(54) Title: ELECTRONIC CIGARETTE

FIG. 19

(57) Abstract: An electronic smoking article includes a liquid supply including liquid material, a heater operable to heat the liquid material to a temperature sufficient to vaporize the liquid material and form an aerosol, a wick in communication with the liquid material and in communication with the heater such that the wick delivers the liquid material to the heater, at least one air inlet operable to deliver air to a central air passage upstream of the heater, and a fibrous element downstream of the heater.

ELECTRONIC CIGARETTE

Cross Reference to Related Application

[0001] This application claims priority under 35 U.S.C. §119(e) to U.S.
5 Provisional Application No. 61/593,004, filed on January 31, 2012, the entire
content of which is incorporated herein by reference thereto.

Summary of Selected Features

[0002] An electronic cigarette or electronic cigar (collectively “electronic
10 smoking article”) is provided which includes a heater element which vaporizes
liquid material to produce an aerosol or “vapor”. The heater element preferably
comprises a resistive heater coil, with a wick extending therethrough. The heater
coil is constructed in a manner and formed from a material such that the production
of hot spots and excessive temperatures are avoided during a puff.

15 [0003] The electronic smoking article preferably includes a mouth end
insert that includes at least two, diverging outlets to impart a fuller mouthfeel from
the vapor output. Preferably, the aforementioned multi-ported mouth end insert
cooperates with an arrangement to decelerate the vapor just upstream of the mouth
end insert so as to avoid perceptions of “hot” at or about the lips of the “smoker”.

20 [0004] The electronic article preferably includes a metal case portion and a
precision-formed primary, air inlet port at a location along the metal case portion,
preferably along a metal side wall portion of the article. The air inlet port is
precision-formed within close tolerances and the air inlet port is sized so as to be the
predominating source of pressure drop along an air pathway of communication

between the air inlet and the source of vapor (the heater). Such arrangement assures that RTD remains essentially the same from one puff to the next and from one article to the next. To further enhance consistent performance, RTD of an article is checked in the course of its manufacture, and corrective measure undertaken, if
5 necessary.

5

Detailed Description

Electronic Smoking Article Layout

[0036] Referring to Figures 1 and 2, an electronic smoking article (electronic cigarette or cigar) 60 is provided and comprises a replaceable cartridge (or first section) 70 and a reusable fixture (or second section) 72, which in the preferred embodiment are coupled together at a threaded connection 205 or by other convenience such as a snug-fit, detent, clamp and/or clasp. Generally, the second section 72 includes a puff sensor 16 responsive to air drawn into the second section 72 via an air inlet port 45 adjacent the free end or tip of the electronic smoking article 60, a battery 1 and control circuitry. The disposable first section 70 includes a liquid supply region of 22 of liquid and a heater 14 that aerosolizes liquid that is drawn from the liquid supply region 22 through a wick 28. Upon completing the threaded connection 205, the battery 1 is connectable with the electrical heater 14 of the first section 70 upon actuation of the puff sensor. Air is drawn primarily into the first section 70 through one or more air inlets 44.

10

15

20

[0037] In the preferred embodiment, once the liquid of the cartridge is spent, only the first section 70 is replaced. An alternate arrangement includes a layout where the entire article 60 is disposed once the liquid supply is depleted. In such case the battery type and other features might be engineered for simplicity and

cost-effectiveness, but generally embodies the same concepts as in the preferred embodiment in which the second section is reused and/or recharged.

[0038] In a preferred embodiment, the electronic smoking article 60 is about the same size as a conventional cigarette. In some embodiments, the electronic smoking article 60 can be about 80 mm to about 110 mm long, preferably about 80 mm to about 100 mm long and about 7 mm to about 8 mm in diameter. For example, in a preferred embodiment, the electronic smoking article is about 84 mm long and has a diameter of about 7.8 mm.

[0039] Preferably, at least one adhesive-backed label is applied to the outer tube 6. The label completely circumscribes the electronic smoking article 60 and can be colored and/or textured to provide the look and/or feel of a traditional cigarette. The label can include holes therein which are sized and positioned so as to prevent blocking of the air inlets 44.

[0040] The outer tube 6 and/or the inner tube 62 may be formed of any suitable material or combination of materials. Examples of suitable materials include metals, alloys, plastics or composite materials containing one or more of those materials, or thermoplastics that are suitable for food or pharmaceutical applications, for example polypropylene, polyetheretherketone (PEEK), ceramic, and polyethylene. Preferably, the material is light and non-brittle.

20

Cartridge Structure

[0041] Referring now to Figures 1, 2 and 3 the first section 70 includes an outer tube (or casing) 6 extending in a longitudinal direction and an inner tube (or chimney) 62 coaxially positioned within the outer tube 6. Preferably, a nose portion

61 (see Figure 3A) of an upstream gasket (or seal) 15 is fitted into an upstream end portion 65 of the inner tube 62, while at the same time, an outer perimeter 67 of the gasket 15 provides a liquid-tight seal with an interior surface of the outer casing 6. The upstream gasket 15 also includes a central, longitudinal air passage 20, which
5 opens into an interior of the inner tube 62 that defines a central channel 21. A transverse channel 33 at a backside portion of the gasket 15 intersects and communicates with the central channel 20 of the gasket 15. This channel 33 assures communication between the central channel 20 and a space 35 (see Figure 2) defined between the gasket 15 and a cathode connector piece 37. In the preferred
10 embodiment, the piece 37 includes a threaded section for effecting the threaded connection 205.

[0042] The cathode connector piece 37 includes opposing notches 38, 38' about its perimeter 39, which, upon insertion of the cathode connector piece 37 into the casing 6, are aligned with the location of each of two RTD-controlling, air inlet
15 ports 44 and 44' in the outer casing 6. In an embodiment, such alignment may appear as shown in Figure 3B (Detail). Such arrangement allows for placement of the ports 44, 44' close to the threaded connection 205 without occlusion by the presence of the cathode connector piece 37. The arrangement also reinforces the area of ports 44, 44' to facilitate precise drilling of the holes 44, 44'.

20

Air Inlets and Control of Resistance to Draw

[0043] In the preferred embodiment, at least one air inlet 44 is formed in the outer tube 6, preferably adjacent the threaded connection 205 to minimize the chance of a smoker's fingers occluding one of the ports and to control the resistance

to draw (RTD) during smoking. Preferably, each of the RTD controlling, air inlets 44 and 44' are machined into the casing 6 with precision tooling such that their diameters are closely controlled and replicated from one electronic smoking article 60 to the next during their manufacture. Preferably, the air inlets 44 and 44' are
5 drilled with carbide drill bits or other high-precision tools and/or techniques. Also preferably, the outer tube 6 is formed of metal or metal alloys such that the size and shape of the air inlets 44, 44' is not altered during manufacturing operations, packaging and smoking. Thus, the air inlets 44, 44' provide consistent RTD. In the
10 preferred embodiment, the air inlets 44, 44' are sized and configured such that the electronic smoking article 60 has a RTD in the range of from about 60 mm H₂O to about 150 mm H₂O, more preferably about 90 mm H₂O to about 110 mm H₂O, most preferably about 100 mm H₂O to about 130 mm H₂O.

[0044] The RTD controlling, air inlets 44 and 44' are the critical orifice (i.e. the smallest orifice along the pathway from the air inlets 44, 44' and the inner
15 passage 21 of the inner tube 62 (where the heater 14 aerosolizes liquid). Accordingly, the air inlets 44 and 44' control the level of resistance to draw of the electronic smoking article 60, which may be set at a level that contributes a drawing experience similar to that of drawing upon a conventional, lit-end cigarette.

[0045] Referring specifically to Figure 1, another aspect of maintaining
20 precise and reproducible resistance to draw is use of a metallic material in the casing 6 which is conducive to precision tooling and techniques. If another material is desired for the casing 6 (such as a plastic for presenting a softer feel), the air inlets 44, 44' may be instead formed in a metallic plate fixture (or insert) 43 provided at

the location of the air inlets 44, 44' so as to maintain the precision of the air inlets 44, 44'.

