(54) Title: INSECTICIDAL ARYLPYRROLINES

(57) Abstract: The invention relates to novel arylpyrroline compounds of formula (I) which have excellent insecticidal activity and which can thus be used as an insecticide.

Insecticidal Arylpyrrolines

The present invention relates to novel arylpyrrolines and their use as insecticides, as well as to processes for the preparation of the arylpyrrolines.

- 5 Certain arylpyrroline compounds are described in WO 2009/072621, Japanese Patent Application Laid-Open No. 2009-32354 and WO2009/000559. It is described therein that some of these compounds have insecticidal activity.

Since ecological and economic demands on modern plant treatment agents are continually increasing, particularly in respect to the amount applied, residue formation, selectivity, toxicity and
 10 favourable production methodology, and also because, for example, resistance problems can occur, there is the on-going task to develop new plant treatment agents that at least in certain areas are able to demonstrate advantages over known agents.

The inventors of the present invention devotedly conducted research to create novel compounds exhibiting higher effects and having a wide spectrum as an insecticide. As a result, they found
 15 novel arylpyrroline compounds, which exhibit high biological activity, a wide spectrum and safety.

Thus, this invention is directed to arylpyrroline compounds of formula (I)

The compounds according to the present invention show a potent insecticidal action and can, therefore, be used as an insecticide. Furthermore, the compounds according to the present invention exhibit a strong control effect against harmful animal pests, in particular arthropods and/or insects, particularly to agricultural pests, without imposing any harmful side effects of drug to the animal or the cultivated plants. The compounds of the present invention can thus be used for the control of a wide range of pest species, for example, harmful sucking insects, chewing insects, as well as other plant parasitic pests, storage insects, hygiene pests and the like, and can be applied for the purpose of disinfestations and extermination thereof.

The active compounds and active compound combinations according to the invention, in combination with good plant tolerance and favourable toxicity to warm-blooded animals and being tolerated well by the environment, are suitable for protecting plants and plant organs, for increasing harvest yields, for improving the quality of the harvested material and for controlling animal pests, in particular insects, arachnids, helminths, nematodes and molluscs, which are encountered in agriculture, in horticulture, in animal husbandry, in forests, in gardens and leisure facilities, in the protection of stored products and of materials, and in the hygiene sector. They can be preferably employed as plant protection agents. They are active against normally sensitive and resistant species and against all or some stages of development. The abovementioned pests include:

It is furthermore possible to control protozoa, such as Eimeria.

All plants and plant parts can be treated in accordance with the invention. Plants are to be understood as meaning in the present context all plants and plant populations such as desired and undesired wild plants or crop plants (including naturally occurring crop plants). Crop plants can be plants which can be obtained by conventional plant breeding and optimization methods or by biotechnological and genetic engineering methods or by combinations of these methods, including the transgenic plants and including the plant cultivars protectable or not protectable by plant breeders' rights. Plant parts are to be understood as meaning all parts and organs of plants above and below the ground, such as shoot, leaf, flower and root, examples which may be mentioned being leaves, needles, stalks, stems, flowers, fruit bodies, fruits, seeds, roots, tubers and rhizomes. The plant parts also include harvested material, and vegetative and generative propagation material, for example cuttings, tubers, rhizomes, offshoots and seeds.

Treatment according to the invention of the plants and plant parts with the active compounds is carried out directly or by allowing the compounds to act on their surroundings, habitat or storage space by the customary treatment methods, for example by immersion, spraying, evaporation, fogging, scattering, painting on, injecting and, in the case of propagation material, in particular in the case of seed, also by applying one or more coats.

The compounds according to the present invention show a systemic action which means that the compounds can permeate plants body and translocate from the underground part of plants to the aerial part of plants.

As already mentioned above, it is possible to treat all plants and their parts according to the invention. In a preferred embodiment, wild plant species and plant cultivars, or those obtained by conventional biological breeding methods, such as crossing or protoplast fusion, and parts thereof, are treated. In a further preferred embodiment, transgenic plants and plant cultivars obtained by genetic engineering methods, if appropriate in combination with conventional methods (Genetically Modified Organisms), and parts thereof, are treated. The terms "parts", "parts of plants" and "plant parts" have been explained above.

Particularly preferably, plants of the plant cultivars which are in each case commercially available or in use are treated according to the invention. Plant cultivars are understood as meaning plants having novel properties ("traits") which have been obtained by conventional breeding, by mutagenesis or by recombinant DNA techniques. These can be cultivars, bio- or genotypes.

