Such a composition may be a colored composition containing pigments or dyes.

5 The present invention also pertains to a process for stabilizing organic material subject to oxidative, thermal and/or actinic degradation which comprises adding to or incorporating into said material at least one compound as of the present invention.

Organic materials to be protected against the damaging effect of light, oxygen and/or heat are or contain in particular organic polymers, preferably synthetic organic polymers. The compounds of the present invention exhibit high thermal stability, compatibility and good
10 persistence in the materials they are incorporated in or applied to.

The present water compatible or water soluble sterically hindered alkoxyamines or hydroxy substituted alkoxyamine compounds are particularly effective towards preventing color fading of compositions comprising pigments or dyes.

The amount of instant stabilizer compounds employed in the compositions of this
25 invention are for example from 0.001% to 10% by weight, based on the weight of the composition and depending on the composition.

For example, the amount of the present stabilizers employed in body care products, household products, textiles and fabrics is from 0.001% to 10% by weight, or from 0.001% to
30 5% by weight, based on the weight of the composition.

The amount of instant stabilizer compounds employed in coatings is from 0.1 to 10% by weight, for example from 0.2 to 5% by weight, for example from 0.5 to 3% by weight

- 27 -

based on the weight of the solvent-free binder. The binders can be dissolved or dispersed in customary organic solvents or in water or can be solvent-free.

If combinations of stabilizers are used, the sum of all light stabilizers is for example
5 from 0.2 to 20% by weight, for instance from 0.5 to 5% by weight, based on the film-forming resin.

The ink jet ink according to this invention comprises 0.01 to 30% by weight, for example 0.1 to 20% by weight, of at least one present sterically hindered amine stabilizer,
10 based on the weight of the ink jet ink.

The ink jet recording material according to this invention comprises 1 to 10000 mg/m², for example 50 to 2000 mg/m², of at least one present sterically hindered amine stabilizer.

15 The present sterically hindered amines can be dissolved either directly in the ink or coating composition or added thereto in the form of an emulsion or suspension. As already mentioned, the present sterically hindered amines can be also applied to the recording material in a separate operation, alone or together with other already described components, as a solution in water or in a suitable organic solvent. Application can be made by spraying,
20 by sizing in a sizing press, by a separate coating operation or by immersion in a vat. After subjecting the recording material to such an after treatment, an additional drying step is necessary.

As mentioned, the stabilized compositions of the invention may optionally also
25 contain other conventional stabilizers. For example, the compositions of this invention may contain from 0.01 to 5%, preferably from 0.025 to 2%, and especially from 0.1 to 1% by weight of various conventional additives, such as the materials listed below, or mixtures thereof.

Example 19: Ink Jet Ink

Magenta and Yellow inks are extracted from an Hewlett-Packard three-color cartridge (HP C1823D). The stabilizer is weighed in an amount of 0.15 g into a test tube and dissolved in 2.85 g of either the magenta or yellow ink. The obtained ink is filtered and transferred into an emptied and carefully cleaned cartridge of a Deskjet 510 printer (Hewlett-Packard). A stepped image is then printed onto plain paper (sihl+eika) or, alternatively, onto Premium Photo paper from Hewlett-Packard (item code C6040A). The produced print is left to dry at 50°C under vacuum for two hours and thereafter irradiated behind a 5 mm thick window glass in an Atlas Ci-35 light fading device equipped with a Xenon lamp. The Atlas device is operated at 43°C, 50%RH without dark cycles and the light intensity is 461 W/m² (300-800 nm). The color density of each step is measured before and after exposure using a MacBeth

Specimens are tested at approximately 625 kilojoule intervals by performing color measurements on an Applied Color Systems

UV Exposure Testing

- 25 Test specimens exposed to UV radiation exhibit exceptional resistance to photodegradation when stabilized with light stabilizer systems comprising a combination of 2-(2-hydroxy-3,5-di-tert-amylphenyl)-2H-benzotriazole, an instant stabilizer and N,N',N'',N'''-tetrakis[4,6-bis(butyl-(1,2,2,6,6-pentamethylpiperidin-4-yl)amino)-s-triazin-2-yl]-1,10-diamino-

Example 59

Molded test specimens are prepared by injection molding thermoplastic olefin (TPO) pellets containing the instant compounds, pigments and other coadditives as described in
5 Example 58.