[0046] It is envisioned that the metallic plate insert 43 may be included even in instances where the casing 6 is metallic, in that such arrangement allows the
5 air inlets 44, 44' to be produced and tested separately (off-line) on a collection of blank metallic plate inserts 43. Advantageously, should any finished metallic plate inserts 43 fail to meet standards or specifications for air inlet diameter (and RTD), the failed inserts may be disposed of instead of entire cartridge assemblies (first section) 70.

10 [0047] Referring back to Figure 1, the metallic plate insert 43 may comprise a separate piece that becomes affixed to an outer surface of the casing 6 or wholly within the casing 6, in which case the outer casing 6 is preferably provided with an oversized hole, which can be superposed over the area of the air inlet 44. It is also envisioned that the insert might be shaped and fitted flush with the contour of
15 the casing 6, using a snap fit and/or adhesive between the insert and the casing 6 or entirely within (internal of the outer casing 6). Preferably the shape and the location of the air inlet 44 of the insert 43 has a symmetry such that the air inlet 44 remains fully operative whether the insert 43 is positioned as shown in Figure 1 or flipped 180 degrees. Moreover, the metallic plate insert 43 can be provided on an inside
20 surface or on an outside surface of the outer casing 6. The metallic plate insert 43 can extend fully or partially about a circumference of the electronic smoking article 60. When the metallic plate insert 43 extends partially about the circumference, multiple metallic plate inserts 43 can be used, each metallic plate insert 43 corresponding to a single air inlet 44, 44'.

[0048] In the preferred embodiment, the second section 72, includes an air inlet 45 at an upstream end 5 of the electronic smoking article 60, which is sized just sufficient to assure proper operation of the puff sensor 16, located nearby. Drawing action upon the mouth end insert 8 is communicated to the air inlet port 45 through central channels provided in the anode post 47c of the first section 70 and the anode connection post 47b of the second section 72 and along space 13 between the battery 1 and the casing of the second section 72. These channels and the port 45 itself are sized such that the airflow rate there through are much smaller than through the air inlets 44, 44', so that the impact on RTD is minimized and consistency in RTD is maintained. For example, each air inlet can be less than about 2.0 mm in width and less than about 1.5 mm in depth. For example, each air inlet can be about 0.7 mm to about 0.8 mm in width and about 0.7 mm to about 0.8 mm in depth. In a preferred embodiment, 95% of the air introduced in the electronic smoking article 60 is through the air inlets 44, 44', whereas only 5% of the total air flow enters through the inlet 45 at the upstream end 5 of the electronic smoking article 60. Preferably, the ratio is determined by making a central channel 34 of the anode post 47b of the second section 72 small enough to impart a pressure drop far greater than that of the air inlets 44, 44'. For example, the central channel 34 of the anode post 47b may be sized to impart a pressure drop of approximately 2000 mm water (in contrast to a nominal pressure drop of 100 mm water from air inlets 44, 44' combined).

[0049] Referring to Figure 18, in order to maintain consistent RTD in the product, a removable protective covering 601 can be applied to the air inlets 44, 44' to prevent degradation from dirt and dings during, manufacture, packaging shipping and handling at retail and beyond as shown in Figure 18. To maintain consistent

RTD until consumption, a circumferential wrapping or tape 601 may be wrapped about the outer casing 6 at the locations of the air inlets 44, 44'. In the alternative or in addition, the electronic smoking article 60 may be accompanied with a reusable protective cover to provide the same or additional protections.

5 **[0050]** In addition, current manufacturing techniques for electronic smoking articles can be modified to include testing for consistent RTD. In other words, there is a need to couple an understanding of how to achieve consistent RTD in the product (as taught above) with an understanding of how to test for it in the course of manufacturing the product (as taught in the following). Achieving
10 consistent RTD from one electronic smoking article to the next promotes consistent performance and delivery levels, and enhances smoking experiences by meeting smoker's expectations that a draw upon an electronic smoking article will be akin to drawing upon a lit end cigarette or cigar. The latter may include testing metallic plate inserts 43 prior to installation as previously described; or instead or in addition,
15 testing completed first sections 70 by fastening a nominal, but inactivated second section 72 to a newly produced first section 70 to create a benign, inactive test configuration that accurately reproduces airflow event, but without risk of heater activation and applying a predetermined drawing action upon the configuration while measuring pressure drop. By way of non-limiting example, a fully assembled
20 electronic smoking article may be drawn through the test configuration while pressure drop is measured using a PV10 pressure drop instrument manufactured by Borgwaldt KC of Chesterfield, Virginia. A suitable pressure drop testing method for electronic smoking articles can be adopted from standard method ISO 6565:2011 entitled "Tobacco and tobacco products – Draw Resistance of Cigarettes and

Pressure Drop of Filter Rods – Standard Conditions and Measurement”, and applied with instrumentation capable of measure pressure drop in a working range of 50 mmWG (mm water gauge) to 1900 mmWG and a diameter range of 5.0 mm to 9.0 mm. The test can be completed in a matter of seconds and the instrumentation can
5 be calibrated to a range of 50 mmWG to 300 mmWG.

[0051] Instead of using an inactivated second section 72, it is envisioned that a releasable test body might be employed to serve the same purpose in a benign (inactive) test configuration. The test body would be configured to reproduce nominal impact of a real reusable second portion 72 upon RTD, but could be
10 optimized for machine handling and high speed automated coupling to and removal from newly produced first sections 70 that are undergoing testing.

[0052] The inclusion of a threaded connection 205 does not facilitate automated, high speed machine handling and execution of the RTD tests. Referring now to Figure 12, an alternative coupling 205’ may include connections comprising
15 pins 501 and releasable detents 503 and/ or electrical bearing surfaces 505 with releasable detents, rotational locking devices or the like. In the illustrated embodiment, the detent 503 cooperates with a raised annulus 509. In the alternative, one or more biased balls may be used in lieu of or in addition to the raised annulus 509. Such arrangements facilitate automated machine handling, provide a greater
20 capacity for speedy yet accurate testing of RTD, and facilitate machine automated execution of RTD testing. It is envisioned that quality control during the drilling of orifices could include a feedback loop such that the RTD test results are monitored to detect trends away from specifications so that corrective measures may be undertaken, such as replacement of a worn drill bit.

[0053] Referring now to Figures 3A and 3B, preferably, the cathode connector piece 37 includes opposing notches 38, 38' about its perimeter 39, which, upon insertion of the cathode connector piece 37 into the outer casing 6, are aligned with the location of each of two or more RTD-controlling, air inlets 44 and 44' in the outer casing 6. In some embodiments, more than two air inlets 44, 44' may be included (e.g., three, four, five, six, seven, eight, nine, ten or more). Alternatively, a single air inlet 44 can be included. In an embodiment, such alignment may appear as shown in Figure 3B. Such arrangement allows for placement of the air inlets 44, 44' close to the threaded connection 205 without occlusion by the presence of the cathode connector piece 37. The arrangement also reinforces the area of air inlets 44, 44', which can serve to facilitate precise drilling of the air inlets 44, 44'. Other arrangements can also be used as discussed below.

[0054] In another embodiment, as shown in Figure 13, the cathode connector piece 37 can include one or more slits 300 formed in the perimeter 39 of the cathode connector piece 37. The outer casing 6 of the cartridge portion 70 is slid over the unthreaded end of the connector piece 37 until it reaches the stop (or edge) 307, leaving a predetermined portion of the slit 300 open to the exterior of the cartridge portion 70 for the admission of air. The admitted air can travel along the slit 300 and into the interior of the cartridge portion 70. The slit 300 may be used as the critical orifice and can be used in lieu of air inlets 44 and 44'. In another embodiment, the slit 300 may be used in addition to air inlets 44 and 44'.

[0055] In yet another embodiment, as shown in Figures 14A, 14B and 14C, the cathode connector piece 37 can include one or more angled holes 301 formed therein, which communicate with one or more slots 302 in a cathode connection

fixture 49b. Preferably, the cathode connection fixture 49b can include an empty annular space 303 in an inner portion thereof which communicates with the one or more slots 302. Air is drawn in through slot 302 and travels into the annular space 303 and from there into the angled holes 307. Thus, there is no need to line up the slot 302 with the angled hole 301 because air will travel around the annular space 303 and into the angled holes 301 even if the holes 301 and slots 302 are not aligned. This arrangement provides advantages during manufacture since the angled holes 301 need not be aligned with the slots 302.

