COMPOUNDS FOR THE MODULATION OF PPAR γ ACTIVITY

Field of the Invention

The present invention relates to compounds that modulate the PPAR γ receptor and are useful in the diagnosis and treatment of type II diabetes (and complications thereof), hypercholesterolemia (and related disorders associated with abnormally high or low plasma lipoprotein or triglyceride levels) and inflammatory disorders.

Background of the Invention

The peroxisome proliferator-activated receptors (PPARs) are transducer proteins belonging to the steroid/thyroid/retinoid receptor superfamily. The PPARs were originally identified as orphan receptors, without known ligands, but were named for their ability to mediate the pleiotropic effects of fatty acid peroxisome proliferators. These receptors function as ligand-regulated transcription factors that control the expression of target genes by binding to their responsive DNA sequence as heterodimers with RXR. The target genes encode enzymes involved in lipid metabolism and differentiation of adipocytes. Accordingly, the discovery of transcription factors involved in controlling lipid metabolism has provided insight into regulation of energy homeostasis in vertebrates, and further provided targets for the development of therapeutic agents for disorders such as obesity, diabetes and dyslipidemia.

PPAR γ is one member of the nuclear receptor superfamily of ligand-activated transcription factors and has been shown to be expressed in an adipose tissue-specific manner. Its expression is induced early during the course of differentiation of several preadipocyte cell lines. Additional research has now demonstrated that PPAR γ plays a pivotal role in the adipogenic signalling cascade. PPAR γ also regulates the ob/leptin gene which is involved in regulating energy homeostasis, and adipocyte differentiation which has been shown to be a critical step to be targeted for anti-obesity and diabetic conditions.

In an effort to understand the role of PPAR γ in adipocyte differentiation, several investigators have focused on the identification of PPAR γ activators. One class of compounds, the thiazolidinediones, which were known to have adipogenic effects on preadipocyte and mesenchymal stem cells *in vitro*, and antidiabetic effects in animal models of non-insulin-dependent diabetes mellitus (NIDDM) were also demonstrated to be PPAR γ -selective ligands. More recently, compounds that selectively activate murine PPAR γ were shown to possess *in vivo* antidiabetic activity in mice.

Despite the advances made with the thiazolidinedione class of antidiabetes agents, unacceptable side effects have limited their clinical use. Accordingly, there remains a need for potent, selective activators of PPAR γ which will be useful for the treatment of NIDDM and other disorders related to lipid metabolism and energy homeostasis. Still further, compounds that block PPAR γ activity would be useful for interfering with the maturation of preadipocytes into adipocytes and thus would be useful for the treatment of obesity and related disorders associated with undesirable adipocyte maturation. Surprisingly, the present invention provides compounds that are useful as activators as well as antagonists of PPAR γ activity and compositions containing them, along with methods for their use.

Detailed Description of Embodiments of the Invention

Abbreviations and Definitions:

The following abbreviations are used herein: PPAR γ : peroxisome proliferator-activated receptor γ ; NIDDM: non-insulin-dependent diabetes mellitus; Et₃N: triethylamine; MeOH: methanol; and DMSO: dimethylsulfoxide.

The term "alkyl", by itself or as part of another substituent means, unless otherwise stated, a straight or branched chain, or cyclic hydrocarbon radical, or combination thereof, which may be fully saturated, mono- or polyunsaturated and can include di- and multivalent radicals, having the number of carbon atoms designated (i.e, C₁-C₁₀ means one to ten carbon atoms). Examples of saturated hydrocarbon radicals include groups such as methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl, isobutyl, sec-butyl, cyclohexyl, (cyclohexyl)ethyl, cyclopropylmethyl, homologs and isomers of, for example, n-pentyl, n-hexyl, n-heptyl, n-octyl, and the like. An unsaturated alkyl group is one having on or more double or triple bonds. Examples of unsaturated alkyl groups include vinyl, 2-propenyl, crotyl, 2-isopentenyl, 2-(butadienyl), 2,4-dipentadienyl, 3-(1,4-pentadienyl), ethynyl, 1- and 3-propynyl, 3-butylnyl, and the higher homologs and isomers. The term "alkyl", unless otherwise noted, is also meant to include those derivatives of alkyl defined in more detail below as "heteroalkyl", "cycloalkyl", and "alkylene". The term "alkylene" by itself or as part of another substituent means a divalent radical derived from an alkane, as exemplified by -CH₂CH₂CH₂CH₂-. Typically, an alkyl group will have from 1 to 24 carbon atoms, with those groups having 10 or fewer carbon atoms being preferred in the present invention. A "lower alkyl" or "lower

30

alkylene" is a shorter chain alkyl or alkylene group, generally having eight or fewer carbon atoms.

