A mounting system for an interface such as a flat panel display such as a computer monitor or television allows the display to be pivoted about a virtual pivot axis which passes through a center of gravity of the display. The system includes a support which is connected directly or indirectly to a support surface and a mount which is connected to a back side of the display. The support and the mount are slidable with respect to one another through an arc which has the virtual pivot axis as its center.

## ADJUSTABLE TILT MOUNT

### CROSS REFERENCE TO RELATED APPLICATIONS

[0001] This application is a continuation of U.S. patent application Ser. No. 11/647,756, filed Dec. 29, 2006, which is a continuation of U.S. patent application Ser. No. 11/194,298, filed Aug. 1, 2005 which is a continuation of U.S. patent application Ser. No. 10/455,624, filed Jun. 6, 2003, which claims priority to U.S. Provisional Pat. App. No. 60/438,889, filed Jan. 9, 2003.

### BACKGROUND OF THE INVENTION

[0002] The present invention relates to mounts for interface devices such as computer monitors and televisions. In particular, the present invention relates to a mount which allows the interface to be tilted about a generally horizontal pivot axis.

[0003] The development of flat panel computer monitors and flat screen televisions offers the opportunity to replace large computer monitors and large television sets with displays having the same screen area but only a small fraction of the depth and weight. This allows computer monitors to be placed on desks without consuming a large portion of the desk top space. Similarly, flat screen televisions can be placed in locations which were previously not practical locations.

[0004] The light weight and thin profile of the flat panel monitors and televisions allows them to be supported on a relatively small base, be hung on a wall, or to be supported by a support system which is connected to a mounting surface such as a wall, a post, or a top, bottom, or side surface of a desk or cabinet. The ability to adjust the orientation of the flat panel display with respect to the viewer is a desirable feature. There is a need for mounting systems which will allow adjustment of the position and the orientation of the display. The support systems should be simple and easy to use, and should be stable so that the display remains in the position and orientation selected.

### BRIEF SUMMARY OF THE INVENTION

[0005] A mounting system for an interface device such as a flat panel display (such as a computer monitor or television) allows the display to be tilted about a horizontal pivot axis which passes through a center of gravity of the display. The system includes a support and a mount which are connected together so that they can slide with respect to one another through an arc path which has the pivot axis at its center. The mount is attached to the back side of the display, while the support is connected directly or indirectly to a support surface.

[0006] The display can be tilted about the pivot axis, which is parallel to the front surface of the display, through a range of angles defined by the arc. Because the pivot axis passes through the center of gravity of the display, the weight of the display is balanced in any one of the angular positions. No clamping or other adjustment is required to hold the display in any one of its tilted positions.

### BRIEF DESCRIPTION OF THE DRAWINGS

[0007] FIGS. 1A-1C are side views showing a first embodiment of the mounting system of the present invention with a flat panel display tilted at three different positions.

[0008] FIGS. 1D-1F are perspective views showing the display tilted at three different positions.

[0009] FIGS. 2A and 2B show front and side views of the mounting system of FIGS. 1A-1F.

[0010] FIGS. 2C-2F show perspective views of the mounting system.

[0011] FIGS. 3A-3C show front, right side, and top views of the mounting bracket of the system of FIG. 2A-2B.

[0012] FIGS. 4A-4C show front, right side, and top views, respectively, of the wall or support bracket of the system of FIGS. 2A-2B.

[0013] FIGS. 5A and 5B show side and front views, respectively, the glide of the system of FIGS. 2A-2B.

[0014] FIGS. 6A-6G show views of a second embodiment of the mounting system of the present invention with a flat panel display tilted in three different positions.

[0015] FIG. 7A-7F show views of the second embodiment of the mounting system of the present invention.

[0016] FIGS. 8A-8C are side, top, and back views, respectively, of an arch of the mounting system of FIGS. 7A-7F.

[0017] FIGS. 9A and 9B are rear and side view of a mount plate of the system of FIGS. 7A-7F.

[0018] FIGS. 10A-10C are front, side and top views of a yoke of the system of FIGS. 7A-7F.