[0056] As shown in Figure 15, in yet another embodiment, the anode post 47c can be shortened as compared to the anode post 47c of Figure 2 so as to provide a larger air gap behind the cathode connector piece 37. Air enters via slot 302' (not shown in Figure 15 other than its relative position) and is drawn through an internal air inlet 44 via annular space 303 and then flows straight into the air gap, through the central channel 34 of the anode post 47c and into the central channel 20 leading to the heater 14.

Liquid Supply Region, Heater and Wick

[0057] Preferably, a nose portion 93 of an downstream gasket 10 is fitted into a downstream end portion 81 of the inner tube 62. An outer perimeter 82 of the gasket 10 provides a substantially liquid-tight seal with an interior surface 97 of the outer casing 6. The downstream gasket 10 includes a central channel 84 disposed between the central passage 21 of the inner tube 62 and the interior of the mouth end insert 8 and which communicates aerosol from the central passage 21 to the mouth end insert 8.

[0058] The space defined between the gaskets 10 and 15 and the outer tube 6 and the inner tube 62 establish the confines of a liquid supply region 22. The liquid supply region 22 comprises a liquid material and optionally a liquid storage medium 210 operable to store the liquid material therein. The liquid storage
5 medium 210 may comprise a winding of cotton gauze or other fibrous material about the inner tube 62.

[0059] In the preferred embodiment, the liquid supply region 22 is contained in an outer annulus 620 between inner tube 62 and outer tube 6 and between the gaskets 10 and 15. Thus, the liquid supply region 22 at least partially
10 surrounds the central air passage 21. The heater 14 extends transversely across the central channel 21 between opposing portions of the liquid supply region 22.

[0060] Preferably, the liquid storage medium 210 is a fibrous material comprising cotton, polyethylene, polyester, rayon and combinations thereof. Preferably, the fibers have a diameter ranging in size from about 6 microns to about
15 15 microns (e.g., about 8 microns to about 12 microns or about 9 microns to about 11 microns). The liquid storage medium 210 can be a sintered, porous or foamed material. Also preferably, the fibers are sized to be irrespirable and can have a cross-section which has a y shape, cross shape, clover shape or any other suitable shape. In the alternative, the liquid supply region 22 may comprise a filled tank
20 lacking a fibrous storage medium 21 and containing only liquid material.

[0061] Also preferably, the liquid material has a boiling point suitable for use in the electronic smoking article 60. If the boiling point is too high, the heater 14 will not be able to vaporize liquid in the wick 28. However, if the boiling point is too low, the liquid may vaporize even when the heater 14 is not being activated.

[0062] Preferably, the liquid material includes a tobacco-containing material including volatile tobacco flavor compounds which are released from the liquid upon heating and may contain nicotine. The liquid may also be a tobacco flavor containing material or a nicotine-containing material having no flavor.

5 Alternatively, or in addition, the liquid may include a non-tobacco material, other flavor materials, and may be nicotine-free. For example, the liquid may include water, solvents, ethanol, plant extracts and natural or artificial flavors. Preferably, the liquid further includes an aerosol former. Examples of suitable aerosol formers are glycerine and propylene glycol. The liquid material may also include

10 preservatives or pH modifying agents, such as organic and inorganic acids.

[0063] Referring now also to Figure 8, in use, liquid material is transferred from the liquid supply region 22 and/or liquid storage medium 210 in proximity of the 14 heater by capillary action of the wick 28. In one embodiment, the wick 28 has a first end portion 29 and a second end portion 31 as shown in Figure 8. The first

15 end 29 and the second end 31 extend into opposite sides of the liquid storage medium 21 for contact with liquid material contained therein. Also preferably, the heater 14 at least partially surrounds a central portion 113 of the wick 28 such that when the heater 14 is activated, the liquid in the central portion 113 of the wick 28 is vaporized by the heater 14 to form an aerosol. The wick 28 preferably comprises

20 filaments having a capacity to draw a liquid, more preferably a bundle of glass (or ceramic) filaments and most preferably a bundle comprising a group of windings of glass filaments, preferably three of such windings, all which arrangements are capable of drawing liquid via capillary action via interstitial spacings between the filaments. Preferably, the wick 28 is flexible and includes three strands, each strand

including a plurality of filaments. Moreover, it is noted that the end portions of the 29 and 31 of the wick 28 are flexible and foldable into the confines of the liquid supply region 22.

5 **[0064]** Advantageously, the liquid material in the liquid supply region 22 is protected from oxygen (because oxygen cannot generally enter the liquid supply region 22 via the wick 28). In some embodiments, the liquid material is also protected from light so that the risk of degradation of the liquid material is significantly reduced. Thus, a high level of shelf-life and cleanliness can be maintained.

10 **[0065]** In the preferred embodiment, the liquid supply region 22 is sized and configured to hold enough liquid material such that the electronic smoking article 60 is operable for smoking for at least about 200 seconds, preferably at least about 250 seconds, more preferably at least 300 seconds and most preferably at least about 350 seconds. Thus, liquid supply region 22 is equivalent to about one pack of 15 traditional cigarettes. Moreover, the electronic smoking article 60 can be configured to allow each puff to last a maximum of about 5 seconds.

Mouth End Insert

20 **[0066]** Referring to Figures 2, 3A, 4, 5, 6, 7 and 17, the first section 70 includes a mouth end insert 8 having at least two diverging outlet passages 24 (e.g., 3, 4, 5 or more, preferably 2 to 10 outlets or more, more preferably 2 to 6 outlet passages 24, even more preferably 4 outlet passages 24). Preferably, the outlet passages 24 are located off-axis and are angled outwardly in relation to the central channel 21 of the inner tube 62 (i.e., divergently). Also preferably, the mouth end

insert (or flow guide) 8 includes outlets 24 uniformly distributed about the perimeter of mouth end insert 8 so as to substantially uniformly distribute aerosol in a smoker's mouth during use and create a greater perception of fullness in the mouth. Thus, as the aerosol passes into a smoker's mouth, the aerosol enters the mouth and moves in
5 different directions so as to provide a full mouth feel. In contrast, electronic smoking articles having a single, on-axis orifice tend to direct its aerosol as single jet of greater velocity toward a more limited location within a smoker's mouth.

[0067] In addition, the diverging outlet passages 24 are arranged and include interior surfaces 83 such that droplets of unaerosolized liquid material, if
10 any, that may be entrained in the aerosol impact the interior surfaces 83 of the mouth end insert 8 and/or impact portions of walls 305 which define the diverging outlet passages 24. As a result such droplets are substantially removed or broken apart, to the enhancement of the aerosol.

[0068] In the preferred embodiment, the diverging outlet passages 24 are
15 angled at about 5° to about 60° with respect to the longitudinal axis of the outer tube 6 so as to more completely distribute aerosol throughout a mouth of a smoker during use and to remove droplets. In a preferred embodiment, there are four diverging outlet passages 24 each at an angle of about 40° to about 50° with respect to the longitudinal axis of the outer tube 6, more preferably about 40° to about 45° and
20 most preferably about 42°.

[0069] Preferably, each of the diverging outlet passages 24 has a diameter ranging from about 0.015 inch to about 0.090 inch (e.g., about 0.020 inch to about 0.040 inch or about 0.028 inch to about 0.038 inch). The size of the diverging outlet

passages 24 and the number of diverging outlet passages 24 can be selected to adjust the resistance to draw (RTD) of the electronic smoking article 60, if desired.

[0070] In one embodiment shown in Figure 16, the mouth end insert 8 can include diverging outlet passages 24 and an on-axis outlet passage 26.

5 [0071] As shown in Figure 2, an interior surface 83 of the mouth end insert 8 can comprise a generally domed surface 83. Alternatively, as shown in Figure 7, the annular interior surface 83' of the mouth end insert 8 can be generally cylindrical or frustoconical, with a planar end surface. Preferably, the interior surface 83 is substantially uniform over the surface thereof. Moreover, the interior surface 83 can
10 be symmetrical about the longitudinal axis of the mouth end insert 8. However, in other embodiments, the interior surface 83 can be irregular and/or have other shapes.