The term "heteroalkyl," by itself or in combination with another term, means, unless otherwise stated, a stable straight or branched chain, or cyclic hydrocarbon radical, or combinations thereof, consisting of the stated number of carbon atoms and from one to three heteroatoms selected from the group consisting of O, N, Si and S, and wherein the nitrogen and sulfur atoms are optionally oxidized and the nitrogen heteroatom may optionally be quaternized. The heteroatom(s) O, N and S may be placed at any interior position of the heteroalkyl group. The heteroatom Si may be placed at any position of the heteroalkyl group, including the position at which the alkyl group is attached to the remainder of the molecule. Examples include $-\text{CH}_2-\text{CH}_2-\text{O}-\text{CH}_3$, $-\text{CH}_2-\text{CH}_2-\text{NH}-\text{CH}_3$, $-\text{CH}_2-\text{CH}_2-\text{N}(\text{CH}_3)-\text{CH}_3$, $-\text{CH}_2-\text{S}-\text{CH}_2-\text{CH}_3$, $-\text{CH}_2-\text{CH}_2-\text{S}(\text{O})-\text{CH}_3$, $-\text{CH}_2-\text{CH}_2-\text{S}(\text{O})_2-\text{CH}_3$, $-\text{CH}=\text{CH}-\text{O}-\text{CH}_3$, $-\text{Si}(\text{CH}_3)_3$, $-\text{CH}_2-\text{CH}=\text{N}-\text{OCH}_3$, and $-\text{CH}=\text{CH}-\text{N}(\text{CH}_3)-\text{CH}_3$. Up to two heteroatoms may be consecutive, such as, for example, $-\text{CH}_2-\text{NH}-\text{OCH}_3$ and $-\text{CH}_2-\text{O}-\text{Si}(\text{CH}_3)_3$. Also included in the term "heteroalkyl" are those radicals described in more detail below as "heteroalkylene" and "heterocycloalkyl." The term "heteroalkylene" by itself or as part of another substituent means a divalent radical derived from heteroalkyl, as exemplified by $-\text{CH}_2-\text{CH}_2-\text{S}-\text{CH}_2\text{CH}_2-$ and $-\text{CH}_2-\text{S}-\text{CH}_2-\text{CH}_2-\text{NH}-\text{CH}_2-$. For heteroalkylene groups, heteroatoms can also occupy either or both of the chain termini. Still further, for alkylene and heteroalkylene linking groups, as well as all other linking group provided in the present invention, no orientation of the linking group is implied.

The terms "cycloalkyl" and "heterocycloalkyl", by themselves or in combination with other terms, represent, unless otherwise stated, cyclic versions of "alkyl" and "heteroalkyl", respectively. Additionally, for heterocycloalkyl, a heteroatom can occupy the position at which the heterocycle is attached to the remainder of the molecule. Examples of cycloalkyl include cyclopentyl, cyclohexyl, 1-cyclohexenyl, 3-cyclohexenyl, cycloheptyl, and the like. Examples of heterocycloalkyl include 1-(1,2,5,6-tetrahydropyridyl), 1-piperidinyl, 2-piperidinyl, 3-piperidinyl, 4-morpholinyl, 3-morpholinyl, tetrahydrofuran-2-yl, tetrahydrofuran-3-yl, tetrahydrothien-2-yl, tetrahydrothien-3-yl, 1-piperazinyl, 2-piperazinyl, and the like.

The terms "halo" or "halogen," by themselves or as part of another substituent, mean, unless otherwise stated, a fluorine, chlorine, bromine, or iodine atom.

Additionally, terms such as "fluoroalkyl," are meant to include monofluoroalkyl and polyfluoroalkyl.

The term "aryl," employed alone or in combination with other terms (*e.g.*, aryloxy, arylthioxy, arylalkyl) means, unless otherwise stated, an aromatic substituent which can be a single ring or multiple rings (up to three rings) which are fused together or linked covalently. The rings may each contain from zero to four heteroatoms selected from N, O, and S, wherein the nitrogen and sulfur atoms are optionally oxidized, and the nitrogen atom(s) are optionally quaternized. The aryl groups that contain heteroatoms may be referred to as "heteroaryl" and can be attached to the remainder of the molecule through a heteroatom. Non-limiting examples of aryl groups include phenyl, 1-naphthyl, 2-naphthyl, 4-biphenyl, 1-pyrrolyl, 2-pyrrolyl, 3-pyrrolyl, 3-pyrazolyl, 2-imidazolyl, 4-imidazolyl, pyrazinyl, 2-oxazolyl, 4-oxazolyl, 2-phenyl-4-oxazolyl, 5-oxazolyl, 3-isoxazolyl, 4-isoxazolyl, 5-isoxazolyl, 2-thiazolyl, 4-thiazolyl, 5-thiazolyl, 2-furyl, 3-furyl, 2-thienyl, 3-thienyl, 2-pyridyl, 3-pyridyl, 4-pyridyl, 2-pyrimidyl, 4-pyrimidyl, 2-benzothiazolyl, 5-benzothiazolyl, 2-benzoxazolyl, 5-benzoxazolyl, purinyl, 2-benzimidazolyl, 5-indolyl, 1-isoquinolyl, 5-isoquinolyl, 2-quinoxalyl, 5-quinoxalyl, 3-quinolyl, and 6-quinolyl. Substituents for each of the above noted aryl ring systems are selected from the group of acceptable substituents described below. The term "arylalkyl" is meant to include those radicals in which an aryl group is attached to an alkyl group (*e.g.*, benzyl, phenethyl, pyridylmethyl and the like) or a heteroalkyl group (*e.g.*, phenoxyethyl, 2-pyridyloxymethyl, 3-(1-naphthyloxy)propyl, and the like).