[0019] FIGS. 11A and 11B are top and end views of a dowel of the system of FIGS. 7A-7F.

[0020] FIGS. 12A and 12B are top and end views of a wheel of the system of FIGS. 7A-7F.

[0021] FIGS. 13A and 13B are perspective views of a third embodiment of the present invention.

[0022] FIG. 14 is a perspective view of a mount and a support bracket of the third embodiment of the invention.

[0023] FIG. 15 is a broken, exploded view of the mount and support bracket of the third embodiment of the invention.

[0024] FIGS. 16A-16C are perspective, front, and bottom views of a fourth embodiment of the present invention.

### DETAILED DESCRIPTION OF THE INVENTION

[0025] FIGS. 1A-1F show a first embodiment of mounting system 10 of the present invention. In FIGS. 1A-1F, mounting system 10 supports display 12, which is a flat panel computer monitor or television at three different positions with respect to vertical.

[0026] Mounting system 10 has three major parts, mount bracket 14, support or wall bracket 16, and a pair of glides 18. Mount bracket 14 is attached to a back surface of monitor 12, while support 16 is connected either directly or indirectly to a support surface such as post P (or a wall).

[0027] Mount bracket 14 has a pair of arcuate slots 20 which define the range of sliding motion of mount bracket 14 with respect to support bracket 16. Glides 18 are carried by support bracket 16 and project into slots 20. Glides 18 ride within slots 20 to allow a sliding movement of mount 14 with respect to support 16. The path of the sliding movement is defined by the arc of slots 20. In the embodiment shown in FIGS. 1A-1F, the extent of angular rotation permitted by sliding movement is approximately 50.degree.

[0028] The arc defined by slots 20 is a portion of a circle having its center defining a horizontal pivot axis 22. As shown in FIGS. 1A-1F, pivot axis 22 is a virtual pivot axis that passes approximately through a center of gravity of display 12. As a result, the weight of display 12 remains balanced about pivot axis 22, regardless of the tilt angle. There is sufficient friction

between glides 18 and slots 20 so that display 12 will remain at whatever tilt angle the user selects.

[0029] The present invention provides a very simple and inexpensive mounting system which allows tilting of display 12 over a wide range of tilt angles. Although the embodiment shown limits the range of tilt angles to approximately 50 degrees, the range could be either larger or smaller depending upon the length of the arc defined by slots 20.

[0030] As shown in FIGS. 2A-2F, mount 14 includes face 30, right side wall 32R, left side wall 32L and mounting ears 34R, 34L, 36R and 36L. Each of the mounting ears 34L, 34R, 36L, and 36R include an outer mounting hole 38 and an inner mounting hole 40. Arc slots 20 are located in left and right side walls 32R and 32L, and are aligned with one another. The curvature of slots 20 define a portion of the circle having a center at pivot axis 22 shown in FIG. 2B.

[0031] Support 16 is a generally U-shaped bracket formed base 50, right side wall 52R, and left side wall 52L. Mounting slots 54 and 56 are used to connect support 16 to a wall, a post, or other support. As seen in FIGS. 2A-2F, side walls 32R and 32L of mount 14 straddle walls 52L and 52R of support 16. Glides 18 are captured between the side walls of mount 14 and support 16. Each glide 18 includes outer projection 60, inner projection 62, and central flange 64. Outer projections 60 project outward through arcuate slots 20. Inner projections 62 are similar in shape to outer projection 60, and extend through mating slots 70 (shown in FIG. 2D) through side walls 52L and 52R of support 16. The size of the arcuate slots 70 in side walls 52L and 52R generally matches the shape of inner projections 62. Flanges 64 are captured between opposing side walls 32L and 52L and 32R and 52R, respectively. As a result, glide 18 is generally held in place with respect to support 16, while mount 14 can slide back and forth along the path defined by arc slots 20 from an upper-most position defined when the upper end of slot 20 engages the upper end of outward projection 60 and a lower-most position in which the lower end of projection 60 engages the lower end of slot 20. These two extreme positions are illustrated in FIGS. 1A, 1B, 1D and 1F.