[0072] In a preferred embodiment, a hollow 911 is disposed at the convergence of the diverging outlet passages 24 within the mouth end insert 8

[0073] The mouth end insert 8 may be integrally affixed within the outer
15 tube 6 of the cartridge 70. Moreover, the mouth end insert 8 can be formed of a polymer selected from the group consisting of low density polyethylene, high density polyethylene, polypropylene, polyvinylchloride, polyetheretherketone (PEEK) and combinations thereof. The mouth end insert 8 may also be colored if desired.

20 [0074] As mentioned previously, the multi-port mouth end insert 8 disperses and changes the direction of the aerosol as it is drawn from the electronic smoking article 60 so as to provide a fuller mouth feel. As aerosol is formed, it passes through the central channel 21 in the inner tube 62 and through the central channel 84 in the downstream gasket 10. In panel testing of early prototypes, some

panelists reported a "hot" sensation on the lips from smoking an electronic smoking article constructed to include a mouth end insert including a plurality of diverging outlet passages 24 and a central channel 84 having a diameter of about 1.3 mm. However, in electronic smoking articles in which the inside diameter of the central
5 channel 84 was increased to about 2.6 mm, reports of "hot" sensations essentially ceased.

[0075] Dynamic modeling of the area at and about the downstream gasket 10 and the mouth end insert 8 has indicated that a small 1 mm wide central channel 84 at the gasket 10 tends to create peak velocities of approximately 12 meters per
10 second (m/sec) in aerosol exiting the mouth end insert. In contrast, modeling of a system including a 5 mm wide central channel 84 indicates peak velocities of only 2.5 m/s is achieved at the exits of the diverging outlet passages 24 of the mouth end insert 8, which is approximately a five-fold decrease in air velocity. From the aforementioned testing and modeling it is believed a further improvement in the
15 organoleptic experience with an electronic smoking article is achieved by preventing acceleration of the aerosol flow stream by increasing the diameter of the central channel 84 before it is drawn through the exits of the diverging outlet passages 24 of the multi-port mouth end insert 8.

[0076] Accordingly, it is advantageous to provide an electronic smoking
20 article having a downstream gasket 10 having a central channel 84, which has a diameter sufficient to prevent acceleration of the aerosol flow stream before reaching the mouth end insert 8. Preferably, the diameter of the central channel 84 is about 2.0 mm to about 3.0 mm, more preferably about 2.4 mm to about 2.8 mm. The mouth end insert 8 then divides output from the central channel 84 into multiple

divergent streams of reduced speed so as to provide a full mouth feel and to avoid sensations of “hot”.

[0077] In that an appropriately sized central channel 84 of the gasket 10 serves to substantially prevent acceleration of the aerosol, such functionality can be further enhanced by providing the exit orifice with a beveled rim (not shown) at its exit plane to further reduce speed of the aerosol before it reaches the mouth end insert 8.

[0078] In an alternative embodiment, the mouth end insert 8 and the downstream gasket 10 can be integrally formed as a single piece so as to enhance consistent performance and to facilitate manufacture.

[0079] As shown in Figures 10 and 11, in an alternative embodiment, the electronic smoking article 60 of Figure 1 can include a mouth end insert 8 having a stationary piece 27 and a rotatable piece 25. Outlets 24, 24' are located in each of the stationary piece 27 and the rotatable piece 25. The outlets 24, 24' match up as shown to allow aerosol to enter a smoker's mouth. However, the rotatable piece 25 can be rotated within the mouth end insert 8 so as to at least partially block one or more of the outlets 24 in the stationary mouth end insert 28. Thus, the consumer can adjust the amount of aerosol drawn with each puff. The outlets 24, 24' can be formed in the mouth end insert mouth end insert 8 such that the outlets 24, 24' diverge to provide a fuller mouth feel during inhalation of the aerosol.

Circuitry, Alloys Improving Consistent Heater Performance, Hot Spots and Carbonyl Abatement

[0080] In the preferred embodiment, the power supply 1 includes a battery arranged in the electronic smoking article 60 such that the anode 47a is downstream
5 of the cathode 49a. A battery anode post 47b of the second section 72 preferably contacts the battery anode 47a.

[0081] More specifically, electrical connection between the anode 47a of the battery 1 and the heater coil 14 in the first section 70 is established through a battery anode connection post 47b in the second section 72 of the electronic smoking
10 article 60, an anode post 47c of the cartridge 70 and an electrical lead 47d connecting a rim portion of the anode post 47c with an electrical lead 109 of the heater element 14 (see Figure 8). Likewise, electrical connection between the cathode 49a of the battery 1 and the other lead 109' of the heater coil 14 is established through the threaded connection 205 between a cathode connection
15 fixture 49b of the second portion 72 and the cathode connector piece 37 of the first section 70 and from there through an electrical lead 49c which electrically connects the fixture 37 to the opposite lead 109' of the heater coil 14.

[0082] Preferably, the electrical leads 47d, 49c and the heater leads 109, 109' are highly conductive and temperature resistant while the coiled section 110 of
20 the heater 14 is highly resistive so that heat generation occurs primarily along the coils 110 of the heater 14. Also preferably, the electrical lead 47d is connected to the heater lead 109 by crimping. Likewise, the electrical lead 49c is connected to the heater lead 109' by crimping. In an alternative embodiment, the electrical leads

47d, 49c can be attached to the heater leads 109, 109' via soldering. Crimping is preferred as it speeds manufacture.

[0083] The battery can be a Lithium-ion battery or one of its variants, for example a Lithium-ion polymer battery. Alternatively, the battery may be a Nickel-metal hydride battery, a Nickel cadmium battery, a Lithium-manganese battery, a
5 Lithium-cobalt battery or a fuel cell. In that case, preferably, the electronic smoking article 60 is usable by a smoker until the energy in the power supply is depleted or in the case of lithium polymer battery, a minimum voltage cut-off level is achieved.

[0084] Alternatively, the power supply 1 may be rechargeable and include
10 circuitry allowing the battery to be chargeable by an external charging device. In that case, preferably the circuitry, when charged, provides power for a pre-determined number of puffs, after which the circuitry must be re-connected to an external charging device. To recharge the electronic smoking article 60, an USB charger or other suitable charger assembly can be used.

[0085] Preferably, the electronic smoking article 60 also includes control
15 circuitry including a puff sensor 16. The puff sensor 16 is operable to sense an air pressure drop and initiate application of voltage from the power supply 1 to the heater 14. As shown in Figure 2, the control circuitry can also include a heater activation light 48 operable to glow when the heater 14 is activated. Preferably, the
20 heater activation light 48 comprises an LED and is at an upstream end of the electronic smoking article 60 so that the heater activation light 48 takes on the appearance of a burning coal during a puff. Moreover, the heater activation light 48 can be arranged to be visible to the smoker. In addition, the heater activation light 48 can be utilized for electronic smoking article system diagnostics or to indicate

that recharging is in progress. The light 48 can also be configured such that the smoker can activate and/or deactivate the light 48 for privacy, such that the light 48 would not activate during smoking if desired.

[0086] Preferably, the at least one air inlet 45 (Figure 1) is located adjacent
5 the puff sensor 16, such that the puff sensor 16 senses air flow indicative of a smoker taking a puff and activates the power supply 1 and the heater activation light 48 to indicate that the heater 14 is working.

[0087] A control circuit is preferably integrated with the puff sensor 16 and supplies power to the heater 14 responsive to the puff sensor 16, preferably with a
10 maximum, time-period limiter.

[0088] Alternatively, the control circuitry may include a manually operable switch for a smoker to initiate a puff. The time-period of the electric current supply to the heater may be pre-set depending on the amount of liquid desired to be vaporized. Alternatively, the circuitry may supply power to the heater 14 as long as
15 the puff sensor 16 detects a pressure drop.