Each of the above terms (*e.g.*, "alkyl," "heteroalkyl" and "aryl") are meant to include both substituted and unsubstituted forms of the indicated radical. Preferred substituents for each type of radical are provided below.

Substituents for the alkyl and heteroalkyl radicals (including those groups often referred to as alkylene, alkenyl, heteroalkylene, heteroalkenyl, alkynyl, cycloalkyl, heterocycloalkyl, cycloalkenyl, and heterocycloalkenyl) can be a variety of groups selected from: -OR', =O, =NR', =N-OR', -NR'R'', -SR', -halogen, -SiR'R''R''', -OC(O)R', -C(O)R', -CO₂R', CONR'R'', -OC(O)NR'R'', -NR''C(O)R', -NR'-C(O)NR''R''', -NR''C(O)₂R', -NH-C(NH₂)=NH, -NR'C(NH₂)=NH, -NH-C(NH₂)=NR', -S(O)R', -S(O)₂R', -S(O)₂NR'R'', -CN and -NO₂ in a number ranging from zero to (2N+1), where N is the total number of carbon atoms in such radical. R', R'' and R''' each independently refer to hydrogen, unsubstituted(C₁-C₈)alkyl and heteroalkyl, unsubstituted aryl, aryl substituted with 1-3 halogens, unsubstituted alkyl, alkoxy or thioalkoxy groups,

or aryl-(C₁-C₄)alkyl groups. When R' and R'' are attached to the same nitrogen atom, they can be combined with the nitrogen atom to form a 5-, 6-, or 7-membered ring. For example, -NR'R'' is meant to include 1-pyrrolidinyl and 4-morpholinyl. From the above discussion of substituents, one of skill in the art will understand that the term "alkyl" is meant to include groups such as haloalkyl (e.g., -CF₃ and -CH₂CF₃) and acyl (e.g., -C(O)CH₃, -C(O)CF₃, -C(O)CH₂OCH₃, and the like). Preferably, the alkyl groups (and related alkoxy, heteroalkyl, etc.) are unsubstituted or have 1 to 3 substituents selected from halogen, -OR', =O, -NR'R'', -SR', -OC(O)R', -C(O)R', -CO₂R', -CONR'R'', -NR''C(O)R', -S(O)₂R', -S(O)₂NR'R'', -CN and -NO₂. More preferably, the alkyl and related groups have 0, 1 or 2 substituents selected from halogen, -OR', =O, -NR'R'', -SR', -CO₂R', -CONR'R'', -NR''C(O)R', -CN and -NO₂.

Similarly, substituents for the aryl groups are varied and are selected from halogen, -OR', -OC(O)R', -NR'R'', -SR', -R', -CN, -NO₂, -CO₂R', -CONR'R'', -C(O)R', -OC(O)NR'R'', -NR''C(O)R', -NR''C(O)₂R', -NR'-C(O)NR''R''', -NH-C(NH₂)=NH, -NR'C(NH₂)=NH, -NH-C(NH₂)=NR', -S(O)R', -S(O)₂R', -S(O)₂NR'R'', -N₃, -CH(Ph)₂, perfluoro(C₁-C₄)alkoxy, and perfluoro(C₁-C₄)alkyl, in a number ranging from zero to the total number of open valences on the aromatic ring system; and where R', R'' and R''' are independently selected from hydrogen, (C₁-C₈)alkyl and heteroalkyl, unsubstituted aryl, (unsubstituted aryl)-(C₁-C₄)alkyl, and (unsubstituted aryl)oxy-(C₁-C₄)alkyl. Preferably, the aryl groups are unsubstituted or have from 1 to 3 substituents selected from halogen, -OR', -OC(O)R', -NR'R'', -SR', -R', -CN, -NO₂, -CO₂R', -CONR'R'', -C(O)R', -NR''C(O)R', -S(O)₂R', -S(O)₂NR'R'', perfluoro(C₁-C₄)alkoxy, and perfluoro(C₁-C₄)alkyl. Still more preferably, the aryl groups have 0, 1 or 2 substituents selected from halogen, -OR', -NR'R'', -SR', -R', -CN, -NO₂, -CO₂R', -CONR'R'', -NR''C(O)R', -S(O)₂R', -S(O)₂NR'R'', perfluoro(C₁-C₄)alkoxy, and perfluoro(C₁-C₄)alkyl.