The light stable formulations are painted with one-pack paint systems and tested for TPO/paint interactions. Before painting, the test specimens are first washed in accordance with GM998-4801 and dried for 15 minutes at 200°F (94°C). Adhesion promoter is applied to
10 the dry film thickness of 0.2-0.4 mils. The samples are dried for five minutes before a 1K basecoat is applied to a film thickness of 1.2-1.4 mils. The painted panels are dried for three minutes, a clearcoat is then applied to a dry film thickness of 1.2-1.5 mils followed by ten minutes flash drying and a 30 minute oven bake at 250°F (121°C).

15 Paint adhesion is measured by Aggressive Adhesion Testing (proprietary test procedure conducted at Technical Finishing, Inc.) and Taber Scuff. Painted panels which retain greater than 80% of the paint finish are considered acceptable. After Aggressive Adhesion Testing, samples with less than 5% paint loss are deemed acceptable.

20 The instant compounds provide very low levels of paint loss when analyzed by the testing protocols listed above.

UV Exposure Testing

Test specimens exposed to UV radiation exhibit exceptional resistance to photodegradation when stabilized with light stabilizer systems comprised of a combination of

5 2-(3,5-di-*t*-amyl-2-hydroxyphenyl)-2H-benzotriazole, an instant stabilizer, and an oligomeric hindered amine. The oligomeric hindered amine is oligomer of N-[[2-(N-2,2,6,6-tetramethylpiperidin-4-yl)butylamino]-s-triazin-4-yl]-N,N'-bis(2,2,6,6-tetramethylpiperidin-4-yl)-1,6-hexanediamine terminated with 2,4-bis(dibutylamino)-s-triazin-6-yl. The Control sample consists of a stabilizer formulation commonly used in the industry to impart UV stability. All of

10 the samples contain Pigment Red 177.

- All formulations are base stabilized with 0.05% dialkylhydroxylamine in the final resin formulation.
- Polymer substrate is a commercially available polypropylene homopolymer - Profax 6501

15 (commercial supplier Montell Polyolefins).

- Color package is 0.25% Red 3B - Pigment Red 177, C.I. # 65300 in the final resin formulation.
- Each formulation contains a hydroxyphenyl benzotriazole UV absorber - 2-(2-hydroxy-3,5-di-*tert*-amylphenyl)-2H-benzotriazole.

20

- Each formulation contains 0.1% calcium stearate.
- Samples are 60 mil thick 2" x 2" injection molded plaques.
- UV exposures conducted under SAE J 1960 - Exterior Automotive conditions.

All additive and pigment concentrations in the final formulations are expressed as

25 weight percent on the resin.

The light stabilized formulations show much greater resistance to photodegradation than unstabilized specimens which fail quickly under the UV exposure conditions outlined above.

Example 61

Film grade polyethylene is dry blended with approximately 10.0% by weight of the test additives and then melt compounded at 200°C into "Masterbatch" pellets. The fully
5 formulated "Masterbatch" pellets are dry blended with polyethylene resin to get the desired final stabilizer concentrations. Typical formulations contain the instant compounds at levels from 0.05% to 2.0%, a metal stearate such as calcium stearate at 0.05% to 0.5%, a phosphite at 0% to 0.1%, a phenolic antioxidant at 0% to 1.25%, an N,N-dialkylhydroxyl-amine at 0% to 0.1% and optionally a hindered amine at 0% to 2.0%. This stabilized fully
10 formulated resin is then blown at 200°C into a 150 micron thick film on a DOLCI film line.

The blown films are exposed in an Atlas Xenon-Arc WeatherOmeter according to ASTM G26 at 63°C bpt, 0.35 W/m² at 340 nm with no spray cycle. Films are tested periodically for any change in elongation using an Instron 112 tensile tester. Failure in this
15 test is determined by observation of the loss of % elongation in the film. The longer it takes for this loss to occur, the more effective is the stabilizer system.

