brine, dried and evaporated to dryness. The crude mixture was purified on silica gel, eluting with 0 to 40% EtOAc in hexane, to give the desired product (3.12 g, 81.12%). LCMS calculated for 

$$\text{C}_{9}\text{H}_{16}\text{NO}_{2}(\text{M+H})^{+}: 152.1; \text{Found: 152.3.}$$

5  

Step 5. methyl 3-(cyanomethyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarboxylate.

To a solution of 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidine (2.01 g, 0.00637 mol) in acetonitrile (4.0E1 mL, 0.77 mol) was added methyl 3-(cyanomethylene)cyclobutanecarboxylate (1.93 g, 0.0127 mol), followed by 1,8-diazabicyclo[5.4.0]undec-7-ene (0.953 mL, 0.00637 mol). The resulting mixture was stirred at 50 °C overnight. After evaporation to dryness, the residue was purified on silica gel, eluting with 0 to 100% EtOAc in hexane, to give the desired Micheal addition product as a mixture of cis- and trans- isomers (2.12 g, 71.3%). LCMS calculated for 

$$\text{C}_{23}\text{H}_{31}\text{N}_{6}\text{O}_{2}\text{Si}(\text{M+H})^{+}: 467.2; \text{Found: 467.4.}$$

Step 6. 3-(hydroxymethyl)-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile.

20  

To a mixture of methyl 3-(cyanomethyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarboxylate (7.0 g, 0.015 mol) in tetrahydrofuran (100 mL, 1 mol) was added lithium tetrahydroborate (0.327 g, 0.0150 mol) at 0 °C. The reaction was then heated at 50 °C for 3 h. To the reaction was added 60 mL of methanol. The resulting mixture was heated at 50 °C for another 15 min, then evaporated to dryness. The residue was treated with 1 N HCl, then neutralized with solid sodium bicarbonate, extracted with EtOAc. The combined organic layers were washed with brine, dried over sodium sulfate and evaporated to dryness. The residue was purified on silica gel, eluting with 0 to 100% EtOAc, to give the desired product as cis- and trans- mixture (5.85 g, 88.91%). LCMS calculated for 

$$\text{C}_{25}\text{H}_{31}\text{N}_{6}\text{O}_{2}\text{Si}(\text{M+H})^{+}: 439.2; \text{Found: 439.4.}$$

Step 7. 3-(hydroxymethyl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile.

25  

To 3-(hydroxymethyl)-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile (0.030 g, 0.000068 mol) was added
1.5 mL of TFA. The reaction was stirred at rt for 30 min, then evaporated to dryness. The crude mixture was dissolved in 1 mL of methanol and treated with 60 μL of ethylenediamine at rt for 5 h. The resulting mixture was purified on RP-HPLC (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.15% NH₄OH) to give the desired products as free bases. First peak retention time 0.766 min, LCMS calculated for C₁₆H₁₂N₆O(M+H)⁺: 309.1; Found: 309.3. ¹H NMR (400 MHz, DMSO-d₆): δ 12.11 (1H, br s), 8.67 (1H, s), 8.65 (1H, s), 8.37 (1H, s), 7.58 (1H, d, J = 3.6), 7.02 (1H, d, J = 3.6 Hz), 4.69 (1H, br s), 3.47 (2H, s), 3.41 (2H, br s), 2.53 (2H, m), 2.37 (2H, m) ppm. Second peak retention time 0.805 min, LCMS calculated for C₁₆H₁₇N₆O(M+H)⁺: 309.1; Found: 309.3. ¹H NMR (400 MHz, DMSO-d₆): δ 12.11 (1H, br s), 8.80 (1H, s), 8.68 (1H, s), 8.40 (1H, s), 7.58 (1H, d, J = 3.6 Hz), 7.07 (1H, d, J = 3.6 Hz), 4.78 (1H, br t, J = 5.2 Hz), 3.47 (2H, br t, J = 5.2 Hz), 3.36 (2H, s), 2.85 (2H, m), 2.29 (2H, m) ppm.

Example 45. cis- and trans-3-(fluoromethyl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile.

To a mixture of 3-(hydroxymethyl)-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutylacetonitrile (0.050 g, 0.00011 mol) in methylene chloride (3.10 mL, 0.0483 mol) in a plastic bottle was added 2-methoxy-N-(2-methoxyethyl)-N-(trifluoro-α(4-sulfanyl)ethanamine (63.0 μL, 0.000342 mol) followed by ethanol (1 μL, 0.00002 mol). The reaction was stirred at rt overnight, then evaporated to drynes to yield the fluorinated product. LCMS (M+H) 441.1.

To the residue from above was added 3 mL of TFA. The reaction was stirred at rt for 30 min, then evaporated to dryness. The crude mixture was dissolved in 1 mL of methanol and treated with 60 μL of ethylenediamine at rt for 5 h. The resulting mixture was purified on RP-HPLC (XBridge C18 column, eluting with a gradient of acetonitrile/water containing
0.15% NH₄OH) to give the desired products as free bases. First peak retention time 0.973 min on analytic LCMS [Waters SunFire HPLC column (C18, 2.1x50 mm, 5 μM), injection volume 2 μL, flow rate 3 mL/min, gradient from 2 to 80% B in 3 minutes (A = water with 0.025% TFA; B = acetonitrile)], LCMS calculated for C₁₆H₁₆FN₅(M+H)⁺: 311.1; Found: 311.3. Second peak retention time 1.006 min on analytic LCMS, LCMS calculated for 
C₁₆H₁₆FN₅(M+H)⁺: 311.1; Found: 311.3. ¹H NMR (500 MHz, DMSO-d₆): δ 12.09 (1H, br s), 8.84 (1H, s), 8.70 (1H, s), 8.43 (1H, s), 7.59 (1H, d, J = 4.0 Hz), 7.08 (1H, d, J = 4.0 Hz), 4.53 (2H, dd, J = 5.5 and 47.5 Hz), 3.38 (2H, s), 2.97 (2H, m), 2.68 (1H, m), 2.39 (2H, m) ppm. ¹⁹F NMR (500 MHz, DMSO-d₆) δ -221.84 (td, J = 47.5 and 21.0 Hz) ppm.

Example 46. cis- and trans-3-(difluoromethyl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile.

Step 1. 3-formyl-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile.

Dimethyl sulfoxide (0.194 mL, 0.00274 mol) was added to a solution of oxalyl chloride (0.145 mL, 0.00171 mol) in methylene chloride (6.384 mL, 0.09959 mol) at -78 °C. After 10 min, 3-(hydroxymethyl)-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile (0.500 g, 0.00114 mol) in methylene chloride (12.77 mL, 0.1992 mol) was added and the resultant mixture was stirred at -78 °C for 30 min. Triethylamine (0.794 mL, 0.00570 mol) was then added and the mixture was stirred for 5 h with the temperature allowed to gradually warm up to rt. After quenching with water, the mixture was extracted with methylene chloride. The organic layers were combined, washed with brine, dried and evaporated to dry. The residue was purified on silica gel, eluting with 0 to 100% EtOAc in hexane, to give the desired aldehyde (430 mg, 86%). LCMS calculated for C₂₂H₂₉N₆O₂Si(M+H)⁺: 437.2; Found: 437.4.

Step 2. 3-(difluoromethyl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-
yl)cyclobutylacetonitrile.

To a mixture of 3-formyl-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl)cyclobutylacetonitrile (0.285 g, 0.000653 mol) in methylene chloride (6 mL, 0.09 mol) in a plastic bottle was added 2-methoxy-N-(2-methoxyethyl)-N-(trifluoro-λ(4)-sulfanyl)ethanamine (0.481 mL, 0.00261 mol) followed by ethanol (8 μL, 0.0001 mol). The reaction was stirred at rt overnight, then evaporated to dryness. LCMS (M+H) 459.4.

To the residue made above was added 3 mL of TFA. The reaction was stirred at rt for 30 min, then evaporated to dryness. The crude mixture was dissolved in 3 mL of methanol and treated with ethylenediamine (0.22 mL, 0.0033 mol) at rt for 5 h. The resulting mixture was purified on RP-HPLC (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.15% NH₄OH) to give the desired products as free bases. First peak retention time 0.935 min, LCMS calculated for C₁₆H₁₃F₂N₆(M+H)+: 329.1; Found: 329.1. ¹H NMR (500 MHz, DMSO-d₆): δ 12.10 (1H, br s), 8.74 (1H, s), 8.69 (1H, s), 8.40 (1H, s), 7.59 (1H, d, J = 3.5 Hz), 7.06 (1H, d, J = 3.5 Hz), 6.20 (1H, td, J = 57.0 and 4.0 Hz), 3.57 (2H, s), 2.98 (1H, m), 2.81 (2H, m), 2.52 (2H, m) ppm. Second peak retention time 0.974 min, LCMS calculated for C₁₆H₁₃F₂N₆(M+H)+: 329.1; Found: 329.1. ¹H NMR (500 MHz, DMSO-d₆): δ 12.10 (1H, br s), 8.78 (1H, s), 8.70 (1H, s), 8.44 (1H, s), 7.60 (1H, d, J = 3.5 Hz), 7.09 (1H, d, J = 3.5 Hz), 6.25 (1H, td, J = 57.0 and 4.5 Hz), 3.41 (2H, s), 3.01 (2H, m), 2.90 (1H, m), 2.56 (2H, m) ppm.

Example 47. cis- and trans-2,2'-[1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl)cyclobutane-1,3-diyl]diacetanitriole.

Step 1. 3-(cyanomethyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl)cyclobutylmethyl methanesulfonate.

To a mixture of 3-(hydroxymethyl)-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl)cyclobutylacetonitrile (0.122 g, 0.000278 mol) in methylene chloride (2 mL, 0.04 mol) was added triethylamine (0.0775 mL, 0.000556
mol) followed by methanesulfonyl chloride (0.0478 g, 0.000417 mol) at 0 °C. The reaction was stirred at rt overnight, quenched with water, extracted with dichloromethane. The organic layers were washed with brine, dried over magnesium sulfate, then evaporated to dryness. The crude mixture was used directly in next step (138 mg, 96.02%). LCMS calculated for C$_{21}$H$_{32}$N$_{6}$O$_{4}$SSi(M+H)$^+$: 517.2; Found: 517.4.

Step 2. 2,2'-[1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutane-1,3-diyl]diacetonitrile.

A mixture of 3-(cyanomethyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylmethyl methanesulphonate (0.138 g, 0.000267 mol) and potassium cyanide (0.0870 g, 0.00134 mol) in N$_{2}$N-dimethylformamide (1.0 mL, 0.013 mol) was heated at 65 °C overnight. After cooled to rt, the mixture was extracted with EtOAc. The combined organic layers were washed with water, brine, dried over magnesium sulfate, then evaporated to dryness. LCMS (M+H) 448.4.

The crude product made above was treated with 1 mL of TFA at rt for 30 min, then evaporated to dryness. The resulting residue was treated with 0.1 mL of ethylenediamine in 1 mL of MeOH at rt overnight. The mixture was applied on RP-HPLC (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.15% NH$_{4}$OH) to give two isomers at a ratio of 3:2. First peak retention time 0.869 min, LCMS calculated for C$_{17}$H$_{16}$N$_{5}$(M+H)$^+$: 318.1; Found 318.3. $^1$H NMR (500 MHz, DMSO-d$_{6}$): δ 12.09 (1H, br s), 8.72 (1H, s), 8.69 (1H, s), 8.39 (1H, s), 7.60 (1H, d, J = 3.5 Hz), 7.05 (1H, d, J = 3.5 Hz), 3.52 (2H, s), 2.79 (2H, br s), 2.68 (1H, m), 2.61 (2H, br s), 2.60 (2H, br s) ppm. Second peak retention time 0.919 min, LCMS calculated for C$_{17}$H$_{16}$N$_{5}$(M+H)$^+$: 318.1; Found 318.3. $^1$H NMR (500 MHz, DMSO-d$_{6}$): δ 12.09 (1H, br s), 8.85 (1H, s), 8.70 (1H, s), 8.43 (1H, s), 7.59 (1H, d, J = 3.5 Hz), 7.08 (1H, d, J = 3.5 Hz), 3.40 (2H, s), 3.07 (2H, m), 2.80 (2H, d, J = 7.0 Hz), 2.70 (1H, m), 2.34 (2H, m) ppm.

Example 48. cis- and trans-3-(cyanomethyl)-1-methyl-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutane-carbonitrile.
**Step 1. 1-methyl-3-methylene cyclobutanecarbonitrile**

To a mixture of 3-methylene cyclobutanecarbonitrile (5.00 g, 0.0537 mol) (from Bephrm Ltd., China) in tetrahydrofuran (200 mL, 2 mol) was added 2.00 M of lithium diisopropylamide in tetrahydrofuran (32.2 mL) at -78 °C. After stirring at -78 °C for 30 min, methyl iodide (4.18 mL, 0.0671 mol) was added. The reaction was stirred at -78 °C for 30 min, then allowed to warm up to rt, quenched with ammonium chloride, then extracted with ether. The combined organic layers were washed with water, brine, dried, and evaporated to dryness. The crude residue was used directly in next step.

**Step 2. 1-methyl-3-oxycyclobutanecarbonitrile.**

A mixture of water (60 mL, 3 mol) and 1,4-dioxane (200 mL, 2 mol), 1-methyl-3-methylene cyclobutanecarbonitrile (5.75 g, 0.0537 mol), and 0.2 M of osmium tetraoxide in water (1 mL) was stirred for 5 min, during which time the mixture became brown. While the temperature was maintained at room temperature, sodium periodate (24.1 g, 0.113 mol) was added in portions over a period of 30 min. The mixture was stirred overnight. The mixture was extracted with dichloromethane and combined organic layers were dried over MgSO₄. After removal of the solvents, the crude product was used directly in next step (5.50 g, 93.92%). ¹H NMR (CDCl₃, 400 MHz): δ 3.74 (2H, m), 3.16 (2H, m), 1.75 (3H, s) ppm.

**Step 3. 3-(cyanomethylene)-1-methylcyclobutanecarbonitrile.**

To a solution of 1.0 M of potassium tert-butoxide in tetrahydrofuran (52.9 mL) at 0 °C was added dropwise a solution of diethyl cyanomethylphosphonate (8.98 mL, 0.0555 mol) in tetrahydrofuran (90 mL, 1 mol). The reaction was warmed to rt and then cooled at 0 °C again. To the reaction mixture was added a solution of 1-methyl-3-oxycyclobutanecarbonitrile (5.50 g, 0.0504 mol) in tetrahydrofuran (40 mL, 0.6 mol). The reaction was allowed to warm up to rt and stirred at rt overnight. After quenching with water, the mixture was extracted with ether. The combined organic layers were washed with water,
brine, dried and evaporated to dryness. The crude mixture was purified on silica gel, eluting with 0 to 60% EtOAc in hexane, to give the desired product (3.12 g, 46.84%). LCMS calculated for C$_8$H$_8$N$_2$(M+H)$^+$: 133.1; Found: 133.1.

5 Step 4. 3-(cyanomethyl)-1-methyl-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile.

To a solution of 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy)methyl-7H-pyrrolo[2,3-d]pyrimidine (0.030 g, 0.000095 mol) in acetonitrile (0.5 mL, 0.01 mol) was added 3-(cyanomethylene)-1-methylcyclobutanecarbonitrile (0.0126 g, 0.0000951 mol), followed by 1,8-diazabicyclo[5.4.0]undec-7-ene (0.0142 mL, 0.0000951 mol). The resulting mixture was stirred at rt overnight, then evaporated to dryness. LCMS (M+H) 448.4.

The crude mixture was treated with 1 mL of TFA (trifluoroacetic acid) at rt for 1 h, and evaporated to dryness. The residue was stirred with 0.050 mL of ethylenediamine in 1 mL of methanol at rt overnight. The reaction mixture was applied on RP-HPLC (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.15% NH$_4$OH) to give the desired products as free bases. First peak retention time 0.916 min, LCMS calculated for C$_{17}$H$_{16}$N$_7$(M+H)$^+$: 318.1; Found 318.4. $^1$H NMR (500 MHz, DMSO-d$_6$): δ 12.10 (1H, br s), 8.93 (1H, s), 8.71 (1H, s), 8.46 (1H, s), 7.61 (1H, d, J = 3.5 Hz), 7.08 (1H, d, J = 3.5 Hz), 3.48 (2H, dd, J = 2.0 and 12.5 Hz), 3.45 (2H, s), 2.74 (2H, dd, J = 2.0 and 12.5 Hz), 1.62 (3H, s) ppm. Second peak retention time 0.988 min, LCMS calculated for C$_{17}$H$_{16}$N$_7$(M+H)$^+$: 318.1; Found 318.4. $^1$H NMR (500 MHz, DMSO-d$_6$): δ 12.10 (1H, br s), 8.84 (1H, s), 8.70 (1H, s), 8.43 (1H, s), 7.61 (1H, d, J = 3.5 Hz), 7.06 (1H, d, J = 3.5 Hz), 3.52 (2H, s), 3.12 (4H, m), 1.45 (3H, s) ppm.

25 Example 49. cis- and trans-3-(cyanomethyl)-1-(methoxymethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile.
Step 1. 1-(methoxymethyl)-3-methylenecyclobutanecarbonitrile

To a mixture of 3-methylenecyclobutanecarbonitrile (1.00 g, 0.0107 mol) in tetrahydrofuran (40 mL, 0.5 mol) was added 2.00 M of lithium diisopropylamide in tetrahydrofuran (6.44 mL) at -78 °C. After stirred at -78 °C for 30 min, to the resulting mixture was added chloromethyl methyl ether (1.02 mL, 0.0134 mol). The reaction was stirred at -78 °C for 30 min, then allowed to warm up to rt, quenched with ammonium chloride, then extracted with ether. The combined organic layers were washed with water, brine, dried, and evaporated to dryness. The crude residue was used directly in next step.

Step 2. 1-(methoxymethyl)-3-oxocyclobutanecarbonitrile.

A mixture of water (2 mL, 0.1 mol) and 1,4-dioxane (7 mL, 0.08 mol), 1-(methoxymethyl)-3-methylenecyclobutanecarbonitrile (0.294 g, 0.00214 mol), and 0.2 M of osmium tetroxide in water (0.04 mL) was stirred for 5 min, during which time the mixture became brown. While the temperature was maintained at room temperature, sodium periodate (0.963 g, 0.00450 mol) was added in portions over a period of 30 min. The mixture was stirred overnight. The mixture was extracted with EtOAc and the combined organic layers were dried over MgSO₄. After removal of the solvents, the crude product was used directly in next step (298 mg, 99.92%). ¹H NMR (400 MHz, CDCl₃): δ 3.70 (2H, s), 3.68 (3H, s), 3.58 (2H, m), 3.38 (2H, m) ppm.

Step 3. 3-(cyanomethylene)-1-(methoxymethyl)cyclobutanecarbonitrile

To a solution of 1.000 M of potassium tert-butoxide in tetrahydrofuran (2.25 mL) at 0 °C was added dropwise a solution of diethyl cyanomethylphosphonate (0.381 mL, 0.00236 mol) in tetrahydrofuran (4 mL, 0.05 mol). The reaction was warmed to rt and then cooled to 0 °C again. To the reaction mixture was added a solution of 1-(methoxymethyl)-3-oxocyclobutanecarbonitrile (0.298 g, 0.00214 mol) in tetrahydrofuran (2 mL, 0.02 mol). The reaction was allowed to warm up to rt and stirred at rt overnight. After quenching with water, the mixture was extracted with ether. The combined organic layers were washed with water, brine, dried and evaporated to dryness. The crude mixture was used directly in next step. LCMS calculated for C₅H₁₁N₂O(M+H)⁺: 163.1; Found: 163.1.
Step 4. 3-(cyanomethyl)-1-(methoxymethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile.

To a solution of 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidine (0.256 g, 0.000812 mol) in acetonitrile (5 mL, 0.1 mol) was added 3-(cyanomethylene)-1-(methoxymethyl)cyclobutanecarbonitrile (0.166 g, 0.00102 mol), followed by 1,8-diazabicyclo[5.4.0]undec-7-ene (0.153 mL, 0.00102 mol). The resulting mixture was stirred at rt overnight, and evaporated to dryness. LCMS (M+H) 478.4.

The crude mixture from above was treated with 1 mL of TFA at rt for 1 h, then evaporated to dryness. The residue was stirred with 0.050 mL of ethylenediamine in 1 mL of methanol at rt overnight. The reaction mixture was applied on RP-HPLC (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.15% NH₄OH) to give the desired products as free bases. First peak retention time 0.969 min, LCMS calculated for C₁₈H₁₈N₃O(M+H)⁺: m/z = 348.2; Found: 348.4. Second peak retention time 0.986 min, LCMS calculated for C₁₈H₁₈N₃O(M+H)⁺: 348.2; Found: 348.4.

Example 50. cis- and trans-3-(cyanomethyl)-1-(fluoromethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile

![Chemical Structure](image)

Step 1. 1-(hydroxymethyl)-3-methylenecyclobutanecarbonitrile.

To a mixture of 1-(methoxymethyl)-3-methylenecyclobutanecarbonitrile (1.40 g, 0.0102 mol) in methylene chloride (30 mL, 0.4 mol) was added 1.0 M of boron tribromide in methylene chloride (12.8 mL) at -78 °C. The reaction was stirred at rt for 2 h, quenched with aq. sodium bicarbonate, and extracted with dichloromethane. The combined organic layers were dried over magnesium sulfate and evaporated to dryness to give the desired product (1.26 g, 100%). ¹H NMR (400 MHz, CDCl₃): δ 4.81 (2H, m), 3.66 (2H, s), 3.10 (2H, m), 2.59 (2H, m) ppm.
Step 2. 1-(fluoromethyl)-3-methylenecyclobutanecarboxonitrile

To a mixture of 1-(hydroxymethyl)-3-methylenecyclobutanecarbonitrile (0.252 g, 0.00205 mol) in methylene chloride (20 mL, 0.3 mol) in a plastic bottle was added 2-methoxy-N-(2-methoxyethyl)-N-(trifluoro-λ4-sulfanyl)ethamine (1.13 mL, 0.00614 mol) followed by ethanol (20 μL, 0.0004 mol). The reaction was stirred at rt overnight, then quenched with aq. sodium bicarbonate, and extracted with dichloromethane. The extracts were combined and washed with water, brine, and dried over magnesium sulfate, and evaporated to dryness. The residue was used directly in next step.