Two of the substituents on adjacent atoms of the aryl ring may optionally be replaced with a substituent of the formula wherein T and U are independently -NH-, -O-, -CH₂- or a single bond, and q is an integer of from 0 to 2. Alternatively, two of the substituents on adjacent atoms of the aryl ring may optionally be replaced with a substituent of the formula -A-(CH₂)_r-B-, wherein A and B are independently -CH₂-, -O-, -NH-, -S-, -S(O)-, -S(O)₂-, -S(O)₂NR'- or a single bond, and r is an integer of from 1 to 3. One of the single bonds of the new ring so formed may optionally be replaced with a double bond. Alternatively, two of the substituents on adjacent atoms of the aryl ring may optionally be replaced with a substituent of the formula -(CH₂)_s-X-(CH₂)_t-, where s

and t are independently integers of from 0 to 3, and X is -O-, -NR'-, -S-, -S(O)-, -S(O)₂-, or -S(O)₂NR'-. The substituent R' in -NR'- and -S(O)₂NR'- is selected from hydrogen or unsubstituted (C₁-C₆)alkyl.

The neutral forms of the compounds may be regenerated by contacting the
30 salt with a base or acid and isolating the parent compound in the conventional manner. The parent form of the compound differs from the various salt forms in certain physical properties, such as solubility in polar solvents, but otherwise the salts are equivalent to the parent form of the compound for the purposes of the present invention.

In addition to salt forms, the present invention provides compounds which are in a prodrug form. Prodrugs of the compounds described herein are those compounds that readily undergo chemical changes under physiological conditions to provide the compounds of the present invention. Additionally, prodrugs can be converted to the
5 compounds of the present invention by chemical or biochemical methods in an *ex vivo* environment. For example, prodrugs can be slowly converted to the compounds of the present invention when placed in a transdermal patch reservoir with a suitable enzyme or chemical reagent.

10 as well as solvated forms, including hydrated forms. In general, the solvated forms are equivalent to unsolvated forms and are intended to be encompassed within the scope of the present invention. Certain compounds of the present invention may exist in multiple crystalline or amorphous forms. In general, all physical forms are equivalent for the uses contemplated by the present invention and are intended to be within the scope of the
15 present invention.

General:

A new class of compounds that interact with PPAR γ has now been discovered. Depending on the biological environment (*e.g.*, cell type, pathological
30 condition of the host, *etc.*), these compounds can activate or block the actions of PPAR γ . By activating the PPAR γ receptor, the compounds will find use as therapeutic agents capable of modulating conditions mediated by the PPAR γ receptor. As noted above, example of such conditions is NIDDM. Additionally, the compounds are useful for the prevention and treatment of complications of diabetes (*e.g.*, neuropathy, retinopathy,

glomerulosclerosis, and cardiovascular disorders), and treating hyperlipidemia. Still further, the compounds are useful for the modulation of inflammatory conditions which most recently have been found to be controlled by PPAR γ (see, Ricote, *et al.*, *Nature*, 391:79-82 (1998) and Jiang, *et al.*, *Nature*, 391:82-86 (1998)). Examples of inflammatory conditions include rheumatoid arthritis and atherosclerosis.

Compounds that act via antagonism of PPAR γ are useful for treating obesity, hypertension, hyperlipidemia, hypercholesterolemia, hyperlipoproteinemia, and metabolic disorders.

Preparation of the Compounds

The compounds disclosed herein can be prepared using standard synthetic methods. For exemplary purposes, Scheme I illustrates methods for the preparation of compounds of structural formula (Ia). One of skill in the art will understand that similar methods can
5 be used for the synthesis of compounds in the other structural classes.

As shown in Scheme I, compounds disclosed herein can be prepared beginning with commercially available 2-chloro-5-nitrobenzotrile (i). Treatment of J with a phenol, thiophenol, or optionally protected aniline in the presence of base and heat provides the adduct (ii). Reduction of the nitro group in ii with, for example, H₂ in the presence of
10 Raney nickel catalyst provides an aniline derivative (iii). Sulfonylation of iii with an appropriate arylsulfonyl halide (Ar¹SO₂Cl) in the presence of base (typically a tertiary amine) provides a target compound (iv). Compound iii can also be converted to a related compound of formula (vi) in which the orientation of the sulphonamide linkage is reversed. Thus, conversion of the aniline iii to the benzenesulfonyl chloride v can be
15 accomplished using methods described in Hoffman, Organic Syntheses Collective Volume VII, p. 508-511. Subsequent treatment of v with an appropriate aniline provides the target compound vi.

Formulation and Administration of the Compounds (Compositions)

20 The compounds of the present invention can be prepared and administered
in a wide variety of oral and parenteral dosage forms. Thus, the compounds of the
present invention can be administered by injection, that is, intravenously, intramuscularly,
intracutaneously, subcutaneously, intraduodenally, or intraperitoneally. Also, the
compounds described herein can be administered by inhalation, for example, intranasally.
25 Additionally, the compounds of the present invention can be administered transdermally.
Accordingly, the present invention also provides pharmaceutical compositions
comprising a pharmaceutically acceptable carrier or excipient and either a compound of
formula (I) or a pharmaceutically acceptable salt of a compound of formula (I).

