COELENTERAZINE ANALOGUES

RELATED APPLICATIONS

[0001] This application claims the benefit of U.S. provisional application serial no. 62/367,689, filed July 28, 2016, which is incorporated herein by reference in its entirety.

TECHNICAL FIELD

[0002] The present disclosure relates to coelenterazine analogues, methods for making coelenterazine analogues, and methods of using coelenterazine analogues in luciferase-based assays.

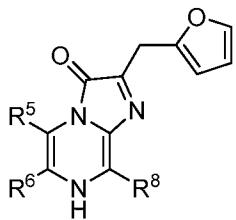

BACKGROUND

[0003] Bioluminescent assays are used extensively in the investigation of cellular physiology, especially processes associated with gene expression. In particular, luciferase reporter enzymes are quite valuable tools in this field, and, to date, there has been intense protein engineering to obtain small and environmentally insensitive luciferases that may be useful in bioluminescent assays. There exist a number of efficient luciferase reporters enabling whole-cell biosensor measurements, drug discovery through high-throughput screening, and *in vivo* imaging, which also permits the study of protein-protein interactions in living cells, apoptosis, and cell viability. Luciferases that use coelenterazine and coelenterazine analogues as substrates are among the most widely used systems due to their brightness and acceptance in whole cell applications.

SUMMARY OF THE INVENTION

[0004] Many known coelenterazine analogues have deficiencies, which limit their effectiveness as luciferase substrates and usefulness in luciferase-based assays. These deficiencies include cell toxicity, light sensitivity, thermodynamic instability, low aqueous solubility, and low cell permeability. Accordingly, there exists a need for coelenterazine analogues with improved properties and methods for synthesizing the analogues.

DETAILED DESCRIPTION

[0018] Disclosed herein are coelenterazine analogues. The coelenterazine analogues can be compounds of formula (I) or formula (II) and can be useful substrates for proteins that utilize coelenterazine (“coelenterazine-utilizing enzymes”) to produce luminescence, including, but not limited to, luciferases and photoproteins found in various marine organisms such as cnidarians (e.g., *Renilla* luciferase), jellyfish (e.g., aequorin from the *Aequorea* jellyfish) and decapods luciferases (e.g., luciferase complex of *Oplophorus gracilirostris*).

[0019] The compounds of formula (I) and formula (II) may produce red-shifted bioluminescent light. Known substrates for the coelenterazine utilizing enzymes, such as the NANOLUC® bioluminescent enzyme, generate bioluminescent light with a peak of about

460 nM. However, the compounds disclosed herein (e.g., compounds of formula (I) and (II)) can provide wavelength shifts of the bioluminescent light from 460 - 596 nM. Unlike blue light, red light is not attenuated in tissue, therefore bioluminescent systems that generate red light are preferred for in vivo imaging applications. Thus, the compounds of formula (I) and (II) may be useful for in vivo luminescent imaging applications as well as in other applications that utilize bioluminescence.

[00127] Compound names are assigned by using Struct=Name naming algorithm as part of CHEMDRAW® ULTRA v. 12.0.

[00128] The compounds may exist as stereoisomers wherein asymmetric or chiral centers are present. The stereoisomers are “R” or “S” depending on the configuration of substituents around the chiral carbon atom. The terms “R” and “S” used herein are configurations as defined in IUPAC 1974 Recommendations for Section E, Fundamental Stereochemistry, in Pure Appl. Chem., 1976, 45: 13-30. The disclosure contemplates various stereoisomers and mixtures thereof, and these are specifically included within the scope of this invention. Stereoisomers include enantiomers and diastereomers and mixtures of enantiomers or diastereomers. Individual stereoisomers of the compounds may be prepared synthetically from commercially available starting materials, which contain asymmetric or chiral centers or by preparation of racemic mixtures followed by methods of resolution well-known to those of ordinary skill in the art. These methods of resolution are exemplified by (1) attachment of a mixture of enantiomers to a chiral auxiliary, separation of the resulting mixture of diastereomers by recrystallization or chromatography, and optional liberation of the optically pure product from the auxiliary as described in Furniss, Hannaford, Smith, and Tatchell, “Vogel’s Textbook of Practical Organic Chemistry”, 5th edition (1989), Longman Scientific & Technical, Essex CM20 2JE, England, or (2) direct separation of the mixture of optical enantiomers on chiral chromatographic columns, or (3) fractional recrystallization methods.

[00129] It should be understood that the compounds may possess tautomeric forms as well as geometric isomers, and that these also constitute an aspect of the invention.