[0032] FIGS. 3A-3C show mount bracket 14 in further detail, and FIGS. 4A-4C show support bracket 16 in further detail. Dimensions of a preferred embodiment are shown in the Figures. For both support 16 and mount 14, a preferred material is 0.075 cold rolled steel (CRS 14 GA). Mount and support brackets 14 and 16 preferably have a powder coat final finish.

[0033] FIGS. 5A and 5B show one of the glides 18. The preferred material for slides 18 is Delrin plastic.

[0034] As shown in FIGS. 3A-3C, 4A-4C and 5A-5B, the preferred radius of the center line of slots 20 and mount 14, slots 70 in support 16, and glides 18 define a radius of curvature of 2.344 inch. This results in a location of pivot axis 22 about one inch forward of the front surfaces of base 30 and mounting ears 34L, 34R, 36L and 36R of mount 14. This location of pivot axis 22, with mount 14 attached generally in the center back of display 12, results in pivot axis 22 passing through or very nearly through the center of gravity of display 12. As a result, display 12 is weight-balanced in the various tilt positions. As configuration and weight distribution of flat screen panels changes, dimensions of the arc path may be changed to maintain weight balance.

[0035] FIGS. 6A-6G show a second embodiment of the present invention. Mounting system 100 supports display 102 in a wide variety of different positions and or orientations, as

illustrated in FIGS. 6A-6G. Mounting system 100 includes mount assembly 104, support assembly 106, side knuckle 108, dog bone support arms 110 and 112, side knuckle 114, and wall plate 116.

[0036] As shown in FIGS. 6A-6G, mounting system 100 is supported from a vertical support, which in this case is pole P. Wall plate 116 is attached to pole P, and side knuckle 114 is attached to wall plate 116.

[0037] The inner end of dog bone 112 is pivotally connected to side knuckle 114 by tapered bearing 122. Adjustment screw 124 controls the drag of taper bearing 122 to control the rotation of dog bone 112 with respect to side knuckle 114.

[0038] The outer end of dog bone 112 is pivotally connected to the inner end of dog bone 110 by tapered bearing 126. Adjustment screw 128 controls the frictional drag produced by tapered bearing 126, and can be used to lock dog bones 112 and 110 in a fixed orientation if desired.

[0039] The outer end of dog bone 110 is pivotally connected by tapered bearing 130 to side knuckle 108. Adjustment screw 132 is used to adjust drag or to lock dog bone 110 and side knuckle 108 together as desired.

[0040] Support assembly 106 is attached by screws to the side arm of side knuckle 108.

[0041] Support 106 forms a sliding connection with mount 104. As in the first embodiment of the present invention, the sliding connection is defined by an arc segment of a circle which has a center defining a pivot axis of display 102. The pivot axis is positioned at or very near the center of gravity of display 102, so that display 102 is weight-balanced in the various tilt positions.

[0042] Mount 104 is attached by screws to the back surface of display 102. Because of the balance of weight about the virtual pivot axis defined by mount assembly 104 and support assembly 106, display 102 can be tilted through a range of positions as illustrated in FIGS. 6A-6G. Display 102 is stable in any of the positions, and once tilted to that position will remain in place without needing to be clamped. Mounting system 100, like mounting system 10, provides an extremely easy-to-use adjustment of tilt of a flat panel display. The user merely moves the display about the pivot axis to the desired mount of tilt, and the display will remain in the tilted position.

[0043] FIGS. 7A-7F show mount assembly 104 and support assembly 106 in greater detail.

[0044] Mount assembly 104 includes arch 140 and mounting plates 142 and 144. Mounting plate 142 is attached to one end of arch 140 by a pair of screws, and mounting plate 144 is attached to the opposite end of arch 140 by a pair of screws. Arch 140 defines an arc having as its center the virtual pivot axis which passes horizontally through display 102. Outer surface 146 has beveled edges 148 along its longitude and latitude. Similarly, inner surface 150 of arch 140 has beveled edges 152. Beveled edges 152 form parallel guide tracks for the sliding movement of arch 140 with respect to support assembly 106.