Step 3. 1-(fluoromethyl)-3-oxocyclobutanecarboxonitrile.

A mixture of water (2 mL, 0.1 mol) and 1,4-dioxane (6 mL, 0.08 mol), 1-(fluoromethyl)-3-methylenecyclobutanecarbonitrile (0.256 g, 0.00204 mol), and 0.2 M of osmium tetroxide in water (0.04 mL) was stirred for 5 min, during which time the mixture became brown. While the temperature was maintained at room temperature, sodium periodate (0.919 g, 0.00430 mol) was added in portions over a period of 30 min. The mixture was stirred overnight. The mixture was extracted with EtOAc and combined organic layers were dried over MgSO₄. After removal of the solvents, the crude product was used directly in next step.

Step 4. 3-(cyanomethylene)-1-(fluoromethyl)cyclobutanecarbonitrile

To a solution of 1.0 M of potassium tert-butoxide in tetrahydrofuran (2.15 mL) at 0 °C was added dropwise a solution of diethyl cyanomethylphosphonate (0.364 mL, 0.00225 mol) in tetrahydrofuran (4 mL, 0.04 mol). The reaction was warmed to rt and then cooled to 0 °C again. To the reaction mixture was added a solution of 1-(fluoromethyl)-3-oxocyclobutanecarbonitrile (0.260 g, 0.00204 mol) in tetrahydrofuran (2 mL, 0.02 mol). The reaction was allowed to warm up to rt and stirred at rt overnight. After quenching with water, the mixture was extracted with ether. The combined organic layers were washed with water then brine, dried, and evaporated to dryness. The crude mixture was used directly in next step.

Step 5. 3-(cyanomethyl)-1-(fluoromethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile

To a solution of 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-
pyrrolo[2,3-d]pyrimidine (0.256 g, 0.000812 mol) in acetonitrile (5 mL, 0.1 mol) was added 3-(cyanomethylene)-1-(fluoromethyl)cyclobutanecarbonitrile (0.153 g, 0.00102 mol), followed by 1,8-diazabicyclo[5.4.0]undec-7-ene (0.153 mL, 0.00102 mol). The resulting mixture was stirred at rt overnight, evaporated to dry. LCMS (M+H) 465.4.

The crude mixture was treated with 1 mL of TFA at rt for 1 h, and evaporated to dryness. The residue was stirred with 0.050 mL of ethylenediamine in 1 mL of methanol at rt overnight. The reaction mixture was applied on RP-HPLC (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.15% NH₄OH) to give the desired products as free bases. First peak retention time 0.939 min, LCMS calculated for C₁₇H₁₅FN₇(M+H)⁺: 336.1; Found: 336.3. ¹H NMR (400 MHz, DMSO-d₆): δ 12.08 (1H, br s), 8.97 (1H, s), 8.70 (1H, s), 8.49 (1H, s), 7.61 (1H, d, J = 3.6 Hz), 7.09 (1H, d, J = 3.6 Hz), 4.81 (2H, d, J = 46.4 Hz), 3.48 (2H, s), 3.44 (2H, m), 2.90 (2H, m) ppm. Second peak retention time 0.978 min, LCMS calculated for C₁₇H₁₅FN₇(M+H)⁺: 336.1; Found: 336.3. ¹H NMR (400 MHz, DMSO-d₆): δ 12.08 (1H, br s), 8.85 (1H, s), 8.68 (1H, s), 8.43 (1H, s), 7.61 (1H, d, J = 4.4 Hz), 7.06 (1H, d, J = 4.4 Hz), 4.58 (2H, d, J = 46.4 Hz), 3.58 (2H, s), 3.26 (2H, m), 3.09 (2H, m) ppm.

Example 51. cis- and trans-1,3-bis(cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile

Step 1. (1-cyano-3-methyleneacrylo)alkyl methyl methanesulfonate.
To a mixture of 1-(hydroxymethyl)-3-methyleneacrylocarbonitrile (0.756 g, 0.00614 mol) in methylene chloride (20 mL, 0.3 mol) was added triethylamine (1.28 mL, 0.00921 mol) followed by methanesulfonyl chloride (0.594 mL, 0.00767 mol) at 0 °C. The reaction was stirred at rt for 1 h, quenched with water, and extracted with dichloromethane. The combined organic layers were washed with water, brine, and then dried over magnesium sulfate and evaporated to dryness. The residue was used directly in next step.
Step 2. 1-(cyanomethyl)-3-methylenecyclobutanecarbonitrile.

A mixture of (1-cyano-3-methylenecyclobutyl)methyl methanesulfonate (0.41 g, 0.0020 mol) and potassium cyanide (0.66 g, 0.010 mol) in N,N-dimethylformamide (5 mL, 0.06 mol) was heated at 65 °C overnight. After diluting with water, the resulting mixture was extracted with EtOAc. The combined organic layers were washed with water, brine, dried and evaporated to dry. The residue was used directly in next step.

Step 3. 1-(cyanomethyl)-3-oxocyclobutanecarbonitrile.

A mixture of water (2 mL, 0.1 mol) and 1,4-dioxane (6 mL, 0.08 mol), 1-(cyanomethyl)-3-methylenecyclobutanecarbonitrile (0.270 g, 0.00204 mol), and 0.2 M of osmium tetroxide in water (0.04 mL) was stirred for 5 min, during which time the mixture became brown. While the temperature was maintained at room temperature, sodium periodate (0.919 g, 0.00430 mol) was added in portions over a period of 30 min. The mixture was stirred overnight. The mixture was extracted with EtOAc and the combined organic layers were dried over MgSO₄. After removal of the solvents, the crude product was used directly in next step.

Step 4. 1-(cyanomethyl)-3-(cyanomethylene)cyclobutanecarbonitrile.

To a solution of 1.0 M of potassium tert-butoxide in tetrahydrofuran (2.15 mL) at 0 °C was added dropwise a solution of diethyl cyanomethylphosphonate (0.364 mL, 0.00225 mol) in tetrahydrofuran (4 mL, 0.04 mol). The reaction was warmed to rt and then cooled to 0 °C again. To the reaction mixture was added a solution of 1-(cyanomethyl)-3-oxocyclobutanecarbonitrile (0.274 g, 0.00204 mol) in tetrahydrofuran (2 mL, 0.02 mol). The reaction was allowed to warm up to rt and stirred at rt overnight. After quenching with water, the mixture was extracted with ether. The combined organic layers were washed with water and brine, then dried and evaporated to dryness. The crude mixture was used directly in next step.

Step 5. 1,3-bis(cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile

To a solution of 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidine (0.256 g, 0.000812 mol) in acetonitrile (5 mL, 0.1 mol) was added 1-(cyanomethyl)-3-(cyanomethylene)cyclobutanecarbonitrile (0.161 g, 0.00102 mol),
followed by 1,8-diazabicyclo[5.4.0]undec-7-ene (0.153 mL, 0.00102 mol). The resulting mixture was stirred at rt overnight, evaporated to dry. LCMS (M+H) 473.4.

The crude mixture was treated with 1 mL of TFA at rt for 1 h, then evaporated to dryness. The residue was stirred with 0.050 mL of ethylenediamine in 1 mL of methanol at rt overnight. The reaction mixture was applied on RP-HPLC (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.15% NH4OH) to give the desired products as free bases. First peak retention time 0.883 min, LCMS calculated for C18H15N8(M+H)+: 343.1; Found: 343.4. 1H NMR (400 MHz, DMSO-d6): δ 12.12 (1H, br s), 8.98 (1H, s), 8.70 (1H, s), 8.48 (1H, s), 7.61 (1H, d, J = 4.0 Hz), 7.10 (1H, d, J = 4.0 Hz), 3.56 (2H, d, J = 13.2), 3.46 (2H, s), 3.42 (2H, m), 2.92 (2H, d, J = 13.2 Hz) ppm. Second peak retention time 0.897 min, LCMS calculated for C18H15N8(M+H)+: 343.1; Found: 343.4. 1H NMR (400 MHz, DMSO-d6): δ 12.08 (1H, br s), 8.85 (1H, s), 8.69 (1H, s), 8.43 (1H, s), 7.61 (1H, m), 7.07 (1H, m), 3.38 (2H, s), 3.27 (2H, m), 3.14 (2H, m), 2.88 (2H, m) ppm.

Example 52. cis and trans-3-(cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile

Step 1. 3-oxocyclobutanecarbonitrile.

A mixture of water (40 mL, 2 mol) and 1,4-dioxane (100 mL, 1 mol), 3-methylene cyclobutanecarbonitrile (3.30 g, 0.0354 mol) (commercially available from Bepharma Ltd., China), and 0.2 M of osmium tetroxide in water (0.7 mL) was stirred for 5 min, during which time the mixture became brown. While the temperature was maintained at room temperature, sodium periodate (15.9 g, 0.0744 mol) was added in portions over a period of 30 min. The mixture was stirred for an additional 1.5 h, then extracted with dichloromethane. The combined organic layers were dried over magnesium sulfate and concentrated to give a solid (2.04 g, 60.54%). 1H NMR (300 MHz, CDCl3): δ 3.58 (4H, m),
3.25 (1H, m) ppm.

**Step 2. 3-(cyanomethylene)cyclobutanecarbonitrile**

To a solution of 1 M of potassium tert-butoxide in THF (67.4 mL) at 0 °C was added dropwise a solution of diethyl cyanomethylphosphonate (11.4 mL, 0.0706 mol) in tetrahydrofuran (100 mL, 1 mol). The reaction mixture was warmed up to room temperature and cooled to 0 °C again. To the resulting mixture, a solution of 3-oxocyclobutanecarbonitrile (6.10 g, 0.0641 mol) in tetrahydrofuran (20 mL, 0.2 mol) was added. The reaction mixture was allowed to warm up to room temperature and stirred for 2 hours. After quenching with water, the mixture was extracted with EtOAc. The combined organic layers were dried and concentrated. The residue was purified by flash silica gel column, eluting with 0-10% MeOH/dichloromethane to give the titled product (5.40 g, 71.26%). LCMS (M+Na) 141.3. 

$^1$H NMR (400 MHz, CDCl$_3$): δ 5.30 (1H, m), 3.40 (2H, m), 3.14 (3H, m) ppm.

**Step 3. 3-(cyanomethyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy)methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutanecarbonitrile**

3-(Cyanomethylene)cyclobutanecarbonitrile (120 mg, 0.0010 mol) was combined with 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy)methyl-7H-pyrrolo[2,3-d]pyrimidine (0.1 g, 0.0003 mol) in acetonitrile (2 mL, 0.04 mol) and 1,8-diazabicyclo[5.4.0]undec-7-ene (6 μL, 0.00004 mol) under nitrogen. The mixture was stirred at room temperature over the weekend. After evaporation to dryness, the crude mixture was purified by flash column, eluting with 0 to 10% MeOH in dichloromethane, to give the desired product. LCMS (M+H) 434.4.

**Step 4. 3-(cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutanecarbonitrile.**

A 500 mL round bottom flask fitted with stir bar, condenser, and nitrogen inlet, was charged with acetonitrile (16.3 mL, 0.311 mol), water (1.4 mL, 0.078 mol) and 3-(cyanomethyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy)methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutanecarbonitrile (1.00 g, 0.00231 mol). The solution was homogeneous. After adding lithium tetrafluoroborate (2.21 g, 0.0231 mol), the resulting mixture was heated to reflux overnight, then charged with 7.2 M of ammonium hydroxide in water (1.2 mL) in portions over a period of 5 minutes at room temperature to adjust pH to 9-
10. The reaction was stirred for 2 h at room temperature. Solid was removed by filtration and the filtrate was diluted with acetonitrile, water, and MeOH. The resultant mixture was purified on Waters XBridge HPLC column (C18, 30x100 mm, 5 μM), with injection volume 5 mL (~50 mg/injection) and flow rate 60 mL/min, at gradient 10-28% B in 12 minutes (A = water with 0.15% NH₄OH; B = acetonitrile with 0.15% NH₄OH), to give the desired products as free bases. First peak retention time 0.826 min at Waters SunFire HPLC column (C18, 2.1x50 mm, 5 μM) with injection volume 2 μL and flow rate 3 mL/min, at gradient from 2 to 80% B in 3 minutes (A = water with 0.025% TFA; B = acetonitrile). LCMS calculated for C₁₆H₁₄N₄(M+H)⁺: 304.1; Found 304.3. ¹H NMR (500 MHz, DMSO-d₆): δ 12.10 (1H, br s), 8.82 (1H, s), 8.70 (1H, s), 8.44 (1H, s), 7.61 (1H, d, J = 4.0 Hz), 7.08 (1H, d, J = 4.0 Hz), 3.59 (1H, m), 3.57 (2H, s), 3.19 (2H, m), 2.86 (2H, m) ppm. Second peak retention time 0.864 min at the same SunFire column HPLC condition, LCMS calculated for C₁₆H₁₄N₄(M+H)⁺: 304.1; Found 304.3. ¹H NMR (400 MHz, CD₂OD): δ 8.67 (1H, s), 8.66 (1H, s), 8.40 (1H, s), 7.51 (1H, d, J = 3.6 Hz), 6.99 (1H, d, J = 3.6 Hz), 3.50 (1H, m), 3.42 (2H, s), 3.24 (2H, m), 3.00 (2H, m) ppm.

Example 53. 3,3-bis(hydroxymethyl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetanitride

![Chemical structure image]

Step 1. diisopropyl 3-oxocyclobutane-1,1-dicarboxylate.

A mixture of diisopropyl 3,3-dimethoxycyclobutane-1,1-dicarboxylate (3 g, 0.01 mol) in 20 mL of trifluoroacetic acid-water (95:5) was stirred at 0 °C for 4 h. The reaction was diluted with EtOAc, washed with water, saturated NaHCO₃ solution, and brine, dried over MgSO₄ and evaporated to give crude product (2.4 g) as yellow oil, which was used directly in the next step. ¹H NMR (CDCl₃, 400 MHz) δ 5.07 (2H, h, J = 6.8 Hz), 3.54 (4H, s), 1.23 (12H, d, J = 6.8 Hz) ppm.
Step 2. diisopropyl 3-(cyanomethylene)cyclobutane-1,1-dicarboxylate

To a mixture of 1.0000 M of potassium tert-butoxide in tetrahydrofuran (17 mL) and THF (10 mL) was added dropwise, at 0 °C, diethyl cyanomethylphosphonate (2.7 mL, 0.017 mol). The reaction was warmed to rt and 30 min later cooled to 0 °C again. To the reaction mixture was added a solution of diisopropyl 3-oxocyclobutane-1,1-dicarboxylate (2.7 g, 0.011 mol) in THF (10 mL). The reaction was allowed to warm up to rt gradually and stirred at rt for 2 h. The reaction was quenched with saturated aq. NH₄Cl and the organic solvent was reduced. The mixture was extracted with EtOAc. The combined organic layers were washed with brine, dried over MgSO₄, concentrated and purified with CombiFlash (silica gel, 0-35% EtOAc/Hex) to give the desired product (2.65 g) as light yellow oil.

Step 3. diisopropyl 3-(cyanomethylene)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutane-1,1-dicarboxylate

Diisopropyl 3-(cyanomethylene)cyclobutane-1,1-dicarboxylate (2.65 g, 0.00999 mol) was combined with 4-((1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidine (1 g, 0.003 mol) in acetonitrile (10 mL) and 1,8-diazabicyclo[5.4.0]undec-7-ene (0.5 mL, 0.003 mol) was added under N₂. The mixture was heated at 50 °C overnight. The reaction was concentrated and purified with CombiFlash (silica gel, 0-50% EtOAc/Hex) to give the desired product (0.3 g) as colorless oil. LCMS calculated for C₂₀H₄₁N₆O₆Si(M+H)⁺: 581.3; Found: 581.4.

Step 4. 3,3-bis(hydroxymethyl)-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile

Diisopropyl 3-(cyanomethylene)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutylacetonitrile (0.3 g, 0.5 mmol) was dissolved in tetrahydrofuran (15 mL, 180 mmol) and lithium tetrahydroborate (0.017 g, 0.77 mmol) was added at 0 °C. The reaction was then heated to 50 °C for 30 min. To the reaction was added MeOH (10 mL). The reaction was held at 50 °C for 15 min, then stripped to near dryness. The residue was treated with 1N HCl, then neutralized with solid NaHCO₃. The mixture was partitioned between water and EtOAc. The phases were separated and the aq. phase was washed with EtOAc. The combined organic phases were washed with water, then brine, dried over MgSO₄, concentrated and purified with CombiFlash (silica gel, 0-100% EtOAc/Hex) to give the desired product (0.145 g, 60%) as colorless oil.
LCMS calculated for C_{23}H_{33}N_{6}O_{3}Si(M+H)^{+}: 469.2; Found: 469.4.

Step 5. 3,3-bis(hydroxymethyl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetanitrile

3,3-Bis(hydroxymethyl)-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetanitrile (0.022 g, 0.000046 mol) was treated with trifluoroacetic acid (0.5 mL, 0.006 mol) at rt for 30 min and evaporated to dryness. The residue was then mixed with ethylenediamine (0.2 mL, 0.003 mol) in MeOH (1 mL) for 2 h. The reaction was concentrated and purified on prep. LCMS (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.15% NH_{4}OH) to give the desired product as free base. LCMS calculated for C_{17}H_{19}N_{6}O_{3}(M+H)^{+}: 339.2; Found: 339.3.

{\textsuperscript{1}H NMR (300 MHz, CD_{3}OD): \delta 8.72 (1H, s), 8.67 (1H, s), 8.39 (1H, s), 7.51 (1H, d, J = 3.3 Hz), 6.97 (1H, d, J = 3.3 Hz), 3.62 (2H, s), 3.46 (2H, s), 3.36 (2H, s), 2.80 (2H, d, J = 13.8 Hz), 2.54 (2H, d, J = 13.8 Hz) ppm.

Example 54. 3,3-bis(fluoromethyl)-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetanitrile

\[
\text{\begin{picture}(100,100)
\put(0,0){\includegraphics[width=5cm]{structure.png}}
\end{picture}}
\]

A solution of 3,3-bis(hydroxymethyl)-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetanitrile (0.03 g, 0.00006 mol) in dichloromethane (3 mL), contained in a Teflon bottle equipped with a nitrogen inlet tube and stirring bar, was treated with 2-methoxy-N-(2-methoxyethyl)-N-(trifluoro-\lambda(4)-sulfanyl)ethanamine (0.06 mL, 0.0004 mol) at rt. Ethanol (0.003 mL, 0.00006 mol) was added, and the mixture was stirred at rt overnight. The resultant mixture was concentrated and purified with prep LCMS (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.15% NH_{4}OH) to give the corresponding fluorinated product, which was treated with trifluoroacetic acid (0.5 mL, 0.006 mol) at rt for 30 min. After
evaporation to dryness, the resultant residue was mixed with ethylenediamine (0.2 mL, 0.003 mol) in MeOH (1 mL) at rt for 2 h. The reaction was evaporated to dry and the residue was purified with prep. LCMS (pH=10) to give the desired product. LCMS calculated for C_{19}H_{17}F_{2}N_{2} (M+H): 343.1; Found: 343.4. \(^1\)H NMR (300 MHz, CDCl\(_3\)): \(\delta\) 9.55 (1H, br s), 8.86 (1H, s), 8.49 (1H, s), 8.35 (1H, s), 7.40 (1H, m), 6.82 (1H, m), 4.54 (2H, d, \(J = 47.7\) Hz), 4.38 (2H, d, \(J = 47.4\) Hz), 3.14 (2H, s), 2.96 (2H, d, \(J = 13.8\) Hz), 2.72 (2H, d, \(J = 13.8\) Hz) ppm.

Example 55. 2,2',2''-[1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutane-1,3,3-triy]triacetonitrile

![Structure diagram]

**Step 1. (3,3-dimethoxycyclobutane-1,1-diyl)dimethanol**

At 0 °C, to a solution of diisopropyl 3,3-dimethoxycyclobutane-1,1-dicarboxylate (3.0 g, 0.010 mol) in THF (20 mL) was added 2.0 M of lithium tetrahydroaluminate in tetrahydrofuran (16 mL) slowly with stirring. The mixture was stirred for 2 h, allowing warm up to rt. At 0 °C, to the reaction was added dropwise water (1.2 mL), 15% NaOH solution (1.2 mL) and water (3.6 mL) successively and the resultant mixture was stirred for 20 min at rt. The mixture was filtered and the filtrate was concentration to give the desired product (1.64 g, 89%) as colorless oil which was used directly in the next step without purification.

**Step 2. (3,3-dimethoxycyclobutane-1,1-diyl)bis(methylene) dimethanesulfonate**

To a mixture of (3,3-dimethoxycyclobutane-1,1-diyl)dimethanol (1.64 g, 0.00931 mol) and triethylamine (7.8 mL, 0.056 mol) in dichloromethane (10 mL) was added methanesulfonyl chloride (2.2 mL, 0.028 mol) dropwise at 0 °C. The resultant mixture was stirred at rt for 1 h. The reaction was diluted with dichloromethane, washed with water and brine, dried over MgSO\(_4\) and concentrated to give crude mesylate product (2.95 g, 95.4%) as brown oil. \(^1\)H NMR (400 MHz, CDCl\(_3\)): \(\delta\) 4.38 (4H, s), 3.14 (6H, s), 3.02 (6H, s), 2.10 (4H,
s) ppm.