For preparing pharmaceutical compositions from the compounds of the
30 present invention, pharmaceutically acceptable carriers can be either solid or liquid. Solid
form preparations include powders, tablets, pills, capsules, cachets, suppositories, and
dispersible granules. A solid carrier can be one or more substances which may also act as

diluents, flavoring agents, binders, preservatives, tablet disintegrating agents, or an encapsulating material.

In powders, the carrier is a finely divided solid which is in a mixture with the finely divided active component. In tablets, the active component is mixed with the carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired.

The powders and tablets preferably contain from 5% or 10% to 70% of the active compound. Suitable carriers are magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose, a low melting wax, cocoa butter, and the like. The term "preparation" is intended to include the formulation of the active compound with encapsulating material as a carrier providing a capsule in which the active component with or without other carriers, is surrounded by a carrier, which is thus in association with it. Similarly, cachets and lozenges are included. Tablets, powders, capsules, pills, cachets, and lozenges can be used as solid dosage forms suitable for oral administration.

For preparing suppositories, a low melting wax, such as a mixture of fatty acid glycerides or cocoa butter, is first melted and the active component is dispersed homogeneously therein, as by stirring. The molten homogeneous mixture is then poured into convenient sized molds, allowed to cool, and thereby to solidify.

Liquid form preparations include solutions, suspensions, and emulsions, for example, water or water/propylene glycol solutions. For parenteral injection, liquid preparations can be formulated in solution in aqueous polyethylene glycol solution.

Aqueous solutions suitable for oral use can be prepared by dissolving the active component in water and adding suitable colorants, flavors, stabilizers, and thickening agents as desired. Aqueous suspensions suitable for oral use can be made by dispersing the finely divided active component in water with viscous material, such as natural or synthetic gums, resins, methylcellulose, sodium carboxymethylcellulose, and other well-known suspending agents.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for oral administration. Such liquid forms include solutions, suspensions, and emulsions. These preparations may contain, in addition to the active component, colorants, flavors, stabilizers, buffers, artificial and natural sweeteners, dispersants, thickeners, solubilizing agents, and the like.

The pharmaceutical preparation is preferably in unit dosage form. In such form the preparation is subdivided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of preparation, such as packeted tablets, capsules, and powders in vials or ampoules. Also, the unit dosage form can be a capsule, tablet, cachet, or lozenge itself, or it can be the appropriate number of any of these in packaged form.

The quantity of active component in a unit dose preparation may be varied or adjusted from 0.1 mg to 1000 mg, preferably 1.0 mg to 100 mg according to the particular application and the potency of the active component. The composition can, if desired, also contain other compatible therapeutic agents.

In therapeutic use for the treatment of obesity, NIDDM, or inflammatory conditions, the compounds utilized in the pharmaceutical method of the invention are administered at the initial dosage of about 0.001 mg/kg to about 100 mg/kg daily. A daily dose range of about 0.1 mg/kg to about 10 mg/kg is preferred. The dosages, however, may be varied depending upon the requirements of the patient, the severity of the condition being treated, and the compound being employed. Determination of the proper dosage for a particular situation is within the skill of the practitioner. Generally, treatment is initiated with smaller dosages which are less than the optimum dose of the compound. Thereafter, the dosage is increased by small increments until the optimum effect under circumstances is reached. For convenience, the total daily dosage may be divided and administered in portions during the day, if desired.

The following examples are offered by way of illustration and are not intended to limit the scope of the invention.

EXAMPLES

Reagents and solvents used below can be obtained from commercial sources such as Aldrich Chemical Co. (Milwaukee, Wisconsin, USA). ¹H-NMR spectra were recorded on a Varian Gemini 400 MHz NMR spectrometer. Significant peaks are tabulated in the order: number of protons, multiplicity (s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br s, broad singlet) and coupling constant(s) in Hertz. Electron Ionization (EI) mass spectra were recorded on a Hewlett Packard 5989A mass spectrometer. Mass spectrometry results are reported as the ratio of mass over charge, followed by the relative abundance of each ion (in parentheses). In tables, a single m/e value is reported for the M+H (or as noted M-H) ion containing the most common atomic

isotopes. Isotope patterns correspond to the expected formula in all cases. Electrospray ionization (ESI) mass spectrometry analysis was conducted on a Hewlett-Packard 1100 MSD electrospray mass spectrometer using the HP1 100 HPLC for sample delivery. Normally the analyte was dissolved in methanol at 0.1mg/mL and 1 microliter was infused with the delivery solvent into the mass spectrometer which scanned from 100 to 1500 daltons. All compounds could be analyzed in the positive ESI mode, using 1:1 acetonitrile/water with 1% acetic acid as the delivery solvent. The compounds provided below could also be analyzed in the negative ESI mode, using 2mM NH₄OAc in acetonitrile/water as delivery solvent.