[0045] Support assembly 106 includes yoke 160, dowels 162, 164, and 166, and wheels 168, 170 and 172. Each of the dowels 162, 164, 166 includes a pair of wheels 168, 170, 172, respectively, for riding on beveled edges of arch 140. Wheels 168 are mounted on opposite ends of dowel 162 to ride on beveled edges 148. Wheels 170 are mounted on dowel 164 to ride on beveled edges 152. Wheels 172 are mounted on dowel 166 and ride on beveled edges 148. Thus arch 140 is captured

between the three sets of rollers **168**, **170**, and **172** while permitting a sliding movement

**[0046]** FIGS. **8A-8C** and **9A-9B** show the components of mount assembly **104** in greater detail. FIGS. **8A-8C** show arc **140**, while FIGS. **9A** and **9B** shown mounting plate **142**. Mounting plate **144** is identical to mounting plate **142**, and is merely inverted as shown in FIGS. **7A-7F**.

**[0047]** FIGS. **11A-11C** shown yoke **160**, which has base sections **180** and **182**, and side walls **184** and **186**. Mounting holes **188** in base section **180** allow yoke **160** to be mounted to a connecting element such as side knuckle **108**, or to be mounted directly to wall plate **116**. Side walls **184** and **186** include aligned slots **190** for dowel **162**, aligned through holes **192** for dowel **164**, and aligned through holes **194** for dowel **166**.

**[0048]** FIGS. **11A** and **11B** show dowel **162**, which is a  $\frac{1}{8}$  inch stainless steel dowel having one chamfered end. Dowels **164** and **166** are identical.

**[0049]** FIGS. **12A** and **12B** show one of the wheels **168** which are mounted on dowel **162**. Wheel **168** includes cylindrical outer end **200**, tapered section **202**, and central bore **204**. The inner diameter of bore **204** is sized to allow wheel **168** to fit over dowel **162**. The angular taper of section **202** matches the angle of the beveled edges **152** of arc **140**.

**[0050]** Both embodiments (**10,100**) of the present invention feature an arcuate sliding movement of a mount (**14,104**) with respect to a support (**16,106**). This defines a pivot axis about which the display (**12,102**) is tilted. The weight-balanced relationship of the display with respect to the pivot axis allows the display to be stable without clamping in any of the range of tilt angles. Thus a simple, easy-to-use tilt adjustment is provided.

**[0051]** FIGS. **13A** and **13B** show a third embodiment of the present invention. FIG. **13A** is a side view of a mounting system **300**, for use with larger displays **302**. As illustrated in FIGS. **13A** and **13B**, the mounting system **300** again includes three major parts, mount bracket **310**, support bracket **312**, and a set of glides **314**. Multiple mount brackets **310** can be used together to support larger sized displays **302** as shown in FIG. **13B**. The mount bracket **310** is attached to a back surface of display **302**. A front surface **304** of the mount bracket **310** acts as a mount plate to secure the mount bracket **310** to the display **302**. Support bracket **312** is preferably mounted or secured to support plate **316**, which in turn is secured to a wall or other support surface such as a post.

**[0052]** FIG. **14** is a perspective view of mount bracket **310** and support bracket **312**. As illustrated in FIG. **14**, mount bracket **310** has a pair of arcuate slots **320** in each of its first and second side walls **306** and **307** which define the range of sliding motion of mount bracket **310** with respect to support bracket **312**. Support bracket **312** preferably includes a first and second sidewall **317** and **318**, respectively, that are held together by fastener **319** that passes through spacer **321**. The support bracket **312** is preferably positioned within the first and second sidewalls **306** and **307** of the mount bracket **310**, such that the first and second sidewalls **317** and **306** and **318** and **307** are positioned next to each other. Each support bracket **312** carries the glides **314** and, preferably includes two glides **314** on each of the first and second sidewalls **317** and **318**. The glides **314** project into arc slots **320** to allow a sliding movement of mount bracket **310** with respect to support bracket **312**. The path of the sliding movement is again defined by the arc of slots **320**.