Step 3. **2,2′-(3,3-dimethoxycyclobutane-1,1-diyl)diacetonitrile**

To a solution of (3,3-dimethoxycyclobutane-1,1-diyl)bis(methylene) dimethanesulfonate (2.9 g, 0.0087 mol) in DMSO (10 mL) was added potassium cyanide (1.7 g, 0.026 mol) and 1,4,7,10,13,16-hexaoxacyclooctadecane (6.9 g, 0.026 mol). The reaction was stirred at 60 °C over night. The reaction was quenched with water, extracted with EtOAc. The combined organic layers were washed with brine, dried over MgSO₄ and concentrated to give crude product (2 g) as brown oil. ¹H NMR (400 MHz, CDCl₃): δ 3.14 (6H, s), 2.78 (4H, s), 2.11 (4H, s) ppm.

Step 4. **2,2′-(3-oxocyclobutane-1,1-diyl)diacetonitrile**

To a mixture of 2,2′-(3,3-dimethoxycyclobutane-1,1-diyl)diacetonitrile (2 g, 0.01 mol) in acetone (5 mL) was added p-toluenesulfonic acid (1 g, 0.006 mol). The mixture was stirred at rt over weekend. The reaction was neutralized with aq. saturated NaHCO₃ solution, extracted with EtOAc. The combined organic layers were washed with brine, dried over MgSO₄ and evaporated to give a crude product as brown oil.

Step 5. **2,2′,2″-cyclobutane-1,1-diyl-3-ylidenetriacetonitrile**

To a solution of 1.0 M of potassium tert-butoxide in tetrahydrofuran (5.1 mL) was added dropwise at 0 °C diethyl cyanomethylphosphonate (0.82 mL, 0.0051 mol). The reaction was warmed to rt and 30 min later cooled to 0 °C again. To the reaction mixture was added a solution of 2,2′-(3-oxocyclobutane-1,1-diyl)diacetonitrile (0.5 g, 0.003 mol) in THF (5 mL). The reaction was allowed to warm up to rt gradually and stirred at rt for 2 h. The reaction was quenched with saturated aq. NH₄Cl, then extracted with EtOAc. The combined organic layers were washed with brine, dried over MgSO₄ and concentrated to give a brown oily crude product, which was used directly in the next step.

Step 6. **2,2′,2″-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutane-1,3,3-triyltriacetonitrile**

The crude 2,2′,2″-cyclobutane-1,1-diyl-3-ylidenetriacetonitrile (1 g, 0.006 mol) was combined with 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidine (0.2 g, 0.0006 mol) in acetonitrile (10 mL) and 1,8-diazabicyclo[5.4.0]undec-7-
ene (0.1 mL, 0.001 mol) was added under nitrogen. The mixture was heated at 50 °C over night. The reaction was concentrated and purified with CombiFlash (silica gel, 0-100% EtOAc/Hex) to give the desired product as light brown oil. LCMS calculated for C_{23}H_{31}N_{8}OSi(M+H)^+: 487.2; Found: 487.4.

5

**Step 7. 2,2',2''-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutane-1,3,3-triytriacetonitrile**

2,2',2''-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutane-1,3,3-triytriacetonitrile (0.03 g, 0.00006 mol) was treated with trifluoroacetic acid (0.5 mL, 0.006 mol) at rt for 30 min and then evaporated to dryness. The residue was mixed with ethylenediamine (0.2 mL, 0.003 mol) in MeOH (1 mL) at rt for 1 h. The reaction was evaporated to dryness and the residue was purified with prep. LCMS (pH=10) to give the desired product. LCMS calculated for C_{19}H_{17}N_{5}(M+H)^+: m/z = 357.1; Found: 357.4. $^1$H NMR (400 MHz, DMSO-d$_6$): δ 12.06 (1H, br s), 8.79 (1H, s), 8.63 (1H, s), 8.38 (1H, s), 7.55 (1H, d, J = 3.6 Hz), 7.01 (1H, d, J = 3.6 Hz), 3.46 (2H, s), 3.03 (2H, s), 2.97 (2H, d, J = 15.2 Hz), 2.76 (2H, s), 2.57 (2H, d, J = 15.2 Hz) ppm.

10

**Example 56. cis- and trans-3-hydroxy-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetamide**

![Chemical structure](image)

**Step 1. N-methoxy-N-methyl-3-oxocyclobutanecarboxamide**

To a mixture of N,O-dimethylhydroxylamine hydrochloride (5.2 g, 0.054 mol), and 3-oxocyclobutanecarboxylic acid (4.0 g, 0.035 mol) in dichloromethane (30 mL) was added N-(3-dimethylaminopropyl)-N'-ethylcarbodiimide hydrochloride (10.0 g, 0.052 mol), 1-hydroxybenzotriazole (7.1 g, 0.052 mol) followed by triethylamine (34 mL, 0.24 mol) at 0 °C. The mixture was stirred at rt over night, then quenched with water. The mixture was extracted with EtOAc. The organic layers were dried over MgSO$_4$, concentrated and purified
with CombiFlash (silica gel, 0-5% for 30 min followed by 5-20% EtOAc/Hex) to give the desired product (4.3 g, 78%) as light yellow oil. LCMS calculated for C\textsubscript{7}H\textsubscript{12}NO\textsubscript{3}(M+H): 158.1; Found: 158.3.

5 Step 2. 3-hydroxy-N-methoxy-N-methylcyclobutanecarboxamide

N-Methoxy-N-methyl-3-oxocyclobutanecarboxamide (1 g, 0.006 mol) was dissolved in methanol (8 mL, 0.2 mol). To the mixture, sodium borohydride (0.2 g, 0.006 mol) was added. The reaction was stirred at rt for 1 h. To the reaction mixture was added 1N aq. HCl to adjust the pH to 2. The mixture was concentrated, then extracted with EtOAc. The combined organic layers were dried over MgSO\textsubscript{4} and concentrated to give crude product (1.4 g) as light yellow oil. LCMS calculated for C\textsubscript{7}H\textsubscript{14}NO\textsubscript{3}(M+H): 160.0; Found: 160.3.

Step 3. 3-[tert-butyl(diphenyl)silyl]oxy-N-methoxy-N-methylcyclobutanecarboxamide

Into a solution of 3-hydroxy-N-methoxy-N-methylcyclobutanecarboxamide (0.6 g, 0.004 mol in DMF (10 mL) was added tert-butylchlorodiphenylsilane (3 mL, 0.01 mol), followed by 1H-imidazole (1 g, 0.02 mol). The mixture was stirred at rt overnight. The reaction was diluted with dichloromethane and washed with sat. NaHCO\textsubscript{3}, water and brine. The organic layers were dried over MgSO\textsubscript{4}, concentrated and purified with CombiFlash (silica gel, 0-30% EtOAc/Hex) to give the desired product (0.7 g, 50%) as cis- and trans-isomer mixtures. LCMS calculated for C\textsubscript{23}H\textsubscript{32}NO\textsubscript{3}Si(M+H): 398.2; Found: 398.1.

Step 4. 1-(3-[tert-butyl(diphenyl)silyl]oxycyclobutyl)ethanone

A solution of 3-[tert-butyl(diphenyl)silyl]oxy-N-methoxy-N-methylcyclobutanecarboxamide (0.7 g, 0.002 mol) in ether (10 mL) was added into 3.0 M of methylmagnesium iodide in ether (3 mL) slowly under N\textsubscript{2}. The reaction was stirred and heated to reflux for 2 h. The mixture was quenched with ice and the ether layer separated. The aq. layer was acidified with 1N HCl and extracted several times with ether. The organic layers were combined, dried over MgSO\textsubscript{4}, concentrated and purified with CombiFlash (silica gel, 0-30% EtOAc/Hex) to give the desired product (0.6 g) as colorless oil. LCMS calculated for C\textsubscript{22}H\textsubscript{29}O\textsubscript{2}Si(M+H): 353.2; Found: 353.3.

Step 5. 3-[tert-butyl(diphenyl)silyl]oxycyclobutyl acetate

To a stirred solution of 1-(3-[tert-butyl(diphenyl)silyl]oxycyclobutyl)ethanone (0.65 g, 0.0018 mol) in dichloromethane (10 mL) at 0 °C, was added sodium bicarbonate (0.39 g,
0.0046 mol) and m-chloroperbenzoic acid (1.0 g, 0.0046 mol) with stirring. The reaction was stirred at rt over night. LCMS showed incomplete reaction, another 2.5 eq. of mCPBA and NaHCO₃ were added and the reaction was stirred for another day. The reaction was quenched with 20% aq. Na₂S₂O₃ solution (50 mL) and stirred for a further 30 min at rt, then extracted with dichloromethane. The combined organic layers were washed with brine, dried over MgSO₄, concentrated and purified on silica gel with Combiflash (silica gel, 0-10% EtOAc/Hex) to give the desired product (0.3 g, 40%) as colorless oil. LCMS calculated for C₂₂H₂₉O₂Si(M+H)⁺: 369.2; Found: 369.4.

Step 6. 3-[tert-butyldiphenyl)silyl]oxy-cyclobutanol

To a solution of 3-[tert-butyldiphenyl)silyl]oxy-cyclobutyl acetate (0.27 g, 0.00073 mol) in THF (5 mL) and MeOH (3 mL) was added 1.0 M of lithium hydroxide in water (10 mL). The reaction was stirred at rt for 1 h. The mixture was quenched with water and extracted with EtOAc. The combined organic layers were dried over MgSO₄ and concentrated to give crude alcohol product (0.3 g) as colorless oil, which was directly used in next step without further purification. LCMS calculated for C₂₀H₂₆O₂NaSi(M+Na)⁺: 349.2; Found: 349.3.

Step 7. 3-[tert-butyldiphenyl)silyl]oxy-cyclobutanone

A solution of oxalyl chloride (0.1 mL, 0.001 mol) in dichloromethane (2 mL) under N₂ was cooled to -78 °C. Dimethyl sulfoxide (0.2 mL, 0.002 mol) was added dropwise. On complete addition, the reaction was stirred for 15 min. A solution of crude 3-[tert-butyldiphenyl)silyl]oxy-cyclobutanol (0.2 g, 0.0006 mol) in dichloromethane (3 mL) was added dropwise and the reaction mixture was stirred for 45 min at -78 °C. Triethylamine (0.5 mL, 0.004 mol) was added dropwise and the reaction was stirred for 15 minutes. The reaction was then allowed to warm to rt, quenched with water and extracted with dichloromethane. The organic layers were combined, washed with brine, dried over MgSO₄ and evaporated to give crude ketone (0.27 g) as yellow oil, which was directly used in the next step without further purification. LCMS calculated for C₂₁H₂₅O₂Si(M+H)⁺: 325.12; Found: 325.3.

Step 8. (3-[tert-butyldiphenyl)silyl]oxy-cyclobutylidene)acetonitrile

To 1.0 M of potassium tert-butoxide in tetrahydrofuran (1.2 mL) was added dropwise, at 0 °C, diethyl cyanomethylphosphonate (0.19 mL, 0.0012 mol). The reaction was warmed to rt and 30 min later cooled to 0 °C again. To the reaction mixture was added a solution of
3-[tert-butyl(diphenyl)silyl]oxy cyclobutanone (0.25 g, 0.00077 mol) in THF (5 mL). The reaction was allowed to warm up to rt gradually and stirred at rt for 2 h. The reaction was quenched with saturated aq. NH₄Cl, extracted with EtOAc. The combined organic layers were washed with brine, dried over MgSO₄, concentrated. The resultant residue was purified with Combiflash (silica gel, 0-20% EtOAc/Hex) to give the desired product (0.2 g) as colorless oil. LCMS calculated for C₂₂H₂₅NOSi(M+H)⁺: 348.1 Found: 348.3.

**Step 9. [3-Hydroxy-1-[4-(1H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutyl]acetonitrile**

(3-[tert-Butyl](diphenyl)silyl)oxy cyclobutylidene)acetonitrile (0.15 g, 0.00043 mol) was combined with 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidine (0.14 g, 0.00043 mol) in acetonitrile (5 mL) and 1,8-diazabicyclo[5.4.0]undec-7-ene (0.064 mL, 0.00043 mol) was added under nitrogen. The mixture was heated to 50 °C over night. LCMS showed a peak with m/z of 425.4, indicating a de-silyl reaction occurred simultaneously during the Micheal addition. The reaction was concentrated and purified on combiflash (silica gel, 0-100% EtOAc/Hex) to yield the desired product. LCMS (M+H) 425.4.

**Step 10. 3-hydroxy-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutylacetonitrile**

3-Hydroxy-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutylacetonitrile (0.020 g, 0.000046 mol) was treated with trifluoroacetic acid (0.5 mL, 0.006 mol) at rt for 30 min and evaporated to dry. The resultant residue was mixed with ethylenediamine (0.2 mL, 0.003 mol) in MeOH (1 mL) for 2 h. The reaction was concentrated and purified on prep. LCMS (pH=10) to give 2 isomers of the desired products. First peak retention time 0.714 min, LCMS calculated for C₁₅H₁₃N₆O(M+H)⁺: 295.1; Found: 295.3. Second peak retention time 0.750 min, LCMS calculated for C₁₅H₁₃N₆O(M+H)⁺: 295.1; Found: 295.3. ¹H NMR (400 MHz, CD₃OD): δ 8.67 (1H, s), 8.66 (1H, s), 8.38 (1H, s), 7.51 (1H, d, J = 3.6 Hz), 6.98 (1H, d, J = 3.6 Hz), 4.37 (1H, s), 3.34 (2H, s), 3.22 (2H, m), 2.48 (2H, m) ppm.

**Example 57. 3-fluoro-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutylacetonitrile**
A solution of 3-hydroxy-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile (0.01 g, 0.00003 mol) (a mixture of cis/trans isomers) in dichloromethane (3 mL), contained in a Teflon bottle equipped with a nitrogen inlet tube and stirring bar, was treated with 2-methoxy-N-(2-methoxyethyl)-N-(trifluoro-λ(4)-sulfanyl)ethanamine (0.03 mL, 0.0002 mol) at rt. Ethanol (0.002 mL, 0.00003 mol) was added, and the mixture was stirred at rt over weekend. The reaction was evaporated to dry and the residue was purified with prep. HPLC (pH=10) to give a mixture of two isomers. LCMS calculated for C_{13}H_{14}FN_{2}(M+H)^{+}: 297.1; Found: 297.3.

Example 58. 3-methyl-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile

**Step 1. 3-(bromomethyl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile**

To an ice-cooled mixture of 3-(hydroxymethyl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile (1.0 g, 0.0023 mol) and carbon tetrabromide (1.1 g, 0.0034 mol) in DMF (7 mL) was added triphenylphosphine (0.90 g, 0.0034 mol) and the mixture was stirred at this temp. for 30 min. To the resulting dark brown solution was added saturated aq. NaHCO$_3$ (5 mL) followed by water (5 mL) and the mixture was extracted with
dichloromethane. The organic layers were combined, washed with water, dried over Na$_2$SO$_4$, concentrated and purified with combiflash (silica gel, 0-40% EtOAc/Hex) to give the desired product (1.0 g, 87%) as light yellow solid. LCMS calculated for C$_{22}$H$_{30}$BrN$_6$OSi(M+H)$^+$: 501.1; Found: 501.3.

Step 2. 3-methyl-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrollo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetanitrile

3-(Bromomethyl)-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrollo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetanitrile (0.65 g, 0.0013 mol) was reacted with sodium tetrahydroborate (0.096 g, 0.0026 mol) in DMF (5.2 mL) (~0.5 M) at rt under nitrogen for 3h. The reaction was quenched with water and extracted with dichloromethane. The organic layers were washed with water, brine, dried over MgSO$_4$, and concentrated to give a yellow oil, the desired product as cis- and trans-isomer mixtures. LCMS calculated for C$_{22}$H$_{31}$N$_6$OSi(M+H)$^+$: 423.2; Found: 423.4.

Step 3. 3-methyl-1-[4-(7H-pyrollo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetanitrile

To a mixture of 3-methyl-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrollo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetanitrile (0.5 g, 0.001 mol) in acetonitrile (8.07 mL, 0.154 mol) and water (0.70 mL, 0.039 mol) was added lithium tetrafluoroborate (1.10 g, 0.0114 mol). The solution was warmed to reflux at 100 °C over 5 days. Charged 7.2 M of ammonium hydroxide in water (0.59 mL) in portions over a period of 5 minutes at rt adjusting pH to 9-10. The reaction mixture was stirred for 2 h at rt. The reaction was filtered and the filtrate was diluted with acetonitrile, water and MeOH and purified with prep. HPLC (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.15% NH$_4$OH) to give the first isomer with retention time 1.057 min, LCMS calculated for C$_{16}$H$_{17}$N$_6$(M+H)$^+$: 293.2; Found: 293.3. $^1$H NMR (500 MHz, CDCl$_3$): δ 10.07 (1H, br s), 8.88 (1H, s), 8.45 (1H, s), 8.34 (1H, s), 7.43 (1H, d, J = 3.5 Hz), 6.85 (1H, d, J = 3.5 Hz), 3.16 (2H, s), 2.77 (2H, m), 2.55 (1H, m), 2.43 (2H, m), 1.24 (3H, d, J = 6.5 Hz) ppm; then the second isomer with retention time 1.107 min; LCMS calculated for C$_{16}$H$_{17}$N$_6$(M+H)$^+$: 293.2; Found: 293.3. $^1$H NMR (500 MHz, CDCl$_3$): δ 10.21 (1H, br s), 8.89 (1H, s), 8.61 (1H, s), 8.37 (1H, s), 7.44 (1H, d, J = 3.5 Hz), 6.86 (1H, d, J = 3.5 Hz), 3.07 (2H, s), 3.05 (2H, m), 2.61 (1H, m), 2.26 (2H, m), 1.25 (3H, d, J = 7.0 Hz) ppm.
Example 59. 3,3-dimethyl-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile.

Step 1. 3-(cyanomethyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutane-1,1-diylbis(methylene) dimethanesulfonate.

To a mixture of 3,3-bis(hydroxymethyl)-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile (0.06 g, 0.0001 mol) and triethylamine (0.1 mL, 0.0008 mol) in dichloromethane (3 mL) was added methanesulfonyl chloride (0.03 mL, 0.0004 mol) slowly. The resultant mixture was stirred at rt for 30 min. The reaction was diluted with dichloromethane, washed with water and brine, dried over MgSO₄, concentrated. The residue was purified on CombiFlash (silica gel, 0-100% EtOAc/Hex) to give the desired product (60 mg, 75%) as white solid. LCMS calculated for C₂₃H₂₇N₆O₃Si(M+H)⁺: 625.2; Found: 625.3.

Step 2. 3,3-dimethyl-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile

3-(Cyanomethyl)-3-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutane-1,1-diylbis(methylene) dimethanesulfonate (0.06 g, 0.0001 mol) was reacted with sodium tetrahydroborate (0.02 g, 0.0004 mol) in DMF (0.8 mL) (~0.5 M) at 65 °C under nitrogen for 2h. The reaction was quenched with water, and extracted with dichloromethane. The organic layers were washed with water, dried over MgSO₄, concentrated. The residue was purified with CombiFlash (silica gel, 0-60% EtOAc/Hex) to give the desired product. LCMS calculated for C₂₃H₃₃N₆OSi(M+H)⁺: 437.2; Found: 437.4.
Step 3. 3,3-dimethyl-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile.

3,3-Dimethyl-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile (0.020 g, 0.000046 mol) was treated with trifluoroacetic acid (0.5 mL, 0.006 mol) at rt for 30 min and then evaporated to dry. The residue was then shaken with ethylenediamine (0.2 mL, 0.003 mol) in MeOH (1 mL) for 2 h. The reaction was concentrated and purified on prep HPLC (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.15% NH₄OH) to give the desired product. LCMS calculated for C₁₇H₁₉N₆(M+H)⁺: 307.2; Found: 307.3. ¹H NMR (400 MHz, DMSO-d₆): δ 12.10 (1H, br s), 8.76 (1H, s), 8.67 (1H, s), 8.40 (1H, s), 7.58 (1H, d, J = 3.6 Hz), 7.05 (1H, d, J = 3.6 Hz), 3.35 (2H, s), 2.75 (2H, d, J = 14 Hz), 2.33 (2H, d, J = 14.0 Hz), 1.22 (3H, s), 1.02 (3H, s) ppm.

Example 60. cis- and trans-3-(benzylxy)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile.

![Chemical structure](image)

Step 1. 1-(2-bromo-1-(bromomethyl)ethoxy)methylbenzene

1-Bromo-2,3-epoxypropane (28 mL, 0.33 mol) and benzyl bromide (39 mL, 0.33 mol) was mixed with mercury(II) chloride (0.04 g, 0.0002 mol). The mixture was heated slowly to 155-160 °C and stirred over night. The reaction mixture was then cooled to room temperature, purified with Combiflash (silica gel, 100% hexanes) to give the desired product (63 g, 62%) as a clear oil. ¹H NMR (400 MHz, CDCl₃): δ 7.40 (5H, m), 4.71 (2H, s), 3.82 (1H, t, J = 4.8 Hz), 3.60 (4H, d, J = 4.8 Hz) ppm.

Step 2. (3-(methylsulfinyl)-3-(methylthio)cyclobutyl)oxymethyl)benzene.