Depending on the plant species or plant cultivars, their location and growth conditions (soils, climate, vegetation period, diet), the treatment according to the invention may also result in superadditive "synergistic" effects. Thus, for example, reduced application rates and/or a widening of the activity spectrum and/or an increase in the activity of the substances and compositions which can be used according to the invention, better plant growth, increased tolerance to high or low temperatures, increased tolerance to drought or to water or soil salt content, increased flowering performance, easier harvesting, accelerated maturation, higher harvest yields, higher quality and/or a higher nutritional value of the harvested products, better storage stability and/or processability of the harvested products are possible, which exceed the effects which were actually to be expected.

The preferred transgenic plants or plant cultivars (obtained by genetic engineering) which are to be treated according to the invention include all plants which, by virtue of the genetic modification, received genetic material which imparts particularly advantageous, useful traits to these plants. Examples of such traits are better plant growth, increased tolerance to high or low temperatures, increased tolerance to drought or to water or soil salt content, increased flowering performance, easier harvesting, accelerated maturation, higher harvest yields, higher quality and/or a higher nutritional value of the harvested products, better storage stability and/or processability of the harvested products. Further and particularly emphasized examples of such traits are a better defence of the plants against animal and microbial pests, such as against insects, mites, phytopathogenic fungi, bacteria and/or viruses, and also increased tolerance of the plants to certain herbicidally active compounds. Examples of transgenic plants which may be mentioned are the

important crop plants, such as cereals (wheat, rice), maize, soya beans, potatoes, sugar beet, tomatoes, peas and other vegetable varieties, cotton, tobacco, oilseed rape and also fruit plants (with the fruits apples, pears, citrus fruits and grapes), and particular emphasis is given to maize, soya beans, potatoes, cotton, tobacco and oilseed rape. Traits that are emphasized in particular are the increased defence of the plants against insects, arachnids, nematodes and slugs and snails by virtue of toxins formed in the plants, in particular those formed in the plants by the genetic material from *Bacillus thuringiensis* (for example by the genes CryIA(a), CryIA(b), CryIA(c), CryIIA, CryIIIA, CryIIIB2, Cry9c, Cry2Ab, Cry3Bb and CryIF and also combinations thereof) (referred to hereinbelow as "Bt plants"). Traits that are also particularly emphasized are the increased defence of the plants against fungi, bacteria and viruses by systemic acquired resistance (SAR), systemin, phytoalexins, elicitors and resistance genes and correspondingly expressed proteins and toxins. Traits that are furthermore particularly emphasized are the increased tolerance of the plants to certain herbicidally active compounds, for example imidazolinones, sulphonylureas, glyphosate or phosphinotricin (for example the "PAT" gene). The genes which impart the desired traits in question can also be present in combination with one another in the transgenic plants. Examples of "Bt plants" which may be mentioned are maize varieties, cotton varieties, soya bean varieties and potato varieties which are sold under the trade names YIELD GARD® (for example maize, cotton, soya beans), KnockOut® (for example maize), StarLink® (for example maize), Bollgard® (cotton), Nucotn® (cotton) and NewLeaf® (potato). Examples of herbicide-tolerant plants which may be mentioned are maize varieties, cotton varieties and soya bean varieties which are sold under the trade names Roundup Ready® (tolerance to glyphosate, for example maize, cotton, soya beans), Liberty Link® (tolerance to phosphinotricin, for example oilseed rape), IMI® (tolerance to imidazolinones) and STS® (tolerance to sulphonylureas, for example maize). Herbicide-resistant plants (plants bred in a conventional manner for herbicide tolerance) which may be mentioned include the varieties sold under the name Clearfield® (for example maize). Of course, these statements also apply to plant cultivars having these genetic traits or genetic traits still to be developed, which plant cultivars will be developed and/or marketed in the future.

The plants listed can be treated according to the invention in a particularly advantageous manner with the compounds according to the invention at a suitable concentration.

The active compounds according to the invention are also suitable for controlling arthropods, helminths and protozoae, which attack animals. Animals include agricultural livestock such as, cattle, sheep, goats, horses, pigs, donkeys, camels, buffaloes, rabbits, chickens, turkeys, ducks, geese, cultured fish, honeybees. Moreover, animals include domestic animals - also referred to as

15 companion animals - such as dogs, cats, cage birds, aquarium fish and what are known as experimental animals such as hamsters, guinea pigs, rats and mice.

By controlling these arthropods, helminths and/or protozoae, it is intended to reduce deaths and improve performance (in the case of meat, milk, wool, hides, eggs, honey and the like) and health of the host animal, so that more economical and simpler animal keeping is made possible by the

20 use of the active compounds according to the invention.