[0089] Preferably, when activated, the heater 14 heats a portion of the wick 28 surrounded by the heater for less than about 10 seconds, more preferably less than about 7 seconds. Thus, the power cycle (or maximum puff length) can range in period from about 2 seconds to about 10 seconds (e.g., about 3 seconds to about 9
20 seconds, about 4 seconds to about 8 seconds or about 5 seconds to about 7 seconds).

[0090] Preferably, the heater 14 is a wire coil that surrounds the wick 28. Examples of suitable electrically resistive materials include titanium, zirconium, tantalum and metals from the platinum group. Examples of suitable metal alloys include stainless steel, nickel-, cobalt-, chromium-, aluminium- titanium-

zirconium-, hafnium-, niobium-, molybdenum-, tantalum-, tungsten-, tin-, gallium-, manganese- and iron-containing alloys, and super-alloys based on nickel, iron, cobalt, stainless steel. For example, the heater can be formed of nickel aluminide, a material with a layer of alumina on the surface, iron aluminide and other composite materials, the electrically resistive material may optionally be embedded in, encapsulated or coated with an insulating material or vice-versa, depending on the kinetics of energy transfer and the external physicochemical properties required. Preferably, the heater 14 comprises at least one material selected from the group consisting of stainless steel, copper, copper alloys, nickel-chromium alloys, super alloys and combinations thereof. In a preferred embodiment, the heater 14 is formed of nickel-chromium alloys or iron-chromium alloys, although the latter is not preferred for reasons which follow. In another embodiment, the heater 14 can be a ceramic heater having an electrically resistive layer on an outside surface thereof.

[0091] In another embodiment, the heater 14 may be constructed of an iron-aluminide (e.g., FeAl or Fe₃Al), such as those described in commonly owned U.S. Patent No. 5,595,706 to Sikka et al. filed December 29, 1994, or nickel aluminide (e.g., Ni₃Al). Use of iron-aluminide is advantageous in that iron-aluminide exhibits high resistivity. FeAl exhibits a resistivity of approximately 180 micro-ohms, whereas stainless steel exhibits approximately 50 to 91 micro-ohms. The higher resistivity lowers current draw or load on the power source (battery) 1.

[0092] In the preferred embodiment, the heater coil 14 is formed from a nickel-chromium alloy that is essentially free of iron content. Experience has indicated that heater coils constructed from an iron chromium alloy suffered

oxidation of their iron content if the alloys were contacted with water during manufacturing operations, during shelf-life and/or operation of the device.

[0093] It is known that heating glycerin and/or propylene glycol beyond certain temperatures produces carbonyls (which include formaldehydes). Iron oxide
5 tends to catalyze these reactions such that carbonyls are produced at lower temperatures. By using alloys essentially free of iron content, such catalyzation is avoided and the possibility of producing carbonyls and other constituents is minimized.

[0094] Moreover, in the manufacture and design of the preferred
10 embodiment, certain aspects and measures are employed to avoid occurrence of unintended “hot spots” in the heater coil 14 during its heating cycle. Hot spots may contribute excessive peak temperatures that may produce undesired constituents that would otherwise be avoided in the absence of a hot spot.

[0095] While not wishing to be bound by theory, it is believed that if a
15 winding of a coil heater 14 is altered such that spacing between loops of the coil 14 is locally reduced, the reduced spacing will create hotspots that are believed to drive peak temperatures beyond desirable levels. It is also believed that establishing uniform spacing along the coils of the heater 14 and taking steps to preserve the original, uniform spacing in the winding of the coil heater 14 will avoid the
20 consequences of “hot spots”.

[0096] In particular and referring to Figure 8, it is envisioned that production of consistent coil spacing 111 throughout the coiled section 110 of a given heater coil 14 may be achieved in ways including using automated winders to wind the coil about the wick 28 and using the wick 28 as an arbor for the winding

step. In the preferred embodiment 3 to 8 windings are preferred, more preferably, 3 to 5 windings.

[0097] Once established, the uniformity of the coil spacing 111 is preserved in the course of manufacture and in the design of the preferred
5 embodiment.

[0098] Referring also to Figure 9A, in particular, the provision of opposing slots 63 in the inner tube 62 facilitates placement of the heater 14 and wick 28 into position within the inner tube 62 without impaction between edges of the slots 63 and the coiled section 110 (shown in Figure 8) of the heater 14.
10 Accordingly, edges of the slots 63 are not allowed to impact and alter the coil spacing 111 of the heater 14, which would otherwise create potential sources of hotspots.

[0099] Referring now to Figure 9B, care is taken to position a closure ring 69 such that it is proximate to or touches but does not urge against the wick 28.
15 Such positioning avoids imposing bending moments upon the heater coil 14 and avoids bowing of the coil 14 which might otherwise produce hotspots along one side of the coil 14 where the coil spacing 111 would become compressed and reduced. Thus, the upstream edge 114 of the closure ring 69 is brought into proximity of the wick 28, but is not positioned over the wick 28 so as to avoid the possibility of the
20 aforementioned bowing effect. The closure ring 69, when placed as shown in Figure 9B, closes off a remainder of open space provided between the heater coil assembly and the slot 63.

[0100] In the preferred embodiment, the inner tube 62 and the closure ring 69 are constructed from woven fiberglass.

[0101] In the preferred embodiment, the inner tube 62 has a diameter of about 4 mm and each of the opposing slots 63 has major and minor dimensions of about 2 mm by about 4 mm.

[0102] In one embodiment, the heater 14 comprises a wire coil which at least partially surrounds the wick 28. In that embodiment, preferably the wire is a metal wire and/or the heater coil may extend fully or partially along the length of the wick 28. The heater coil 14 may extend fully or partially around the circumference of the wick 28. In another embodiment, the heater coil is not in contact with the wick 28.

[0103] Preferably, the heater 14 heats liquid in the wick 28 by thermal conduction. Alternatively, heat from the heater 14 may be conducted to the liquid by means of a heat conductive element or the heater 14 may transfer heat to the incoming ambient air that is drawn through the electronic smoking article 60 during use, which in turn heats the liquid by convection.

[0104] In one embodiment, the wick 28 comprises a ceramic wick of ceramic filaments having a capacity to draw a liquid. As noted above, the wick 28 is at least partially surrounded by the heater 14. Moreover, in the preferred embodiment, the wick 28 extends through opposed slots 63 in the inner tube 62 such that each end of the wick 28 is in contact with the liquid supply region 22 (shown in Figure 2).

[0105] In the preferred embodiment, the wick 28 comprises filaments and comprises a bundle of glass filaments. For example, the wick 28 may include a plurality of filaments. The filaments or threads may be generally aligned in a direction perpendicular (transverse) to the longitudinal direction of the electronic

smoking article. Preferably, the wick 28 includes 1 to 8 filaments, more preferably 2 to 6 filaments. In the preferred embodiment, the wick 28 includes 3 strands, each strand comprising a plurality of glass filaments twisted together.

[0106] In the preferred embodiment, the structure of the wick 28 is formed of filaments through which the liquid can be transported to the heater 14 by capillary action. The wick 28 can include filaments having a cross-section which is generally cross-shaped, clover-shaped, Y-shaped or in any other suitable shape.

[0107] Preferably, the wick 28 includes any suitable material or combination of materials. Examples of suitable materials are glass, ceramic- or graphite-based materials. Moreover, the wick 28 may have any suitable capillarity drawing action to accommodate aerosol generating liquids having different liquid physical properties such as density, viscosity, surface tension and vapor pressure. The capillary properties of the wick 28, combined with the properties of the liquid, ensure that the wick 28 is always wet in the area of the heater 14 to avoid overheating of the heater 14.

[0108] Instead of using a wick 28, the heater 14 can be a porous material which incorporates a resistance heater formed of a material having a high electrical resistance capable of generating heat quickly.

[0109] Preferably, the wick 28 and the fibrous medium of the liquid supply region 22 are constructed from glass fiber.