2.5 M of n-butyllithium in hexane (19 mL) was added to a solution of (methylsulfinyl)(methylthio)methane (5.0 g, 0.040 mol) in THF (10 mL) dropwise at -10 °C
and the mixture was stirred for 3 h. To the resultant solution was added dropwise [2-bromo-1- (bromomethyl)ethoxy]methylbenzene (4.9 g, 0.016 mol) at -70 °C over 30 min. The mixture was stirred at this temperature for 3 h and then at rt overnight. The reaction was diluted with dichloromethane and washed with water. The aqueous phases were extracted with dichloromethane. The organic layers were combined, washed with brine, dried over MgSO₄, concentrated and purified with CombiFlash (silica gel, 0-55% EtOAc/Hex) to give the desired product (2.4 g, 56%) as brown oil. LCMS (M+Na) 293.3. ¹H NMR (400 MHz, CDCl₃): δ 7.30 (5H, m), 4.45 (2H, s), 4.33 (1H, m), 2.75 (2H, m), 2.65 (2H, m), 2.41 (3H, s), 2.12 (3H, s) ppm.

Step 3. 3-(benzyloxy)cyclobutanone.

([3-(methylsulfanyl)-3-(methylthio)cyclobutyl]oxymethyl)benzene (2.4 g, 0.0089 mol) was dissolved in Et₂O (40 mL) and 35% perchloric acid (1.8 mL) was added. The resulting mixture was stirred at rt overnight. To the reaction mixture was added solid NaHCO₃ and MgSO₄ and stirred for a while. The insoluble solid was filtered off. The filtrate was concentrated and purified with combiflash (silica gel, 100% dichloromethane) to give the desired product (0.7 g) as light yellow oil. LCMS calculated for C₁₁H₁₃O₂(M+H)⁺: 177.1. Found: 177.3.

Step 4. 3-(benzyloxy)cyclobutylidene]acetonitrile.

To a mixture of 1.0000 M of potassium tert-butoxide in tetrahydrofuran (0.68 mL) and THF (5 mL) was added, at 0 °C, diethyl cyanomethylphosphonate (0.11 mL, 0.00068 mol) dropwise. The reaction was warmed to rt and 30 min later cooled to 0 °C again. To the reaction mixture was added a solution of 3-(benzyloxy)cyclobutanone (0.1 g, 0.0006 mol) in THF (5 mL). The reaction was stirred overnight, allowing warmed up to rt. The reaction was quenched with saturated aq. NH₄Cl solution, extracted with EtOAc. The combined organic layers were washed with water and brine, dried over MgSO₄ and concentrated to dryness. The crude product was used directly in next step without further purification.

Step 5. 3-(benzyloxy)-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4- yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile.

To a mixture of [3-(benzyloxy)cyclobutylidene]acetonitrile (0.1 g, 0.0005 mol) and 4-(1H-pyrazol-4-yl)-7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidine (0.1 g,
0.0003 mol) in acetonitrile (5 mL) was added 1,8-diazabicyclo[5.4.0]undec-7-ene (0.05 mL, 0.0003 mol) under nitrogen. The mixture was heated at 50 °C overnight, then concentrated under reduced pressure. The residue was purified with combiflash (silica gel, 0-55% EtOAc/Hex) to give the desired product as cis- and trans-isomer mixture. LCMS calculated for C_{28}H_{35}N_{6}O_{2}Si(M+H)^{+}: 515.3; Found: 515.4.

**Step 6.** 3-(benzyl)oxy)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile.

3-(Benzyl)oxy)-1-[4-(7-[2-(trimethylsilyl)ethoxy)methyl]-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutylacetonitrile (0.024 g, 0.000046 mol) was treated with trifluoroacetic acid (0.5 mL, 0.006 mol) at rt for 30 min, then evaporated to dry. The residue was dissolved in MeOH (1 mL) and treated with ethylenediamine (0.2 mL, 0.003 mol) at rt for 2 h. The reaction mixture was concentrated in vacuo and the resulting residue purified on prep. HPLC (XBridge C18 column, eluting with a gradient of acetonitrile/water containing 0.15% NH_{4}OH) to give 2 isomers of the desired products. First peak retention time 1.406 min; LCMS calculated for C_{22}H_{21}N_{6}O(M+H)^{+}: 385.2; Found: 385.3. ^{1}H NMR (400 MHz, DMSO-d_{6}): δ 12.10 (1H, br s), 8.71 (1H, s), 8.67 (1H, s), 8.38 (1H, s), 7.58 (1H, d, J = 3.6 Hz), 7.33 (4H, m), 7.29 (1H, m), 7.05 (1H, d, J = 3.6 Hz), 4.43 (2H, s), 4.23 (1H, m), 3.43 (2H, s), 2.78 (2H, m), 2.74 (2H, m) ppm. Second peak retention time 1.474 min, LCMS calculated for C_{22}H_{21}N_{6}O(M+H)^{+}: 385.2; Found: 385.3. ^{1}H NMR (400 MHz, DMSO-d_{6}): δ 12.10 (1H, br s), 8.79 (1H, s), 8.67 (1H, s), 8.39 (1H, s), 7.59 (1H, d, J = 3.6 Hz), 7.34 (4H, m), 7.29 (1H, m), 7.06 (1H, d, J = 3.6 Hz), 4.44 (2H, s), 4.14 (1H, m), 3.44 (2H, s), 3.16 (2H, m), 2.44 (2H, m) ppm.

**Example 61.** Large scale preparation of 1-(ethylsulfonfyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl]acetonitrile phosphoric acid salt
Step 1 tert-Butyl 3-(cyanomethylene)azetidine-1-carboxylate (2).

Diethyl cyanomethyl phosphonate (745 g, 4.20 mol, 1.20 eqiv) and anhydrous THF (9 L) was added to a four-neck flask equipped with thermowell, addition funnel and nitrogen protection tube. The solution was cooled with an ice-methanol bath to -14 °C and a 1.0 M solution of t-BuOK in THF (3.85 L, 3.85 mol, 1.1 equiv) was added over 20 min keeping the temperature < -5 °C. The mixture was stirred for 3 hr at -10 °C and a solution of 1-tert-butoxycarbonyl-3-azetidinone (1, 600 g, 3.50 mol) in THF (2 L) was added over 2 hr while keeping the reaction temperature < -5 °C. The reaction mixture was stirred at -5 to -10 °C over 1 hr and then slowly warmed up to room temperature and stirred at room temperature for overnight. The reaction mixture was then diluted with water (4.5 L) and saturated brine (4.5 L) and extracted with ethyl acetate (2 x 9 L). The combined organic layers were combined and washed with brine (6 L), dried over anhydrous Na₂SO₄. The organic solvent was
removed under reduced pressure, diluted with dichloromethane (4 L) and adsorbed onto silica gel (1.5 kg). The product was purified by flash column chromatography (SiO₂, 3.5 kg × 2), each column was eluted with (8 L of heptane, 8 L of 5% AcOEt/heptane, 12 L of 10% AcOEt/heptane, 40 L of 25% AcOEt/heptane) to give the pure tert-butyl 3-(cyanomethylene)azetidine-1-carboxylate (2, 414.7 g, 679.8 g theoretical, 61% yield) as white solid. For 2: ¹H NMR (300 MHz, CDCl₃) δ 1.46 (s, 9H), 4.62 (m, 2H), 4.72 (m, 2H), 5.41 (m, 1H).

Step 2. 2-(1-(Ethylsulfonyl)azetidin-3-ylidene)acetonitrile (4).

tert-Butyl 3-(cyanomethylene)azetidine-1-carboxylate (2, 1000 g, 5.2 mol) was diluted with acetonitrile (7 L) and 3 N aqueous HCl (7 L). This resulting reaction mixture was stirred at room temperature for 18 h. When TLC showed the reaction was deemed complete, the reaction mixture was concentrated under reduced pressure. The residual solids were then suspended in acetonitrile (12 L) and cooled to 5°C. Diisopropyl amine (2.7 L, 15.6 mol, 3 equiv) was slowly added to the suspension while keeping the temperature < 15°C. The homogeneous solution was allowed to cool to 5°C and ethanesulfonyl chloride (730 mL, 7.73 mol, 1.5 equiv) was added over 1 h while keeping the reaction temperature < 15°C. The resulting solution was allowed to slowly warm to room temperature and stirred at room temperature for overnight. The additional amount of ethanesulfonyl chloride (100 mL, 1.05 mol, 0.2 equiv) was added and the reaction mixture was stirred for an additional 2 h at room temperature. After the reaction was deemed complete, the reaction mixture was concentrated under reduced pressure to a volume of about 4 L. This solution was then placed in a 50 L separatory funnel, diluted with dichloromethane (10 L) and washed with half saturated brine (10 L). The aqueous phase was extracted with dichloromethane (5 L). The combined organic layers were dried over sodium sulphate and absorbed onto silica gel (1 Kg) under reduced pressure. The material was then loaded onto a silica gel column (2.5 Kg) and eluted with 20 % ethyl acetate in heptane (40 L), 40 % ethyl acetate in heptane (80 L) and finally 60 % ethyl acetate in heptane (40 L) to afford pure 2-(1-(ethylsulfonyl)azetidin-3-ylidene)acetonitrile (4, 567 g, 968.4 g theoretical, 58.6 % yield) as a off-white solid. For 4: ¹H NMR (300 MHz, CDCl₃) δ 1.38 (t, 3H), 3.05 (q, 2H), 4.72 (m, 2H), 4.79 (m, 2H), 5.41 (m, 1H); MS: m/z calcd. 187.05; found: 187.1.
Step 3. 2-(1-(Ethylsulfonyl)azetidin-3-ylidene)acetonitrile (4) and 2-(3-chloro-1-(ethylsulfonyl)azetidin-3-yl)acetonitrile (4B).

tert-Butyl 3-(cyanomethylene)azetidine-1-carboxylate (2, 82 g, 0.42 mol) was added to THF (850 mL) and the resulting solution was cooled to 0°C before a 4 M HCl solution in 1,4-dioxane (850 mL, 3.38 mol, 8.0 equiv) was added over 1 h while keeping the temperature < 5°C. The resulting reaction mixture was slowly warmed to room temperature and stirred at room temperature for 18 h. When the reaction was deemed complete, the reaction mixture was concentrated under reduced pressure and the residue was placed under high vacuum for an additional 3 h before being treated with THF (900 mL) and diisopropylethylamine (183 mL, 1.06 mol, 2.5 equiv) at room temperature. The resulting solution was then cooled to 0°C and ethanesulfonyl chloride (56 mL, 0.59 mol, 1.4 equiv) was added while keeping the reaction temperature < 5°C. The ice bath was removed and the reaction was stirred at room temperature for 18 h. When TLC indicated the reaction was complete, the reaction mixture was diluted with ethyl acetate (1 L) and washed with saturated brine (1 L). The aqueous layer was extracted with ethyl acetate (2 x 500 mL). The combined organic layers were dried over sodium sulphate and concentrated under reduced pressure. The residue was diluted with dichloromethane and absorbed onto silica gel (150 g). This mixture was purified by column chromatography (1.5 Kg silica gel) eluting with heptane (4 L), 10 % EtOAc in heptane (4 L), 20 % EtOAc in heptane (8L), 30 % EtOAc in heptane (12 L), and finally with 40 % EtOAc in heptane (12 L) to afford 2-(1-(ethylsulfonyl)azetidin-3-ylidene)acetonitrile (4) and 2-(3-chloro-1-(ethylsulfonyl)azetidin-3-yl)acetonitrile (4B) as a off-white solid (58.1 g, 68% yield), which was found to be an approximately one to one mixture of compound 4 and 4B. For 4: $^1$H NMR (300 MHz, CDCl$_3$) $\delta$ 1.38 (t, 3H), 3.05 (q, 2H), 4.72 (m, 2H), 4.79 (m, 2H), 5.41 (m, 1H); MS: $m/z$ calcd. 187.05; found: 187.1. For 4B: $^1$H NMR (300 MHz, CDCl$_3$) $\delta$ 1.38 (t, 3H), 3.05 (q, 2H), 3.1 (s, 2H), 4.15 (d, 2H), 4.37 (d, 2H); MS: $m/z$ calcd. 222.9; found: 222.9.

Step 4. 2-(1-(Ethylsulfonyl)-3-(4-(7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl)acetonitrile (6).

To a solution of 2-(1-(ethylsulfonyl)azetidin-3-ylidene)acetonitrile (4) and 2-(3-chloro-1-(ethylsulfonyl)azetidin-3-yl)acetonitrile (4B) obtained from the previous reaction as an approximate one to one mixture (4 and 4B, 184 g, 919 mmol, 1.2 equiv) and 4-(1H-pyrazol-4-yl)-7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidine (5, 241 g,
766 mmol) in acetonitrile (6 L) was added DBU (137 mL, 919 mmol, 1.2 equiv) dropwise over 30 min at room temperature. The resulting reaction mixture was stirred overnight at room temperature. When the reaction was deemed complete, the solvent was removed under reduced pressure. The resulting solid was dissolved in 6 L of ethyl acetate and 2 L of acetonitrile at 40°C and the solution was washed with a mixture of brine (3 L) and water (1 L). The aqueous layer was extracted with ethyl acetate (3 x 1.6 L). The combined organic layers were washed with brine (1.6 L) and the solvent was removed under reduced pressure. Toluene (2 L) was added to the residue and the azeotropic distillation was repeated under reduced pressure. The residue was triturated with MTBE (1.5 L, methyl t-butyl ether) and the solids were collected by filtration. The brown solid was dissolved completely in ethyl acetate (3 L) at 50°C before the solution was treated with charcoal (30 g) and silica gel (30 g). The resulting mixture was stirred at 45°C for 1 h before being filtered hot through celite. The solvent was removed under reduced pressure and the residue was triturated with MTBE (3 L). The solids were collected by filtration and washed with MTBE (1 L). The solids were then completely dissolved in isopropanol (8.8 L) at 70°C, and the resulting solution was gradually cooled down to room temperature with stirring for overnight. The solids were collected by filtration, washed with isopropanol (1.3 L) and heptane (2 x 490 mL), and dried in an oven overnight to afford 2-(1-(ethoxysulfonfyl))-3-(4-(7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl)acetonitrile (6, 327 g, 384.3 g theoretical, 85% yield) as an off-white solid. For 6: 1H NMR (300 MHz, CDCl3) δ 0.00 (s, 9H), 0.99 (m, 2H), 1.49 (t, 3H), 3.15 (q, 2H), 3.49 (s, 2H), 3.60 (m, 2H), 4.30 (d, 2H), 4.70 (d, 2H), 5.76 (s, 2 H), 6.83 (s, 1H), 7.50 (s, 1H), 8.40 (s, 1H), 8.50 (s, 1H), 8.90 (s, 1H); MS: m/z calcd. 502.20; found: 502.3.

Step 5. 2-(3-(4-(7H-Pyrrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)-1-(ethoxysulfonfyl)azetidin-3-yl)acetonitrile (7).

To a solution of 2-(1-(ethoxysulfonfyl))-3-(4-(7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl)acetonitrile (6, 327 g, 655 mmol) in acetonitrile (3 L) and water (300 mL) was added LiBF₄ (614 g, 6.55 mol, 10.0 equiv). The resulting reaction mixture was stirred at 75°C for overnight. The reaction mixture was cooled to 0°C before a solution of ammonium hydroxide (NH₄OH, 570 mL) in water (2.2 L) was added slowly to keep the temperature below 10°C (pH 9-10). The mixture was stirred at room temperature for overnight. When the reaction was deemed complete, water (10 L)
was added and the resulting mixture was vigorously stirred for 3 h at room temperature. The solids were collected by filtration, washed with water (6.7 L) and heptane (6.7 L), and dried in vacuum oven at 45°C over the weekend. The dried solid was then dissolved in 20% MeOH in dichloromethane (12 L), and was purified by column chromatography on 1.3 Kg of silica gel eluting with a 20% MeOH in dichloromethane solution (18L) to afford 2-(3-(4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl)-IH-pyrazol-1-yl)-1-(ethylsulfonyl)azetidin-3-yl)acetonitrile (7, 204 g, 243.3 g theoretical, 83.8% yield) as an off-white solid. For 7: 1H NMR (300 MHz, d6-DMsol) δ 1.25 (t, 3H), 3.25 (q, 2H), 3.75 (s, 2H), 4.25 (d, 2H), 4.65 (d, 2H), 7.10 (d, 1H), 7.65 (dd, 1H), 8.50 (s, 1H), 8.70 (s, 1H), 8.95 (s, 1H), 12.2 (bs, 1H); MS: m/z calcd. 372.12; found: 372.0.

Step 6. 2-(3-(4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl)-IH-pyrazol-1-yl)-1-(ethylsulfonyl)azetidin-3-yl)acetonitrile phosphoric acid salt.

To a solution of 2-(3-(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-IH-pyrazol-1-yl)-1-(ethylsulfonyl)azetidin-3-yl)acetonitrile (7, 204 g, 550 mmol) in acetonitrile (5.1 L) and ethanol (1.6 L) was added a solution of phosphoric acid (67.4 g, 688 mmol, 1.25 equiv) in ethanol (800 mL) slowly over 30 min at 70°C. The resulting reaction mixture was stirred at 70°C for 2 h before being gradually cooled to room temperature with stirring for overnight. The solids were collected by filtration, washed with acetonitrile (160 mL) and dried in vacuum oven at 45°C for 6 h to afford 2-(3-(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-IH-pyrazol-1-yl)-1-(ethylsulfonyl)azetidin-3-yl)acetonitrile phosphoric acid salt (240 g, 258.2 g theoretical, 93% yield) as a white solid. For final product: 1H NMR (300 MHz, d6-DMsol) δ 1.25 (t, 3H), 3.25 (q, 2H), 3.75 (s, 2H), 4.20 (d, 2H), 4.61 (d, 2H), 7.10 (d, 1H), 7.60 (dd, 1H), 8.50 (s, 1H), 8.70 (s, 1H), 8.95 (s, 1H), 12.2 (bs, 1H); MS: m/z calcd. 372.12; found: 372.0.

Example 62. 4-Chloro-7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidine (3).

To a flask equipped with a nitrogen inlet, an addition funnel, a thermowell, and the mechanical stirrer was added 4-chloro-7H-pyrrolo[2,3-d]pyrimidine (1, 600 g, 3.91 mol) and N,N-dimethylacetamide (DMAC, 9.6 L) at room temperature. The mixture was cooled to 0 - 5°C in an ice/brine bath before solid sodium hydride (NaH, 60 wt%, 174 g, 4.35 mol, 1.1 equiv) was added in portions at 0 - 5°C. The reaction mixture went to a dark solution during
15 minutes. Trimethylsilylethoxymethyl chloride (2, SEM-Cl, 763 mL, 4.31 mol, 1.1 equiv) was then added slowly via an addition funnel at a rate that the internal reaction temperature did not exceed 5 °C. The reaction mixture was then stirred at 0 - 5 °C for 30 minutes. When the reaction was deemed complete determined by TLC and HPLC, the reaction mixture was quenched by water (1 L). The mixture was then diluted with water (12 L) and MTBE (8 L). The two layers were separated and the aqueous layer was extracted with MTBE (8 L). The combined organic layers were washed with water (2 x 4 L) and brine (4 L) and dried over sodium sulfate (Na₂SO₄). The solvents were removed under reduced pressure. The residue was then dissolved in heptane (2 L), filtered and loaded onto a silica gel (SiO₂, 3.5 Kg) column eluting with heptane (6 L), 95% heptane/ethyl acetate (12 L), 90% heptane/ethyl acetate (10 L), and finally 80% heptane/ethyl acetate (10 L). The fractions containing the pure desired product were combined and concentrated under reduced pressure to give 4-chloro-7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidine (3, 987 g, 1109.8 g theoretical, 88.9% yield) as a pale yellow oil which partially solidified to an oily solid on standing at room temperature. For 3: ¹H NMR (DMSO-d₆, 300 MHz) δ 8.67 (s, 1H), 7.87 (d, 1H, J = 3.8 Hz), 6.71 (d, 1H, J = 3.6 Hz), 5.63 (s, 2H), 3.50 (t, 2H, J = 7.9 Hz), 0.80 (t, 2H, J = 8.1 Hz), 1.24 (s, 9H) ppm; ¹³C NMR (DMSO-d₆, 100 MHz) δ 151.3, 150.8, 150.7, 131.5, 116.9, 99.3, 72.9, 65.8, 17.1, -1.48 ppm; C₁₂H₁₆ClN₃OSi (MW 283.83), LCMS (EI) m/e 284/286 (M⁺ + H).

\]
Example 63. 4-(1H-Pyrazol-4-yl)-7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-
d]pyrimidine (5).

To a reactor equipped with the overhead stirrer, a condenser, a thermowell, and a
nitrogen inlet was charged water (H₂O, 9.0 L), solid potassium carbonate (K₂CO₃, 4461 g,
32.28 mol, 2.42 equiv), 4-chloro-7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-
d]pyrimidine (3, 3597 g, 12.67 mol), 1-(1-ethoxyethyl)-4-((4,4,5,5-tetramethyl-1,3,2-
dioxaborolan-2-yl)-1H-pyrazole (4, 3550 g, 13.34 mol, 1.05 equiv), and 1-butanol (27 L) at
room temperature. The resulting reaction mixture was degassed three times backfilling with
nitrogen each time before being treated with tetrakis(triphenylphosphine)palladium(0)
(Pd(PPh₃)$_4$, 46 g, 0.040 mol, 0.003 equiv) at room temperature. The resulting reaction
mixture was heated to gentle reflux (about 90 °C) for 1 - 4 hours. When the reaction was
determined complete by HPLC, the reaction mixture was gradually cooled down to
room temperature before being filtered through a Celite bed. The Celite bed was washed with
ethyl acetate (2 x 2 L) before the filtrates and washing solution were combined. The two
layers were separated, and the aqueous layer was extracted with ethyl acetate (12 L). The
combined organic layers were concentrated under reduced pressure to remove solvents, and
the crude 4-(1-(1-ethoxyethyl)-1H-pyrazol-4-yl)-7-((2-(trimethylsilyl)ethoxy)methyl)-7H-
pyrrolo[2,3-d]pyrimidine (6) was directly charged back to the reactor with tetrahydrofuran
(THF, 4.2 L) for the subsequent acid-promoted de-protection reaction without further
purification.