[00130] The present disclosure also includes isotopically-labeled compounds, which are identical to those recited in formula (I), but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes suitable for inclusion in the compounds of the invention are hydrogen, carbon, nitrogen, oxygen, phosphorus, sulfur, fluorine, and chlorine, such as, but not limited to, ²H, ³H, ¹³C, ¹⁴C, ¹⁵N, ¹⁸O, ¹⁷O, ³¹P, ³²P, ³⁵S, ¹⁸F, and ³⁶Cl, respectively. Substitution with heavier isotopes such as deuterium, i.e., ²H, can afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements, and, hence, may be preferred in some circumstances. The compound may incorporate positron-emitting isotopes for medical imaging and positron-emitting tomography (PET) studies for determining the distribution of receptors. Suitable positron-emitting isotopes that can be incorporated in compounds of formula (I) are ¹¹C, ¹³N, ¹⁵O, and ¹⁸F. Isotopically-labeled compounds of formula (I) can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described in the accompanying Examples using appropriate isotopically-labeled reagent in place of non-isotopically-labeled reagent.

A. Properties of the Compounds

[00131] The compounds of formula (I) and formula (II) may be substrates of luciferases to produce luminescence. The compounds may have improved water solubility, improved stability, improved cell permeability, increased biocompatibility with cells, reduced autoluminescence, and/or reduced toxicity.

[00132] “Luminescence” refers to the light output of a luciferase under appropriate conditions, e.g., in the presence of a suitable substrate such as a coelenterazine analogue. The light output may be measured as an instantaneous or near-instantaneous measure of light output (which is sometimes referred to as “T=0” luminescence or “flash”) at the start of the luminescence reaction, which may be initiated upon addition of the coelenterazine substrate. The luminescence reaction in various embodiments is carried out in a solution. In other embodiments, the luminescence reaction is carried out on a solid support. The solution may contain a lysate, for example from the cells in a prokaryotic or eukaryotic expression system. In other embodiments, expression occurs in a cell-free system, or the luciferase protein is secreted into an extracellular medium, such that, in the latter case, it is not necessary to

produce a lysate. In some embodiments, the reaction is started by injecting appropriate materials, e.g., coelenterazine analogue, buffer, etc., into a reaction chamber (e.g., a well of a multiwell plate such as a 96-well plate) containing the luminescent protein. In still other embodiments, the luciferase and/or coelenterazine analogues (e.g., compounds of formula (I) and (II)) are introduced into a host, and measurements of luminescence are made on the host or a portion thereof, which can include a whole organism or cells, tissues, explants, or extracts thereof. The reaction chamber may be situated in a reading device which can measure the light output, e.g., using a luminometer or photomultiplier. The light output or luminescence may also be measured over time, for example in the same reaction chamber for a period of seconds, minutes, hours, etc. The light output or luminescence may be reported as the average over time, the half-life of decay of signal, the sum of the signal over a period of time, or the peak output. Luminescence may be measured in Relative Light Units (RLUs).

[00133] Compounds of formula (I) and formula (II) can have an RLU of greater than or equal to 1, greater than or equal to 2, greater than or equal to 3, greater than or equal to 4, greater than or equal to 5, greater than or equal to 10, greater than or equal to 20, greater than or equal to 30, greater than or equal to 40, greater than or equal to 50, or greater than or equal to 100, relative to coelenterazine or a known coelenterazine analogue such as furimazine.

[00134] Compounds of formula (I) and formula (II) can have a λ_{max} of 450-700 nanometers, 460-600 nanometers, 470-600 nanometers, 480-600 nanometers, 490-600 nanometers, 500-600 nanometers, 510-600 nanometers, 520-600 nanometers, 530-600 nanometers, 540-600 nanometers, 550-600 nanometers, 560-600 nanometers, 570-600 nanometers, 580-600 nanometers, 590-600 nanometers, 470-590 nanometers, 480-580 nanometers, 490-570 nanometers, 500-560 nanometers, or 510-550 nanometers. Compounds of formula (I) and formula (II) can have a λ_{max} greater than or equal to 450 nanometers, greater than or equal to 460 nanometers, greater than or equal to 470 nanometers, greater than or equal to 480 nanometers, greater than or equal to 490 nanometers, greater than or equal to 500 nanometers, greater than or equal to 510 nanometers, greater than or equal to 520 nanometers, greater than or equal to 530 nanometers, greater than or equal to 540 nanometers, greater than or equal to 550 nanometers, greater than or equal to 560 nanometers, greater than or equal to 570 nanometers, greater than or equal to 580 nanometers, greater than or equal to 590 nanometers, greater than or equal to 600 nanometers, greater than or equal to 610 nanometers, greater than or equal to 620 nanometers, greater than or equal to 630 nanometers, greater than or equal to 640

nanometers, greater than or equal to 650 nanometers, greater than or equal to 660 nanometers, greater than or equal to 670 nanometers, greater than or equal to 680 nanometers, greater than or equal to 690 nanometers, or greater than or equal to 700 nanometers.