**[0053]** As in the other embodiments, the arc defined by the slots **320** is a portion of a circle having its center defining a horizontal pivot axis **322**. This virtual pivot axis will pass through a center of gravity of display **302**. As a result, the weight of display **302** remains balanced about pivot axis **322**, regardless of the tilt angle. Maintaining the display **302** in a balanced state allows easy adjustment by a user with minimal force. Once positioned, the display **302** will remain in that position. FIG. **13A** illustrates in phantom the range of tilt angles for the display **302** about pivot axis **322**.

**[0054]** Given the minimal force required to adjust the display **302**, locking mechanism **324** can be incorporated as part of mounting system **300**. Locking mechanism **324** secures display **302** in place once display **302** has been positioned. Locking mechanism **324** secures display **302** by securing mount bracket **310** in place with respect to support bracket **312**. While locking mechanism **324** is not required to maintain display **302** in place, locking mechanism **324** helps avoid the display **302** from being re-positioned due to inadvertent contact. The user does not have to support or hold display **302** in place while tightening the locking mechanism **324**. When multiple mount brackets **310** are used together, the locking mechanism **324** is preferably positioned to face outward rather than toward the middle of the display **302** for easy access by the user to tighten the locking mechanism **324**. A similar type of locking mechanism could also be incorporated with the earlier described mounting systems **10, 100**.

**[0055]** FIG. **15** shows a broken, exploded view of the mounting system **300** on a side that includes the locking mechanism **324**. FIG. **15** illustrates the interaction of the mount **310**, support bracket **312** and glide **314**. In this embodiment, the glides **314** are separate pieces with preferably two glides **314** on each of the first and second sidewalls **317** and **318**. As with the other glide **18**, glides **314** include an outer projection **326**, inner projection **328** and central flange **330**. Outer projection **326** projects outward through arcuate slot **320**. Inner projections **328** are similar in shape to outer projection **326**, and extend through slots **332** placed in the first and second sidewalls **317** and **318** of support bracket **312**. The size of arcuate slots **332** generally matches the shape of inner projections **328**. Central flanges **330** are captured between opposing sidewalls **306** and **317** of mount bracket **310** and support bracket **312**, respectively. Thus glides **314** are generally held in place with respect to support bracket **312** and mount bracket **310** slides back and forth along the path defined by arc slots **320**.

**[0056]** The use of multiple glides **314** on each side of support bracket **312** could similarly be incorporated into the embodiments described by FIGS. **1A-1F**. Alternatively, the two glides **314** could be replaced by ball bearings, or any number of similar objects that can ride within the arc slots **320** defined by the mount bracket **312**.

**[0057]** Support bracket **312** includes a hook **334** at its top and a flange **336** at its bottom. The hook **334** is placed on a rail **338** at the top of the support plate or base **316**. Once the hook **334** is secured on the rail **338**, flange **336** fits beneath rail **340** at the bottom of support plate **316**. Flange **336** preferably includes a threaded through hole **342** that will accept a set screw **343** that can be secured against the bottom rail **340**. Tightening the set screw will help avoid the support bracket **312**, and thus the display **302**, from being pulled out from the support plate **316** or sliding laterally along the rails **338** and **340**. Support bracket **312** and support plate **316** allow the display **302** to be slid or repositioned laterally along the rails

**338** and **340** once the hook(s) **334** are placed on the rail **338**. The support plate **316** also includes a series of openings **372** that allow for mounting support plate **316** to a wall. A number of different methods may be employed for mounting the support plate **316** to the wall, including differently shaped and spaced openings.

**[0058]** Mount **310** includes slots **344** that provide flexibility in securing display **302** to mount bracket **310**. Alternate mounting techniques or patterns could also be used to secure the display **302** to the mount bracket **310**.