72.1

To a solution of 3,4-dichlorothiophenol (0.87 mL) and 4-fluoro-3-chloronitrobenzene (1.2 g) in THF (12 mL) was added a solution of potassium *t*-butoxide in THF (1 M, 3.7 mL). Ethanol was added to form a precipitate and the mixture was heated to dissolve the solid. The mixture was then cooled to ambient temperature and water was added. The resulting solids were collected by filtration and washed with water. The product was dissolved in methylene chloride, dried over magnesium sulfate, filtered and concentrated to provide a yellow nitro intermediate (2.08 g).

SnCl₂ hexahydrate (7 g) was added to a solution of the intermediate nitro compound in ethyl acetate (40 mL) at 85°C. After 12 hr, the reaction was treated with 420 mL of 0.5 N NaOH solution and diluted with EtOAc (100 mL). The milky suspension was filtered through Celite and rinsed with additional EtOAc. The layers were separated and the water layer was extracted with additional EtOAc. The combined organic portions were dried over MgSO₄, filtered and concentrated under vacuum to provide the aniline derivative 72.1, which was used without purification.

The compounds provided in Table 9 were prepared using 72.1 and commercially available substituted benzenesulfonyl chlorides and/or using the intermediates and methods described in the examples above.

EXAMPLE 77

This example illustrates the preparation of anilines 77.7, 77.8 and 77.9

In analogy to the procedures of Weinstock et. al (*J. Med. Chem.* 30:1166-1176 (1987), conc. sulfuric acid (8.74 g) was added slowly to a solution of 5-chloro-2-methylaniline (25g) in chlorobenzene (120 mL) to form a thick slurry. Powdered NaSCN (18.6g) was added. The mixture was heated at 110°C for one hour then maintained at 50°C overnight. After dilution with hexane (300 mL), the solid was collected by filtration, washed with hot water and rinsed with ethyl ether to afford 15.65g of intermediate thiourea 77.1 which was used directly in the next step.

Bromine (25.44g) was added to a suspension of 77.1 (15g) in chloroform (110 mL) maintained below +10°C. After the addition was complete, the reaction was allowed to warm to RT then heated at reflux for 30 minutes. After cooling, the orange solid was collected by filtration and suspended in acetone (100mL) which discharges the remaining color. Solids were collected by filtration and rinsed with ethyl ether to afford the HBr salt.

EXAMPLE 85

This illustrates the synthesis of compound 85.3

Compound 85.1 was prepared by a modification of the published
 5 procedure of Albert and Barlin (J. Chem. Soc. 2384-2396 (1959). 3-Aminoquinoline
 (15.0 g, 105 mmol) was suspended in a mixture of 10N HCl (40 mL), ice (21g) and water
 (100 mL) at 0-5 °C, before sodium nitrite (7.6 g, 110 mmol) was added slowly. The
 mixture was then added portionwise to another solution of potassium ethyl xanthate (20.8
 g, 125 mmol) in water (60 mL) at 45 °C. The mixture was heated for 1 hr before cooling
 10 off. The mixture was then extracted with ether. The ethereal solution was washed with
 2N NaOH solution, water, and brine before drying over magnesium sulfate. After
 filtration, the removal of the solvent gave a brown oil (15g), which was then dissolved in
 ethanol (150 mL) and refluxed with KOH (25g) under nitrogen overnight. The ethanol
 solvent was then removed under vacuum, and the residue was separated between water
 15 and ether. The ethereal solution was discarded. The aqueous solution was acidified to
 pH = ~4, before it was extracted with ether. Then ethereal solution was washed with
 brine, dried over magnesium sulfate, filtered and concentrated under vacuum to give
 crude product (7.5g) as a brown oil. Subsequent flash chromatography with eluent (0%-
 5%-10% ethyl acetate / dichloromethane) produced 3-mercaptoquinoline (85.1) (5.35g,
 20 32% yield) as a solid.

$^1\text{H NMR}$ (DMSO) δ 9.02 (1H, d, $J = 2.3$ Hz), 8.63 (1H, d, $J = 2.2$ Hz),
 7.95-8.05 (2H, m), 7.75-8.02 (1H, m), 7.60-7.67 (1H, m).

To a mixture of 3-mercaptoquinoline (85.1) (1.18 g, 7.33 mmol) and 1,2,3-
 chloro-5-nitrobenzene (1.66 g, 7.33 mmol) dissolved in ethanol (100 mL), was added a
 25 THF solution of *t*-BuOK (7.5 mL, 1M). The mixture was then heated at 80 °C overnight
 before cooling off. After the removal of ethanol solvent, the mixture was separated
 between ethyl acetate and water. The organic solution was washed with brine, dried over
 magnesium sulfate and filtered. The filtrate was then concentrated to give a crude

product, which was then flash chromatographed with eluent (10% hexanes / dichloromethane) to afford **85.2** (1.80 g, 70% yield) as a yellow oil.

