international application published under the patent cooperation treaty (pct)

Title: CASING FOR A COSMETIC ARTICLE

Abstract: The invention relates to a casing (50) for a cosmetic article (52), comprising a base (58) having an inner surface (59) which accommodates a mirror (60); a lid (62) rotatably mounted relative to the base (58) and an intermediate tray (66) located between the base (58) and the lid (62) for accommodating the cosmetic article (52), the intermediate tray (66) being slidably mounted to the base (58) wherein rotation of the lid (62) from the closed position to the open position causes the tray (66) to slide from the retracted position to the extended position.
Declarations under Rule 4.17:
— of inventorship (Rule 4.17(iv))

Published:

FIELD OF THE INVENTION

The invention relates to a casing for a cosmetic article.

BACKGROUND OF THE INVENTION

Casings containing cosmetic articles are known, and typically comprise a base having one or more recesses for accommodating cosmetic articles, such as cosmetic powder pans and associated cosmetic applicators, and a cover which is hinged to the base for closing or opening the casing.

In some casings, a mirror may be fixed to an inner surface of the cover, so that when the user opens the casing, he or she can simultaneously access the cosmetic article and make the mirror appear in a single gesture, the mirror facilitating the application of the relevant cosmetic product.

In other casings, the cover comprises a window through which the cosmetic article can be viewed when the cover is in the closed position. Such a window allows the appearance of the cosmetic article housed within the casing to be displayed, without the need to open the casing. Such a presentation is particularly advantageous when the casings are displayed in retail stores. As the cosmetic articles are visible through the cover, it is not necessary to provide separate descriptions of the articles, such as photographs, colour charts, or separate testing samples. However, due to the presence of a window in the cover, it is generally not possible to include a mirror in the cover. To overcome this, casings have been known to provide windows in their base
but this is far from convenient, as it also means that the pan in which the cosmetic product is prepared has to be transparent. This limits the pan to plastic material, and still does not allow the consumer to see the cosmetic product when it is displayed on the shelf.

OBJECT OF THE INVENTION

An aim of the invention is therefore to provide a casing for a cosmetic article, which not only can accommodate a mirror, to facilitate the application of the cosmetic product, but which simultaneously can include a window on the top surface, ie the cover, to enable a visual inspection of the cosmetic articles when the casing is closed.

SUMMARY OF THE INVENTION

According to the invention there is provided a casing for a cosmetic article, the casing comprising:

a base having an inner surface which accommodates a mirror;

a lid rotatably mounted to the base, the lid being rotatable, relative to the base, between a closed position and an opened position; and

an intermediate tray located between the base and the lid for accommodating the cosmetic article, the intermediate tray being slidably mounted to the base so as to be movable relative to the base between a retracted position, in which the intermediate tray substantially covers the inner surface of the base, and an
extended position, in which the intermediate tray exposes the mirror,

wherein rotation of the lid from the closed position to the open position causes the tray to slide from the retracted position to the extended position.

In an embodiment, when the lid is in the opened position and the intermediate tray is in the extended position the mirror is exposed.

In an embodiment, the lid comprises an inspection window, so that when the lid is in the closed position the cosmetic article can be visually inspected through the inspection window.

In an embodiment, the intermediate tray is mounted to the lid so that when the lid is rotated from the closed position to the opened position, the intermediate tray automatically slides from the retracted position to the extended position so as to expose the mirror.

In an embodiment, the base comprises a first guide channel and the intermediate tray comprises a first guide pin that can slide along the first guide channel of the base as the intermediate tray slides between the retracted and extended positions.

In an embodiment, the first guide channel allows the simultaneous rotation and translation of the first guide pin within the first guide channel.

In an embodiment, the lid is rotatably mounted to the base about a first axis (axis of rotation), and the intermediate tray is slidably mounted to the base according to a second axis (axis of sliding), the second axis being perpendicular to the first axis.
In a first embodiment, the intermediate tray is rotatably mounted to the lid, with the rotatable mounting between the lid and the base and the rotatable mounting between intermediate tray and the lid defining a hinging arrangement to cause the automatic sliding of the intermediate tray relative to the base when the lid is moved from the closed position to the opened position.

In a second embodiment, the intermediate tray is slidably mounted to the lid so as to be slidably movable, relative to the lid, when the lid is rotated from the closed position to the opened position.