For example, it is desirable to prevent or interrupt the uptake of blood by the parasites from the hosts (when applicable). Also, controlling the parasites may help to prevent the transmittance of infectious agents.

The term "controlling" as used herein with regard to the veterinary field, means that the active

25 compounds are effective in reducing the incidence of the respective parasite in an animal infected with such parasites to innocuous levels. More specifically, "controlling", as used herein, means that the active compound is effective in killing the respective parasite, inhibiting its growth, or inhibiting its proliferation.

Generally, when used for the treatment of animals, the active compounds according to the invention

30 can be applied directly. Preferably, they are applied as pharmaceutical compositions which may contain pharmaceutically acceptable excipients and/or auxiliaries which are known in the art.

In the veterinary field and in animal keeping, the active compounds are applied (= administered) in

the known manner by enteral administration in the form of, for example, tablets, capsules, drinks, drenches, granules, pastes, boluses, the feed-through method, or suppositories; or by parenteral administration, such as injections (intramuscular, subcutaneous, intravenous, intraperitoneal and the like), implants, nasal application, or dermal application in the form of, for example, bathing or dipping, spraying, pouring-on and spotting-on, washing, dusting, and with the aid of active-compound-comprising shaped articles such as collars, ear tags, tail tags, limb bands, halters, marking devices and the like. The active compounds may be formulated as shampoo or as suitable formulations usable in aerosols, or unpressurized sprays, for example, pump sprays and atomizer sprays.

- 10 When used for livestock, poultry, domestic animals and the like, the active compounds according to the invention can be applied as formulations (for example, powders, wettable powders ["WP"], emulsions, emulsifiable concentrates ["EC"], flowables, homogeneous solutions, and suspension concentrates ["SC"]) which comprise the active compounds in an amount of from 1 to 80% by weight, either directly or after dilution (e.g. 100- to 10 000-fold dilution), or else as a chemical bath.
- 15 When used in the veterinary field, the active compounds according to the invention may be used in combination with suitable synergists or other active compounds, such as acaricides, insecticides, anthelmintics, or anti-protozoal drugs.

In the present invention, a substance having an insecticidal action against pests including all of these is referred to as an insecticide.

Examples of the formulation forms include solutions, emulsions, wettable powders, water dispersible granules, suspensions, powders, foams, pastes, tablets, granules, aerosols, active compound-infiltrated natural and synthetic materials, microcapsules, seed coating agents, formulations used with a combustion apparatus (for example, fumigation and smoking cartridges, cans, coils or the like as the combustion apparatus), or ULV (cold mist, warm mist), and the like.

- These formulations can be produced by methods that are known per se. For example, a formulation can be produced by mixing the active compound with a developer, that is, a liquid diluent or carrier; a liquefied gas diluent or carrier; or a solid diluent or carrier, and optionally with a surfactant, that is, an emulsifier and/or dispersant and/or foaming agent.

In the case where water is used as the developer, for example, an organic solvent can also be used as an auxiliary solvent.

The liquefied gas diluent or carrier may be those which are gaseous at normal temperature and normal pressure, for example, aerosol propellants such as butane, propane, nitrogen gas, carbon dioxide and halogenated hydrocarbons.

Examples of the solid diluent include pulverized natural minerals (for example, kaolin, clay, talc, chalk, quartz, attapulgite, montmorillonite, diatomaceous earth, and the like), pulverized synthetic minerals (for example, highly dispersed silicic acid, alumina, silicates and the like), and the like.

Examples of the solid carrier for granules include pulverized and screened rocks (for example, calcite, marble, pumice, sepiolite, dolomite and the like), synthetic granules of inorganic and organic powder, fine particles of organic materials (for example, sawdust, coconut shells, maize cobs, tobacco stalk and the like), and the like.

Examples of the dispersant include lignin sulfite waste liquor and methylcellulose.

Fixing agents can also be used in the formulations (powders, granules, or emulsions), and examples of the fixing agent include carboxymethylcellulose, natural and synthetic polymers (for example, gum arabic, polyvinyl alcohol, polyvinyl acetate, and the like) and the like.

Colorants can also be used, and examples of the colorants include inorganic pigments (for example, iron oxide, titanium oxide, Prussian Blue and the like), organic dyes such as alizarin dyes, azo dyes or metal phthalocyanine dyes, and in addition, trace elements such as the salts of iron, manganese, boron, copper, cobalt, molybdenum and zinc.

The formulations in general can contain the active ingredient in an amount ranging from 0.1 to 95% by weight, and preferably 0.5 to 90% by weight.