$^1\text{H NMR}$ (DMSO) δ 8.75 (1H, d, $J = 2.3$), 8.51 (1H, s), 8.22 (1H, s), 8.01 (1H, d, $J = 8.4$ Hz), 7.92 (1H, d, $J = 7.6$ Hz), 7.74-7.80 (1H, m), 7.60-7.66 (1H, m).

5 An ethyl acetate solution (100 mL) of **85.2** (1.80 g, 5.1 mmol) and tin chloride (II) dihydrate (6.88 g, 30 mmol) was heated at reflux overnight before cooling off. The solution was then poured into 1N NaOH solution (400 mL). After stirring for 30 min, the mixture was separated, and the organic solution was washed with water, saturated sodium bicarbonate and brine. After drying over magnesium sulfate, the solution was filtered and concentrated under vacuum. The residue was mixed with dichloromethane (10 mL) and sonicated. Subsequent vacuum filtration provided the aniline **85.3** (1.35g, 82% yield) as an off-white solid.

10 $^1\text{H NMR}$ (DMSO) δ 8.61 (1H, d, $J = 2.4$), 7.96 (1H, d, $J = 8.4$ Hz), 7.88 (1H, d, $J = 8.2$ Hz), 7.83 (1H, d, $J = 2.2$ Hz), 7.67-7.72 (1H, m), 7.54-7.60 (1H, m). mp 15 213.2 °C.

EXAMPLE 86

This illustrates the synthesis of compound **86** (see Table 16).

The aniline **85.3** (250 mg, 0.78 mmol) and 2-chlorobenzenesulfonyl chloride (339 mg, 1.60 mmol) were dissolved in a mixed solvent of THF (5 mL) and dichloromethane (5 mL). To the solution was added pyridine (0.185 mL, 2.34 mmol) and catalytic amount of DMAP. The solution was heated at 50 °C to distill off dichloromethane, and then THF with assistance of vacuum. The residue was flash chromatographed with eluent (2.5% ethyl acetate / dichloromethane) to give sulfonamide **86** (302 mg, 78%) as an off-white solid.

25 $^1\text{H NMR}$ (DMSO) δ 11.58 (1H, s), 8.61 (1H, d, $J = 2.4$ Hz), 8.19 (1H, d, $J = 7.6$ Hz), 7.83-8.00 (3H, m), 7.67-7.75 (3H, m), 7.56-7.65 (2H, m), 7.31 (2H, s). MS (M+H) 494.9. mp: 219.6 °C. Anal. calcd: C 50.87, H 2.64, N 5.65; found C 50.86, H 2.62, N 5.52.

EXAMPLE 109

This example illustrates the synthesis of 109.1.

10

A round-bottomed flask was charged with 2-chloro-4-nitrobenzoyl chloride (3.50 g, 15.9 mmol), 2-ethylbenzofuran (2.11 g, 14.4 mmol), and anhydrous methylene chloride (20 mL). This was cooled in an ice/water bath and titanium tetrachloride (5.49 g, 28.9 mmol) was added in a dropwise fashion with vigorous stirring. After addition was complete, the reaction was stirred at 0°C for 20 minutes and then was warmed to room temperature for an additional four hours. The reaction was then diluted with 80 mL of methylene chloride and washed twice with 50 mL volumes of 2N HCl and then once with 50 mL of brine. The organics were dried over Na₂SO₄ and concentrated to

20

a yellow oil. This oil was further purified using silica gel flash chromatography (eluting with 20% hexanes in methylene chloride). The desired fractions were concentrated to give 2.9 g (61%) of ketone 109.1 as an off-white solid. MS ESI m/e: 330.0 (M + H).

EXAMPLE 110

(2,6-Dichloro-4-nitro-phenyl)-acetic acid (110)

To a solution of diethyl malonate (Aldrich, 13.8 mL, 90 mmol) in DMF (60 mL) was added cesium carbonate (Aldrich, 48.9 g, 150 mmol). The mixture was heated to 70 °C and then was added 1,2,3-trichloro-5-nitrobenzene (Aldrich, 13.56 g, 60 mmol). The mixture was stirred at 70°C for 3 hours and cooled to room temperature. A 2M aqueous solution of HCl (50 mL) was added and the crude reaction mixture was extracted 3x with EtOAc (150 mL). The organic layers were combined and washed twice with a brine solution (150 mL), dried over Na₂SO₄, and concentrated under vacuum. The light yellow oil was used for the next reaction without further purification.

15

The light yellow oil was suspended in 90 mL of 6 N aqueous HCl. The mixture was refluxed overnight (15 hours). The mixture was cooled in the ice bath for 2 hours and filtered. The crude solid product was triturated with CH₂Cl₂/Hexanes to give compound 110 (11.5 g, 77%) as pale brown solid.