To a suspension of crude 4-(1-(1-ethoxyethyl)-1H-pyrazol-4-yl)-7-((2-
(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidine (6), made as described above, in
tetrahydrofuran (THF, 4.2 L) in the reactor was charged water (H₂O, 20.8 L), and a 10%
aqueous HCl solution (16.2 L, 45.89 mol, 3.44 equiv) at room temperature. The resulting
reaction mixture was stirred at 16 – 30 °C for 2 – 5 h. When the reaction was deemed
de complete by HPLC analysis, the reaction mixture was treated with a 30% aqueous sodium
hydroxide (NaOH) solution (4 L, 50.42 mol, 3.78 equiv) at room temperature. The resulting
reaction mixture was stirred at room temperature for 1 – 2 h. The solids were collected by
filtration and washed with water (2 x 5 L). The wet cake was charged back to the reactor with
acetonitrile (21.6 L), and resulting suspension was heated to gentle reflux for 1 – 2 h. The
clear solution was then gradually cooled down to room temperature with stirring, and solids
were precipitated out from the solution with cooling. The mixture was stirred at room
temperature for an additional 1 – 2 h. The solids were collected by filtration, washed with
acetonitrile (2 x 3.5 L), and dried in oven under reduced pressure at 45 – 55 °C to constant
weight to afford 4-(1H-pyrazol-4-yl)-7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-
d]pyrimidine (5, 3281.7 g, 3996.8 g theoretical, 82.1% yield) as white crystalline solids (99.5 area% by HPLC). For 5: 1H NMR (DMSO-d6, 400 MHz) δ 13.41 (br. s, 1H), 8.74 (s, 1H), 8.67 (br. s, 1H), 8.35 (br. s, 1H), 7.72 (d, 1H, J = 3.7 Hz), 7.10 (d, 1H, J = 3.7 Hz), 5.61 (s, 2H), 3.51 (t, 2H, J = 8.2 Hz), 0.81 (t, 2H, J = 8.2 Hz), 0.13 (s, 9H) ppm; C15H23N5OSi (MW, 315.45), LCMS (EI) m/z 316 (M+ + H).

Example 64. 1-Benzhydrylazetidin-3-ol hydrochloride (23).

A solution of diphenylmethanamine (21, 2737 g, 15.0 mol, 1.04 equiv) in methanol (MeOH, 6 L) was treated with 2-(chloromethyl)oxirane (22, 1330 g, 14.5 mol) from an addition funnel at room temperature. During the initial addition a slight endotherm was noticed. The resulting reaction mixture was stirred at room temperature for 3 days before being warmed to reflux for an additional 3 days. When TLC showed that the reaction was deemed complete, the reaction mixture was first cooled down to room temperature and then to 0 – 5 °C in an ice bath. The solids were collected by filtration and washed with acetone (4 L) to give the first crop of the crude desired product (23, 1516 g). The filtrate was concentrated under reduced pressure and the resulting semisolid was diluted with acetone (1 L). This solid was then collected by filtration to give the second crop of the crude desired product (23, 221 g). The crude product, 1-benzhydrylazetidin-3-ol hydrochloride (23, 1737 g, 3998.7 g theoretical, 43.4% yield), was found to be sufficiently pure to be used in the subsequent reaction without further purification. For 23: 1HNMR (DMSO-d6, 300 MHz), δ 12.28 (br. d, 1H), 7.7 (m, 5H), 7.49 (m, 5H), 6.38 (d, 1H), 4.72 (br. s, 1H), 4.46 (m, 1H), 4.12 (m, 2H), 3.85 (m, 2H) ppm; C16H18ClNO (free base of 23, C16H17NO MW, 239.31), LCMS (EI) m/z 240 (M+ + H).

\]
Example 65. tert-Butyl 3-hydroxyazetidine-1-carboxylate (24).

A suspension of 1-benzhydrylazetidin-3-ol hydrochloride (23, 625 g, 2.27 mol) in a 10 % solution of aqueous sodium carbonate (Na₂CO₃, 5 L) and dichloromethane (CH₂Cl₂, 5 L) was stirred at room temperature until all solids were dissolved. The two layers were separated, and the aqueous layer was extracted with dichloromethane (CH₂Cl₂, 2 L). The combined organics extracts were dried over sodium sulfate (Na₂SO₄) and concentrated under reduced pressure. This resulting crude free base of 23 was then dissolved in THF (6 L) and the solution was placed into a large Parr bomb. Di-tert-butyl dicarbonate (BOC₂O, 545 g, 2.5 mol, 1.1 equiv) and 20 % palladium (Pd) on carbon (125 g, 50 % wet) were added to the Parr bomb. The vessel was charged to 30 psi with hydrogen gas (H₂) and stirred under steady hydrogen atmosphere (vessel was recharged three times to maintain the pressure at 30 psi) at room temperature for 18 h. When HPLC showed that the reaction was complete (when no more hydrogen was taken up), the reaction mixture was filtered through a Celite pad and the Celite pad was washed with THF (4 L). The filtrates were concentrated under reduced pressure to remove the solvent and the residue was loaded onto a Biocage 150 column with a minimum amount of dichloromethane (CH₂Cl₂). The column was eluted with 20 – 50 % ethyl acetate in heptane and the fractions containing the pure desired product (24) were collected and combined. The solvents were removed under reduced pressure to afford tert-butyl 3-hydroxyazetidine-1-carboxylate (24, 357 g, 393.2 g theoretical, 90.8% yield) as colorless oil, which solidified upon standing at room temperature in vacuum. For 24: ¹HNMR (CDCl₃, 300 MHz), δ 4.56 (m 1H), 4.13 (m, 2H), 3.81 (m, 2H), 1.43 (s, 9H) ppm.

Example 66. tert-Butyl 3-oxoazetidine-1-carboxylate (7).

A solution of tert-butyl 3-hydroxyazetidine-1-carboxylate (24, 50 g, 289 mmol) in ethyl acetate (400 mL) was cooled to 0 °C. The resulting solution was then treated with solid TEMPO (0.5 g, 3.2 mmol, 0.011 equiv) and a solution of potassium bromide (KBr, 3.9 g, 33.2 mmol, 0.115 equiv) in water (60 mL) at 0 – 5 °C. While keeping the reaction temperature between 0 - 5 °C a solution of saturated aqueous sodium bicarbonate (NaHCO₃, 450 mL) and an aqueous sodium hypochlorite solution (NaClO, 10 - 13 % available chlorine, 450 mL) were added. Once the solution of sodium hypochlorite was added, the color of the reaction mixture was changed immediately. When additional amount of sodium hypochlorite solution was added, the color of the reaction mixture was gradually faded. When TLC showed that all of the starting material was consumed, the color of the reaction mixture was
no longer changed. The reaction mixture was then diluted with ethyl acetate (EtOAc, 500 mL) and two layers were separated. The organic layer was washed with water (500 mL) and the saturated aqueous sodium chloride solution (500 mL) and dried over sodium sulfate (Na₂SO₄). The solvent was then removed under reduced pressure to give the crude product, tert-butyl 3-oxazetidine-1-carboxylate (7, 48 g, 49.47 g theoretical, 97% yield), which was found to be sufficiently pure and was used directly in the subsequent reaction without further purification. For crude 7: ¹H NMR (CDCl₃, 300 MHz), δ 4.65 (s, 4H), 1.42 (s, 9H) ppm.

Example 67. tert-Butyl 3-(cyanomethylene)azetidine-1-carboxylate (9).

Diethyl cyanomethyl phosphonate (8, 745 g, 4.20 mol, 1.20 equiv) and anhydrous tetrahydrofuran (THF, 9 L) was added to a four-neck flask equipped with a thermowell, an addition funnel and the nitrogen protection tube at room temperature. The solution was cooled with an ice-methanol bath to -14 °C and a 1.0 M solution of potassium tert-butoxide (t-BuOK) in anhydrous tetrahydrofuran (THF, 3.85 L, 3.85 mol, 1.1 equiv) was added over 20 min while keeping the reaction temperature below -5 °C. The resulting reaction mixture was stirred for 3 h at -10 °C and a solution of 1-tert-butoxycarbonyl-3-azetidinone (7, 600 g, 3.50 mol) in anhydrous tetrahydrofuran (THF, 2 L) was added over 2 h while keeping the internal temperature below -5 °C. The reaction mixture was stirred at -5 to -10 °C over 1 h and then slowly warmed up to room temperature and stirred at room temperature for overnight. The reaction mixture was then diluted with water (4.5 L) and saturated aqueous sodium chloride solution (NaCl, 4.5 L) and extracted with ethyl acetate (EtOAc, 2 x 9 L). The combined organic layers were washed with brine (6 L) and dried over anhydrous sodium sulfate (Na₂SO₄). The organic solvent was removed under reduced pressure and the residue was diluted with dichloromethane (CH₂Cl₂, 4 L) before being absorbed onto silica gel (SiO₂, 1.5 Kg). The crude product, which was absorbed on silica gel, was purified by flash column chromatography (SiO₂, 3.5 Kg, 0 – 25% EtOAc/hexanes gradient elution) to afford tert-butyl 3-(cyanomethylene)azetidine-1-carboxylate (9, 414.7 g, 679.8 g theoretical, 61% yield) as white solid. For 9: ¹H NMR (CDCl₃, 300MHz), δ 5.40 (m, 1H), 4.70 (m, 2H), 4.61 (m, 2H), 1.46 (s, 9H) ppm; C₁₀H₁₄N₂O₂ (MW, 194.23), LCMS (EI) m/z 217 (M⁺ + Na).
Example 68. 2-(1-(Ethylsulfonyl)azetidin-3-ylidene)acetonitrile (11).

A solution of tert-butyl 3-(cyanomethylene)azetidine-1-carboxylate (9, 1000g, 5.2 mol) in acetonitrile (7 L) and a 3 N aqueous HCl solution (7 L) was stirred at room temperature for 18 h. When HPLC showed that all the starting material (9) was consumed, the reaction mixture was concentrated under reduced pressure to dryness. The residue, which contains the crude desired deprotection product (10), was then suspended in acetonitrile (12 L) and the resulting suspension was cooled to 0 - 5 °C. Diisopropylethylamine (DIEA, 3.14 L, 18.03 mol, 3.5 equiv) was then slowly added while keeping the internal temperature below 5 °C. The resulting homogeneous solution was allowed to cool down to 0 °C and ethane sulfonyl chloride (EtSO₂Cl, 730 mL, 7.73 mol, 1.5 equiv) was added over 1 h while keeping the internal temperature below 5 °C. The resulting reaction mixture was allowed to gradually warm to room temperature and stirred at room temperature for overnight. When HPLC showed that the reaction was complete, the reaction mixture was concentrated under reduced pressure to a volume of approximately 2 L. The bath temperature of the rotary evaporator is set to not exceed 45 °C. The concentrated residue was then diluted with dichloromethane (CH₂Cl₂, 10 L) and the resulting dichloromethane solution was washed with aqueous sodium chloride solution (10 L). The aqueous phase was back extracted with dichloromethane (CH₂Cl₂, 5 L). The combined organic layers were dried over anhydrous sodium sulfate (Na₂SO₄) and the residue was absorbed onto silica gel (SiO₂, 1 Kg) under reduced pressure. The bath temperature of the rotary evaporator was set to not exceed 45 °C. The material was then loaded onto a silica gel column (SiO₂, 2.5 Kg) and eluted with 20 – 60 % ethyl acetate in heptane to afford 2-(1-(ethylsulfonyl)azetidin-3-ylidene)acetonitrile (11, 882 g, 968.4 g theoretical, 91 % yield) as off-white solids. For 11: ¹H NMR (CDCl₃, 300 MHz) δ 5.46 (m,
1H), 4.77 (m, 2H), 4.70 (m, 2H), 3.05 (q, 2H), 1.39 (t, 3H) ppm; C_{7}H_{10}N_{2}O_{2}S (MW, 186.23), LCMS (El) m/e 187 (M^+ + H).

Example 69. 2-(1-(Ethylsulfonyl)-3-(4-(7-(2-((trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl)acetonitrile (12).

Method A. To a suspension of 4-((1H-pyrazol-4-yl)-7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidine (5, 440 g, 1.395 mol) and 2-(1-ethylsulfonyl)azetidin-3-ylidene)acetonitrile (11, 312.4 g, 1.68 mol, 1.2 equiv) in acetonitrile (4.4 L) was added DBU (249.8 mL, 1.67 mol, 1.2 equiv) drop wise to keep the reaction temperature between 15 – 25 °C. After adding DBU, the reaction mixture became homogeneous, but a precipitate appeared in 30 min. The reaction mixture was stirred for 3 h at room temperature. When HPLC showed that the reaction was deemed complete, the reaction mixture was quenched with water (11 L). The resulting mixture was stirred at room temperature for additional 30 min and then filtered. The solid cake was washed with water (4 L), MTBE (2 L) and dried in vacuum oven at 35 °C for 24 h to afford crude 2-(1-(ethylsulfonyl)-3-(4-((2-((trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl)acetonitrile (12, 681 g, 699.8 g theoretical, 97.3 % yield) as white solids, which was found to be sufficiently pure for the subsequent reaction without further purification. For 12: ^1HNMR (CDCl₃, 300 MHz), δ 8.86 (s, 1H), 8.45 (s, 1H), 8.35 (s, 1H), 7.43 (d, 1H), 6.80 (d, 1H), 5.68 (s, 2H), 4.65 (d, 2H), 4.27 (d, 2H), 3.55 (s, 2H), 3.4 (t, 2H), 3.07 (m, 2H), 1.42 (m, 3H), 0.92 (m, 2H), -0.05 (s, 9H) ppm; C_{22}H_{31}N_{7}O_{3}SSi (MW, 501.68), LCMS (El) m/e 502 (M^+ + H).
Example 70. 2-(3-(4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)-1-(ethylsulfonyl)azetidin-3-yl)acetonitrile (14).

Method A. To a solution of 2-(1-(ethylsulfonyl)-3-(4-(7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl)acetonitrile (12, 400 g, 797 mmol) in acetonitrile (3.6 L) and water (360 mL) was added solid lithium tetrafluoroborate (LiBF₄, 747.5 g, 7.97 mol, 10.0 equiv) at room temperature. The resulting reaction mixture was warmed to 80 °C and stirred at 80 °C for overnight. When HPLC showed the first stage of deprotection was complete, which afforded the corresponding hydroxymethyl intermediate 13, the reaction mixture was cooled down to room temperature gradually and subsequently to 0 °C. A solution of ammonium hydroxide (28 – 30% aqueous NH₄OH, 680 mL) in water (2.7 L) was added slowly to the reaction mixture to adjust pH to 9-10 while keeping the internal temperature below 10 °C. The resulting mixture was stirred at room temperature for overnight. When HPLC showed that the second stage of deprotection was complete, the reaction mixture was added into water (10 L), and the resulting mixture was vigorously stirred at room temperature for 3 h. The solids were collected by filtration, washed with water (8 L) and heptane (8 L), and dried in convection oven at 35 °C over the weekend. The dried solids were dissolved in 20 % MeOH in dichloromethane (16 L) before
being purified by column chromatography on 1.6 Kg of silica gel (SiO₂). The column was
eluted with a 20 % MeOH in dichloromethane solution (CH₂Cl₂, 18 L) to give 2-(3-(4-(7H-
pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)-1-(ethylsulfonyl)azetidin-3-yl)acetonitrile
(14, 239.5 g, 296.1 g theoretical, 80.9% yield) as off-white solids. For 14: ¹H NMR (DMSO-
d₆, 300 MHz) δ 12.15 (s, 1H), 8.94 (s, 1H), 8.72 (s, 1H), 8.49 (s, 1H), 7.63 (d, 1H), 7.09 (d,
1H), 4.62 (d, 2H), 4.25 (d, 2H), 3.71 (s, 2H), 3.24 (q, 2H), 1.26 (t, 3H) ppm; C₁₈H₁₇N₇O₄S
(MW, 371.42), LCMS (EI) m/e 372 (M⁺ + H).

Example 71. 2-(3-(4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)-1-(ethylsulfonyl)azetidin-3-yl)acetonitrile phosphate salt.

To a solution of 2-(3-(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)-1-(ethylsulfonyl)azetidin-3-yl)acetonitrile (14, 471.2 g, 1268.6 mmol) in acetonitrile (10.86 L)
and ethanol (3.75 L) was added an 85 % aqueous solution of phosphoric acid (H₃PO₄, 191.6
g, 1661.7 mmol, 1.31 equiv) in ethanol (EtOH, 1.68 L) slowly over 50 min at 70 °C. The
resulting reaction mixture was cooled down to room temperature slowly and stirred at room
temperature for overnight. The solids were collected by filtration and washed with
acetonitrile (500 mL). The resulting wet cake was then suspended in ethanol (EtOH, 7.0 L)
before being treated with an aqueous 85 % solution of phosphoric acid (H₃PO₄, 95.1 g, 824.6
mmol, 0.65 equiv) in ethanol (EtOH, 1.23 L) at room temperature. The resulting mixture was
then warmed to reflux and stirred at reflux for 1 h before being cooled down to room
temperature slowly and stirred at room temperature for overnight. The solids were collected
by filtration, washed with ethanol (2 L) and heptane/ethanol (v/v 2/1, 2.1 L), and dried in
vacuum oven at 40 °C for overnight to afford 2-(3-(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-
pyrazol-1-yl)-1-(ethylsulfonyl)azetidin-3-yl)acetonitrile phosphate salt (534.8 g, 595.5 g
theoretical, 89.8% yield) as white crystalline solids. For phosphate salt: mp: 187 °C;

Example 72. tert-Butyl 3-(cyanomethyl)-3-(4-(7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidine-1-carboxylate (15).

To a suspension of tert-butyl 3-(cyanomethylene)azetidine-1-carboxylate (9, 417.2 g, 2.15 mol, 1.05 equiv) and 4-(1H-pyrazol-4-yl)-7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidine (5, 645 g, 2.04 mol) in acetonitrile (4.9 L) was added DBU (30.5 mL, 0.204 mol, 0.1 equiv) drop wise at room temperature. The resulting reaction mixture was then stirred at room temperature for 3 h. After about 1 h, a clear, brown solution was obtained. When LCMS showed that no starting material remained, silica gel (SiO_{2}, 1 Kg) was added and the mixture was concentrated to dryness under reduced pressure. This material, which contains the crude desired product (15), was then loaded onto a pre-packed silica column (SiO_{2}, 2.5 Kg) and the column was eluted with 60 – 80% of ethyl acetate/heptane.

The fractions containing the pure desired product (15) were combined and concentrated under reduced pressure to give the desired product as thick oil which was then stirred in heptane at room temperature until crystallization occurred. The solids were collected by filtration and washed with heptane to afford tert-butyl 3-(cyanomethyl)-3-(4-(7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidine-1-carboxylate (15, 1014.9 g, 1039.7 g theoretical, 97.6% yield) as white solids. For 15: ^1H NMR (DMSO-d_{6}, 300 MHz) δ 8.93 (s, 1H), 8.77 (s, 1H), 8.47 (s, 1H), 7.80 (d, 1H, J = 3.8 Hz), 7.20 (d, 1H, J = 3.7 Hz), 5.63 (s, 2H), 4.50 (d, 2H, J = 9.3 Hz), 4.21 (d, 2H, J = 9.3 Hz), 3.66 (s, 2H), 3.52 (t, 2H, J = 7.8 Hz), 1.40 (s, 9H), 0.82 (t, 2H, J = 8.1 Hz), -0.12 (s, 9H) ppm; C_{23}H_{35}N_{7}O_{2}Si (MW, 509.68), LCMS (EI) m/e 510 (M^+ + H) and 532 (M^+ + Na).
Example 73.  2-(3-(4-(7-((2-(Trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl)acetonitrile (16).

To a solution of tert-butyl 3-(cyanomethyl)-3-(4-(7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidine-1-carboxylate (15, 389.6 g, 0.765 mol) in dichloromethane (CH$_2$Cl$_2$, 7 L) was added a solution of hydrogen chloride (HCl) in dioxane (4 M, 1.15 L, 4.6 mol, 6.0 equiv) drop wise at room temperature. The resulting reaction mixture was stirred at room temperature for 48 h. When LCMS showed that all of the starting material had been consumed, the reaction mixture was transferred in portions to a 22 L separation funnel containing aqueous ammonium hydroxide (NH$_4$OH, about 4% v/v, 2.5 L). Gas was evolved but the funnel stayed
cool to the touch. Ice cubes were periodically added as a precaution. Once all of the reaction mixture was added, stirring was continued for about 15 min. The pH of the aqueous layer was found to be close to 11. The two layers were separated and the organic layer was washed with brine (2 L), dried over anhydrous sodium sulfate (Na₂SO₄) and concentrated under reduced pressure to a minimum volume. Heptane (about 3 L) was added to the residue and the resulting suspension was concentrated to dryness under reduced pressure to give crude 2-(3-(4-(7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl)acetonitrile (16, 268.2 g, 313.3 g theoretical, 85.6% yield) as an orange oil which was used directly for the subsequent reaction without further purification. For crude

16: 1H NMR (300 MHz, CDCl₃): δ 8.92 (s, 1H), 8.45 (s, 1H), 8.39 (s, 1H), 7.47 (d, 1H), 6.87 (d, 1H), 5.74 (s, 2H), 4.36 (d, 2H), 3.95 (d, 2H), 3.77 (s, 2H), 3.62 (t, 2H), 1.9 (br. s, 1H), 0.99 (t, 2 H), 0.01 (s, 9H) ppm; C₂₉H₂₇N₆Si (MW, 409.56), LCMS (EI) m/e 410 (M⁺ + H).

Example 75. 2-((Ethylsulfonyl)-3-(4-(7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl)acetonitrile (12).