In an embodiment, the sliding movement of the intermediate tray relative to the base occurs simultaneously with the sliding movement of the intermediate tray relative to the lid.

In an embodiment, the lid comprises a second guide channel and the intermediate tray comprises a second guide pin that can slide along the second guide channel of the lid as the lid is rotated from the closed position to the opened position.

In an embodiment, the intermediate tray is rotatably mounted to the lid, with the second guide channel allowing the simultaneous rotation and translation of the second guide pin within the second guide channel.

In an embodiment, the casing includes a support arm having a first end which is hinged to the base and a second end which is hinged to the intermediate tray, so as to guide the sliding movement of the intermediate part relative to the base and the lid.

In an embodiment, the base defines a recess for snugly accommodating the intermediate tray when the lid is in the closed position.
BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 shows an exploded perspective view of a casing for a cosmetic article according to a first embodiment of the present invention;

Figure 2 shows a perspective view of the casing of Figure 1 in a fully closed position;

Figure 3 shows a perspective view of the casing of Figure 1 in a fully opened position;

Figures 4 to 6 show cross-sectional side views of the casing of Figures 1 to 3, as the casing moves from a fully closed position (Figure 4), to a semi-opened position (Figure 5) and then finally to a fully opened position (Figure 6);

Figure 7 shows a perspective view of a casing for a cosmetic article according to a second embodiment of the present invention, the casing being shown in a fully opened position;

Figure 8 shows a perspective view of the casing of Figure 7 in a fully closed position; and

Figures 9 to 11 show cross-sectional side views of the casing of Figures 7 and 8, as the casing moves from a fully closed position (Figure 9), to a semi-opened position (Figure 10) and then finally to a fully opened position (Figure 11).
DESCRIPTION OF PREFERRED EMBODIMENTS

Referring first to Figures 1 to 6, a casing 10 for a cosmetic article 12 is provided. As indicated above, the cosmetic article 12 may comprise a cosmetic powder pan 14 and an associated cosmetic applicator 16. The casing 10 comprises a base 18 having an inner surface 19 that typically accommodates a mirror 20, as well as a lid 22 to cover the base 18. The lid 22 typically comprises a translucent or transparent inspection window 24, but the lid 22 may also be opaque. In the illustrated embodiments, the inspection window 24 occupies the entire area of the lid 22, but clearly the inspection window 24 may be provided in a dedicated area within the lid 22, so as to, for example, only display the cosmetic powder pan 14.

The lid 22 is movable, relative to the base 18, between a closed position, as shown in Figures 2 and 4, and an opened position, as shown in Figures 3 and 6 (and any intermediate position, such as the semi-opened position shown in Figure 5). In the illustrated embodiment, the lid 22 is rotatably mounted to the base 18, with the lid 22 comprising a first pair of ears or lugs 26.1, 26.2 that are rotatably fitted to a corresponding pair of pins 28.1, 28.2 extending from the base 18. This arrangement constitutes hinge means allowing rotation of the lid 22 relative to base 18, in a well known manner.

The free edges 22.1, 18.1 of the lid 22 and base 18, respectively, may be fitted with complementary snap-fit formations 22.2, 18.2, respectively, to enable the base 18 and the lid 22 to be securely fastened to each other when the lid 22 is in a closed position.

The casing 10 further comprises an intermediate tray 30 located between the base 18 and the lid 22, with the base 18 defining a recess 18.3 for snugly accommodating the intermediate tray 30 when the lid 22 is in the closed position. The intermediate tray 30 in turn accommodates or houses the
cosmetic article 12 either loosely or within dedicated recesses 30.1, 30.2 for the cosmetic powder pan 14 and the applicator 16, respectively.

The intermediate tray 30 is slidably mounted to the base 18 so as to be movable relative to the base 18 from a retracted position, as shown in Figures 2 and 4, in which the intermediate tray 30 substantially covers the base 18, to a semi-extended position, as shown in Figure 5, and a fully extended position, in which the intermediate tray 30 exposes the inner surface 19 of the base 18 and thus, typically, the underlying mirror 20, as shown in Figures 3 and 6.

As best shown in Figure 3, the lid 22 is rotatably mounted to the base 18 about a first axis of rotation 32, and the intermediate tray 30 is slidably mounted to the base 18 according to a second axis of sliding 34, the second axis 34 being perpendicular to the first axis of rotation 32.