Sleeve Assembly

[0110] As shown in Figure 17, the electronic smoking article 60 can also include a sleeve assembly 87 removably and/or rotatably positioned about a first

section 70 of the electronic smoking article 70. Moreover, the sleeve assembly 87 insulates at least a portion of the first section 70 so as to maintain the temperature of the aerosol prior to delivery to the smoker. In the preferred embodiment, the sleeve assembly 87 is rotatable about the electronic smoking article 60 and includes spaced
5 apart slots 88 arranged transversely about the sleeve assembly such that the slots 88 line up with the air inlets 44, 44' in the first section 70 to allow air to pass into the electronic smoking article 60 when a smoker draws a puff. Before or during smoking, the smoker can rotate the sleeve assembly 87 such that the air inlets 44, 44' are at least partially blocked by the sleeve assembly 87 so as to adjust the
10 resistance to draw and/or ventilation of the electronic smoking article 60 if desired.

[0111] Preferably, the sleeve assembly 87 is made of silicone or other pliable material so as to provide a soft mouthfeel to the smoker. However, the sleeve assembly 87 can be formed in one or more pieces and can be formed of a variety of materials including plastics, metals and combinations thereof. In a
15 preferred embodiment, the sleeve assembly 87 is a single piece formed of silicone. The sleeve assembly 87 can be removed and reused with other electronic smoking articles or can be discarded along with the first section 70. The sleeve assembly 87 can be any suitable color and/or can include graphics or other indicia.

Aroma Delivery

20 [0112] As shown in Figure 29, the electronic smoking article 60 can also include an aroma strip 89 located on an outer surface 91 of at least one of the first section 70 and the second section 72. Alternatively, the aroma strip 89 can be located on a portion of the sleeve assembly 87. Preferably, the aroma strip 89 is located between the battery of the device and the heater 14 such that the aroma strip

89 is adjacent a smoker's nose during smoking. The aroma strip 89 can include a gel, film or solution including a fragrance or flavor material that is released before and/or during smoking. In one embodiment, the flavor aroma of the gel, fluid and/or solution can be released by the action of a puff which may open a vent over the
5 aroma strip when positioned inside the first section 70 (not shown). Alternatively, heat generated by the heater 14 can cause the release of the aroma.

[0113] In one embodiment, the aroma strip 89 can include tobacco flavor extracts. Such an extract can be obtained by grinding tobacco material to small pieces and extracting with an organic solvent. The extract can then be filtered, dried
10 (for example with sodium sulfate) and concentrated. Alternatively, the extracts can be obtained using techniques known in the field of flavor chemistry, such as the Solvent Assisted Flavor Extraction (SAFE) distillation technique (Engel et al. 1999), which allows separation of the volatile fraction from the non-volatile fraction. Additionally, pH fractionation and chromatographic methods can be used for further
15 separation and/or isolation of specific compounds.

[0114] The aroma strip 89 can be a polymeric or paper strip to which the extract or flavor material can be applied, for example, using a paintbrush or by impregnation. The flavor material can be natural or artificial. Alternatively, the extract or flavor material can be encapsulated in a paper ring and/or strip and
20 released manually by the smoker, for example by squeezing during smoking the aroma strip.

Fibrous Element

[0115] As shown in Figures 19, 20 and 21, the electronic smoking article 60 can include a fibrous element or filter 300, 300' downstream of the heater 14 in lieu of the mouth end insert 8 (shown in Figure 2). In an alternative embodiment shown in Figures 25 and 26, the fibrous element 300 can be included downstream of the heater and in addition to the mouth end insert 8. The fibrous element 300, 300' can be positioned between the heater 14 and the mouth end insert 8 as shown in Figure 26 or downstream of the mouth end insert 8, as shown in Figure 25.

[0116] The addition of a fibrous element 300, 300' can aid in adjusting the resistance to draw of the electronic smoking article 60. Additionally, the fibrous element 300, 300' can alter the character of the aerosol by providing additives and/or can provide additional flavors, aromas, and alter the mouth feel of the aerosol during smoking. The fibrous element 300, 300' can be constructed in a manner similar to filters used in traditional smoking articles.

[0117] Preferably, the fibrous element 300 is manufactured as a permanent part of the first section 70, and thus, would be discarded along with a disposable first section 70. In alternative embodiment, the fibrous element 300' can be a detachable fibrous element as shown in Figures 23 and 24.

[0118] In the preferred embodiment, the fibrous element 300, 300' includes low efficiency filter material. The fibrous element 300, 300' can include a bundle of fibrous material formed as a plug. The fibrous material can be any of the variety of fibrous materials suitable for use in traditional smoking article filter elements. The fibrous material can comprise cellulose acetate fibers, polyester fibers, polypropylene fibers, paper and the like. For example, the fibrous element 300, 300'

can comprise cellulose acetate tow and can be wrapped with a paper material if desired.

[0119] Various filter constructions can be used to form the filter element. Exemplary filter structures include, but are not limited to, a mono filter, a dual filter, 5 a triple filter, a cavity filter, a recessed filter, a free-flow filter or combinations thereof. Mono filters typically contain cellulose acetate tow or cellulose paper materials. Dual filters typically comprise a cellulose acetate mouth end plug and a pure cellulose or cellulose acetate segment. The length and pressure drop of the segments, which can be associated with the type of material used to construct the 10 fibrous element 300, 300', can be adjusted to provide the desired filtration and resistance to draw (RTD).

[0120] The fibrous element 300, 300' can have a length of about 3 mm to about 10 mm. Preferably, the diameter of the fibrous element 300, 300' is about the same or less than the diameter of the electronic smoking article 60.

15 [0121] As shown in Figure 20, the fibrous element 300, 300' can be a plug-space-plug fibrous element including an upstream plug 342 of fibrous material, a downstream plug 340 of fibrous material and a space 344 therebetween. An additive 348 can be placed within the space 344. Alternatively, as shown in Figure 21, the additive 348 can be dispersed throughout all or a portion of the fibrous material used 20 to form one or more plugs of fibrous material in the fibrous element 300, 300', in addition to additive 348 contained in a space, if included in the fibrous element 300, 300'. Thus, for example, the additive can be dispersed in the upstream plug 342 and the downstream plug 340 of the fibrous element 300, 300' if desired.

[0122] Detachable fibrous elements 300' can be purchased in packs including a plurality of fibrous elements 300', each having the same or different additives 348 so that the smoker can choose the preferred fibrous element 300' and additive 348. The detachable fibrous element 300' can be inserted into the
5 electronic smoking article 60 or otherwise attached thereto. For example, in one embodiment, the fibrous element 300 can be inserted into an open mouth end 346 of an electronic smoking article 60, shown in Figure 22. Alternatively, as shown in Figures 24 and 25, the fibrous element 300, 300' of an electronic smoking article 60 can be paired with a sleeve 325 which can detachably slide onto the mouth end of
10 the electronic smoking article 60, including the mouth end insert 8 if desired. The sleeve 325 can include a snap-fit mechanism or can simply be held in place by friction fit.

[0123] In one embodiment, in addition to additives 348 contained in the fibrous element 300, 300', an outer surface of the mouth end of the electronic
15 smoking article and/or an outer surface of the fibrous element 300, 300' can be impregnated with additives 348 or include a coating 370 (shown in Figures 22 and 25) of additive-containing microcapsules or other flavor and/or aroma compositions in addition to the additives 348 contained in the fibrous element 300, 300'. The additives 348 can be released in response to moisture from the smoker's mouth and
20 lips and can be encapsulated with water soluble materials having varying levels of water solubility so as to provide controlled release of the additive over a period of time. The coating material can include the same additive 348 as that contained in the fibrous element 300, 300' or a different additive 348. By including an impregnated additive 348 or an additive-containing coating 370 along with the

additives 348 in the fibrous element 300, 300', release of the additives 348 can be staggered during smoking and/or multiple additives can be delivered.

[0124] As used herein, the term "additive" means any material or component which modifies the characteristics of the electronic smoking article 60 when the electronic smoking article is smoked. Any appropriate additive material or combination of materials may be contained in the fibrous element 300, 300'. Such additive materials include flavor materials, aromatic materials, pH modifying agents, chemesthesis agents including cooling agents and warming agents, carbon dioxide formers, commercially available flavor systems, nicotine in liquid, salt or powder form, and other smoke modifiers. Additionally, the additive materials may also include diluents or solvents that may impact the sensorial attributes of the aerosol. For example, the fibrous element 300, 300' can include Carbosation™ (available from Ogawa & Co), which can enhance and/or create a carbonated mouth feel.

