(57) **ABSTRACT**

A golf club head having multiple structural columns is disclosed herein. A body comprises a face section, a sole section, and a crown or return section, and defines a hollow interior. Each of the structural columns extends from the crown or return section to the sole section within the hollow interior to reduce stresses placed on the face section during impact with a golf ball. The structural columns are all located within 1 inch of a rear surface of the face section measured along a plane normal to the center of the face, and are spaced a distance of 0.500 to 2.00 inch from one another within the hollow interior.

BACKGROUND OF THE INVENTION

[0003] Field of the Invention

[0004] The present invention relates to a golf club head. More specifically, the present invention relates to a golf club head with stress-reducing features connecting a crown portion with a sole portion via a hollow interior and disposed proximate a striking face section.

[0005] Description of the Related Art

[0006] The prior art discloses various golf club heads having interior structures. For example, Kosmatka, U.S. Pat. No. 6,299,547 for a Golf Club Head With an Internal Striking Plate Brace, discloses a golf club head with a brace to limit the deflection of the striking plate, Yabu, U.S. Pat. No. 6,852,038 for a Golf Club Head And Method of Making The Same, discloses a golf club head with a sound bar, Galloway, U.S. Pat. No. 7,118,493 for a Multiple Material Golf Club Head, discloses a golf club head with a composite aft body having an interior sound component extending upward from a sole section of a metal face component, Seluga et al., U.S. Pat. No. 8,834,294 for a Golf Club Head

With Center Of Gravity Adjustability, discloses a golf club head with a tube having a mass for adjusting the CG of a golf club head, and Dawson et al., U.S. Pat. No. 8,900,070 for a Weighted Golf Club Head discloses a golf club head with an interior weight lip extending from the sole towards the face. However, the prior art fails to disclose an interior structure that increases ball speed through reducing stress in the striking face section at impact, with a minimal increase in mass to the golf club head.

BRIEF SUMMARY OF THE INVENTION

[0007] The golf club head comprises interior structures connecting a crown section to a sole section to reduce the stress in a striking face section during impact with a golf ball. In some embodiments, the interior structures are hollow tubes or solid rods composed of a titanium alloy.

[0008] One aspect of the present invention is a golf club head comprising a cast metal body. The cast metal body comprises a toe structural connector, a heel structural connector, a striking face section, a crown return portion and a sole section. The toe structural connector comprises a body with a crown end, a sole end, a forward surface, a rearward surface, a heel surface and a toe surface. The heel structural connector comprises a body with a crown end, a sole end, a forward surface, a rearward surface, a heel surface and a toe surface. The striking face section has an exterior surface, an interior surface, an upper perimeter and a lower perimeter. The crown return portion extends rearward from the upper perimeter of the striking face section. The sole section portion extends rearward from the lower perimeter of the striking face section. The crown end of the toe structural connector is connected to the crown return portion. The crown end of the heel structural connector is connected to the crown return portion. The sole end of the toe structural connector is connected to the sole section. The sole end of the heel structural connector is connected to the sole section. A contact surface area between the crown return portion and both of the crown end of the toe structural connector and the crown end of the heel structural connector ranges from 1% to 5% of the surface area of the crown return portion. The toe structural connector and the heel structural connector attenuate movement of the crown return portion and the sole section when the striking face section impacts a golf ball.

[0009] In some embodiments, each of the structural connectors comprises a structure selected from the group consisting of a solid rod and a hollow tube. In another, further embodiment, each of the structural connectors is a solid rod composed of a metal material selected from the group consisting of titanium alloy and steel. In an alternative embodiment, each of the structural connectors is located no more than 0.25 inch from the rear face surface along the vertical plane extending through the face center perpendicular to the striking face section.

[0010] Another aspect of the current invention is golf club head comprising a metal body comprising a striking face section, a sole section extending from a lower edge of the striking face section, and a return section extending from an upper edge of the striking face section, the return section and sole section defining an upper opening, and the striking face section, sole section, and return section defining a hollow body interior, and first and second structural connectors disposed within the hollow body interior and extending from the return section to the sole section, wherein each of the first and second structural connectors is a solid metal rod,

wherein no portion of either the first or second structural connectors makes contact with the striking face section, wherein the golf club head satisfies the equation $V_{ballnorm} \geq 0.0356x + 140.82$, and wherein

$$V_{ballnorm} = \frac{m_h V_{inh} + m_h V_{inh} \left[\frac{V_{cr} \left(1 + \frac{m_b}{m_c} \right) + \frac{m_b}{m_c} + \frac{V_{br}}{V_{bin}} \left(1 + \frac{m_b}{m_p} \right) + \frac{m_b}{m_p} - 0.822 \right]}{m_h + m_b}.$$

In a further embodiment, the golf club head may comprise a crown insert that may be permanently affixed to the body to close the upper opening. In some embodiments, the crown insert may be composed of a carbon composite material, and each of the first and second stiffening members may be integrally cast with the body.