[00135] “Biocompatibility” refers to the tolerance of a cell (e.g., prokaryotic or eukaryotic) to a coelenterazine analogue (e.g., compounds of formula (I)). Biocompatibility of a coelenterazine analogue is related to the stress it causes on the host cell.

[00136] Enhanced biocompatibility of the coelenterazine analogues (e.g., compounds of formula (I)), may be determined by measuring cell viability and/or growth rate of cells. For example, enhanced biocompatibility of the coelenterazine analogues may be determined by measuring cell viability in the absence of luciferase expression of cells exposed to the coelenterazine analogues compared to native or known coelenterazines to determine how compatible and/or toxic the coelenterazine analogues are to the cells.

[00137] In particular, enhanced biocompatibility may be determined using cell viability analysis (e.g., using the CELLTITER-GLO® Luminescent Cell Viability assay), an apoptosis assay (e.g., using the CASPASE-GLO® technology), or another method known in the art. The effect of the disclosed compounds on cell viability or apoptosis may be compared to the effect of native or known coelenterazine analogues on cell viability or apoptosis.

[00138] Enhanced biocompatibility may also be determined by measuring the effect of the coelenterazine analogues (e.g., compounds of formula (I)) on cell growth or gene expression. For example, enhanced biocompatibility of the compounds of formula (I) or formula (II) may be determined by measuring the cell number after a period of time or by determining the expression of stress response genes in a sample of cells that are exposed to compounds of formula (I) or formula (II) compared to cells exposed to a native or known coelenterazine or no coelenterazine. The effect of the disclosed compounds on cell growth or gene expression may be compared to a native or known coelenterazine.

[00144] Scheme 3 illustrates the conversion of available aminopyrazine starting materials to compounds of formula (I) and formula (II). Bromination of the aminopyrazines can provide dibromo intermediate **J**. Intermediate **J** can undergo Suzuki coupling(s) to install substituents X and Y to provide intermediate **K**. Where R^z is chloro, a substitution or coupling reaction can be used to install substituent Z and convert intermediate **K** to intermediate **L**. Reaction of intermediate **L** with diethoxy compound **M** can provide compounds of formula (I) and formula (II). Where R^z is cyano, intermediate **K** can be converted directly to compounds of formula (I) and formula (II) by reaction with the diethoxy compound **M**.

Scheme 4. Synthesis of compounds of formula (I) and formula (II)

Intermediate **P** can be hydrogenated to provide intermediate **Q**. Intermediate **Q** can undergo Suzuki coupling to intermediate **R**, followed by treatment with TFA and subsequent cyclization promoted by the addition of carbonyldiimidazole, providing compounds of formula (I) and formula (II).

Scheme 5. Synthesis of compounds of formula (I) and formula (II)

[00146] Scheme 5 illustrates the preparation of compounds of formula (I) and formula (II). Starting ketone **S** can undergo reaction with amyl nitrite under basic conditions to provide oxime intermediate **T**. Intermediate **T** can be converted to amine **U** via reaction with 2-aminoacetonitrile and subsequent intramolecular cyclization. Intermediate **V** can be prepared by bromination and reduction of the N-oxide of intermediate **U**. N-oxide intermediate **U** can be reduced with hydrogen in the presence of Ni-Raney catalyst, and the corresponding reduced aminopyrazine can then react with N-bromosuccinimide in dichloromethane to afford

[00147] Optimum reaction conditions and reaction times for each individual step can vary depending on the particular reactants employed and substituents present in the reactants used. Specific procedures are provided in the Examples section. Reactions can be worked up in the conventional manner, e.g., by eliminating the solvent from the residue and further purified according to methodologies generally known in the art such as, but not limited to, crystallization, distillation, extraction, trituration, and chromatography. Unless otherwise described, the starting materials and reagents are either commercially available or can be prepared by one skilled in the art from commercially available materials using methods described in the chemical literature. Starting materials, if not commercially available, can be prepared by procedures selected from standard organic chemical techniques, techniques that are analogous to the synthesis of known, structurally similar compounds, or techniques that are analogous to the above described schemes or the procedures described in the synthetic examples section.

[00148] Routine experimentations, including appropriate manipulation of the reaction conditions, reagents and sequence of the synthetic route, protection of any chemical functionality that cannot be compatible with the reaction conditions, and deprotection at a suitable point in the reaction sequence of the method are included in the scope of the invention. Suitable protecting groups and the methods for protecting and deprotecting different substituents using such suitable protecting groups are well known to those skilled in the art; examples of which can be found in PGM Wuts and TW Greene, in Greene's book titled Protective Groups in Organic Synthesis (4th ed.), John Wiley & Sons, NY (2006), which is incorporated herein by reference in its entirety. Synthesis of the compounds of the invention can be accomplished by methods analogous to those described in the synthetic schemes described hereinabove and in specific examples.