**[0059]** FIG. 15 further illustrates the locking mechanism **324**. The main parts of the locking mechanism **324** include a square opening **350** through each of the parallel sidewalls **317** and **318** of support bracket **312**, a bolt **352**, and a knob **354**, or other easy to grip device that includes a nut or threaded insert to receive and secure bolt **352**. The square opening **350** is located between the pair of glides **314** found on each of the first and second sidewalls **317** and **318** of the support bracket **312**. The bolt **352** fits into the square opening **350** such that the head **356** of the bolt **352** will not fit through the opening **350**, but a square base **358** of the shank of the bolt **352** located next to the head will prevent the bolt from turning during the fastening process. The bolt **352** extends through the opening **350** of the support bracket **312**, and through the arc slot **320** of the mount bracket **310**. The knob **354** fits onto and receives the threaded portion **360** of the shank of the bolt **352**. When loose, the locking mechanism **324** allows for easy adjustment of the display **302** which remains balanced about the pivot axis **322**. When tightened, the locking mechanism **324** exerts a force on the mount bracket **310** and support bracket **312** compressing them together and creating enough friction that the display **302** will not be tilted or its position altered by accidental or incidental bumping or jarring.

**[0060]** A similar locking mechanism as described above in the previous embodiment can also be incorporated into the earlier embodiments described in FIGS. 1-12. An alternative embodiment of a locking mechanism **402** is shown in FIGS. 16A-16C. In FIGS. 16A-16C, the locking mechanism **402** includes a bolt **404** that extends through a mounting systems **400**, which includes mount bracket **406**, support bracket **408** and glides **410**. As in the earlier embodiments, glides **410** are carried by support bracket **408** and project into slots **412**, which defines the path of sliding movement. Thus glides **412** are generally held in place with respect to support bracket **408** and mount bracket **406** slides back and forth along the path defined by arc slots **412**. The bolt **404** preferably extends through the glides **412**, mount bracket **406** and support bracket **408**. A nut **414**, preferably a wing nut to simplify turning, is fastened onto threaded shaft **416** of bolt **404**. By tightening wing nut **414** onto bolt **404**, mount bracket **406**, support bracket **408**, and glides **410** are compressed together preventing movement of mount bracket **406** relative to support bracket **408**. Again, locking mechanism **402** is not required to maintain mount bracket **406** in position relative to support bracket **408**, but rather is incorporated to avoid movement due to accidental or inadvertent contact.

**[0061]** Although the Figures show a number of embodiments, others should be mentioned briefly. The mount assembly **14** as described in FIGS. 2A-2F has slots **20**, and support **16** has glides **18**, which slide back and forth in slots **20**. In another embodiment, the mount assembly **14** has glides **18**, and the support assembly **16** is equipped with slots **20** which the glides **18** rock back and forth in. In another embodiment,

the glides **18** are replaced with separate pegs or dowels, spaced apart, which fit into the slots **20** and follow the path defined by the arced slots.

**[0062]** As described in FIGS. 7A-7F, the arch **140** is located on the mount assembly **104**. In another embodiment, the arch **140** is held in place by the support assembly **106**. In this embodiment, the yoke **160**, dowels **162**, **164**, and **166**, and wheels **168**, **170**, and **172** are located instead on the mount assembly, so that as the mount is moved through the arc defined by the arch located on the support assembly, the display would be tilted about the pivot axis. In yet another embodiment, the location of the dowels is inverted, so that dowel **164** rides on beveled edges **152**, and dowels **162**, **166**, ride on beveled edges **148**.

What is claimed is:

1. A mounting system for a flat panel electronic display device, the system comprising a base and a pair of support bracket assemblies, the base defining an upper rail and a lower rail, each support bracket assembly having a hook selectively engagable with the upper rail of the base to couple the support bracket assembly with the base, each support bracket assembly presenting a mounting surface for receiving the flat panel electronic display thereon and including a first portion carrying a guide structure and a second portion carrying a traveler engaged and slidable in the guide structure so as to define a pivot axis forward of the mounting surface, wherein when the flat panel electronic display device is received on the mounting surfaces of the support bracket assemblies, the flat panel electronic display is selectively tiltable about the pivot axis.