Method B. To a solution of crude 2-(3-(4-(7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl)acetonitrile (16, 423.7 g, 1.03 mol) in ethyl acetate (EtOAc, 6.5 L) at 0 - 5 °C was added a solution of ethane sulfonyle chloride (EtSO₂Cl, 117 mL, 1.23 mol, 1.2 equiv) in ethyl acetate (110 mL) drop wise. The resulting reaction mixture was allowed to warm gradually to room temperature and stirred at room temperature for overnight. When LCMS analysis showed that no starting material remained and the reaction mixture was transferred to a 22 L separation funnel and washed with water (4 L), brine (2 L) and saturated aqueous sodium bicarbonate solution (NaHCO₃, 2 L). The combined aqueous layer was back extracted with ethyl acetate (EtOAc, 2 L). The combined organic layers were washed with brine, dried over anhydrous sodium sulfate (Na₂SO₄) and concentrated under reduced pressure. The crude material was purified on silica gel eluted with dichloromethane/ethyl acetate (100/0 to 0/100). The fractions containing the pure desired product (12) were combined and concentrated under reduced pressure to a minimum volume before being treated with heptane at room temperature. The solids were collected by filtration and washed with heptane to afford 2-((ethylsulfonyl)-3-(4-(7-((2-(trimethylsilyl)ethoxy)methyl)-7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl)acetonitrile (12, 397 g, 516.7 g theoretical, 76.8% yield) as white solids, which was found
to be identical to the material prepared by method A in every comparable aspect. For 12: $^1$H NMR (CDCl$_3$, 300 MHz), $\delta$ 8.86 (s, 1H), 8.45 (s, 1H), 8.35 (s, 1H), 7.43 (d, 1H), 6.80 (d, 1H), 5.68 (s, 2H), 4.65 (d, 2H), 4.27 (d, 2H), 3.55 (s, 2H), 3.4 (t, 2H), 3.07 (m, 2H), 1.42 (m, 3H), 0.92 (m, 2H), -0.05 (s, 9H) ppm; C$_{22}$H$_{31}$N$_2$O$_5$S$i$ (MW, 501.68), LCMS (El) $m/e$ 502 ($M^+ + H$).

Example 76. [4-(1H-Pyrazol-4-yl)-7H-pyrrolo[2,3-d]pyrimidin-7-yl]methyl pivalate (19). To a oven dried 3 L 4-neck round bottom flask equipped with a stirring bar, a septa, a thermocouple, a 500 mL addition funnel and the nitrogen inlet was charged solid sodium hydride (NaH, 60 wt% in mineral oil, 32.82 g, 0.82 mol, 1.20 equiv) and anhydrous 1,2-dimethoxyethane (DME, 500 mL, 4.8 mol) and the resulting mixture was cooled to 0 - 3 °C. To a oven dried 1 L round bottom flask was charged 4-chloro-7H-pyrrolo[2,3-d]pyrimidine (1, 105.0 g, 0.684 mol) and 1,2-dimethoxyethane (DME, 750 mL, 7.2 mol) and the resulting slurry was then portion wise added to the suspension of sodium hydride in DME via large bore canula over 30 minutes at 5 - 12 °C. The resulting reaction mixture was heterogeneous. Following the addition, the cold bath was removed and the mixture was gradually warmed to room temperature and allowed to stir at room temperature for 1 hour before being cooled to 0 - 5 °C. Chloromethyl pivalate (pivaloyloxyethyl chloride, POM-Cl, 112 ml, 0.752 mol, 1.1 equiv) was then added drop wise into the reaction mixture over 30 minutes with stirring at 0 - 5 °C. The addition of chloromethyl pivalate was mildly exothermic and the reaction temperature went up to as high as 14 °C. After addition of chloromethyl pivalate, the cooling bath was removed and the reaction mixture was allowed to return to room temperature and
stirred at room temperature for 90 min. When the reaction was deemed complete after confirmed by HPLC, the reaction mixture was carefully quenched with water (100 mL) and this quenched reaction mixture, which contains crude POM-protected chloroazapuine (17), was used directly in the subsequent Suzuki coupling reaction without further work-up and purification.

To the quenched reaction mixture, which contains crude POM-protected chloroazapuine (17) made as described above, was added 1-(1-ethoxyethyl)-4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-1H-pyrazole (4, 200 g, 0.75 mol, 1.10 equiv) and solid potassium carbonate (K$_2$CO$_3$, 189 g, 1.37 mol, 2.0 equiv) at room temperature. The resulting mixture was degassed by passing a stream of nitrogen through the solution for 15 minutes before being treated with tetrakis(triphenylphosphine)palladium(0) (Pd(PPh$_3$)$_4$, 7.9 g, 0.08 mmol, 0.01 equiv) and the resulting reaction mixture was heated at reflux (about 82 °C) for 10 hours. When the reaction was deemed complete by TLC (1:1 hexanes/ethyl acetate) and LCMS, the reaction mixture was cooled to room temperature, diluted with ethyl acetate (2 L) and water (1 L). The two layers were separated, and the aqueous layer was extracted with ethyl acetate (500 mL). The combined organic layers were washed with water (2 x 1 L) and brine (1 L) before being concentrated under reduced pressure to afford crude 4-[1-(1-ethoxyethyl)-1H-pyrazol-4-yl]-7H-pyrrolo[2,3-d]pyrimidin-7-yl]methyl pivalate (18) as a pale-yellow oil, which was directly used in the subsequent de-protection reaction without further purification.

A solution of crude 18 in THF (1 L, 12.3 mol) was treated with a 4 N aqueous HCl solution (500 mL) at room temperature. The resulting reaction mixture was subsequently stirred at room temperature for 5 h. When the reaction was deemed complete, the reaction mixture was cooled to 0 - 5 °C before the pH was adjusted to 9 -10 with a 1 M aqueous sodium hydroxide (NaOH) solution (2 L). The mixture was then concentrated under reduced pressure to remove most of the THF and the resulting suspension was stirred at room temperature for 2 h. The solids were collected by filtration, washed with water (3 x 500 mL), and dried in vacuum oven to afford 4-[1H-pyrazol-4-yl]-7H-pyrrolo[2,3-d]pyrimidin-7-yl]methyl pivalate (19, 157.5 g, 204.43 g theoretical, 77% yield for three steps) as off-white solids, which was found to be sufficiently pure (> 98 area% by HPLC) to do the subsequent reaction without further purification. For 19: $^1$H NMR (DMSO-$d_6$, 400 MHz) $\delta$ 13.42 (br s, 1H), 8.76 (s, 1H), 8.67 (s, 1H), 8.33 (s, 1H), 7.68 (d, 1H, $J = 3.8$ Hz), 7.11 (d, 1H, $J = 3.8$ Hz), 6.21 (s, 2H), 1.06 (s, 9H) ppm; $^{13}$C NMR (DMSO-$d_6$, 100 MHz) $\delta$ 177.74, 152.31,
152.09, 151.91, 139.52, 130.39, 120.51, 113.93, 101.91, 67.26, 38.98, 27.26 ppm; C_{13}H_{17}N_{3}O_{2} (MW, 299.33), LCMS (EI) m/e 300 (M^+ + H).

Example 77. (4-(1-(3-(Cyanomethyl)-1-(ethylsulfonyl)azetidin-3-yl)-1H-pyrazol-4-yl)-7H-pyrrolo[2,3-d]pyrimidin-7-yl)methyl pivalate (20).

To a suspension of [4-(1H-pyrazol-4-yl)-7H-pyrrolo[2,3-d]pyrimidin-7-yl]methyl pivalate (19, 10.0 g, 33.4 mmol) and 2-(1-(ethylsulfonyl)azetidin-3-ylidene)acetonitrile (11, 6.22 g, 33.4 mmol, 1.0 equiv) in N,N-dimethylformamide (DMF, 20 mL) was added DBU (254 mg, 1.67 mmol, 0.05 equiv) drop wise to keep the reaction temperature between 15 – 25 °C. After adding DBU, the reaction mixture became homogeneous within 90 min. The reaction mixture was stirred for 3 h at room temperature. When HPLC showed that the reaction was deemed complete, the reaction mixture was quenched with water (120 mL) and acetonitrile (80 mL). The resulting mixture was stirred at room temperature for an additional 30 min. The solids were collected by filtration, washed with a mixture of acetonitrile and water (2/3 by volume, 2 x 20 mL), and dried in vacuum oven at 40 - 45 °C for 24 h to afford crude (4-(1-(3-(cyanomethyl)-1-(ethylsulfonyl)azetidin-3-yl)-1H-pyrazol-4-yl)-7H-pyrrolo[2,3-d]pyrimidin-7-yl)methyl pivalate (20, 14.5 g, 16.2 g theoretical, 89.5 % yield) as white solids, which was found to be sufficiently pure (> 98.0% by HPLC) for the subsequent reaction without further purification. For 20: $^1$HNMR (CDCl$_3$, 300 MHz), δ 8.87 (s, 1H), 8.43 (s, 1H), 8.37 (s, 1H), 7.51 (d, 1H, $J = 3.6$ Hz), 6.76 (d, 1H, $J = 3.6$ Hz), 6.26 (s, 2H), 4.64 (d, 2H, $J = 9.6$ Hz), 4.25 (d, 2H, $J = 9.6$ Hz), 3.41 (s, 2H), 3.09 (q, 2H, $J = 7.6$ Hz), 1.42 (t, 3H, $J = 7.6$ Hz), 1.17 (s, 9H) ppm; C$_{22}$H$_{27}$N$_{3}$O$_{4}$S (MW, 485.56), LCMS (EI) m/e 486 (M^+ + H).
Example 78. 2-(3-(4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)-1-(ethylsulfonfyl)azetidin-3-yl)acetonitrile (14).

Method B. A suspension of (4-(1-(3-(cyanomethyl)-1-(ethylsulfonfyl)azetidin-3-yl)-1H-pyrazol-4-yl)-7H-pyrrolo[2,3-d]pyrimidin-7-yl)methyl pivalate (20, 1.0 g, 2.06 mmol) in methanol (MeOH, 5 mL) and tetrahydrofuran (THF, 20 mL) was treated with a 1 M aqueous sodium hydroxide solution (NaOH, 2.3 mL, 2.3 mmol, 1.12 equiv) at room temperature, and the resulting reaction mixture was stirred at room temperature for 2 – 3 h. When HPLC showed that the reaction was deemed complete, the reaction mixture was quenched with water (10 mL) and a 1 N aqueous HCl solution (0.2 mL) to adjust pH to 7 – 7.5 at room temperature. The resulting mixture was stirred at room temperature for 30 min before the solids were collected by filtration. The solids were washed with a mixture of acetonitrile and water (2/3 by volume, 2 x 4 mL) and dried in vacuum at 40 - 45 °C for 24 h to afford crude 2-(3-(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)-1-(ethylsulfonfyl)azetidin-3-yl)acetonitrile (14, 658 mg, 765 mg theoretical, 86% yield) as off-white solids, which was found to be identical to the material prepared by Method A. For crude 14: 1H NMR (DMSO-d$_6$, 300 MHz) δ 12.15 (s, 1H), 8.94 (s, 1H), 8.72 (s, 1H), 8.49 (s, 1H), 7.63 (d, 1H), 7.09 (d,
1H), 4.62 (d, 2H), 4.25 (d, 2H), 3.71 (s, 2H), 3.24 (q, 2H), 1.26 (t, 3H) ppm; C_{18}H_{17}N_{7}O_{2}S (MW, 371.42), LCMS (EI) m/z 372 (M^+ + H).

Method C. Alternatively, a suspension of (4-(1-(3-(cyanomethyl)-1-(ethylsulfonyl)azetidin-3-yl)-1H-pyrazol-4-yl)-7H-pyrrolo[2,3-d]pyrimidin-7-yl)methyl pivalate (20, 10.0 g, 20.6 mmol) and lithium hydroxide monohydrate (2.59 g, 61.8 mmol) in acetonitrile (CH_{3}CN 40 mL) and isopropyl alcohol (10 mL) was heated at 45 – 50 °C for 6 hours. When HPLC showed that the reaction was deemed complete, the reaction mixture was cooled to room temperature and 1M hydrochloric acid aqueous solution (41 mL) as added to adjust the pH to 6 – 7 at temperature below 25 °C. After the acid addition, the mixture was stirred at room temperature for 1 h and the precipitates were isolated by filtration. The wet cake was washed with water (50 mL) and dried in vacuum oven at 50 °C to give crude 2-(3-(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)-1-(ethylsulfonyl)azetidin-3-yl)acetonitrile (14, 6.0 g, 7.65 g theoretical, 78% yield) as off-white solids, which was found to be identical to the material prepared by Method A.

Example 79. {1-(Cyclopropylsulfonyl)-3-[4-(7-[[2-(trimethylsilyl)ethoxy]methyl]-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile (25).

To a oven dried 2 L round bottom flask equipped with the overhead stirring, a nitrogen inlet, a septa and a thermocouple was charged anhydrous tetrahydrofuran (THF, 800 mL), {3-[4-(7-[[2-(trimethylsilyl)ethoxy]methyl]-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile (16, 38.6 g, 94.2 mmol) and N,N-diisopropylethylamine (DIEA, 22.0 mL, 126 mmol, 1.34 equiv) at room temperature. The resulting solution was then cooled to 0 – 5 °C before being charged with cyclopropanesulfonyl chloride (14.3 mL, 134 mmol, 1.42 equiv) portion wise over eight minutes via syringe at 0 – 5 °C. After 10 minutes, the ice bath was removed and the reaction mixture was allowed to warm gradually to room temperature. When HPLC showed that the reaction was complete after 22 h, the reaction mixture was concentrated under reduced pressure to remove about 400 mL of solvent. The residue was treated with ethyl acetate (EtOAc, 500 mL) and the resulting solution was washed with 20% aqueous sodium chloride solution (NaCl, 300 mL). The aqueous layer was back extracted with ethyl acetate (EtOAc, 150 mL). The combined organic fractions were dried over magnesium sulfate (MgSO_{4}) and concentrated under reduced pressure to yield the crude product (25) as an amber oil. The crude product was then purified by flash column chromatography (SiO_{2}, 50% to 70% ethyl acetate/hexane gradient elution) to afford {1-(cyclopropylsulfonyl)-3-[4-(7-[[2-
(trimethylsilyl)ethoxy)methyl]-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl)azetidin-3-yl)acetonitrile (25, 39.4 g, 48.4 g theoretical, 81.4% yield) as a light yellow oil, which solidified upon standing at room temperature in vacuum. For 25: 1H NMR (DMSO-d6, 300 MHz) δ 8.98 (s, 1H), 8.78 (s, 1H), 8.50 (s, 1H), 7.81 (d, 1H, J = 3.8 Hz), 7.20 (d, 1H, J = 3.6 Hz), 5.63 (s, 2H), 4.66 (d, 2H, J = 9.5 Hz), 4.28 (d, 2H, J = 9.3 Hz), 3.69 (s, 2H), 3.52 (t, 2H, J = 7.8 Hz), 2.84 (m, 1H), 1.01 (m, 4H), 0.82 (t, 2H, J = 8.4 Hz), -0.12 (s, 9H) ppm; C23H31N7O5Si (MW, 513.69), LCMS (EI) m/e 514 (M+ + H) and 536 (M+ + Na).

Example 80. 2-(3-(4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)-1-(cyclopentylsulfonyl)azetidin-3-yl)acetonitrile (27).

To a 500 mL round bottom flask equipped with a stir bar, a condenser, a thermocouple and a nitrogen inlet was charged 1-(cyclopentylsulfonyl)-3-[4-(7-[(trimethylsilyl)ethoxy]methyl]-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl)azetidin-3-yl)acetonitrile (25, 17.5 g, 34.1 mmol), acetonitrile (254 mL) and water (23.9 mL) at room temperature. The resulting reaction mixture was charged with solid lithium tetrafluoroborate (LiBF4, 32.6 g, 341 mmol, 10.0 equiv) in one portion at room temperature. The resulting reaction mixture was warmed to reflux and stirred at reflux for 21 h. When HPLC showed that the first stage of deprotection reaction was complete, which produced the corresponding
hydroxymethyl intermediate 26, the reaction mixture was allowed to gradually cool to room
temperature before the solution pH was adjusted to 9 - 10 with a 20% aqueous NH₄OH
solution (45 mL) at room temperature. The resulting reaction mixture was then stirred at
room temperature for overnight. When HPLC showed that the second stage of deprotection
reaction was complete, the reaction mixture was filtered through a Celite pad and the Celite
pad was washed with ethyl acetate (EtOAc, 50 mL). The filtrates were then diluted with a
20% aqueous sodium chloride solution (NaCl, 200 mL) and ethyl acetate (EtOAc, 200 mL).
The two layers were separated, and the aqueous layer was extracted with ethyl acetate
(EtOAc, 200 mL). The combined organic fractions were washed with 1 M aqueous sodium
bicarbonate solution (NaHCO₃, 200 mL) and water (200 mL). The combined aqueous
solution was back extracted with ethyl acetate (EtOAc, 100 mL). The combined organic
fractions were then dried over magnesium sulfate (MgSO₄) and concentrated under reduced
pressure to give the crude product (27) as light yellow solids. The crude solids were then
treated with acetonitrile (200 mL) and the resulting suspension was warmed to 60 °C for 15
minutes before being cooled down to room temperature and stirred at room temperature for
60 minutes. The solids were collected by filtration and washed with a small volume of
acetonitrile to give the first crop of the desired product (27, 6.9 g). The combined filtrates
were then concentrated to afford yellow solids, which was treated with acetonitrile (100 mL)
and warmed to 60 °C for 30 minutes. The suspension was cooled down to room temperature
and stirred at room temperature for 60 minutes. The solids were collected by filtration and
washed with a small volume of acetonitrile to give the second crop of the desired product (27,
3.0 g). The filtrate was then concentrated and the residue was purified by flash column
chromatography (SiO₂, 50% ethyl acetate/acetonitrile elution) to give the third crop of the
desired product (27, 1.4 g). This reaction afforded 2-(3-(4-((7H-pyrrolo[2,3-d]pyrimidin-4-yl)-
1H-pyrazol-1-yl)-1-(cyclopropylsulfonyl)azetidin-3-yl)acetonitrile (27, 11.3 g, 13.07 g
theoretical, 86.5% overall yield) as off-white solids. For 27: ¹H NMR (DMSO-d₆, 400 MHz)
δ 12.16 (br. s, 1H), 8.95 (s, 1H), 8.70 (s, 1H), 8.48 (s, 1H), 7.62 (dd, 1H, J = 3.6, 2.3 Hz),
7.08 (dd, 1H, J = 3.5, 1.4 Hz), 4.66 (d, 2H, J = 9.4 Hz), 4.28 (d, 2H, J = 9.4 Hz), 3.69 (s, 2H),
2.84 (m, 1H), 1.01 (m, 4H) ppm; C₁₇H₁₇N₃O₂S (MW, 383.43), LCMS (EI) m/e 384 (M⁺ + H).

Example 81. 2-(3-(4-((7H-Pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)-1-(cyclopropylsulfonyl)azetidin-3-yl)acetonitrile phosphoric acid salt.
To a 1 L round bottom flask equipped with a stir bar, an addition funnel, a nitrogen inlet and a condenser was charged 2-(3-(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)-1-(cyclopropylsulfonyl)azetidin-3-yl)acetonitrile (27, 11.3 g, 29.5 mmol) and acetonitrile (275 mL) at room temperature. The resulting mixture was warmed to 70 °C before being charged with ethanol (EtOH, 150 mL) in three portions at 70 °C. The resulting homogeneous solution was filtered into a clean 1 L round bottom flask equipped with the overhead stirring, an addition funnel, a nitrogen inlet and a condenser. The mixture was then warmed to 67 °C producing a homogeneous solution again. A solution of phosphoric acid (H₃PO₄, 3.03 g, 30.9 mmol, 1.05 equiv) in ethanol (EtOH, 30 mL) was then charged drop wise to the solution over ten minutes at 67 °C. The solution was still homogeneous after the end of the addition of phosphoric acid ethanol solution. The resulting reaction mixture was stirred at 67 °C for 10 minutes before being gradually cooled down to room temperature and stirred at room temperature for 19 h. The solids were collected by filtration and washed with acetonitrile (2 x 40 mL). The wet cake was partially dried under high vacuum and then transferred to a 75 °C vacuum oven and dried to constant weight to afford 2-(3-(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)-1-(cyclopropylsulfonyl)azetidin-3-yl)acetonitrile phosphate (12.0 g, 14.2 g theoretical, 84.5% yield) as white solids. For Phosphate: ¹H NMR (DMSO-d₆, 500 MHz) δ 12.13 (br. s, 1H), 9.20 (br. s, 3H), 8.94 (s, 1H), 8.70 (s, 1H), 8.47 (s, 1H), 7.61 (dd, 1H, J = 3.4, 2.3 Hz), 7.07 (dd, 1H, J = 3.6, 1.6 Hz), 4.65 (d, 2H, J = 9.1 Hz), 4.28 (d, 2H, J = 9.7 Hz), 3.68 (s, 2H), 2.82 (m, 1H), 1.01 (m, 4H) ppm; ¹³C NMR (DMSO-d₆, 125 MHz) δ 152.9, 151.6, 150.0, 140.6, 130.3, 127.7, 122.9, 117.3, 113.8, 100.7, 59.7, 57.1, 27.6, 25.4, 4.9 ppm; C_{17}H_{20}N_{5}O_{5}PS (MW, 481.42; C_{17}H_{17}N_{5}O_{2}S for free base, MW, 383.43), LCMS (EI) m/z 384 (M⁺ + H).