[00149] When an optically active form of a disclosed compound is required, it can be obtained by carrying out one of the procedures described herein using an optically active

starting material (prepared, for example, by asymmetric induction of a suitable reaction step) or by resolution of a mixture of the stereoisomers of the compound or intermediates using a standard procedure (such as chromatographic separation, recrystallization or enzymatic resolution).

[00150] Similarly, when a pure geometric isomer of a compound is required, it can be obtained by carrying out one of the above procedures using a pure geometric isomer as a starting material or by resolution of a mixture of the geometric isomers of the compound or intermediates using a standard procedure such as chromatographic separation.

[00151] Basic addition salts may be prepared during the final isolation and purification of the disclosed compounds by reaction of a carboxyl group with a suitable base such as the hydroxide, carbonate, or bicarbonate of a metal cation such as lithium, sodium, potassium, calcium, magnesium, or aluminum, or an organic primary, secondary, or tertiary amine. Quaternary amine salts can be prepared, such as those derived from methylamine, dimethylamine, trimethylamine, triethylamine, diethylamine, ethylamine, tributylamine, pyridine, N,N-dimethylaniline, N-methylpiperidine, N-methylmorpholine, dicyclohexylamine, procaine, dibenzylamine, N,N-dibenzylphenethylamine, 1-ephedamine and N,N'-dibenzylethylenediamine, ethylenediamine, ethanolamine, diethanolamine, piperidine, piperazine, and the like.

[00152] It can be appreciated that the synthetic schemes and specific examples as described are illustrative and are not to be read as limiting the scope of the invention as it is defined in the appended claims. All alternatives, modifications, and equivalents of the synthetic methods and specific examples are included within the scope of the claims.

3. Methods of Use and Kits

[00153] The compounds of the disclosure may be used in any way that luciferase substrates, e.g., coelenterazine analogues, have been used. For example, they may be used in a bioluminogenic method that employs an analogue of coelenterazine to detect one or more molecules in a sample, e.g., an enzyme, a cofactor for an enzymatic reaction, an enzyme substrate, an enzyme inhibitor, an enzyme activator, or OH radicals, or one or more conditions, e.g., redox conditions. The sample may include an animal (e.g., a vertebrate), a plant, a fungus, physiological fluid (e.g., blood, plasma, urine, mucous secretions), a cell, a cell lysate, a cell supernatant, or a purified fraction of a cell (e.g., a subcellular fraction). The presence, amount, spectral distribution, emission kinetics, or specific activity of such a

molecule may be detected or quantified. The molecule may be detected or quantified in solution, including multiphasic solutions (e.g., emulsions or suspensions), or on solid supports (e.g., particles, capillaries, or assay vessels).

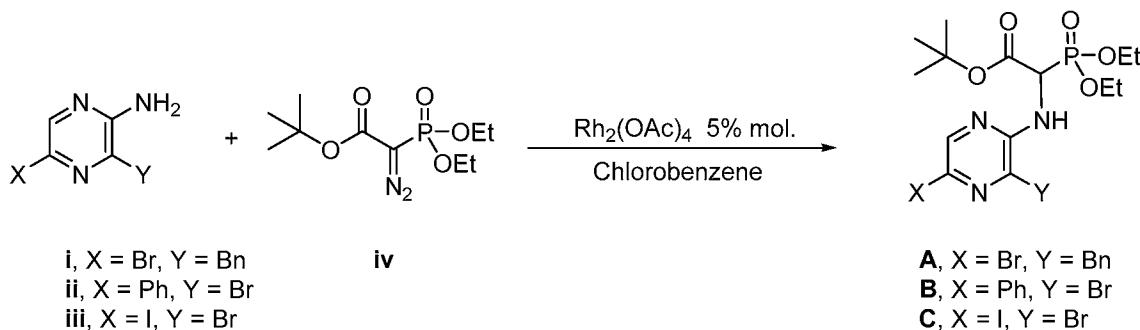

[00154] In certain embodiments, the compounds of formula (I) or formula (II) may be used to quantify a molecule of interest. In some embodiments, a coelenterazine analogue (e.g., a native or known coelenterazine or a compound of formula (I) or formula (II)) can be used as a probe of a specific biochemical activity, e.g., apoptosis or drug metabolism.