The films containing the instant compound mixture show good light stabilizing efficacy.
20

Example 62

Film grade polyethylene is dry blended with 10% loading of the test additives, as described in Example 61, and then melt compounded at 200°C into fully formulated master
25 batch pellets. The master batch pellets are dry blended with the polyethylene resin to get the final stabilizer concentration. The fully formulated resin is then blown at 200°C into a 150 micron thick film using a DOLCI film line.

The resulting films are exposed on a greenhouse on galvanized iron backing.
30 Treatment includes applications of pesticides on a regular basis (i.e. sodium N-methyldithiocarbamate, VAPAM' every six months and SESMETRIN' every month). Performance is measured by monitoring the percent residual elongation. Failure is defined as the time to a 50% loss of original elongation.

- 85 -

The films containing the instant compounds show good resistance to pesticides.

Example 63

- 5 Greenhouse film samples are prepared as described in Example 61, but in addition to the instant compounds also contain a metal stearate or a metal oxide. Typical formulations contain from 0.05 to 2% by weight of the instant hindered amines, 0.05 to 0.5% of a metal stearate such as calcium oxide, and 0.05 to 0.5% of a metal oxide such as zinc oxide or magnesium oxide.
- 10 Effectiveness is monitored as described in Example 62. The films containing the instant compounds exhibit good light stability.

Example 64

- 15 Molding grade polypropylene is dry blended with test additives and then melt compounded into pellets. In addition to the instant compounds, selected flame retardants are also included. The flame retardants are tris(3-bromo-2,2-bis(bromomethyl)propyl)phosphate, decabromodiphenyl oxide, ethylene bis-(tetrabromophthalimide), or ethylene bis-(dibromo-
- 20 norbornanedicarboximide). The pelletized fully formulated resin is then injection molded into test specimens using a Boy 50M laboratory model injection molder.
- 25 Test plaques are mounted in metal frames and exposed in an Atlas Ci65 Xenon Arc Weather-Ometer with intermittent light/dark cycles and water spray following the ASTM G26 test procedure. Specimens are tested at periodic intervals for changes in tensile properties. Failure in this test is determined by the observation of the loss of tensile properties. The longer it takes for the loss in properties to occur, the more effective is the stabilizer system.
- 30 The test samples containing the instant compounds exhibit good light stabilization properties.

- 86 -

Example 65

Resin materials of the general class known as thermoplastic elastomers, examples of which include, copolymers of styrene with butadiene or isoprene and/or ethylene-cobutylene
5 such as SBS, SEBS and SIS, are dry blended with the instant compounds and melt compounded into pellets. Typical formulations contain the instant compounds at levels from 0.05% to 2.0%, a metal stearate such as calcium stearate at 0.05% to 0.5%, pigments from 0% to 5%, UV absorbers at levels of 0.05% to 2.0%, phosphites at 0.0% - 0.1%, phenolic
10 antioxidants at 0.0% - 1.25%, N,N-dialkylhydroxylamine at 0.0% - 0.1%, and optionally other hindered amine stabilizers at levels of 0.0% to 2.0%.

The pelletized fully formulated resin is then processed into a useful article such as blown or cast extrusion into film; injection molded into a molded article; thermoformed into
15 molded articles; extruded into wire and cable housing; or rotational molded into hollow articles.

The materials containing the instant compounds exhibit stability against deleterious effects of UV light and thermal exposure.

20 Example 66

25 (3,3',5,5'-tetra-tert-butyl-1,1'-biphenyl-2,2'-diyl) phosphite], tetrakis(2,4-di-butylphenyl) 4,4'-biphenylenediphosphonite, tris(nonylphenyl) phosphite, bis(2,4-di-tert-butylphenyl) pentaerythrityl diphosphite, 2,2'-ethylidenebis(2,4-di-tert-butylphenyl) fluorophosphite and 2-butyl-2-ethylpropan-1,3-diyl 2,4,6-tri-tert-butylphenyl phosphite as well as the instant
30 compounds also exhibit stability against the deleterious effects of actinic light and thermal exposure.