In the retracted position, as shown in Figures 2 and 4, the mirror 20 is sandwiched between the base 18 and the intermediate tray 30.

Thus, in use, but as will be explained in more detail further below, when the lid 22 is in the closed position the cosmetic article 12 can be visually inspected through the inspection window 24, and when the lid 22 is in the opened position and the intermediate tray 30 is in the extended position the mirror 20 is exposed.

In the illustrated embodiment, the intermediate tray 30 is mounted to the lid 22 so that when the lid 22 is moved from the closed position to the opened position, the intermediate tray 30 is pulled by the lid 22 and automatically slides from the retracted position to the extended position so as to expose the inner surface 19, and thus the mirror 20. In particular, the intermediate tray 30 is rotatably mounted to the lid 22, with the lid comprising a second pair of ears or lugs 22.3, 22.4 that are rotatably fitted to a corresponding pair of pins 30.3,
30.4, respectively, extending from the side walls of the intermediate tray 30. This allows rotation of the tray 30 relative to the lid 22 while the lid 22 is moved, with the base 18 having slots 18.4, 18.5 on the inner parts of its side wall to accommodate the second pair of ears or lugs 22.3, 22.4 of the lid 22, as best shown in Figure 2.

The rotatable mounting between the lid 22 and the base 18 and the rotatable mounting between intermediate tray 30 and the lid 22 defines a hinging arrangement to cause the automatic sliding of the intermediate tray 30 relative to the base 18 when the lid 22 is moved from the closed position to the opened position.

In an embodiment, the base 18 comprises a pair of opposed first guide channels 18.6, 18.7 and the intermediate tray 30 comprises a corresponding pair of first guide pins 30.5, 30.6 extending from the side walls of the tray 30. The first guide channels 18.6, 18.7 are rectilinear and extend along a direction which is perpendicular to the axis of rotation of the lid 22 relative to the base 18. The length of the first guide channels 18.6, 18.7 is designed so as to limit the length of travel of the tray 30 between its retracted and extended positions. Thus, when the first guide pins 30.5, 30.6 abut against the ends of the first guide channels 18.6, 18.7, this defines the fully opened position shown in Figures 3 and 6. In one version, the first guide channels 18.6, 18.7 extend up to approximately midway of the length of the base 18, with this distance corresponding substantially with the width of the underlying mirror 20.

The first guide pins 30.5, 30.6 are snugly accommodated within the first guide channels 18.6, 18.7 so that the pins 30.5, 30.6, and thus the tray 30, can slide along the first guide channels 18.6, 18.7 of the base 18 as the intermediate tray 30 slides between the retracted and extended positions. In addition, since the lid 22 is rotatably mounted to the base 18, the first guide channels 18.6,
18.7 allow the simultaneous rotation and translation of the first guide pins 30.5, 30.6 within the first guide channels 18.6, 18.7.

Turning now to Figures 7 to 11, a second embodiment of a casing 50 for a cosmetic article 52 is provided, the cosmetic article 52 again typically comprising a cosmetic powder pan 54 and an associated cosmetic applicator 56.

The casing 50 comprises a base 58 having an inner surface 59 that typically accommodates a mirror 60, as well as a lid 62 to cover the base 58. Significantly, the mirror 60 substantially covers the entire inner surface 59 of the base 58, and is thus significantly larger than the mirror 20 used in the first embodiment shown in Figures 1 to 6. The lid 62 typically comprises a translucent or transparent inspection window 64, which can either occupy the entire area of the lid 62, as shown, or take up a smaller area of the lid 62 so as to, for example, only display the cosmetic powder pan 54. In one version, however, the lid 62 may be opaque.

The lid 62 is movable, relative to the base 58, between a closed position, as shown in Figures 8 and 9, and an opened position, as shown in Figures 7 and 11 (and any intermediate position, such as the semi-opened position shown in Figure 10). In the illustrated embodiment, the lid 62 is rotatably mounted to the base 58 in any one of a number of well known ways, such as with the use of ears or lugs on the lid that are rotatably fitted to pins extending from the base 58, as described above with reference to the first embodiment.