2. The mounting system of claim 1, wherein each support bracket assembly includes a latching element selectively shiftable between a first position wherein the latching element is engaged with the lower rail of the base to inhibit removal of the support bracket assembly from the base, and a second position wherein the latching element is clear of the lower rail of the base so as to enable removal of the support bracket assembly from the base.

3. The mounting system of claim 2, wherein the latching element includes a set screw.

4. The mounting system of claim 1, wherein the base further comprises an access aperture for cabling.

5. The mounting system of claim 1, wherein the mounting surface of each support bracket assembly has at least one elongated slot for attaching the flat panel electronic display device.

6. The mounting system of claim 1, further comprising a friction mechanism for selectively securing a tilt angle of the flat panel electronic display device with respect to the base.

7. The mounting system of claim 1, wherein each support bracket assembly includes a plurality of guide structures and a plurality of travelers.

8. The mounting system of claim 7, wherein each of the plurality of travelers is engaged and slidable in a separate one of the plurality of guide structures.

9. An electronic display system comprising:

a flat panel electronic display; and

a mount for attaching the flat panel electronic display to a wall of a structure, the mount comprising a base and a pair of support bracket assemblies, the base defining an upper rail and a lower rail, each support bracket assembly having a hook selectively engagable with the upper rail of the base to couple the support bracket assembly with the base, each support bracket assembly presenting a mounting surface receiving a rear surface of the flat

panel electronic display thereon, each support bracket assembly including a first portion carrying a guide structure and a second portion carrying a traveler engaged and slidable in the guide structure so as to define a generally horizontal pivot axis forward of the mounting surface and extending through the flat panel electronic display device, wherein the flat panel electronic display is selectively tiltable about the pivot axis.

**10.** The system of claim **9**, wherein each support bracket assembly includes a latching element selectively shiftable between a first position wherein the latching element is engaged with the lower rail of the base to inhibit removal of the support bracket assembly from the base, and a second position wherein the latching element is clear of the lower rail of the base so as to enable removal of the support bracket assembly from the base.

**11.** The system of claim **9**, wherein the pivot axis is disposed proximate a center of gravity of the flat panel electronic display device.

**12.** The system of claim **9**, wherein the base further comprises at least one access aperture for cabling.

**13.** The system of claim **9**, wherein the mounting surface of each support bracket assembly has at least one elongated slot for attaching the flat panel electronic display device.

**14.** The system of claim **9**, further comprising a friction mechanism for selectively securing a tilt angle of the flat panel electronic display device with respect to the base.

**15.** The system of claim **9**, wherein each support bracket assembly includes a plurality of guide structures and a plurality of travelers.

**16.** The system of claim **15**, wherein each of the plurality of travelers is engaged and slidable in a separate one of the plurality of guide structures.

**17.** A mounting system for a flat panel electronic display device, the system comprising a base and a pair of support bracket assemblies, the base defining an upper rail and a lower rail, each support bracket assembly having a hook selectively engagable with the upper rail of the base to couple the support bracket assembly with the base, each support bracket assembly presenting a mounting surface for receiving the flat panel electronic display thereon and including means for defining a pivot axis forward of the mounting surface, wherein when the flat panel electronic display device is received on the mounting surfaces of the support bracket assemblies, the flat panel electronic display is selectively tiltable about the pivot axis.

**18.** The mounting system of claim **17**, wherein the means for defining a pivot axis forward of the mounting surface includes a first portion of the support bracket assembly carrying a guide structure and a second portion of the support bracket assembly carrying a traveler engaged and slidable in the guide structure.

**19.** The mounting system of claim **18**, wherein each support bracket assembly includes a plurality of guide structures and a plurality of travelers.

**20.** The mounting system of claim **19** wherein each of the plurality of travelers is engaged and slidable in a separate one of the plurality of guide structures.

**21.** The mounting system of claim **17**, further comprising means for selectively securing a tilt angle of the flat panel electronic display device with respect to the base.