[0125] When included, the diluent can be an aerosol forming agent, such as glycerin or propylene glycol.

[0126] As used herein, the term "flavor material" means any liquid or solid flavor containing material or formulation that can release flavors and/or aromas into the aerosol stream. Suitable flavors or flavorings include, but are not limited to, menthol, mint, such as peppermint and spearmint, chocolate, licorice, citrus and other fruit flavors, gamma octalactone, vanillin, ethyl vanillin, breath freshener flavors, spice flavors such as cinnamon, methyl salicylate, linalool, bergamot oil, geranium oil, lemon oil, ginger oil, and tobacco flavor. Other suitable flavors may include flavor compounds selected from the group consisting of an acid, an alcohol,

an ester, an aldehyde, a ketone, a pyrazine, combinations or blends thereof and the like.

[0127] The flavor material can be in the form of particles, granules, fibers, capsules, microcapsules, powders, crushed plant material, aromatic barks, seeds, 5 pieces of dried fruits and/or root material, or any other suitable form. For example, the flavor material can include tobacco beads, flavor beads, mentholated flavor beads, flavor capsules and other flavor materials as used in traditional tobacco smoke filters.

[0128] Suitable flavor materials can be non-volatile or volatile and can be 10 delivered to the mouth via the condensation of the aerosol in the filter followed by entrapment and/or dissolution of the flavor material in droplets and/or deposition of the droplets to the tongue of the smoker during a puff. The droplets can consist of constituents used to form the aerosol including propylene glycol, glycerin, water and optionally nicotine. The flavor material can be released into the aerosol and/or can 15 be delivered to a smoker's mouth via contact with moisture from the smoker's lips.

[0129] The flavor materials can provide a bitter taste. Suitable compounds which provide a bitter taste include, without limitation, caffeine, denatonium benzoate, theobromine, quinine, and naringin.

[0130] The flavor materials can provide a sour taste. Suitable compounds 20 which provide a sour taste include, without limitation, citric acid, malic acid, succinic acid and tartaric acid.

[0131] The flavor materials can provide a salty taste. Suitable compounds which provide a salty taste include, without limitation, sodium chloride and potassium chloride.

[0132] The flavor materials can provide a sweet taste. Suitable compounds which provide a sweet taste include, without limitation, carbohydrates, including sucrose, and high intensity sweeteners, including sucralose and saccharin.

[0133] The flavor materials can provide umami and mouth feel. Suitable
5 compounds which provide umami and mouth feel include, without limitation, monosodium glutamate, gamma-glutamyl peptides, such as gamma-glutamylcysteine-beta-alanine, (R)-strombine.

[0134] In one embodiment, the additive can be a chemesthesis agent and/or can be chosen to alter the mouthfeel of the aerosol. For example, the additive can be
10 a chemesthesis agent that provides a warm, tingling sensation and/or a cooling sensation. Alternatively, to provide a “fatty” mouthfeel, the additive can be an edible fat, such as a medium chain triglyceride, triacetin or Neobee® M-5. In another embodiment, to provide an “astringent” mouthfeel, the additive can be tannic acid. Additives such as capsaicin, piperine, alpha-hydroxy-sanshool, and (8)-gingerole
15 can be included to provide a warm, tingling or burning sensation. Additives including menthol, menthyl lactate, WS-3 (N-Ethyl-p-menthane-3-carboxamide), WS-23 (2-Isopropyl-N,2,3-trimethylbutyramide) and Evercool 180™ can be included to provide a cooling sensation. In addition, the additive can include extracts, such as coffee extract, red pepper extract, ginger extract and peppermint
20 oil.

[0135] In another embodiment, the additive can reduce the harsh characteristics of nicotine in the aerosol and/or otherwise alter the character of the aerosol. For example, the additive can be an acid solution including an edible acid. The acid solution can be added to the fibrous element 300, 300' such that the acid

will react with nicotine carried in the aerosol stream to form a nicotine salt and decrease the amount of volatile nicotine free base in the aerosol which is believed to cause throat irritation during smoking. Suitable acids for inclusion in the acid solution include, without limitation, citric acid, malic acid, lactic acid, hydrochloric acid and combinations thereof. In addition to the acid solution, an ionic resin or an absorbent can be included in the fibrous element 300, 300' to help absorb nicotine from the gas phase to reduce irritation. Suitable absorbents include activated carbon and silica gel.

[0136] In yet another embodiment, the additive can include aroma materials which are volatile and which release vapor during puffing and can be perceived via retronasal pathways.

[0137] In a preferred embodiment, the fibrous element 300, 300' includes multiple fibrous materials and/or additives therein, each having a different pH value. Aerosol passing through the fibrous element 300, 300' can be modified depending on the pH of the materials used to form the fibrous element 300, 300' and the additives 348 contained therein. For example, the fibrous element 300, 300' can be formed of cellulose acetate that is treated with an additive. The additive can include pH modifying agents that is applied as an acid solution. A suitable acid solution includes about 20 to about 150mg of 2% citric acid in a mixture of propylene glycol, glycerol and water, and has a pH of about 4. This solution, when added to a fibrous plug 300, 300' and used in an electronic smoking article 60, has been found to provide a milder and less irritating smoking experience as compared to electronic smoking articles not including a fibrous element treated in this manner.

[0138] Alternatively, the additive 348 can be a pH modifying material that is applied to the fibrous material of the fibrous element 300, 300' as a solution. The solution can include about 20 mg to about 100 mg of 2% sodium bicarbonate in a mixture of propylene glycol, glycerol and water, the solution having a pH of about 5 10. Such, a solution, when added to fibrous element 300, 300' that is placed in an electronic smoking article have been found to increase the impact and irritation of the aerosol on a smoker's throat as compared to electronic smoking articles including a fibrous element 300, 300' not treated with such a solution.

[0139] During smoking, additives in the form of microparticulate solids 10 can be entrained in the aerosol and transferred to the smoker. If the additive includes volatile materials, such as menthol or other volatile flavors, the additive may diffuse into the aerosol as it passes through the fibrous element 300, 300'. Finally, portions of the aerosol may be deposited in or condense in the fibrous element 300, 300' causing additives to dissolve therein. The additives may then be 15 delivered when a smoker takes a puff on the electronic smoking article 60.

[0140] As noted above, the additive can provide carbon dioxide to the aerosol stream. It is believed that the addition of carbon dioxide to an aerosol stream can enhance the flavor and mouth feel of the aerosol. Some aerosols can seem artificial, stale, and/or lacking in character as compared to smoke from a 20 traditional cigarette. Thus, the addition of additives which can provide carbon dioxide to the aerosol stream may enhance the flavor of the aerosol.

[0141] In one embodiment, to increase the carbon dioxide above those in atmospheric concentrations, the additive 348 can comprise sodium bicarbonate and one or more acids, such as citric acid. The sodium bicarbonate and citric acid can

generate and/or release carbon dioxide in the presence of an aerosol carrier, such as propylene glycol.

[0142] Alternatively, the additive 348 could be a salt, such as ammonium bicarbonate that releases a desired amount of carbon dioxide in the presence of heat
5 from the aerosol. The salt could be placed in the fibrous element or on a screen 401 (shown in Figures 21 and 27). In one embodiment shown in Figure 27, the screen 401 could be attached to a sleeve 325, which can be attached to a mouth end of the outer tube 6 during manufacture or just prior to smoking. Alternatively, as shown in Figure 27, the screen 401 can be placed in the electronic smoking article 60
10 upstream of the fibrous element 300.

[0143] In another embodiment, shown in Figure 28, the electronic smoking article 60 can include a tank 403 of carbon dioxide. The control system of the electronic smoking article 60 can be programmed to selectively release a small amount of carbon dioxide from the tank 403 with each puff if desired to enhance the
15 mouth feel of the aerosol.