[0011] Yet another aspect of the present invention is a golf club head comprising a metal body comprising a striking face section, a sole section extending from a lower edge of the striking face section, a return section extending from an upper edge of the striking face section, and an aft end opposite the striking face section, the return section and sole section defining an upper opening, and the striking face section, sole section, and return section defining a hollow body interior, first and second structural connectors disposed within the hollow body interior and extending from the return section to the sole section, and a carbon composite crown insert permanently affixed to the body to close the upper opening, wherein each of the first and second structural connectors is located closer to the striking face section than to the aft end within the hollow body interior, wherein the golf club head has a volume of 420 cubic centimeters to 470 cubic centimeters, wherein the golf club head satisfies the equation $V_{ballnorm} \geq 0.0356x + 141.19$, and wherein

$$V_{ballnorm} = \frac{m_h V_{inh} + m_h V_{inh} \left[\frac{V_{cr} \left(1 + \frac{m_b}{m_c} \right) + \frac{m_b}{m_c} + \frac{V_{br}}{V_{bin}} \left(1 + \frac{m_b}{m_p} \right) + \frac{m_b}{m_p} - 0.822 \right]}{m_h + m_b}.$$

[0012] In some embodiments, the first structural connector comprises an upper end proximate the return section and a lower end proximate the sole section, the upper end is spaced a first distance from the striking face section, and the lower end is spaced a second distance from the striking face section that is greater than the first distance. In a further embodiment, the first distance is 0.120 inch to 0.150 inch, and the second distance is 0.180 inch to 0.210 inch. In another embodiment, each of the first and second structural connectors has a length of 1.00 inch to 2.50 inches, the first structural connector extends approximately parallel with the second structural connector, and the first structural connector is spaced a distance of 0.75 inch to 1.50 inch from the second structural connector.

[0013] Having briefly described the present invention, the above and further objects, features, and advantages thereof will be recognized by those skilled in the pertinent art from the following detailed description of the invention when taken in conjunction with the accompanying drawings.

[0034] FIG. 19 is a front elevation view of a golf club head with structural columns with a face removed to illustrate the interior of the golf club head.

DETAILED DESCRIPTION OF THE INVENTION

[0035] A preferred embodiment of the golf club head 10 with structural connectors is shown in FIGS. 1-8. The golf club head 10 preferably includes a body 20 having a striking face section 30 with a face center 34, a return section 32 extending rearwards away from an upper edge 31 of the striking face section 30, sole section 22 extending rearwards away from a lower edge 33 of the striking face section 30, a hosel 24 for engaging a shaft, a heel end 23, a toe end 25, an upper opening 26, a hollow interior 27, and an aft end 28.

A crown section 40 is comprised of the return section 32 and a crown insert 42 that is placed over the upper opening 26 to enclose the hollow interior 27. The body 20 also includes three cutouts 70, 72, 74 in a center area 21 of the sole section 22, which are closed by a cover piece 80 having a density that is lower than the density of the material used to make the body 20. Each of the crown section 40 and cover piece 80 preferably is composed of a carbon composite material, while the body 20 is composed of a metal material such as titanium alloy or steel.

[0036] Within the hollow interior 27, two structural connectors 50, 52 extend from the sole section 22 upward to the return section 32 approximately parallel with the rear surface 36 of the striking face section 30 and with each other. In an alternative embodiment, the structural connectors 50, 52 extend to the crown insert 42 instead; what is important is that the structural connectors 50, 52 connect the crown section 40 to the sole section 22 proximate the striking face section 30, without making contact with any portion of the striking face section 30, even when the striking face section 30 impacts a golf ball. The structural connectors 50, 52 must, in any event, be closer to the striking face section 30 than to the aft end 28 of the body 20.