Example 82: {1-(Ethylsulfonyl)-3-[3-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrrol-1-yl]azetidin-3-yl}acetonitrile

![Example 82: Diagram](image-url)
Step 1. 4-(1H-pyrrol-3-yl)-7-[[2-(trimethylsilyl)ethoxy]methyl]-7H-pyrrolo[2,3-d]pyrimidine

A mixture of 4-chloro-7-[[2-(trimethylsilyl)ethoxy]methyl]-7H-pyrrolo[2,3-d]pyrimidine (12.9 g, 45.4 mmol) (prepared as in WO 2007/070514, Ex.65) and [1-(trisopropylsilyl)-1H-pyrrol-3-yl]boronic acid (Frontier Scientific) (10.4 g, 38.9 mmol) and sodium carbonate (4.36 g, 41.2 mmol) in 1,2-dimethoxyethane (100 mL) and water (35 mL) was degassed by purging with a stream of nitrogen for 20 minutes. Tetrakis(triphenylphosphine)palladium(0) (2.25 g, 1.94 mmol) was then added and the reaction was heated to reflux for 9 hours. As the coupling reaction proceeded, the TIPS protecting group was also slowly removed. The solvent was removed by rotary evaporation and the product was purified by flash column chromatography, eluting with a gradient from 10-50% ethyl acetate in hexanes to afford the desired product (7 g, 57%).

1H NMR (300 MHz, CDCl₃): δ 8.93 (br s, 1H), 8.84 (s, 1H), 7.73-7.69 (m, 1H), 7.33 (d, 1H), 7.04-7.00 (m, 1H), 6.94 (dd, 1H), 6.85 (d, 1H), 5.66 (m, 2H), 3.55 (m, 2H), 0.92 (m, 2H), -0.06 (s, 9H). LCMS (M+H)+: 315.2.

Step 2.

A solution of 4-(1H-pyrrol-3-yl)-7-[[2-(trimethylsilyl)ethoxy]methyl]-7H-pyrrolo[2,3-d]pyrimidine (0.100 g, 0.318 mmol) and [1-(ethylsulfonyl)azetidin-3-ylidene]acetoneitrile (0.118 g, 0.636 mmol, prepared as in Example 68) in acetonitrile (1 mL) was treated with 1,8-diazabicyclo[5.4.0]undec-7-ene (24 μL, 0.16 mmol). The mixture was stirred for 4 hours. The solvent was evaporated. The residue was partitioned between ethyl acetate and saturated sodium bicarbonate solution, then extracted with two further portions of ethyl acetate. The combined extracts were dried over sodium sulfate, decanted and concentrated. The crude product was stirred with 25% TFA / DCM (8 mL) overnight. The solvents were evaporated. The product was then stirred with ethylenediamine (0.3 mL) in methanol (5 mL). Preparative HPLC-MS (eluting with a gradient of methanol and water containing 0.15% NH₄OH) was used to purify the product.

1H NMR (300 MHz, CDCl₃): δ 8.59 (s, 1H), 7.54 (dd, 1H), 7.27 (d, 1H), 6.95 (dd, 1H), 6.82 (dd, 1H), 6.74 (d, 1H), 4.49 (d, 2H), 4.15 (d, 2H), 3.24 (s, 2H), 3.02 (q, 2H), 1.33 (t, 3H);

LCMS (M+H)+: 371.1.

Example 83: 4-{1-[1-(Ethylsulfonyl)-3-(fluoromethyl)azetidin-3-yl]-1H-pyrazol-4-yl}-7H-pyrrolo[2,3-d]pyrimidine trifluoroacetic acid salt
Step 1. tert-butyl 3-[fluoro(phenylsulfonyl)methylene]azetidine-1-carboxylate

To a mixture of fluromethyl phenyl sulfone (0.50 g, 2.9 mmol) and phosphorochloridic acid, diethyl ester (0.415 mL, 2.87 mmol) in tetrahydrofuran (6 mL, 70 mmol) was added 1.000 M of lithium hexamethyldisilazide in tetrahydrofuran (6.2 mL, 6.2 mmol) dropwise at -78 °C. After the mixture was stirred at -78 °C for 1 h, a solution of tert-butyl 3-oxoazetidine-1-carboxylate (0.378 g, 2.21 mmol) in tetrahydrofuran (1.3 mL, 16 mmol) was added. The reaction was allowed to warm to ambient temperature and stirred for 2 h at rt. The reaction was poured into an ice-cold mixture of EtOAc and sat. ammonium chloride. The organic layer was separated and the aq. layer was extracted with EtOAc. The combined organic layers were washed with brine, and dried over sodium sulfate. The solvent was removed under reduced pressure and the resulting residue was purified on silica gel, eluting with 0 to 50% EtOAc in hexane, to give the desired product (560 mg, 77.5%). LCMS calculated for C13H18FNO4SNa(M+Na)+: m/z = 350.1; Found (M+Na) 350.3.

Step 2. tert-butyl 3-[fluoro(phenylsulfonyl)methyl]-3-[4-(7-[(2-(trimethylsilyl)ethoxy)methyl]-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidine-1-carboxylate

A mixture of 4-(1H-pyrazol-4-yl)-7-{2-(trimethylsilyl)ethoxy}methyl]-7H-pyrrolo[2,3-d]pyrimidine (0.40 g, 1.3 mmol), tert-butyl 3-[fluoro(phenylsulfonyl)methylene]azetidine-1-carboxylate (0.56 g, 1.7 mmol), and 1,8-diazabicyclo[5.4.0]undec-7-ene (0.182 mL, 1.22 mmol) in acetonitrile (6 mL, 100 mmol) was stirred at rt for 3 h. After evaporation to dryness, the residue was purified on silica gel, eluting with 0 to 100% EtOAc in hexane, to give the desired product (820 mg, 100%). LCMS calculated for C30H40F6N6O6S11(M+H)+: m/z = 643.3; Found: 643.4. 1H NMR (CDCl3, 300 MHz) δ 8.92 (1H, s), 8.55 (1H, s), 8.32 (1H, s), 7.87 (2H, m), 7.68 (1H, m), 7.55 (2H, m), 7.47 (1H, d, J = 3.6 Hz), 6.84 (1H, d, J = 3.6 Hz), 5.77 (1H, d, J = 45.6 Hz), 5.74 (2H, s), 4.93
(1H, d, J = 10.2 Hz), 4.73–4.58 (3H, m), 3.60 (2H, t, J = 8.1 Hz), 1.51 (9H, s), 0.98 (3H, t, J = 8.1 Hz), 0.07 (9H, s) ppm. \(^{19}\)F NMR (CDCl\(_3\), 300 MHz) \(\delta\) -181.84 (1F, d, J = 48.6 Hz) ppm.

**Step 3. tert-butyl 3-(fluoromethyl)-3-\{4-\{7-\{2-(trimethylsilyl)ethoxy\}methyl\}-7H-pyrrolo[2,3-d]pyrimidin-4-yl\}-1H-pyrazol-1-yl\}azetidine-1-carboxylate**

To a mixture of tert-butyl 3-[fluoro(phenylsulfonyl)methyl]-3-\{4-\{7-\{2-(trimethylsilyl)ethoxy\}methyl\}-7H-pyrrolo[2,3-d]pyrimidin-4-yl\}-1H-pyrazol-1-yl\}azetidine-1-carboxylate (0.312 g, 0.485 mmol) and disodium hydrogen phosphate (1.38 g, 9.71 mmol) in methanol (7.5 mL, 180 mmol) was added sodium mercury amalgam (2.17 g, 9.71 mmol), under nitrogen, at -20 °C. The reaction was stirred at -20 to 0 °C for 1 h, diluted with EtOAc, then quenched with sat. ammonium chloride. The mixture was filtered through Celite and the solid collected was treated with elemental sulfur powder to destroy the mercury residue. The filtrate layers were separated and the organic layers were washed with brine, dried over sodium sulfate and evaporated. The residue was purified on silica gel, eluting with 0 to 80% EtOAc in hexane, to give the desired product (120 mg, 49.2%). LCMS calculated for C\(_{24}\)H\(_{36}\)FN\(_6\)O\(_3\)Si(M+H\(^+\)): m/z = 503.3; Found: 503.2.

**Step 4. 4-\{1-\{1-(ethylsulfonyl)-3-(fluoromethyl)azetidin-3-yl\}-1H-pyrazol-4-yl\}-7-\{2-(trimethylsilyl)ethoxy\}methyl\}-7H-pyrrolo[2,3-d]pyrimidine**

tert-Butyl 3-(fluoromethyl)-3-\{4-\{7-\{2-(trimethylsilyl)ethoxy\}methyl\}-7H-pyrrolo[2,3-d]pyrimidin-4-yl\}-1H-pyrazol-1-yl\}azetidine-1-carboxylate (0.120 g, 0.239 mmol) was treated with 4.00 M of hydrogen chloride in 1,4-dioxane (1.0 mL, 4.0 mmol) at rt for 1h, then evaporated to dryness under reduced pressure. LCMS (M+H) 403.4. To the resultant crude HCl salt in acetonitrile (4 mL, 80 mmol) was added triethylamine (0.0998 mL, 0.716 mmol) followed by ethanesulfonyl chloride (0.0317 mL, 0.334 mmol). The mixture was stirred at rt for 30 min. After quenching with aq. sodium bicarbonate, the mixture was extracted with dichloromethane. The combined organic layers were washed with water, brine and dried over sodium sulfate, evaporated to dry. The residue was used directly in next step. LCMS calculated for C\(_{21}\)H\(_{32}\)FN\(_6\)O\(_2\)SSi(M+H\(^+\)): m/z = 495.2; Found: 495.4.

**Step 5. 4-\{1-\{1-(ethylsulfonyl)-3-(fluoromethyl)azetidin-3-yl\}-1H-pyrazol-4-yl\}-7H-pyrrolo[2,3-d]pyrimidine**
4-{1-[1-(Ethylsulfonyl)]-3-(fluoromethyl)azetidin-3-yl]-1H-pyrazol-4-yl}-7-{(2-(trimethylsilyl)ethoxy)methyl}-7H-pyrrolo[2,3-d]pyrimidine (0.060 g, 0.12 mmol) was treated with 2 mL of TFA at rt for 30 min. The reaction mixture was evaporated to dryness. LCMS (M+H) 395.3: The resulting residue was dissolved in 3 mL of methanol and treated with ethylenediamine (0.0811 mL, 1.21 mmol) at rt for 30 min. The mixture was purified on RP-HPLC (XBridge C18 column, eluting with a gradient of acetone/water containing 0.2% TFA) to give the desired product as TFA salt. LCMS calculated for C_{15}H_{15}F_{16}O_{2}S(M+H)^{+} (free base): m/z = 365.1; Found: 365.3. $^1$H NMR (DMSO-d$_6$, 300 MHz) δ 12.57 (1H, br s), 8.94 (1H, s), 8.81 (1H, s), 8.53 (1H, s), 7.75 (1H, br s), 7.21 (1H, br s), 5.03 (2H, d, J = 46.8 Hz), 4.53 (1H, dd, J = 9.0 and 2.7 Hz), 4.24 (1H, d, J = 9.0 Hz), 3.25 (2H, q, J = 7.2 Hz), 1.23 (3H, t, J = 7.2 Hz) ppm. $^{19}$F NMR (DMSO-d$_6$, 300 MHz) δ -74.98 (3F, s), -225.56 (1F, t, J = 48.3 Hz) ppm.

**Example A: In vitro JAK Kinase Assay**

Compounds herein were tested for inhibitory activity of JAK targets according to the following *in vitro* assay described in Park *et al.*, *Analytical Biochemistry* 1999, 269, 94-104. The catalytic domains of human JAK1 (a.a. 837-1142), JAK2 (a.a. 828-1132) and JAK3 (a.a. 781-1124) with an N-terminal His tag were expressed using baculovirus in insect cells and purified. The catalytic activity of JAK1, JAK2 or JAK3 was assayed by measuring the phosphorylation of a biotinylated peptide. The phosphorylated peptide was detected by homogeneous time resolved fluorescence (HTRF). IC$_{50}$s of compounds were measured for each kinase in the reactions that contain the enzyme, ATP and 500 nM peptide in 50 mM Tris (pH 7.8) buffer with 100 mM NaCl, 5 mM DTT, and 0.1 mg/mL (0.01%) BSA. The ATP concentration in the reactions was 90 μM for Jak1, 30 μM for Jak2 and 3 μM for Jak3.

Reactions were carried out at room temperature for 1 hr and then stopped with 20 μL 45 mM EDTA, 300 nM SA-APC, 6 nM Eu-Py20 in assay buffer (Perkin Elmer, Boston, MA). Binding to the Europium labeled antibody took place for 40 minutes and HTRF signal was measured on a Fusion plate reader (Perkin Elmer, Boston, MA). The compounds of Examples 1-60, 82, and 83 were found to have IC$_{50}$ values less than 60 nM for at least one of JAK1, JAK2, and JAK3.

**Example B: Cellular Assays**

150
One or more compounds herein were tested for inhibitory activity of JAK targets according to at least one of the following cellular assays.

Cancer cell lines dependent on cytokines and hence JAK/STAT signal transduction, for growth, were plated at 6000 cells per well (96 well plate format) in RPMI 1640, 10% FBS, and 1 nG/mL of appropriate cytokine. Compounds were added to the cells in DMSO/media (final concentration 0.2% DMSO) and incubated for 72 hours at 37 °C, 5% CO2. The effect of compound on cell viability was assessed using the CellTiter-Glo Luminescent Cell Viability Assay (Promega) followed by TopCount (Perkin Elmer, Boston, MA) quantitation. Potential off-target effects of compounds were measured in parallel using a non-JAK driven cell line with the same assay readout. All experiments were performed in duplicate.

The above cell lines can also be used to examine the effects of compounds on phosphorylation of JAK kinases or potential downstream substrates such as STAT proteins, Akt, Shp2, or Erk. These experiments can be performed following an overnight cytokine starvation, followed by a brief preincubation with compound (2 hours or less) and cytokine stimulation of approximately 1 hour or less. Proteins are then extracted from cells and analyzed by techniques familiar to those schooled in the art including Western blotting or ELISAs using antibodies that can differentiate between phosphorylated and total protein. These experiments can utilize normal or cancer cells to investigate the activity of compounds on tumor cell survival biology or on mediators of inflammatory disease. For example, with regards to the latter, cytokines such as IL-6, IL-12, IL-23, or IFN can be used to stimulate JAK activation resulting in phosphorylation of STAT protein(s) and potentially in transcriptional profiles (assessed by array or qPCR technology) or production and/or secretion of proteins, such as IL-17. The ability of compounds to inhibit these cytokine mediated effects can be measured using techniques common to those schooled in the art.

Compounds herein can also be tested in cellular models designed to evaluate their potency and activity against mutant JAKs, for example, the JAK2V617F mutation found in myeloid proliferative disorders. These experiments often utilize cytokine dependent cells of hematological lineage (e.g. BaF/3) into which the wild-type or mutant JAK kinases are ectopically expressed (James, C., et al. Nature 434:1144-1148; Staerk, J., et al. JBC 280:41893-41899). Endpoints include the effects of compounds on cell survival, proliferation, and phosphorylated JAK, STAT, Akt, or Erk proteins.

Certain compounds herein have been or can be evaluated for their activity inhibiting T-cell proliferation. Such as assay can be considered a second cytokine (i.e. JAK) driven
proliferation assay and also a simplistic assay of immune suppression or inhibition of immune activation. The following is a brief outline of how such experiments can be performed. Peripheral blood mononuclear cells (PBMCs) are prepared from human whole blood samples using Ficoll Hypaque separation method and T-cells (fraction 2000) can be obtained from PBMCs by elutriation. Freshly isolated human T-cells can be maintained in culture medium (RPMI 1640 supplemented with 10% fetal bovine serum, 100 U/ml penicillin, 100 μg/ml streptomycin) at a density of 2 x 10^5 cells/ml at 37 °C for up to 2 days. For IL-2 stimulated cell proliferation analysis, T-cells are first treated with Phytohemagglutinin (PHA) at a final concentration of 10 μg/mL for 72h. After washing once with PBS, 6000 cells/well are plated in 96-well plates and treated with compounds at different concentrations in the culture medium in the presence of 100 U/mL human IL-2 (ProSpec-Tany Technogene; Rehovot, Israel). The plates are incubated at 37 °C for 72h and the proliferation index is assessed using CellTiter-Glo Luminescent reagents following the manufactory suggested protocol (Promega; Madison, WI).

15 Example C: In vivo anti-tumor efficacy

Compounds herein can be evaluated in human tumor xenograft models in immune compromised mice. For example, a tumorigenic variant of the INA-6 plasmacytoma cell line can be used to inoculate SCID mice subcutaneously (Burger, R., et al. *Hematol J.* 2:42-53, 2001). Tumor bearing animals can then be randomized into drug or vehicle treatment groups and different doses of compounds can be administered by any number of the usual routes including oral, i.p., or continuous infusion using implantable pumps. Tumor growth is followed over time using calipers. Further, tumor samples can be harvested at any time after the initiation of treatment for analysis as described above (Example B) to evaluate compound effects on JAK activity and downstream signaling pathways. In addition, selectivity of the compound(s) can be assessed using xenograft tumor models that are driven by other know kinases (*e.g.* Bcr-Abl) such as the K562 tumor model.

Example D: Murine Skin Contact Delayed Hypersensitivity Response Test

Compounds herein can also be tested for their efficacies (of inhibiting JAK targets) in the T-cell driven murine delayed hypersensitivity test model. The murine skin contact delayed-type hypersensitivity (DTH) response is considered to be a valid model of clinical contact dermatitis, and other T-lymphocyte mediated immune disorders of the skin, such as psoriasis (*Immunol Today*. 1998 Jan;19(1):37-44). Murine DTH shares multiple
characteristics with psoriasis, including the immune infiltrate, the accompanying increase in inflammatory cytokines, and keratinocyte hyperproliferation. Furthermore, many classes of agents that are efficacious in treating psoriasis in the clinic are also effective inhibitors of the DTH response in mice (Agents Actions. 1993 Jan;38(1-2):116-21).

On Day 0 and 1, Balb/c mice are sensitized with a topical application, to their shaved abdomen with the antigen 2,4-dinitro-fluorobenzene (DNFB). On day 5, ears are measured for thickness using an engineer’s micrometer. This measurement is recorded and used as a baseline. Both of the animals’ ears are then challenged by a topical application of DNFB in a total of 20 μL (10 μL on the internal pinna and 10 μL on the external pinna) at a concentration of 0.2%. Twenty-four to seventy-two hours after the challenge, ears are measured again. Treatment with the test compounds was given throughout the sensitization and challenge phases (day -1 to day 7) or prior to and throughout the challenge phase (usually afternoon of day 4 to day 7). Treatment of the test compounds (in different concentration) was administered either systemically or topically (topical application of the treatment to the ears). Efficacies of the test compounds are indicated by a reduction in ear swelling comparing to the situation without the treatment. Compounds causing a reduction of 20% or more were considered efficacious. In some experiments, the mice are challenged but not sensitized (negative control).

The inhibitive effect (inhibiting activation of the JAK-STAT pathways) of the test compounds can be confirmed by immunohistochemical analysis. Activation of the JAK-STAT pathway(s) results in the formation and translocation of functional transcription factors. Further, the influx of immune cells and the increased proliferation of keratinocytes should also provide unique expression profile changes in the ear that can be investigated and quantified. Formalin fixed and paraffin embedded ear sections (harvested after the challenge phase in the DTH model) are subjected to immunohistochemical analysis using an antibody that specifically interacts with phosphorylated STAT3 (clone 58E12, Cell Signaling Technologies). The mouse ears are treated with test compounds, vehicle, or dexamethasone (a clinically efficacious treatment for psoriasis), or without any treatment, in the DTH model for comparisons. Test compounds and the dexamethasone can produce similar transcriptional changes both qualitatively and quantitatively, and both the test compounds and dexamethasone can reduce the number of infiltrating cells. Both systemically and topical administration of the test compounds can produce inhibitive effects, i.e., reduction in the number of infiltrating cells and inhibition of the transcriptional changes.
Example E: *In vivo* anti-inflammatory activity

Compounds herein can be evaluated in rodent or non-rodent models designed to replicate a single or complex inflammation response. For instance, rodent models of arthritis can be used to evaluate the therapeutic potential of compounds dosed preventatively or therapeutically. These models include but are not limited to mouse or rat collagen-induced arthritis, rat adjuvant-induced arthritis, and collagen antibody-induced arthritis. Autoimmune diseases including, but not limited to, multiple sclerosis, type I-diabetes mellitus, uveoretinitis, thyroditis, myasthenia gravis, immunoglobulin nephropathies, myocarditis, airway sensitization (asthma), lupus, or colitis may also be used to evaluate the therapeutic potential of compounds herein. These models are well established in the research community and are familiar to those schooled in the art (Current Protocols in Immunology, Vol 3., Coligan, J.E. *et al*, Wiley Press.; *Methods in Molecular Biology*: Vol. 225, Inflammation Protocols., Winyard, P.G. and Willoughby, D.A., Humana Press, 2003.).

Example F: Animal Models for the Treatment of Dry Eye, Uveitis, and Conjunctivitis

Compounds may be evaluated in one or more preclinical models of dry eye known to those schooled in the art including, but not limited to, the rabbit concanavalin A (ConA) lacrimal gland model, the scopolamine mouse model (subcutaneous or transdermal), the Botulinum mouse lacrimal gland model, or any of a number of spontaneous rodent autoimmune models that result in ocular gland dysfunction (e.g. NOD-SCID, MRL/lpr, or NZB/NZW) (Barabino et al., Experimental Eye Research 2004, 79, 613-621 and Schrader et al., Developmental Ophthalmology, Karger 2008, 41, 298-312, each of which is incorporated herein by reference in its entirety). Endpoints in these models may include histopathology of the ocular glands and eye (cornea, etc.) and possibly the classic Schirmer test or modified versions thereof (Barabino et al.) which measure tear production. Activity may be assessed by dosing via multiple routes of administration (e.g. systemic or topical) which may begin prior to or after measurable disease exists.