[00155] In certain embodiments, the compounds of formula (I) or formula (II) can be used for detecting luminescence in live cells, e.g., *in vivo*. In some embodiments, a luciferase can be expressed in cells (as a reporter or otherwise), and the cells treated with a coelenterazine analogue (e.g., a compound of formula (I) or formula (II)), which will permeate cells in culture, react with the luciferase, and generate luminescence. In addition to being cell permeant, the compounds of formula (I) or formula (II) show comparable biocompatibility to native coelenterazine in terms of cell viability. In some embodiments, the compounds of formula (I) or formula (II) containing chemical modifications known to increase the stability of native coelenterazine in media can be synthesized and used for more robust, live cell luciferase-based reporter assays. In still other embodiments, a sample (including cells, tissues, animals, etc.) containing a luciferase and a compound of formula (I) or formula (II) may be assayed using various microscopy and imaging techniques, e.g., *in vivo* imaging. In still other embodiments, a secretable luciferase is expressed in cells as part of a live-cell reporter system.

[00156] In certain embodiments, the compounds of formula (I) or formula (II) disclosed herein may be provided as part of a kit. In some embodiments, the kit may include one or more luciferases (in the form of a polypeptide, a polynucleotide, or both) and a coelenterazine analogue of formula (I) or formula (II), along with suitable reagents and instructions to enable a user to perform assays such as those disclosed herein. The kit may also include one or more buffers such as those disclosed herein.

Example 2. Synthetic Method I

[00161] General procedure for Method I: In a 20 mL vial, one of **A-C** (200 mg, 0.39 mmol, 1 eq.), 2-furaldehyde (0.43 mmol, 1.1 eq.), and 15 mL of methanol was placed. 1,1,3,3-Tetramethylguanidine (135 mg, 1.2 mmol, 3 eq.) was added, and the reaction mixture was stirred at room temperature for 1-2 hours. The progress of the reaction was monitored by LCMS. After the reaction was complete, the mixture was poured into water, extracted with ethyl acetate, and dried over MgSO_4 . The drying agent was removed by filtration, and the

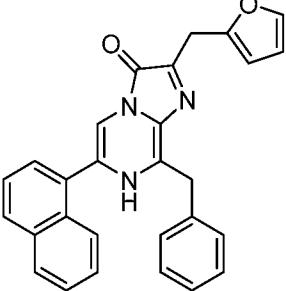

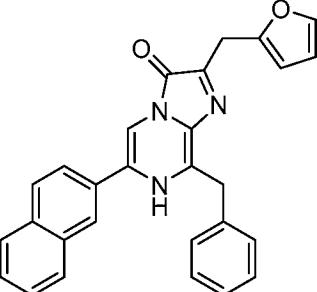

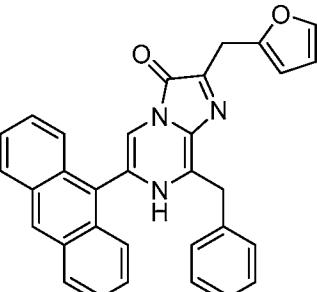

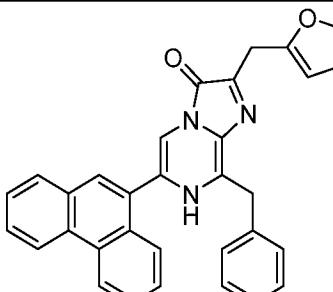

solvent was concentrated under reduced pressure. The residue was purified using flash chromatography on silica gel with heptane/ethyl acetate as eluent to provide one of **D-F**.

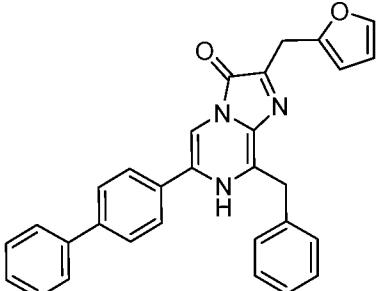

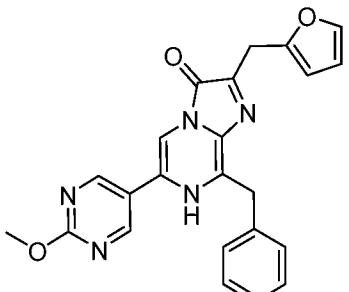

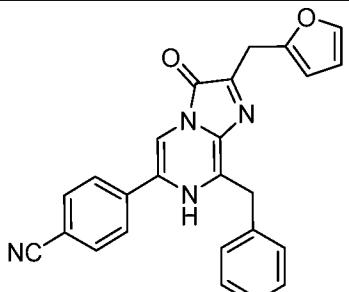

[00162] In a parr-shaker reactor flask, one of **D-F** (0.3 mmol, 1 eq.), $\text{Rh}(\text{PPh}_3)_3\text{Cl}$ (0.03 mmol, 0.1 eq.), and 50 mL of ethanol was placed. The reactor was charged with H_2 (50 psi) and shaken for 20 hours at room temperature. The reaction was monitored by LCMS. All volatiles were removed under reduced pressure, and the residue was purified by flash chromatography on silica gel using heptane/ethylacetate as eluent. The reduced aminopyrazine derivatives **G-I** were isolated.