[0037] As shown in FIG. 3, the preferred embodiment has two structural connectors 50, 52, each of which is a solid rod composed of a lightweight, strong metal material such as titanium alloy or steel, though in an alternative embodiment the structural connectors 50, 52 each may be a hollow tube or other hollow structure made of a strong lightweight metal or a composite material. In another embodiment, the golf club head 10 may include both the solid rod and hollow types of structural connectors 50. The structural connectors 50, 52 preferably are co-cast with the body 20 using a wax molding process, though in alternative embodiments may be added after the body 20 is manufactured and secured to the body 20 via welding, brazing, solder, or adhesive, and/or mechanically.

[0038] In the preferred embodiment, each of the structural connectors 50, 52 has a diameter of 0.050 inch to 0.200 inch and a length of 1 to 2.5 inches. The structural connectors 50, 52 are both preferably located within 1 inch of the rear surface 36 of the striking face section 30 measured along a vertical plane 60 extending through the face center 34 perpendicular to the striking face section 30. No portion of any structural connectors 50, 52 should be located outside of this 1-inch range; in fact, it is more preferable for each structural connector 50, 52 to be located even closer to the rear surface 36 of the striking face section 30. In the preferred embodiment, the structural connectors are spaced 0.136 inch to 0.210 inch from the rear surface 36, with the upper end 50a, 52a of each structural connector 50, 52 spaced a distance D₁ that is slightly closer to the rear surface 36 than the spacing D₂ of the lower end 50b, 52b. In the preferred embodiment, D₁ ranges from 0.120 inch to 0.150 inch, while D₂ ranges from 0.180 inch to 0.210 inch. The structural connectors 50, 52 are also spaced from one another by a distance D₃ of 0.500 to 2.00 inch, more preferably approximately 0.75 to 1.50 inch, and most preferably approximately 1.00 inch. This positioning of the structural connectors 50, 52 optimizes the normalized ball speed relationship to Characteristic Time (CT), as measured in μs by the U.S. Golf Association (USGA) CT test.

[0039] Normalized ball speed removes the variable effect of a golf club head's mass and loft, and the construction of

a particular golf ball, from testing the speed of a golf ball upon impact with any given golf club head, including the golf club head 10 of the present invention; in other words, it allows an apples-to-apples comparison of golf club head performance. Normalized ball speed can be determined for a golf club head using the following steps, which are also outlined in the flow chart of FIG. 9.

[0040] First, provide a titanium 6-4 calibration plate 90 with a mass of approximately 190 grams, a diameter D₄ of approximately 4 inches, a minimum thickness T₁ of approximately 0.100-0.150 inch, and a maximum thickness T₂ of approximately 0.200-0.400 inch, as shown in FIGS. 10 and 11, and strike the center 92 of the calibration plate with a test golf ball moving at approximately 109 mph (step 100). Measure the return velocity V_{br} of the ball (step 110). Then, strike the same test golf ball, again traveling at approximately 109 mph, with the center 34 of the striking face section 30 of the golf club head 10 being assessed (step 120), and measure the rebound velocity V_{cr} of the test golf ball (step 130). Next, measure and record the mass of the plate m_p, golf ball m_b, golf club head 10 m_c, measured head test ball in velocity (109 mph target) V_{cin}, measured plate test ball in velocity (109 mph target) V_{bin}, measured head test ball return velocity V_{cr}, and measured plate test ball return velocity V_{br} (step 140). Finally, calculate the normalized ball speed (V_{ballnorm}) using the following equation (step 150):

$$V_{ballnorm} = \frac{m_h V_{inh} + m_h V_{inh} \left[\frac{V_{cr} \left(1 + \frac{m_b}{m_c} \right) + \frac{m_b}{m_c} + \frac{V_{br} \left(1 + \frac{m_b}{m_p} \right)}{V_{cin}} + \frac{m_b}{m_p} - 0.822 \right]}{m_h + m_b}$$

In this equation, V_{inh} is 100 and m_h is 200.

[0041] The golf club head 10 of the present invention has a V_{ballnorm} ≥ 0.0356x + 140.82, and more preferably a V_{ballnorm} ≥ 0.0356x + 141.19. The positioning of the structural connectors 50, 52 allow the golf club head 10 to satisfy this equation; as shown in FIG. 12, prior art golf club heads, which do not include the structural connector structure, fall well short of this performance metric.

[0042] In addition to optimizing the normalized ball speed of the golf club head 10, locating the stiffening members 50, 52 within the region of the golf club head 10 defined above has the greatest stress-reducing effect on the golf club head 10. If any of the structural connectors 50, 52 are placed more than 1 inch away from the rear surface 36 of the striking face section 30, they will not have a noticeable effect on the stress placed on the striking face section 30 when the golf club head 10 is in use, and will use discretionary mass without providing a significant performance benefit.