The compound according to the present invention can also exist as an admixture with other active compounds, for example, insecticides, poisonous baits, bactericides, miticides, nematocides, fungicides, growth regulators, herbicides and the like, in the form of their commercially useful formulation forms and in the application forms prepared from those formulations.

- 5 The content of the compound according to the present invention in a commercially useful application form can be varied within a wide range.

The concentration of the active compound according to the present invention in actual usage can be, for example, in the range of 0.0000001 to 100% by weight, and preferably 0.00001 to 1% by weight.

- 10 The compounds according to the present invention can be used through conventional methods that are appropriate for the usage form.

Next, the present invention is exemplified by way of the following examples, but the invention is not intended to be limited thereto.

In addition, Me stands for Methyl, Ac stands for acetyl and Ms stands for methanesulfonyl in the examples. References to room temperature means temperatures of about 18 to about 30° C.

- 20 **Example A: Synthesis of 5-[3-(2,6-dichloropyridin-4-yl)-3-(trifluoromethyl)-3,4-dihydro-2H-pyrrol-5-yl]-2-(1H-1,2,4-triazol-1-yl)benzonitrile (No. 1-1)**

Step 1. Synthesis of 2,6-dichloro-4-(3,3,3-trifluoroprop-1-en-2-yl)pyridine.

- 25 2,6-dichloro-4-iodopyridine (0.87 g), (3,3,3-trifluoroprop-1-en-2-yl)boronic acid (purity: 65%, 0.75 g) and potassium carbonate (0.96 g) were dissolved in the mixed solvent of THF and water, which was then degassed three times. To the solution was added dichlorobis(triphenylphosphine)

palladium (II) (0.04 g), and the mixture was heated to reflux for 3 hours under argon atmosphere. The mixture was cooled to room temperature and then poured into water, which was then extracted twice with hexane. The organic layer was combined, which was then washed with water and dried over anhydrous magnesium sulfate. After the drying agent was filtered off, the solvent was distilled away under reduced pressure, and the residue was then purified by silica gel chromatography to obtain 2,6-dichloro-4-(3,3,3-trifluoroprop-1-en-2-yl)pyridine (0.70 g) at a yield of 82%.

¹H-NMR(CDCl₃)δ: 6.03 (1H, s), 6.21 (1H, s), 7.34 (2H, s)

To the crude solution of methyl 3-cyano-4-(1H-1,2,4-triazol-1-yl)-N-[(trimethylsilyl)methyl]benzenecarbamidithioate (Japanese patent application JP2008-143120) was added 2,6-dichloro-4-(3,3,3-trifluoroprop-1-en-2-yl)pyridine (0.15 g) and the resultant mixture was cooled to -10°C. Additionally, a solution of tetrabutylammonium fluoride (0.70 mL of 1.0 M in THF) in THF was added over 10 minutes under argon atmosphere. The reaction mixture was stirred for 30 minutes at the same temperature and returned to room temperature gradually, and then stirred 3 hours. Water was added to the reaction liquor, and aqueous layer was extracted with ethyl acetate. The combined organic layers were washed with a saturated aqueous brine, and subsequently dried over magnesium sulfate. After filtering the reaction mixture, the solvent was distilled off under reduced pressure, and the resulting mixture was purified by silica gel chromatography, to obtain 5-[3-(2,6-dichloropyridin-4-yl)-3-(trifluoromethyl)-3,4-dihydro-2H-pyrrol-5-yl]-2-(1H-1,2,4-triazol-1-yl)benzonitrile (0.14 g) at a yield of 46%.

Example B: Synthesis of N-(4-{3-[2,6-bis(trifluoromethyl)pyridin-4-yl]-3-(trifluoromethyl)-3,4-dihydro-2H-pyrrol-5-yl}-2-bromobenzyl)propanamide (No. 2-2733)

Step 1. Synthesis of 2,6-bis(trifluoromethyl)-4-(3,3,3-trifluoroprop-1-en-2-yl)pyridine.

4-bromo-2,6-bis(trifluoromethyl)pyridine (1.53 g), (3,3,3-trifluoroprop-1-en-2-yl)boronic acid (purity: 40%, 2.00 g) and potassium carbonate (1.58 g) were dissolved in the mixed solvent of THF and water, which was then degassed three times. To the solution was added
 5 dichlorobis(triphenylphosphine) palladium (II) (0.07 g), and the mixture was heated to reflux for 3 hours under argon atmosphere. The mixture was cooled to room temperature and then poured into water, which was then extracted twice with pentane. The organic layer was combined, which was then washed with water and dried over anhydrous magnesium sulfate. After the drying agent was filtered off, the solvent was distilled away under reduced pressure, and the residue was then
 10 purified by silica gel chromatography to obtain 2,6-bis(trifluoromethyl)-4-(3,3,3-trifluoroprop-1-en-2-yl)pyridine (1.59 g) at a yield of 98%.