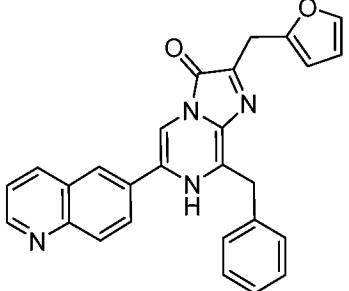

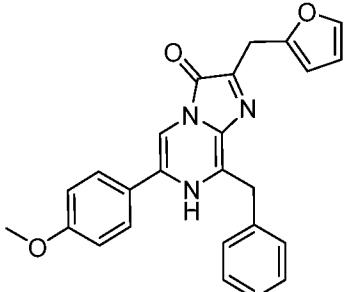

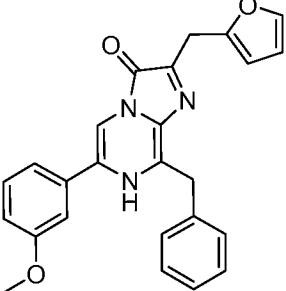

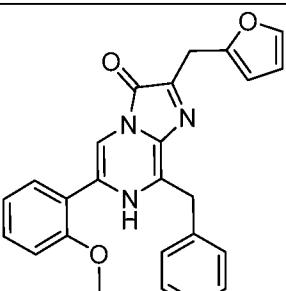

[00163] Compounds with the general structure **G, H, I** (0.225mmol, 1 eq.) was dissolved in dioxane (8 mL). To this solution, appropriate boronic acid, boronic acid pinacol ester or potassium trifluoroborate (0.248 mmol, 1.1 eq), $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$ (0.022 mmol, 0.1 eq.), and Cs_2CO_3 (0.675 mmol, of 1M solution, 3 eq.) were added. The reaction mixture was heated at 80°C for 1-4 hours. The progress of the reaction was monitored by LCMS. After reaction was complete, the reaction mixture was adsorbed on celite and purified by silica gel column chromatography using Heptane/EtOAc as eluent. Fractions containing the product were collected and concentrated under reduced pressure.

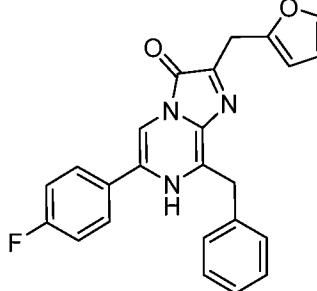

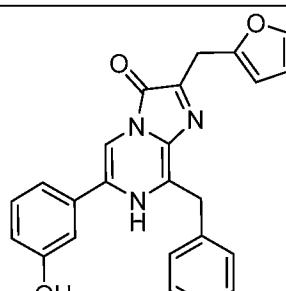

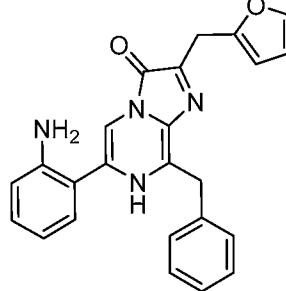

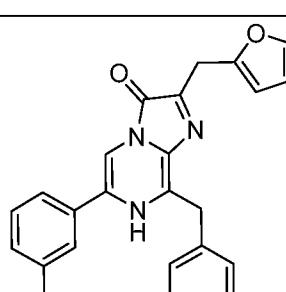

[00164] The Suzuki coupling product (0.25 mmol, 1 eq.) was dissolved in dichloromethane (5 mL), and to this solution, trifluoroacetic acid (2 mL) was added. The reaction mixture was stirred at room temperature for 12 hours. The progress of the reaction was monitored by LCMS. After the reaction was complete, all volatiles were removed under reduced pressure, and the residue was co-evaporated 3 times with 10 mL of toluene to remove all TFA and provide the corresponding carboxylic acid intermediate. After drying under high vacuum, the carboxylic acid intermediate was dissolved in dichloromethane (15 mL), and to this solution, carbodiimidazole (CDI) (122 mg, 0.75 mmol, 3 eq.) was added. The reaction mixture was stirred at room temperature for 20 minutes and then poured into 0.01 M HCl (50 mL), extracted with dichloromethane, and dried over MgSO_4 . The drying agent was removed by filtration, and the solvent was concentrated under reduced pressure. The residue was purified via flash chromatography on silica gel using dichloromethane/methanol as eluent. The corresponding coelenterazine analogue of formula (I) was isolated.