[0043] FIGS. 13-19 illustrate the contact surface area 55a and 55b between each of the structural connecting 50 and 52 and the return section 32 of the body 20 of the golf club head 10. The cast metal body 20 preferably comprises a toe structural connector 52, a heel structural connector 50, a striking face section 30, a crown return portion 32 and a sole section 22.

[0044] In one embodiment, shown in FIGS. 3A and 19, the toe structural connector 52 comprises a body with a crown end 52a, a sole end 52b, a forward surface 52c (shown in FIG. 19), a rearward surface 52d, a heel surface 52f and a toe surface 52e. The heel structural connector 50 comprises a

body with a crown end **50a**, a sole end **50b**, a forward surface **50c** (shown in FIG. 19), a rearward surface **50d**, a heel surface **50f** and a toe surface **50e**. In this embodiment, each of the heel structural connector **50** and the toe structural connector **52** has a radius of curvature preferably ranging from 0.02 inch to 0.1 inch, more preferably from 0.025 inch to 0.05 inch, and most preferably 0.0395 inch. The striking face section **30** has an exterior surface **30a**, an interior surface **36**, an upper perimeter **31** and a lower perimeter **33**. The crown return portion **32** extends rearward from the upper perimeter **31** of the striking face section **30** preferably approximately 0.5 inch to 1.5 inches, more preferably 0.6 inch to 1.0 inch, and most preferably approximately 0.725 inch. The sole section **22** portion extends rearward from the lower perimeter **33** of the striking face section **30**. The crown end **52a** of the toe structural connector **52** is connected to the crown return portion **32**. The crown end **50a** of the heel structural connector **50** is connected to the crown return portion **32**. The sole end **52b** of the toe structural connector **52** is connected to the sole section **22**. The sole end **50a** of the heel structural connector **50** is connected to the sole section **22**.

[0045] A contact surface area **57a**, **57b** between the crown return portion **32** and both of the crown end **52a** of the toe structural connector **52** and the crown end **50a** of the heel structural connector **50a** ranges from 1% to 5% of the surface area of the crown return portion **32**. The surface area of the crown return portion ranges from 2.5 square inches to 4.0 square inches. The contact surface area **55a** between the crown return portion **32** and the crown end **52a** of the toe structural connector **52** preferably ranges from 0.02 square inches to 0.1 square inch, more preferably from 0.035 square inch to 0.075 square inch, and most preferably is 0.045 square inch. As shown in FIG. 18, the contact surface area **55b** between the crown return portion **32** and the crown end **50a** of the heel structural connector **50** preferably ranges from 0.02 square inches to 0.1 square inch, more preferably from 0.035 square inch to 0.075 square inch, and most preferably is 0.045 square inch. As shown in FIG. 17, the contact surface area **57a** between the sole section **22** and the sole end **52b** of the toe structural connector **52** preferably ranges from 0.015 square inches to 0.1 square inch, more preferably from 0.025 square inch to 0.05 square inch, and most preferably is 0.03 square inch. The contact surface area **57b** between the sole section **22** and the sole end **50b** of the heel structural connector **50** preferably ranges from 0.015 square inches to 0.1 square inch, more preferably from 0.025 square inch to 0.05 square inch, and most preferably is 0.03 square inch.

[0046] The toe structural connector **52** and the heel structural connector **50** preferably attenuate movement of the crown return portion **32** and the sole section **22** when the striking face section **30** impacts a golf ball.

[0047] The toe structural connector **52** and the heel structural connector **50** each preferably have a length from the sole end **50b**, **52b** to the crown end **50a**, **52a** ranging from 1 inch to 2.5 inches. As shown in FIG. 3A, the heel surface **52f** of the toe structural connector **52** is a distance ranging from 0.75 inch to 1.5 inches from the toe surface **50e** of the heel structural connector **50**. A contact area **55a**, **55b**, between the crown return portion **32** and each of the toe structural connector **52** and the heel structural connector **50** preferably ranges from 0.02 square inches to 0.04 square inches.

[0048] As shown in FIG. 5A, the forward surface **50c** and **52c** of each of the toe structural connector **52** and the heel structural connector **50** is at least 0.120 inch rearward from the interior surface **36** of the striking face section **30** and the rearward surface **50d**, **52d** of each of the toe structural connector **52** and the heel structural connector **50** is no more than 1.0 inch rearward from the interior surface **36** of the striking face section **30**.