[0144] In another embodiment, the additive 348 be nicotine in a liquid, salt or powder form. The nicotine can be included only in the fibrous element 300, 300', such that the liquid material is nicotine-free and only includes aerosol formers such as propylene glycol or glycerine, water, and optionally flavor. Alternatively, the liquid
20 supply can include nicotine in addition to that included as an additive in the fibrous element 300, 300'. As the aerosol passes through the fibrous element 300, 300', nicotine can be picked up for delivery to the smoker along with the aerosol. Additional additives can be included in the fibrous element 300, 300' along with the nicotine if desired.

[0145] Preferably, the nicotine is held in a liquid suspension in the fibrous element 300, 300'. Alternatively, the nicotine could be held in a polymeric film, such as a pectin film, held within the fibrous element 300, 300' or within the space of a plug-space-plug fibrous element 300, 300'. In addition to the fibrous element
5 300, 300' or in lieu thereof, a resin could be positioned downstream of the heater. The resin can be an ion-exchange resin, such as polyacrylex and the nicotine could be bound within the resin. Various fibrous elements 300, 300' could be purchased, each having different nicotine contents, if desired.

[0146] Advantageously, forming an aerosol without nicotine is believed to
10 reduce throat irritation and chest impact. However, adding nicotine to the aerosol after formation of the aerosol is believed to reduce any impact nicotine may have on the throat.

[0147] Preferably, the additive 348 is added in an amount sufficient to provide additional flavors and/or aromas, enhance, or alter the mouth feel of the
15 aerosol. For example, about 0.05 mg to about 100 mg of additive can be included in a fibrous element 300.

[0148] When the word "about" is used in this specification in connection with a numerical value, it is intended that the associated numerical value include a tolerance of $\pm 10\%$ around the stated numerical value. Moreover, when reference is
20 made to percentages in this specification, it is intended that those percentages are based on weight, i.e., weight percentages.

[0149] Moreover, when the words "generally" and "substantially" are used in connection with geometric shapes, it is intended that precision of the geometric shape is not required but that latitude for the shape is within the scope of the

disclosure. When used with geometric terms, the words "generally" and "substantially" are intended to encompass not only features which meet the strict definitions but also features which fairly approximate the strict definitions.

- [0150] It will now be apparent that a new, improved, and nonobvious
- 5 electronic smoking article has been described in this specification with sufficient particularity as to be understood by one of ordinary skill in the art. Moreover, it will be apparent to those skilled in the art that numerous modifications, variations, substitutions, and equivalents exist for features of the electronic smoking article which do not materially depart from the spirit and scope of the invention.
- 10 Accordingly, it is expressly intended that all such modifications, variations, substitutions, and equivalents which fall within the spirit and scope of the invention as defined by the appended claims shall be embraced by the appended claims.

We Claim:

1. An electronic smoking article comprising:
 - an outer tube extending in a longitudinal direction;
 - an inner tube within the outer tube;
 - 5 a liquid supply comprising a liquid material, the liquid supply contained in an outer annulus between the outer tube and the inner tube;
 - a heater located in the inner tube;
 - a wick in communication with the liquid supply and surrounded by the heater such that the wick delivers liquid material to the heater and the heater heats the
 - 10 liquid material to a temperature sufficient to vaporize the liquid material and form an aerosol in the inner tube; and
 - a fibrous element located downstream of the heater.
2. The electronic smoking article of Claim 1, further including a mouth end
- 15 insert, said mouth end insert comprising at least two diverging outlet passages operable to distribute aerosol throughout a mouth of a smoker during a puff.
3. The electronic smoking article of Claim 2, wherein each of the at least two diverging outlet passages is angled at about 5° to about 60° in relation to a
- 20 longitudinal axis of the electronic smoking article.
4. The electronic smoking article of Claim 1, wherein the fibrous element comprises a low efficiency filter material.

5. The electronic smoking article of Claim 1, wherein the fibrous element comprises fibrous material selected from the group consisting of cellulose acetate, polyester, polypropylene, paper, and combinations thereof.

5 6. The electronic smoking article of Claim 1, wherein the fibrous element further comprises at least one additive.

7. The electronic smoking article of Claim 6, wherein the at least one additive is selected from the group consisting of flavor materials, aromatic materials, pH
10 modifying agents, chemesthesis agents, carbon dioxide formers, smoke modifiers, diluents, aerosol formers, nicotine, and combinations thereof.

8. The electronic smoking article of Claim 1, wherein the fibrous element has a length ranging from about 3 mm to about 10 mm.

15

9. The electronic smoking article of Claim 1, wherein the fibrous element comprises an upstream plug of fibrous material, a downstream plug of fibrous material, and a space therebetween.

20 10. The electronic smoking article of Claim 9, wherein at least one additive is contained in the space.

11. The electronic smoking article of Claim 1, wherein the fibrous element is detachable.

12. The electronic smoking article of Claim 11, wherein the fibrous element includes a sleeve that is attachable to a mouthend of the outer tube.
- 5 13. The electronic smoking article of Claim 11, wherein the electronic smoking article is an electronic cigarette including a recess at a mouth end and the fibrous element is insertable therein.
14. The electronic smoking article of Claim 1, wherein the fibrous element has a
10 coating thereon.
15. The electronic smoking article of Claim 7, wherein the additive is selected from the group consisting of caffeine, denatonium benzoate, theobromine, quinine, naringin, citric acid, malic acid, succinic acid, tartaric acid, sodium chloride,
15 potassium chloride, sucrose, fructose, sucralose, saccharin, monosodium glutamate, gamma-glutamyl peptides, medium chain triglycerides, triacetin, neobee, tannic acid, and combinations thereof.
16. The electronic smoking article of Claim 7, wherein the chemesthesis agent is
20 selected from the group consisting of capsaicin, piperine, alpha-hydroxy-sanshool, (8)-gingerole, menthol, menthyl lactate and combinations thereof.

17. The electronic smoking article of Claim 7, wherein the pH modifying agent is selected from the group consisting of citric acid, malic acid, lactic acid, hydrochloric acid and combinations thereof.
- 5 18. The electronic smoking article of Claim 1, further including at least one absorbent, and the absorbent is selected from the group consisting of activated carbon, silica gel and combinations thereof.
- 10 19. The electronic smoking article of Claim 7, wherein the aerosol former is selected from the group consisting of propylene glycol, glycerin and combinations thereof.
- 15 20. The electronic smoking article of Claim 7, wherein the carbon dioxide formers are selected from the group consisting of sodium bicarbonate, citric acid and combinations thereof.
21. The electronic smoking article of Claim 6, wherein the additive is included in the fibrous element in an amount ranging from about 0.05 mg to about 100 mg.
- 20 22. The electronic smoking article of Claim 1, wherein the electronic smoking article comprises a first section attachable to a second section and wherein the wick, the liquid supply and fibrous element are contained in the first section and a power supply is operable to apply voltage across the heater contained in the second section.

23. The electronic smoking article of Claim 1, wherein the electronic smoking article comprises a single outer tube and wherein the wick, the liquid supply, the fibrous element, the heater and a power supply are contained in the outer tube.

5 24. The electronic smoking article of Claim 6, wherein the at least one additive is dispersed substantially uniformly throughout the fibrous element.

25. The electronic smoking article of Claim 7, wherein the additive is nicotine and the liquid material is nicotine-free.

10

26. An electronic smoking kit, the kit comprising:

(a) an electronic smoking article, the electronic smoking article comprising:

an outer tube extending in a longitudinal direction;

an inner tube within the outer tube;

15 a liquid supply comprising a liquid material, the liquid supply

contained in an outer annulus between the outer tube and the inner tube;

a heater located in the inner tube; and

a wick in communication with the liquid supply and surrounded by

the heater such that the wick delivers liquid material to the heater and the

20 heater heats the liquid material to a temperature sufficient to vaporize the

liquid material and form an aerosol in the inner tube; and

(b) a plurality of detachable fibrous elements, each detachable fibrous

element comprising at least one additive.

27. The electronic smoking kit of Claim 26, wherein the at least one additive is selected from the group consisting of flavor materials, aromatic materials, pH modifying agents, chemesthesis agents, carbon dioxide formers, smoke modifiers, diluents, aerosol formers, nicotine, and combinations thereof.

5

28. The electronic smoking kit of Claim 27, wherein the additive is nicotine and a nicotine content of each of the plurality of detachable fibrous elements is different.