Example 67 Polyester Urethane Coating

The hindered amine test stabilizers are incorporated into a two-component polyester urethane coating based on a commercially available polyester polyol (DESMOPHEN® 670-

Each coating formulation is applied by draw down onto transparent glass slides
10 approximately 4" x 6" to a film thickness of about 2 mils (0.002").

The instant compounds provide excellent solubility and compatibility in a polyester urethane coating.

Example 83 Photographic Layers

Chromogenic photographic layers are prepared by hand-coating a gelatine emulsion containing silver bromide, yellow coupler and an additive on a polyethylene-coated paper.

- 98 -

The composition of the layer is as given in following table, amounts are in mg/m²:

Component	Amount in the layer
Gelatine	5150
AgBr	520
Yellow coupler	1.07 mmol/m ²
Coupler solvent solv1	33% of the coupler weight/m ²
Additive	30% of the coupler weight/m ²
Hardener ha1	300
Surfactant su1	340

5 The layers are dried for 7 days in a ventilated cabinet.

The dried samples are exposed to white light through a stepwedge of 0.3 logE exposure steps. They are developed with the P94 process for negative color paper from Agfa-Gevaert, following the manufacturers' recommendations.

10

After exposure and processing, the remission density of the yellow dye is measured in the blue channel. The samples are then exposed in an Atlas WeatherOmeter behind a separate UV filter so as to receive 60kJ/cm² light energy. The UV filter consists of an emulsion coated onto a polyester transparent support, such that the layer contains 1g/m² of a benzotriazole UV absorber. The temperature is 43°C and the relative humidity 50%. The density loss starting from a blue-density of 1 is determined. Low ΔD number are desired.

15

The additives of the present invention improve the light stability of yellow photographic layers.

Example 85 Preformed Films for Lamination to Plastic Parts

20

The instant invention also pertains to protective and decorative films which are preformed, then applied to a substrate via a dry paint transfer process. These films consist of a single decorative layer which is applied to a carrier sheet, then laminated to a self-supporting, thermoformable backing sheet. The carrier sheet is then removed from the

- 100 -

opposite side of the film, exposing the decorative layer. The composite film/backing sheet then is thermoformed to a three-dimensional shape. Additionally, these films may also consist of multiple layers, where, for example, a thermoplastic, thermoformable clearcoat is applied to the carrier sheet, then hardened to form an optically clear film. A color coat is then
 5 applied to the exposed face of the clearcoat, and hardened, resulting in a clear coat/color coat paint film supported by the carrier. This composite is then laminated to a thermoformable backing sheet. The carrier sheet is removed, as above, and the composite clearcoat/colorcoat/backing is then thermoformed.

10 The polymeric resins for the above application must be thermoplastic, and may be fluoropolymer/acrylic blends.

Example 86 Coextrusion over Polycarbonate

15 A sheet composition suitable for use in weatherable glazing is prepared by coextrusion of a 0.010" thick light stabilized PMMA layer ("cap layer") over a 0.100" thick polycarbonate bulk substrate ("bulk layer"). Composition of the layers is given in the table below.

Cap Layer	100.00 phr PMMA 0.10 phr process stabilizer 0.25 phr Instant Compound 3.50 phr HPT UV absorber
Bulk Layer	100.00 phr Polycarbonate (e.g. LEXAN® 141 from GE) 0.08 phr phosphite process stabilizer 0.10 phr BZT UV absorber

20

The weatherability of the sheets of the present invention, containing the instant hindered amines is superior to a control sheet prepared without the use of NOR HALS in the cap layer.

25

Coextruded sheets are also prepared, replacing HPT UV absorber in the cap layer with each of 2,2'-methylene-bis(4-t-octyl-(6-2H-benzotriazol-2-yl)phenol) and 2-(2-hydroxy-

- 101 -

3,5-di- α -cumylphenyl)-2H-benzotriazole. Excellent results are achieved for these coextruded sheets containing the instant hindered amines.

BZT UV absorber is 2-(2-hydroxy-3,5-di- α -cumylphenyl)-2H-benzotriazole, HPT
 5 UV absorber is 4,6-diphenyl-2-(4-hexyloxy-2-hydroxyphenyl)-s-triazine. Phosphite stabilizer is tris(2,4-di-tert-butylphenyl) phosphite. Process stabilizer is a 80:20 blend of tris(2,4-di-tert-butylphenyl) phosphite and β -(3,5-di-tert-butyl-4-hydroxyphenyl)propionic acid octadecanoic ester.