[0049] When the golf club head **10** is designed as a driver, it preferably has a volume from 200 cubic centimeters to 600 cubic centimeters, more preferably from 300 cubic centimeters to 500 cubic centimeters, and most preferably from 420 cubic centimeters to 470 cubic centimeters, with a most preferred volume of 460 cubic centimeters. In the preferred embodiment, the golf club head **10** has a volume of approximately 450 cc to 460 cc.

[0050] The volume of the golf club head **10** also varies between fairway woods (preferably ranging from 3-woods to eleven woods) with smaller volumes than drivers. When designed as a driver, the golf club head **10** preferably has a mass of no more than 215 grams, and most preferably a mass of 180 to 215 grams; when designed as a fairway wood, the golf club head **10** preferably has a mass of 135 grams to 200 grams, and preferably from 140 grams to 165 grams.

[0051] In each of the embodiments disclosed herein, the striking face section **30** preferably has a varying thickness such as that described in U.S. Pat. No. 7,448,960, for a Golf Club Head With Variable Face Thickness, which pertinent parts are hereby incorporated by reference. Other alternative embodiments of the thickness of the striking face section **30** are disclosed in U.S. Pat. No. 6,398,666, for a Golf Club Striking Plate With Variable Thickness, U.S. Pat. No. 6,471,603, for a Contoured Golf Club Face and U.S. Pat. No. 6,368,234, for a Golf Club Striking Plate Having Elliptical Regions Of Thickness, all of which are owned by Callaway Golf Company and which pertinent parts are hereby incorporated by reference. Alternatively, the striking face section **30** may have a uniform thickness.

[0052] In each of the embodiments disclosed herein, the body **20** is preferably cast from molten metal in a method such as the well-known lost-wax casting method. The metal for casting is preferably titanium or a titanium alloy such as 6-4 titanium alloy, alpha-beta titanium alloy or beta titanium alloy for forging, and 6-4 titanium for casting. Alternatively, the body **20** is composed of 17-4 steel alloy. Additional methods for manufacturing the body **20** include forming the body **20** from a flat sheet of metal, super-plastic forming the body from a flat sheet of metal, machining the body **20** from a solid block of metal, electrochemical milling the body **20** from a forged pre-form, casting the body using centrifugal casting, casting the body **20** using levitation casting, and like manufacturing methods.

[0053] In other embodiments, the golf club head **10** may have a multi-material composition such as any of those disclosed in U.S. Pat. Nos. 6,244,976, 6,332,847, 6,386,990, 6,406,378, 6,440,008, 6,471,604, 6,491,592, 6,527,650, 6,565,452, 6,575,845, 6,478,692, 6,582,323, 6,508,978, 6,592,466, 6,602,149, 6,607,452, 6,612,398, 6,663,504, 6,669,578, 6,739,982, 6,758,763, 6,860,824, 6,994,637, 7,025,692, 7,070,517, 7,112,148, 7,118,493, 7,121,957, 7,125,344, 7,128,661, 7,1634,70, 7,226,366, 7,252,600, 7,258,631, 7,314,418, 7,320,646, 7,387,577, 7,396,296, 7,402,112, 7,407,448, 7,413,520, 7,431,667, 7,438,647, 7,455,598, 7,476,161, 7,491,134, 7,497,787, 7,549,935,

7,578,751, 7,717,807, 7,749,096, and 7,749,097, the disclosure of each of which is hereby incorporated in its entirety herein.

[0054] From the foregoing it is believed that those skilled in the pertinent art will recognize the meritorious advancement of this invention and will readily understand that while the present invention has been described in association with a preferred embodiment thereof, and other embodiments illustrated in the accompanying drawings, numerous changes, modifications and substitutions of equivalents may be made therein without departing from the spirit and scope of this invention which is intended to be unlimited by the foregoing except as may appear in the following appended claims. Therefore, the embodiments of the invention in which an exclusive property or privilege is claimed are defined in the following appended claims.