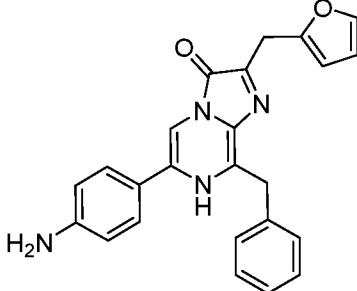

[00165] The following compounds were prepared using the general procedure of Method I and compound **A** as starting material to provide compounds of formula (I-a). Substitution at the R^6 substitution site was achieved by using the appropriate organoborane reagent for the Suzuki coupling reaction.

Example 7. Luminescent Properties

[00199] Luminescence Assay Procedure: Each compound to be screened was dissolved in DMSO (5mM) and then further diluted to 100uM in NANO-GLO® Luciferase Assay Buffer. Each diluted substrate was then combined in equal volumes with purified NANOLUC® Luciferase diluted into CO₂ independent media+10% FBS. Initial light output for each substrate was measured in a GLOMAX®-Multi+ luminometer three minutes after substrate addition and then at five minute intervals as a means to determine signal half-life.

[00200] The synthesized coelenterazine analogues (compounds of formula (I) and (II)) were evaluated for their suitability as luciferase substrates. NANOLUC® luciferase was employed for the screening because it is a small (19 kDa), stable, and particularly bright enzyme. Table 1 demonstrates that the synthesized compounds possess relative light unit (RLUs) and half-life data that is comparable to a known coelenterazine analogue, 8-benzyl-2-(furan-2-ylmethyl)-6-phenylimidazo[1,2-a]pyrazin-3(7H)-one (furimazine), which is known to be superior to coelenterazine as a luciferase substrate. The data also show that many analogues produce red-shifted light as evidenced by an increase in λ_{max} .

Example 8. Screening 6'OH coelenterazine analogs with NanoLuc and Renilla Luciferase

[00201] Luminescence Assay Procedure: Each compound to be screened was diluted to a concentration of 100uM in Renilla Glo Luciferase Assay buffer (Promega Corporation) and then further diluted to 2x serial dilution in Renilla Glo Luciferase Assay Buffer.

NANOLUC® luciferase and Renilla luciferase were diluted to a concentration of 4ng/ml in OptiMEM+0.1% FBS. 50ul of each compound dilution was then mixed with 50ul of each enzyme dilution and incubated for 1 minute at room temperature. Light output for each

compound was measured on a GLOMAX®-Multi+ luminometer. Km and Vmax were calculated for each enzyme/substrate combination using a GraphPad Prism Michaelis-Menten non-linear fit (FIGS. 1A-1D).

[00202] FIGS. 1A-1D demonstrate that Renilla luciferase produced ~7X more light with Coelenterazine-H compared to Furimazine. NanoLuc® luciferase produced significantly more light than Renilla with both furimazine and Coelenterazine-H.

Example 9. Autoluminescence Determination

A. Substrate Titration

[00203] **Luminescence Assay Procedure:** Each compound to be screened was diluted to a concentration of 100uM in Renilla Glo Luciferase Assay buffer (Promega Corporation), and 50ul mixed with 50ul of OptiMEM + 0.1% FBS. Light output for each compound was measured on a GLOMAX®-Multi+ luminometer.

[00204] FIG. 2A demonstrates that AS-353 produced ~9X more autoluminescence compared to Furimazine or coelenterazine-H, and AS-361 produced ~2X more autoluminescence compared to Furimazine or Coelenterazine-H.

B. Enzyme Titration

[00205] **Luminescence Assay Procedure:** Renilla luciferase and NanoLuc Luciferase were diluted to a concentration of 4ug/ml (4ng/uL) in OptiMEM + 0.1% FBS. 10x serial dilutions of the luciferases were then prepared in OptiMEM + 0.1% FBS. Each substrate was diluted to 100uM into Renilla Glo Luciferase assay buffer (Promega Corporation). The 10x enzyme serial dilutions were then combined with the substrate dilutions, 50ul mixed with 50ul compound, and incubated for 1 minute at room temperature. Light output for each compound was measured on a GLOMAX®-Multi+ luminometer.

[00206] FIG. 2B demonstrates that the combination of NanoLuc® luciferase and AS-360 provides the brightest luminescence in the panel tested and is nearly 30X brighter than both Renilla and NanoLuc® luciferase with AS-361. AS-353 produces ~100X lower RLU values

with NanoLuc compared to AS-360. Renilla Luciferase produces enzyme dependent luminescence with AS-353 only at the highest enzyme concentration.