10 **Example 87** Multilayer Polymer Structures

The instant compounds have utility as light stabilizers to protect light sensitive polymers present in multilayer polymer structures. Examples of such polymer structures include but are not limited to:

15

1.) Sheets and signs as seen in WO97/42261; and United States Patent No. 5,387,458 which are incorporated herein by reference;

2.) Solar Control Films of Various Construction as seen in United States Patent Nos.
 20 3,290,203, 3,681,179, 3,776,805 and 4,095,013, incorporated herein by reference; and

3.) Base stock or cap stock for coextrusion structures such as window profiles, laminates over automotive bumpers or auto exterior panels.

25 Window profiles include photosensitive polymers such as ABS, ASA, SAN or vinylogous polymers such as PVC. Automotive polymeric materials which are photosensitive include for example ABS, SAN, ASA and polycarbonate as well as blends such as PC/ABS, which include Pulse[®] from Dow, Cycloy[®] from GE, Bayblend[®] from Bayer, PC/PBT known as Xenoy[®] from GE, PC/ASA such as Geloy[®] from GE, and the "W-4" polymer as disclosed
 30 by General Electric Company (Modern Plastics May 2000 pages 90-91).

The instant hindered amines of this disclosure act to protect against photolytic degradation of a polymer component, or an incorporated pigment, dye colorant, or protect adhesive or "tie-layers" in such constructions.

- 102 -

A multilayer polymer composite is prepared by different routes, such as co-extrusion of one or more polymer compositions to form the multilayer composite. Alternatively, compression molding or thermoforming of one or polymer compositions produces the desired polymer composite. In particular, these techniques are used in the manufacture of signage, typically composed of one or more layers of polymeric materials formed on top of a base material (metal sheet, plastic, etc).

Examples of potential polymeric materials that may comprise one or more sections of the laminate, sign, sheet or composite structure may include:

polycarbonate
polyesters such as PET, PBT, PEN, PTT
acrylics such as PMMA and acrylate copolymer or terpolymers
polyolefins
vinylous polymers and copolymers composed of vinyl chloride, vinyl acetate, vinylidene chloride, vinylidene fluoride.

The present hindered amines each provide excellent stabilization to such constructions.

Example 88 Photo-Cured White Pigmented Coating

A model white UV-curable coating for wood is prepared based on polyester acrylate chemistry with a titanium dioxide level of 25 % by weight. A base formulation is prepared which is complete excluding a photoinitiator hindered amine of component (b):

Rutile TiO_2 , 100.0 g
Ebercyl[®] 830, 240.0 g
HDODA, 42 g
TMPTA, 18.0 g

The TiO_2 is added as a 63 % dispersion in a portion of the Ebercyl[®] 830. Ebercyl[®] 830 is a hexafunctional polyester acrylate oligomer. HDODA is 1,6-hexanediol diacrylate.

- 103 -

TMPTA is trimethylolpropane triacrylate. The Ebecryl[®] products as well as the acrylate monomers are available from UCB Chemicals Corp., Smyrna, GA.

5 To a portion of the base formulation is added a photoinitiator mixture of bis(2,4,6-trimethylbenzoyl)phenylphosphine oxide /1-hydroxycyclohexylphenylketone in a 1:2 ratio. The photoinitiator mixture is 3.0 weight percent of the total formulation.

10 The formulations further contain 1 % each of the instant hindered amines of the present disclosure.

Eight replicate prints of each formulation are prepared. Films are prepared with a draw-down bar over a white Scotchcal[®] vinyl film from 3M. Samples are cured with a moving belt at 58 feet/min. under two medium pressure mercury lamps perpendicular to the belts @ 300 watts/in. each. The prints received one pass under the lamps. Irradiance received is 15 618 mJ/cm². Final cured thickness is 2.1 mils (53 microns).

The present hindered amines provide excellent stabilization to the photo-cured coatings.