$^1\text{H-NMR}(\text{CDCl}_3)\delta$: 6.17 (1H, s), 6.35 (1H, s), 7.92 (2H, s)

Step 2. Synthesis of 4-{3-[2,6-bis(trifluoromethyl)pyridin-4-yl]-3-(trifluoromethyl)-3,4-dihydro-2H-pyrrol-5-yl}-2-bromobenzyl acetate.

Under argon atmosphere, t-BuOK(0.36g) was slowly added to 2-bromo-4-
 {[(trimethylsilyl)methyl]carbamothioyl}benzyl acetate (1.0g) and iodomethane (0.45g) in THF at -
 10°C, and the resultant mixture was stirred for 30minutes at the same temperature. 2,6-
 20 bis(trifluoromethyl)-4-(3,3,3-trifluoroprop-1-en-2-yl)pyridine (1.1g) was added to the reaction
 mixture, and then n-Bu₄NF in THF (0.25ml, 1M solution) was slowly added to the mixture at -
 10°C under argon atmosphere. After stirring the resultant blend for 30 minutes at the same
 temperature, the blend was allowed to slowly warm to room temperature. The blend was stirred at
 room temperature overnight. The blend was diluted with t-BuOMe, and washed with 1N HCl and
 25 brine. The organic layer was dried over MgSO₄. The solvent was evaporated under reduced

pressure and the residue was purified by column chromatography to get the targeted product (0.58g).

5 Step 3. Synthesis of (4-{3-[2,6-bis(trifluoromethyl)pyridin-4-yl]-3-(trifluoromethyl)-3,4-dihydro-2H-pyrrol-5-yl}-2-bromophenyl)methanol.

4-{3-[2,6-bis(trifluoromethyl)pyridin-4-yl]-3-(trifluoromethyl)-3,4-dihydro-2H-pyrrol-5-yl}-2-bromobenzyl acetate(0.5g) and Sodium methoxide(0.005g) in MeOH(10ml) were stirred at room temperature for 30 minutes. The mixture was diluted with t-BuOMe, and washed with brine, and the organic layer was dried over MgSO₄. After the solvent was evaporated under reduced pressure, the targeted product was obtained (0.4g).

¹H-NMR (CDCl₃) δ: 2.07 (1H, t), 3.48 (1H, d), 3.91 (1H, dd), 4.51 (1H, d), 4.81 (2H, d), 5.01 (1H, dd), 7.63 (1H, d), 7.81 (1H, dd), 7.85 (2H, s), 8.07 (1H, d)

15 Step 4. Synthesis of 1-(4-{3-[2,6-bis(trifluoromethyl)pyridin-4-yl]-3-(trifluoromethyl)-3,4-dihydro-2H-pyrrol-5-yl}-2-bromophenyl)methanamine.

Methanesulfonyl chloride (0.17g) was added to (4-{3-[2,6-bis(trifluoromethyl)pyridin-4-yl]-3-(trifluoromethyl)-3,4-dihydro-2H-pyrrol-5-yl}-2-bromophenyl)methanol (0.46g) and triethylamine (0.26g) in THF at -10°C and the resultant mixture was stirred for 30min. Biological Examples

Unless not mentioned otherwise, the test solutions were prepared as follows:

Containing as solvent: Dimethylformamide, 3 parts by weight; and as emulsifier: Polyoxyethylene alkyl phenyl ether, 1 part by weight. To prepare the test solution, 1 part by weight of an active
5 compound is mixed with the above-mentioned amount of solvent containing the above-mentioned amount of emulsifier, and the mixture is diluted with water to the desired concentration.

Biological Test Example 1: Test against tobacco cutworm (*Spodoptera litura*) larvae

The leaves of sweet potato were immersed in the test solution at the appropriate concentration, and the leaves were dried in air. The leaves were then placed in a petri dish having a diameter of 9 cm,
10 and ten third-instar larvae of tobacco cutworm were released therein. The petri dish was placed in a temperature-controlled chamber at 25°C. After 2 days and 4 days sweet potato leaves were additionally added. After 7 days, the number of dead larvae was counted to calculate the insecticidal activity. An insecticidal activity of 100 % means that all larvae were killed, whereas an insecticidal activity of 0 % means that no larva was killed. In the current test, the results of two