Compounds may be evaluated in one or more preclinical models of uveitis known to those schooled in the art. These include, but are not limited to, models of experimental autoimmune uveitis (EAU) and endotoxin induced uveitis (EIU). EAU experiments may be performed in the rabbit, rat, or mouse and may involve passive or activate immunization. For instance, any of a number or retinal antigens may be used to sensitize animals to a relevant immunogen after which animals may be challenged ocularly with the same antigen. The EIU model is more acute and involves local or systemic administration of lipopolysaccharide at
sublethal doses. Endpoints for both the EIU and EAU models may include fundoscopic exam, histopathology amongst others. These models are reviewed by Smith et al. (Immunology and Cell Biology 1998, 76, 497-512).

Activity is assessed by dosing via multiple routes of administration (e.g. systemic or topical) which may begin prior to or after measurable disease exists. Some models listed above may also develop scleritis/episcleritis, choroiditis, cyclitis, or iritis and are therefore useful in investigating the potential activity of compounds for the therapeutic treatment of these diseases.

Compounds may also be evaluated in one or more preclinical models of conjunctivitis known those schooled in the art. These include, but are not limited to, rodent models utilizing guinea-pig, rat, or mouse. The guinea-pig models include those utilizing active or passive immunization and/or immune challenge protocols with antigens such as ovalbumin or ragweed (reviewed in Groneberg, D.A., et al., Allergy 2003, 58, 1101-1113).

Rat and mouse models are similar in general design to those in the guinea-pig (also reviewed by Groneberg). Activity may be assessed by dosing via multiple routes of administration (e.g. systemic or topical) which may begin prior to or after measurable disease exists. Endpoints for such studies may include, for example, histological, immunological, biochemical, or molecular analysis of ocular tissues such as the conjunctiva.

Example G: Comparative Data

Table 3 below provides potency data for the compound of Example 1 compared with other JAK inhibitors described in US Pat. App. Pub. No. 2007/0135461.

The JAK1 and JAK2 data in Table 3 was obtained using the *in vitro* assay procedures described in Example A above. The INA-6 data in Table 3 was obtained using the cellular assay procedure of Example B above, where the cancer cells used were INA-6 cells (Burger et al., *The Hematology Journal* (2001), 2, 42-53). Comparative 1 corresponds to the compound 1-{4-(1H-pyrrolo[2,3-b]pyridin-4-yl)-1H-pyrazol-1-yl}cyclopentyl)acetonitrile; Comparative 2 corresponds to the compound 1-{4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)cyclopentyl}acetonitrile; Comparative 3 corresponds to the compound 3-{1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)cyclopentyl}propanenitrile; Comparative 4 corresponds to the compound 1-{4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)cyclohexyl}acetonitrile; and Comparative 5 corresponds to the compound N'-cyano-4-(cyanomethyl)-4-{4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl}piperidine-1-carboximidamide.
What is claimed is:

1. A compound of Formula I, II, III, or IV:

   - **I**: \( R^1 \)
   - **II**: \( R^1 \)
   - **III**: \( R^1 \)
   - **IV**: \( R^1 \)

   or pharmaceutically acceptable salt thereof, wherein:
   - \( L \) is \( \text{SO}_2 \) or \( \text{CO} \);
   - \( R^1 \) is \( C_{1-6} \) alkyl, \( C_{3-7} \) cycloalkyl, phenyl, 5- or 6-membered heteroaryl, indolyl, \( NR^2 R^3 \), or \( OR^4 \), wherein said alkyl, cycloalkyl, phenyl, or heteroaryl is optionally substituted with 1, 2, or 3 substituents wherein each are independently \( \text{F, CN, or C}_{1-4} \) alkyl;
   - \( R^2 \) and \( R^3 \) are independently \( \text{H, C}_{1-4} \) alkyl, or phenyl; and
   - \( R^4 \) is \( C_{1-6} \) alkyl, phenyl, or benzyl;
   - \( R^5 \) and \( R^6 \) are independently \( \text{H, F, CN, OH, C}_{1-4} \) alkyl, benzyloxy, \( C_{2-8} \) dialkylaminosulfonyl, or 5-membered heteroaryl, wherein said alkyl is optionally substituted by 1, 2, or 3 substituents, wherein said substituents are each independently \( \text{F, OH, CN, or C}_{1-4} \) alkoxy, and wherein said 5-membered heteroaryl is optionally substituted with \( C_{1-4} \) alkyl;
   - wherein when \( L \) is \( \text{SO}_2 \), \( R^1 \) is other than \( OR^4 \), and wherein when one of \( R^5 \) and \( R^6 \) is \( \text{OH} \), then the other of \( R^5 \) and \( R^6 \) is other than \( \text{CN or F} \).

2. The compound of claim 1, or pharmaceutically acceptable salt thereof, wherein \( L \) is \( \text{SO}_2 \).
3. The compound of claim 1, or pharmaceutically acceptable salt thereof, wherein L is CO.

4. The compound of any one of claims 1-3, or pharmaceutically acceptable salt thereof, wherein \( R^1 \) is methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl, 2-methylprop-1-yl, or 1-methylprop-1-yl, each optionally substituted with 1, 2, or 3 F.

5. The compound of any one of claims 1-3, or pharmaceutically acceptable salt thereof, wherein \( R^1 \) is \( C_{1-4} \) alkyl.

6. The compound of any one of claims 1-3, or pharmaceutically acceptable salt thereof, wherein \( R^1 \) is ethyl.

7. The compound of any one of claims 1-3, or pharmaceutically acceptable salt thereof, wherein \( R^1 \) is \( C_{3-7} \) cycloalkyl optionally substituted by \( C_{1-4} \) alkyl.

8. The compound of any one of claims 1-3, or pharmaceutically acceptable salt thereof, wherein \( R^1 \) is phenyl optionally substituted with F, methyl, or CN.

9. The compound of any one of claims 1-3, or pharmaceutically acceptable salt thereof, wherein \( R^1 \) is a 5-membered heteroaryl which is thieryl, pyrazolyl, pyrrolyl, 1,2,4-oxadiazooyl, or isoxazolyl, each optionally substituted with \( C_{1-4} \) alkyl.

10. The compound of any one of claims 1-3, or pharmaceutically acceptable salt thereof, wherein \( R^1 \) is pyridinyl.

11. The compound of any one of claims 1-3, or pharmaceutically acceptable salt thereof, wherein \( R^1 \) is \( NR^2 R^3 \) or \( OR^4 \).

12. The compound of claim 1, or pharmaceutically acceptable salt thereof, wherein L is SO\(_2\) and \( R^1 \) is \( C_{1-6} \) alkyl.
13. The compound of claim 1, or pharmaceutically acceptable salt thereof, wherein one of R⁵ and R⁶ is H and the other is H, F, CN, OH, C₁₄ alkyl, benzylxoy, C₂₈ dialkylaminosulfonyl, or 5-membered heteroaryl, wherein said alkyl is optionally substituted by 1, 2, or 3 substituents, wherein said substituents are F, OH, CN, or C₁₄ alkoxy, and wherein said 5-membered heteroaryl is optionally substituted with C₁₄ alkyl.

14. The compound of claim 13, or pharmaceutically acceptable salt thereof, wherein R⁵ and R⁶ are independently H, F, CN, OH, or methyl.

15. The compound of claim 13, or pharmaceutically acceptable salt thereof, wherein R⁵ and R⁶ are independently H or CN.

16. {1-(Ethylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile or a pharmaceutically acceptable salt thereof.

17. {1-(Ethylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile phosphoric acid salt.

18. {1-[(1-Methyl-1H-pyrazol-3-yl)sulfonyl]-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile, or a pharmaceutically acceptable salt thereof.

19. 1-[(1-Methylcyclopropyl)carbonyl-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile or a pharmaceutically acceptable salt thereof.

20. 1-[(1-Methylcyclopropyl)sulfonfyl]-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile or a pharmaceutically acceptable salt thereof.
21. 1-(Methylsulfonyl)-3-[(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

22. 1-(Phenylsulfonyl)-3-[(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

23. 1-(Isopropylsulfonyl)-3-[(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

24. 1-(Butylsulfonyl)-3-[(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

25. 1-(Tert-butylsulfonyl)-3-[(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

26. 3-(Cyanomethyl)-N,N-dimethyl-3-[(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidine-1-sulfonamide or a pharmaceutically acceptable salt thereof.

27. 3-[(4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-1-yl]-1-[(3,3,3-trifluoropropyl)sulfonyl]azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

28. 1-(Isobutyrsulfonyl)-3-[(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

29. 1-(Sec-butylsulfonyl)-3-[(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

30. 1-[(5-Methyl-2-thienyl)sulfonyl]-3-[(4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl)azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.
31. 1-[(4-Fluorophenyl)sulfonyl]-3-[4-(7H-pyrrolo[2, 3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

32. 1-[(3-Fluorophenyl)sulfonyl]-3-[4-(7H-pyrrolo[2, 3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

33. 1-[(2-Fluorophenyl)sulfonyl]-3-[4-(7H-pyrrolo[2, 3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

34. 1-(Pyridin-3-ylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

35. 1-(Pyridin-2-ylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

36. 1-(Cyclopropylcarbonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

37. 1-[(1-Methylcyclopropyl)carbonyl]-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

38. 1-Benzoyl-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

39. 1-[(6-Methylpyridin-2-yl)carbonyl]-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidine-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

40. 1-(Pyridin-3-ylcarbonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.
41. {1-(3-Methylbenzoyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile or a pharmaceutically acceptable salt thereof.

42. {1-(4-Methylbenzoyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile or a pharmaceutically acceptable salt thereof.

43. 3-({3-(Cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-1-yl}carbonyl)benzonitrile or a pharmaceutically acceptable salt thereof.

44. [3-[4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]-1-(2-thiencylcarbonyl)azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

45. [3-[4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]-1-(1H-pyrrol-2-ylcarbonyl)azetidin-3-yl]acetonitrile or a pharmaceutically acceptable salt thereof.

46. {1-(1H-Indol-2-ylcarbonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile or a pharmaceutically acceptable salt thereof.

47. {1-(Isoxazol-5-ylcarbonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile or a pharmaceutically acceptable salt thereof.

48. {1-(1H-Pyrazol-3-ylcarbonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile or a pharmaceutically acceptable salt thereof.

49. isobutyl 3-(Cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidine-1-carboxylate or a pharmaceutically acceptable salt thereof.

50. phenyl 3-(Cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidine-1-carboxylate or a pharmaceutically acceptable salt thereof.
51. benzyl 3-(Cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidine-1-carboxylate or a pharmaceutically acceptable salt thereof.

52. 3-(Cyanomethyl)-N-phenyl-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidine-1-carboxamide or a pharmaceutically acceptable salt thereof.

53. 3-(Cyanomethyl)-N,N-dimethyl-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanesulfonamide or a pharmaceutically acceptable salt thereof.

54. 3-Isoxazol-3-yl-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile or a pharmaceutically acceptable salt thereof.

55. {3-(3-Methyl-1,2,4-oxadiazol-5-yl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutyl}acetonitrile or a pharmaceutically acceptable salt thereof.

56. {3-(3-Tert-butyl-1,2,4-oxadiazol-5-yl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutyl}acetonitrile or a pharmaceutically acceptable salt thereof.

57. 1-[4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile or a pharmaceutically acceptable salt thereof.

58. 3-(Hydroxymethyl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile or a pharmaceutically acceptable salt thereof.

59. 3-(Fluoromethyl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile or a pharmaceutically acceptable salt thereof.

60. 3-(Difluoromethyl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile or a pharmaceutically acceptable salt thereof.
61. 2,2'-[1-[4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutane-1,3-diyl]diacetonitrile or a pharmaceutically acceptable salt thereof.

62. 3-(Cyanomethyl)-1-methyl-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutanecarbonitrile or a pharmaceutically acceptable salt thereof.

63. 3-(Cyanomethyl)-1-(methoxymethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutanecarbonitrile or a pharmaceutically acceptable salt thereof.

64. 3-(Cyanomethyl)-1-(fluoromethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutanecarbonitrile or a pharmaceutically acceptable salt thereof.

65. 1,3-bis(Cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutanecarbonitrile or a pharmaceutically acceptable salt thereof.

66. 3,3-bis(Hydroxymethyl)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutylacetonitrile or a pharmaceutically acceptable salt thereof.

67. 3,3-bis(Fluoromethyl)-1-[4-(7-[2-(trimethylsilyl)ethoxy]methyl-7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutylacetonitrile or a pharmaceutically acceptable salt thereof.

68. 2,2',2''-[1-[4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutane-1,3,3-triyl]triacetonitrile or a pharmaceutically acceptable salt thereof.

69. 3-hydroxy-1-[4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutylacetonitrile or a pharmaceutically acceptable salt thereof.

70. 3-fluoro-1-[4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutylacetonitrile or a pharmaceutically acceptable salt thereof.
71. 3-methyl-1-[4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile or a pharmaceutically acceptable salt thereof.

72. 3,3-dimethyl-1-[4-(7H-Pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile or a pharmaceutically acceptable salt thereof.

73. 3-(Benzyloxy)-1-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutylacetonitrile or a pharmaceutically acceptable salt thereof.

74. 3-(Cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile, or a pharmaceutically acceptable salt thereof.

75. cis-3-(Cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile, or a pharmaceutically acceptable salt thereof.

76. trans-3-(Cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile, or a pharmaceutically acceptable salt thereof.

77. {1-(Propylsulfonfyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile, or a pharmaceutically acceptable salt thereof.

78. 1-(Cyclopropylsulfonfyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile or a pharmaceutically acceptable salt thereof.

79. {1-(Ethylsulfonfyl)-3-[3-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrrol-1-yl]azetidin-3-yl}acetonitrile, or a pharmaceutically acceptable salt thereof.

80. 4-{1-[1-(Ethylsulfonfyl)-3-(fluoromethyl)azetidin-3-yl]-1H-pyrazol-4-yl}-7H-pyrrolo[2,3-d]pyrimidine or a pharmaceutically acceptable salt thereof.

81. A composition comprising a compound of any one of claims 1-80, or
pharmaceutically acceptable salt thereof, and at least one pharmaceutically acceptable carrier.

82. The composition of claim 81 which is suitable for topical administration.

83. Use of a therapeutically effective amount of a compound of any one of claims 1-80, or pharmaceutically acceptable salt thereof, for treating an autoimmune disease in a patient in need thereof.

84. The use of claim 83 wherein said autoimmune disease is a skin disorder, multiple sclerosis, rheumatoid arthritis, psoriatic arthritis, juvenile arthritis, type 1 diabetes, lupus, inflammatory bowel disease, Crohn's disease, myasthenia gravis, immunoglobulin nephropathies, myocarditis, or autoimmune thyroid disorder.

85. The use of claim 84 wherein said autoimmune disease is rheumatoid arthritis.

86. The use of claim 84 wherein said autoimmune disease is a skin disorder, and is atopic dermatitis, psoriasis, skin sensitization, skin irritation, skin rash, contact dermatitis or allergic contact sensitization.

87. The use of claim 86 wherein said skin disorder is psoriasis.

88. Use of a therapeutically effective amount of a compound of any one of claims 1-80, or pharmaceutically acceptable salt thereof, for treating an inflammatory disease in a patient in need thereof.

89. Use of a therapeutically effective amount of a compound of any one of claims 1-80, or pharmaceutically acceptable salt thereof, for treating cancer in a patient in need thereof.
90. The use of claim 89 wherein said cancer is a solid tumor, prostate cancer, renal cancer, hepatic cancer, breast cancer, lung cancer, thyroid cancer, Kaposi’s sarcoma, Castleman’s disease, pancreatic cancer, lymphoma, leukemia, or multiple myeloma.

91. Use of a therapeutically effective amount of \(1-(\text{ethylsulfonyl})-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidin-3-yl\) acetonitrile, or pharmaceutically acceptable salt thereof, for treating rheumatoid arthritis in a patient in need thereof.

92. Use of a therapeutically effective amount of \(3-(\text{cyanomethyl})-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]cyclobutanecarbonitrile\), or a pharmaceutically acceptable salt thereof, for treating rheumatoid arthritis in a patient in need thereof.

93. Use of a therapeutically effective amount of \(1-(\text{propylsulfonyl})-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidin-3-yl\) acetonitrile, or a pharmaceutically acceptable salt thereof, for treating rheumatoid arthritis in a patient in need thereof.

94. Use of a therapeutically effective amount of \(1-(\text{cyclopropylsulfonyl})-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidin-3-ylacetanitride\) or a pharmaceutically acceptable salt thereof, for treating rheumatoid arthritis in a patient in need thereof.

95. Use of a therapeutically effective amount of \(1-(\text{ethylsulfonyl})-3-[3-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrrol-1-yl]azetidin-3-yl\) acetonitrile, or a pharmaceutically acceptable salt thereof, for treating rheumatoid arthritis in a patient in need thereof.

96. Use of a therapeutically effective amount of \(1-(\text{ethylsulfonyl})-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl]-1H-pyrazol-1-yl]azetidin-3-yl\) acetonitrile, or
pharmaceutically acceptable salt thereof, for treating psoriasis in a patient in need thereof.

97. Use of a therapeutically effective amount of 3-(cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile, or a pharmaceutically acceptable salt thereof, for treating psoriasis in a patient in need thereof.

98. Use of a therapeutically effective amount of {1-(propylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl}acetonitrile, or a pharmaceutically acceptable salt thereof, for treating psoriasis in a patient in need thereof.

99. Use of a therapeutically effective amount of 1-(cyclopropylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile or a pharmaceutically acceptable salt thereof, for treating psoriasis in a patient in need thereof.

100. Use of a therapeutically effective amount of {1-(ethylsulfonyl)-3-[3-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrrol-1-yl]azetidin-3-yl}acetonitrile, or a pharmaceutically acceptable salt thereof, for treating psoriasis in a patient in need thereof.

101. Use of a therapeutically effective amount of a compound of any one of claims 1-80, or pharmaceutically acceptable salt thereof, for manufacture of a medicament for treating an autoimmune disease in a patient in need thereof.

102. The use of claim 101 wherein said autoimmune disease is a skin disorder, multiple sclerosis, rheumatoid arthritis, psoriatic arthritis, juvenile arthritis, type I diabetes, lupus, inflammatory bowel disease, Crohn's disease, myasthenia gravis, immunoglobulin nephropathies, myocarditis, or autoimmune thyroid disorder.
103. The use of claim 102 wherein said autoimmune disease is rheumatoid arthritis.

104. The use of claim 102 wherein said autoimmune disease is a skin disorder, and is atopic dermatitis, psoriasis, skin sensitization, skin irritation, skin rash, contact dermatitis or allergic contact sensitization.

105. The use of claim 104 wherein said skin disease is psoriasis.

106. Use of a therapeutically effective amount of a compound of any one of claims 1-80, or pharmaceutically acceptable salt thereof, for manufacture of a medicament for treating an inflammatory disease in a patient in need thereof.

107. Use of a therapeutically effective amount of a compound of any one of claims 1-80, or pharmaceutically acceptable salt thereof, for manufacture of a medicament for treating cancer in a patient in need thereof.

108. The use of claim 107 wherein said cancer is a solid tumor, prostate cancer, renal cancer, hepatic cancer, breast cancer, lung cancer, thyroid cancer, Kaposi's sarcoma, Castleman's disease, pancreatic cancer, lymphoma, leukemia, or multiple myeloma.

109. Use of a therapeutically effective amount of \{1-(ethylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl\}acetonitrile, or pharmaceutically acceptable salt thereof, for manufacture of a medicament for treating rheumatoid arthritis in a patient in need thereof.

110. Use of a therapeutically effective amount of 3-(cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile, or a pharmaceutically acceptable salt thereof, for manufacture of a medicament for treating rheumatoid arthritis in a patient in need thereof.
111. Use of a therapeutically effective amount of \{1-(propylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl\}acetonitrile, or a pharmaceutically acceptable salt thereof, for the manufacture of a medicament for treating rheumatoid arthritis in a patient in need thereof.

112. Use of a therapeutically effective amount of \{1-(cyclopropylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile or a pharmaceutically acceptable salt thereof, for the manufacture of a medicament for treating rheumatoid arthritis in a patient in need thereof.

113. Use of a therapeutically effective amount of \{1-(ethylsulfonyl)-3-[3-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrrol-1-yl]azetidin-3-yl\}acetonitrile, or a pharmaceutically acceptable salt thereof, for the manufacture of a medicament for treating rheumatoid arthritis in a patient in need thereof.

114. Use of a therapeutically effective amount of \{1-(ethylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl\}acetonitrile, or a pharmaceutically acceptable salt thereof, for the manufacture of a medicament for treating psoriasis in a patient in need thereof.

115. Use of a therapeutically effective amount of \{3-(cyanomethyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]cyclobutanecarbonitrile, or a pharmaceutically acceptable salt thereof, for the manufacture of a medicament for treating psoriasis in a patient in need thereof.

116. Use of a therapeutically effective amount of \{1-(propylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-yl\}acetonitrile, or a pharmaceutically acceptable salt thereof, for the manufacture of a medicament for treating psoriasis in a patient in need thereof.

117. Use of a therapeutically effective amount of \{1-(cyclopropylsulfonyl)-3-[4-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrazol-1-yl]azetidin-3-ylacetonitrile or a
pharmaceutically acceptable salt thereof, for the manufacture of a medicament for treating psoriasis in a patient in need thereof.

118. Use of a therapeutically effective amount of \{1-(ethylosulfonyl)-3-[3-(7H-pyrrolo[2,3-d]pyrimidin-4-yl)-1H-pyrrol-1-yl]azetidin-3-yl\}acetonitrile, or a pharmaceutically acceptable salt thereof, for the manufacture of a medicament for treating psoriasis in a patient in need thereof.

119. A composition comprising the compound of claim 16 or a pharmaceutically acceptable salt thereof, and at least one pharmaceutically acceptable carrier.

120. The composition of claim 119 which is suitable for oral administration.

121. A composition comprising the compound of claim 74, 75, or 76 or a pharmaceutically acceptable salt thereof, and at least one pharmaceutically acceptable carrier.