As is well known in the art, the free edges 62.1, 58.1 of the lid 62 and base 58, respectively, may be fitted with complementary snap-fit formations 62.2, 58.2, respectively, to enable the base 58 and the lid 62 to be securely fastened to each other when the lid 62 is in a closed position.
The casing 50 further comprises an intermediate floating tray 66 located between the base 58 and the lid 62, with the base 58 defining a recess 58.3 for snugly accommodating the intermediate tray 66 when the lid 62 is in the closed position. As described above, the intermediate tray 66 in turn may accommodate or house the cosmetic article 52 either loosely or within dedicated recesses 66.1, 66.2 for the cosmetic powder pan 54 and the applicator 56, respectively.

The intermediate tray 66 is slidably mounted to both the base 58 and lid 62 so as to be movable relative, to the base 58 and the lid 62, from a retracted position, as shown in Figures 8 and 9, in which the intermediate tray 66 substantially covers the base 58 and the mirror 60, to a semi-extended position, as shown in Figure 10, and a fully extended position, in which the intermediate tray 66 exposes fully the base 58 and thus the mirror 60, as shown in Figures 7 and 11. The sliding action of the intermediate tray 66 relative to the base 58 occurs simultaneously with the sliding action of the intermediate tray 66 relative to the lid 62.

Thus, in use, but as will be explained in more detail further below, when the lid 62 is in the closed position the cosmetic article 52 can be visually inspected through the inspection window 64, and when the lid 62 is in the opened position the intermediate tray 66 is pulled away from the base 58 so as to expose the underlying mirror 60. In particular, the intermediate tray 66 is mounted to the base 58 and to the lid 62 so that when the lid 62 is moved from the closed position to the opened position, the intermediate tray 66 is pulled by the lid 62 and automatically slides, relative to both the base 58 and the lid 62, from the retracted position to the extended position so as to expose the mirror 60.

In an embodiment, the base 58 comprises a pair of opposed first guide channels 58.4, 58.5 and the intermediate tray 66 comprises a corresponding
pair of first guide pins 66.3, 66.4 extending from the side walls of the tray 66. Similarly, the lid 62 comprises a pair of second guide channels 62.3, 62.4 and the intermediate tray 66 comprises a pair of second guide pins 66.5, 66.6 that can slide along the second guide channels 62.3, 62.4 of the lid 62 as the lid 62 is moved from the closed position to the opened position (and thus as the tray 66 moves from the retracted position to the extended position). The second guide channels 62.3, 62.4 are rectilinear and extends along a direction which is perpendicular to the axis of rotation of the lid 62 relative to the base 58. The guide pins 66.3, 66.4, 66.5, 66.6 are snugly accommodated within the guide channels 58.4, 58.5, 62.3, 62.4 and are constrained to travel securely along the length of these guide channels 58.4, 58.5, 62.3, 62.4.

The lengths of the first and second guide channels 58.4, 58.5, 62.3, 62.4 are designed so as to limit the length of travel of the tray 66 between its retracted and extended positions. Thus, when the first guide pins 66.3, 66.4 abut against the ends of the first guide channels 58.4, 58.5, the second guide pins 66.5, 66.6 abut against the ends of the second guide channels 62.3, 62.4, so as to define the fully opened position shown in Figures 7 and 11. In one version, the first guide channels 58.4, 58.5 extend substantially along the entire length of the base 58, with this distance corresponding substantially with the width of the underlying mirror 60, and the second guide channels 62.3, 62.4 extend up to approximately midway of the length of the lid 62.

The casing 50 includes a pair of support arms 68, 70 having a first end which is hinged to the base 58 and a second end which is hinged to the intermediate tray 66, so as to guide the sliding movement of the intermediate tray 66 relative to the base 58 and the lid 62.

As best shown in Figure 7, the lid 62 is rotatably mounted to the base 58 about a first axis of rotation 72, the intermediate tray 66 is slidably mounted to the base 58 according to a second axis of sliding 74, and the intermediate tray 66
is slidably mounted to the lid 62 according to a third axis of sliding 76. The second and third axes 74, 76 are perpendicular to the first axis of rotation 72.