We claim as our invention the following:

1. A golf club head comprising:
 - a cast metal body comprising
 - a toe structural connector comprising a body with a crown end, a sole end, a forward surface, a rearward surface, a heel surface and a toe surface,
 - a heel structural connector comprising a body with a crown end, a sole end, a forward surface, a rearward surface, a heel surface and a toe surface,
 - a striking face section having an exterior surface, an interior surface, an upper perimeter and a lower perimeter,
 - a crown return portion extending rearward from the upper perimeter of the striking face section, and
 - a sole section portion extending rearward from the lower perimeter of the striking face section;
 - wherein the crown end of the toe structural connector is connected to the crown return portion, the crown end of the heel structural connector is connected to the crown return portion, the sole end of the toe structural connector is connected to the sole section, and the sole end of the heel structural connector is connected to the sole section;
 - wherein a contact surface area between the crown return portion and both of the crown end of the toe structural connector and the crown end of the heel structural connector ranges from 1% to 5% of the surface area of the crown return portion;
 - wherein the toe structural connector and the heel structural connector attenuate movement of the crown return portion and the sole section when the striking face section impacts a golf ball.
2. The golf club head according to claim 1 wherein the toe structural connector and the heel structural connector each have a length from the sole end to the crown end ranging from 1 inch to 2.5 inches.
3. The golf club head according to claim 1 wherein the heel surface of the toe structural connector is a distance ranging from 0.75 inch to 1.5 inches from the toe surface of the heel structural connector.
4. The golf club head according to claim 1 wherein the golf club head has a volume ranging from 420 cubic centimeters to 470 cubic centimeters.
5. The golf club head according to claim 1 wherein the cast metal body is composed of a titanium alloy.
6. The golf club head according to claim 1 wherein the golf club head has a mass ranging from 185 grams to 215 grams.

7. The golf club head according to claim 1 further comprising a crown portion composed of a carbon composite material.

8. The golf club head according to claim 1 wherein the sole section comprises a plurality of cutouts covered with a plurality of cover pieces, each of the plurality of cover pieces composed of a carbon composite material.

9. The golf club head according to claim 1 wherein a contact area between the crown return portion and each of the toe structural connector and the heel structural connector ranges from 0.02 square inches to 0.04 square inches.

10. The golf club head according to claim 1 wherein the forward surface of each of the toe structural connector and the heel structural connector is at least 0.120 inch rearward from the interior surface of the striking face section and the rearward surface of each of the toe structural connector and the heel structural connector is no more than 1.0 inch rearward from the interior surface of the striking face section.

11. A golf club head comprising:

- a cast metal body comprising
 - a toe structural connector comprising a body with a crown end, a sole end, a forward arc surface, a rearward arc surface, a heel arc surface and a toe arc surface,
 - a heel structural connector comprising a body with a crown end, a sole end, a forward arc surface, a rearward arc surface, a heel arc surface and a toe arc surface,
 - a striking face section having an exterior surface, an interior surface, an upper perimeter and a lower perimeter,
 - a crown return portion extending rearward from the upper perimeter of the striking face section,
 - a sole section portion extending rearward from the lower perimeter of the striking face section, and
 - a hosel section;
 - a crown body attached to the crown return portion, the crown body composed of a carbon composite material;
 - wherein the crown end of the toe structural connector is connected to the crown return portion, the crown end of the heel structural connector is connected to the crown return portion, the sole end of the toe structural connector is connected to the sole section, and the sole end of the heel structural connector is connected to the sole section;
 - wherein a contact surface area between the crown return portion and both of the crown end of the toe structural connector and the crown end of the heel structural connector ranges from 1% to 5% of the surface area of the crown return portion;
 - wherein the toe structural connector and the heel structural connector attenuate movement of the crown return portion and the sole section when the striking face section impacts a golf ball.
12. The golf club head according to claim 11 wherein the toe structural connector and the heel structural connector each have a length from the sole end to the crown end ranging from 1 inch to 2.5 inches.
 13. The golf club head according to claim 11 wherein the heel arc surface of the toe structural connector is a distance ranging from 0.75 inch to 1.5 inches from the toe arc surface of the heel structural connector.

14. The golf club head according to claim **11** wherein the golf club head has a volume ranging from 420 cubic centimeters to 470 cubic centimeters.

15. The golf club head according to claim **11** wherein the cast metal body is composed of a titanium alloy.

16. The golf club head according to claim **11** wherein the golf club head has a mass ranging from 185 grams to 215 grams.

17. The golf club head according to claim **11** wherein the body of each of the toe structural connector and the heel structural connector is hollow.

18. The golf club head according to claim **11** wherein the sole section comprises a plurality of cutouts covered with a plurality of cover pieces, each of the plurality of cover pieces composed of a carbon composite material.

19. The golf club head according to claim **11** wherein a contact area between the crown return portion and each of the toe structural connector and the heel structural connector ranges from 0.002 square inches to 0.03 square inches.

20. The golf club head according to claim **11** wherein the cast metal body is composed of a steel material.