Example 10. Luminescence and Autoluminescence Determination in Various Buffers Using NANOLUC® Luciferase or Renilla Luciferase

[00207] Luminescence Assay Procedure: Each compound to be screened was diluted to a concentration of 100uM (50uM final concentration) in Renilla Glo Luciferase Assay buffer (Promega Corporation), NANO-GLO Luciferase Assay Buffer (Promega Corporation), or 20uM (10uM final) in OptiMEM + 0.1% FBS. NANOLUC® luciferase and Renilla luciferase were serially diluted to 4, 40, and 400ng/ml in OptiMEM + 0.1% FBS. 50ul of each compound dilution was mixed with 50ul enzyme dilution and incubated for 1 minute at room temperature. Autoluminescence spectra of AS-353 was measured by adding 20uM of substrate to OptiMEM+20% FBS and then 50ul of this dilution was combined with 50ul of OptiMEM+0.1% FBS. Spectral measurements were measured using a Tecan M-1000 luminometer. (3 nM intervals/20 nM bandpass).

[00208] FIGS. 3A-3C and FIGS. 4A-4D demonstrate that all of the substrates tested shifted the NanoLuc® luciferase spectral properties to red (AS-353, AS-360, AS-361, AS-262, AS-310, AS-174). The spectral properties of Renilla were shifted to blue with ~50nM with Furimazine compared to Coelenterazine-H. The only substrate tested that shifted the Renilla spectra to red was AS-361.

Example 11. BRET (bioluminescent resonance energy transfer) Spectral Measurements

A. In Vitro

[00209] Assay Procedure: Each compound to be screened was diluted to a concentration of 50uM in PBS. Then, 5nM of a NanoLuc-HaloTag fusion protein (Promega Corporation), 5nM NanoBRET618 HALOTAG® ligand, and 50 μ M compound were combined, and spectral measurements taken using a BMG ClarioStar (500 msec integration time, 2 nm intervals/20 nm bandpass). A “no acceptor” control containing only the NanoLuc-HaloTag fusion protein (i.e., no NanoBRET618 HALOTAG® ligand) was also performed for each compound to determine emission spectra of the compounds.

[00210] The results in FIGS. 5A-5I demonstrate that the compounds tested in this experiment are suitable as donors for BRET based detection systems. In addition, the data indicates that energy transfer efficiency increases when decreasing the spectral separation between the compound (BRET donor) and NanoBRET618 HALOTAG® ligand (acceptor).

B. Protein-Protein Interaction in HeLa Cells

[00211] Assay Procedure: HeLa cells were transiently transfected with constructs for the expression of Frb-NANOLUC® fusion protein and FKBP-HALOTAG® fusion protein (both from Promega Corporation) at a 1:5 DNA ratio and plated in a white 96-well tissue culture plate at a density of 20,000 cells per well in DMEM + 10% FBS. After 24 hours, the cells were labeled (FKBP-HaloTag) by replacing the medium with OptiMEM containing 250nM NanoBRET618 HALOTAG® ligand (Promega Corporation) followed by a 60 minute incubation. The protein-protein interaction (PPI) between FKBP-HaloTag and Frb-NanoLuc was induced by the addition of either a serial dilution of rapamycin (FIGS. 6A-6F) or 1uM rapamycin (FIGS. 7A-7F) followed by a 10 minute incubation period. Each compound was then added to a well of cells at a final concentration of 50uM. Spectral measurements were taken immediately after compound addition on a BMG ClarioStar (500 msec integration time, 2 nm intervals /20 nm bandpass).

[00212] The results in FIGS. 6A-6F demonstrate the use of the compounds as a donor in a BRET-based assay for the detection of protein-protein interactions in living cells. The treatment with rapamycin leads to a dose dependent change in the emission ratio (610/460)

indicative of the change in energy transfer between the compounds (donor) and NanoBRET618 substrate.

[00213] The results in FIGS. 7A-7F show a comparison of emission spectra obtained from untreated and rapamycin treated cells respectively to demonstrate the treatment induced change in energy transfer between the compounds (donor) and NanoBRET618 substrate.

Example 12. Effect of Substrates on Cell Viability

[00214] **Assay Procedure:** HEK293 or HeLa cells were plated into wells of a white, 96-well tissue culture plate in 100 ml DMEM + 10% FBS and incubated for 24h at 37°C. The medium was then replaced with 100 ml DMEM + 10% FBS supplemented with a serial titration of the indicated substrate followed by 6h incubation at 37°C. Cell viability was assessed using CellTiter Glo (Promega) following manufacturer's instructions. Figures 8A-8B show the means ± SEM of 3 independent experiments performed in triplicate.

1. Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. As all searchable claims could be searched without effort justifying an additional fees, this Authority did not invite payment of additional fees.

3. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

1-23(completely); 26-33(partially)

Remark on Protest

The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.

The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.

No protest accompanied the payment of additional search fees.