The present invention thus provides a cosmetic article casing having a window to allow a user to visually inspect the contents of the casing, but that allows the user, in a single gesture, to simultaneously provide access to the cosmetic article within the casing and to expose a mirror to facilitate application of the cosmetic product.
CLAIMS

1. A casing (10, 50) for a cosmetic article (12, 52), the casing comprising:

   a base (18, 58) having an inner surface (19, 59) which accommodates a mirror (20, 60);

   a lid (22, 62) rotatably mounted to the base (18, 58), the lid being rotatable, relative to the base (18, 58), between a closed position and an opened position; and

   an intermediate tray (30, 66) located between the base (18, 58) and the lid (22, 62) for accommodating the cosmetic article (12, 52), the intermediate tray (30, 66) being slidably mounted to the base (18, 58) so as to be movable relative to the base between a retracted position, in which the intermediate tray (30, 66) substantially covers the inner surface (19, 59) of the base, and an extended position, in which the intermediate tray (30, 66) exposes the mirror (20, 60),

   wherein rotation of the lid (22, 62) from the closed position to the open position causes the tray (30, 66) to slide from the retracted position to the extended position.

2. The casing of claim 1, wherein when the lid (22, 62) is in the opened position and the intermediate tray (30, 66) is in the extended position, the mirror (20, 60) is exposed.

3. The casing of claim 2, wherein the base (18, 58) defines a recess (18.3, 58.3) for snuggly accommodating the intermediate tray (30, 66) when the lid (22, 62) is in the closed position, with the mirror (20, 60) accordingly
being sandwiched between the base (18, 58) and the intermediate tray (30, 66).

4. The casing of one of claims 1 to 3, wherein the lid (22, 62) comprises an inspection window (24, 64), so that when the lid (22, 62) is in the closed position the cosmetic article (12, 52) can be visually inspected through the inspection window (24, 64).

5. The casing of one of claims 1 to 4, wherein the intermediate tray (30, 66) is mounted to the lid (22, 62) so that when the lid (22, 62) is rotated from the closed position to the opened position, the intermediate tray (30, 66) automatically slides from the retracted position to the extended position so as to expose the mirror (20).

6. The casing of one of claims 1 to 5, wherein the base (18, 58) comprises a first guide channel (18.6, 18.7, 58.4, 58.5) and the intermediate tray (30, 66) comprises a first guide pin (30.5, 30.6, 66.3, 66.4) that can slide along the first guide channel of the base as the intermediate tray (30, 66) slides between the retracted and extended positions.

7. The casing of claim 6, wherein the first guide channel (18.6, 18.7, 58.4, 58.5) allows the simultaneous rotation and translation of the first guide pin (30.5, 30.6, 66.3, 66.4) within the first guide channel.

8. The casing of one of claims 1 to 7, wherein the lid (22, 62) is rotatably mounted to the base (18, 58) about a first axis (32, 72), and the intermediate tray (30, 66) is slidably mounted to the base (18, 58) according to a second axis (34, 74), the second axis being perpendicular to the first axis.
9. The casing of one of claims 1 to 8, wherein the intermediate tray (30, 66) is rotatably mounted to the lid (22, 62), with the rotatable mounting between the lid (22, 62) and the base (18, 58) and the rotatable mounting between intermediate tray (30, 66) and the lid (22, 62) defining a hinging arrangement to cause the automatic sliding of the intermediate tray (30, 66) relative to the base (18, 58) when the lid is moved from the closed position to the opened position.

10. The casing of one of claims 1 to 9, wherein the intermediate tray (66) is slidably mounted to the lid (62) so as to be slidably movable, relative to the lid (62), when the lid is rotated from the closed position to the opened position.

11. The casing of claim 10, wherein the sliding movement of the intermediate tray (66) relative to the base (58) occurs simultaneously with the sliding movement of the intermediate tray (66) relative to the lid (62).

12. The casing of one of claims 10 and 11, wherein the lid (62) comprises a second guide channel (62.3, 62.4) and the intermediate tray (66) comprises a second guide pin (66.5, 66.6) that can slide along the second guide channel (62.3, 62.4) of the lid (62) as the lid (62) is rotated from the closed position to the opened position.

13. The casing of claim 12, wherein the intermediate tray (66) is rotatably mounted to the lid (62), with the second guide channel (62.3, 62.4) allowing the simultaneous rotation and translation of the second guide pin (66.5, 66.6) within the second guide channel (62.3, 62.4).

14. The casing of one of claims 10 to 13, including a support arm (68, 70) having a first end which is hinged to the base (58) and a second end
which is hinged to the intermediate tray (66), so as to guide the sliding movement of the intermediate tray (66) relative to the base (58) and the lid (62).