EXAMPLE 112

2-Amino-4-chloro-benzenethiol hydrochloride (112)

By the procedure of R.L.Danley and D. A. Zazaris (Can. J. Chem. 43, 2610-2612 (1965) sodium tetrasulfide was obtained by dissolving sulfur (Aldrich, 9.6 g,

300 mmol) in molten sodium sulfide nonahydrate (Aldrich, 24.0 g, 100 mmol). This hot liquid was added to a solution of 2,5-dichloronitrobenzene (Aldrich, 38.4 g, 200 mmol) in 95% ethanol (140 mL). After the exothermic reaction had ceased, the mixture was refluxed for 2 hours and filtered while hot. The precipitate was washed with water (50 mL) and ethanol (50 mL) to give 37.7 g of intermediate trisulfide as a yellow solid.

$^1\text{H NMR}$ (CDCl_3) δ 8.83 (d, $J = 2.3$ Hz, 1H), 7.76 (d, $J = 8.6$ Hz, 1H), 7.55 (dd, $J = 8.6, 2.3$ Hz, 1H).

Concentrated hydrochloric acid (125 mL) was slowly (overnight, 15 hours) added to a well-stirred suspension of the trisulfide (37.7 g) described above and tin (Aldrich, 88 g, 737 mmol) in 95% ethanol (200 mL). After filtration of the hot solution, the filtrate was allowed to stand at room temperature overnight to precipitate the crude product. The precipitate was collected by filtration, washed with 1:1 ethanol/concentrated HCl. Recrystallization from 1:1 MeOH/concentrated HCl gave compound 112 (13.8 g) as white needles.

$^1\text{H NMR}$ ($\text{DMSO}-d_6$) δ 6.96 (d, $J = 8.3$ Hz, 1H), 6.86 (d, $J = 2.3$ Hz, 1H), 6.50 (dd, $J = 8.3, 2.3$ Hz, 1H).

(2,6-dichloro-4-nitro-phenyl)-acetic acid (example 110, 2.50 g, 10.0 mmol). The resulting mixture was stirred at room temperature for 1 hour, then heated at 90°C overnight (15 hours). After cooled to room temperature, the reaction mixture was poured to ice and the resulting mixture was extracted 3x with EtOAc (50 mL). EXAMPLE 148

This illustrates the synthesis of (2-fluoro-4-nitro-phenyl)acetic acid 148.

15 A round-bottomed flask was charged with diethyl malonate (8.6 g, 54 mmol), cesium carbonate (29.3 g, 90 mmol), and anhydrous DMF (36 mL). The mixture was warmed to 70 °C and 2,4-difluoronitrobenzene (5.75 g, 36 mmol) was added in a dropwise fashion with vigorous stirring. The reaction medium immediately turned dark purple. After the addition was complete, the reaction was stirred at 70°C for 30 minutes.
 20 After cooling to room temperature, the reaction was quenched with 4 mL of acetic acid and then poured into 300 mL of 0.3 N HCl_(aq). The purple color discharged completely upon addition to the acid. The mixture was then neutralized by adding solid NaHCO₃ until no gas evolution took place. The mixture was extracted 2 x 150 mL 1:1 diethyl ether:hexanes. The combined organic layers were washed 2 x 100 mL DI water and 1 x
 25 50 mL sat. brine. The organic layer was dried over MgSO₄ and concentrated to a yellow oil. This oil was suspended in 40 mL of 6N HCl_(aq) and the mixture heated to reflux for

16 h. Upon cooling, crystals separated and were collected by filtration. The crystals were dried under vacuum to yield 2-fluoro-4-nitro-phenylacetic acid (148) as off-white crystals (5.42 g).

25 A round-bottomed flask was charged with 2-mercapto-5-methylbenzimidazole (4.84 g, 29.5 mmol), potassium hydroxide (1.66 g, 29.5 mmol), and water (18 mL). This suspension was heated to 120°C for 3.0 hours. Then 3,4,5-trichloronitrobenzene (6.68 g, 29.5 mmol) dissolved in 53 mL of *n*-butanol was added

dropwise while the reaction stirred at 120°C. All the white solids went into solution and the solution proceeded to turn a deep red color. The reaction was left stirring for five days, at which point a yellow precipitate was seen. The reaction was then cooled to room temperature and the precipitate was filtered and washed with distilled water to yield 8.10 g (78%) of compound 150 as canary yellow crystals which were a 50/50 mixture of both possible tautomers.

This was stirred at room temperature for 12 hours, after which 2,6-lutidine hydrochloride was seen as a white

precipitate. The reaction was diluted with 40 mL of EtOAc and washed with 30 mL of 1N aqueous HCl followed by 30 mL of brine. The organics were dried over magnesium sulfate and concentrated to a clear oil that was dissolved in 30 mL of THF. To this was added 30 mL of 0.5N aqueous KOH. This was stirred at room temperature for 12 hours, and the reaction color progressed from a light yellow to a deep orange. Next, the pH was brought to 7.0 with 1.0N HCl and the THF was removed *in vacuo*. The remaining aqueous phase was extracted with 100 mL of Et₂O. The organic layer was dried over sodium sulfate and concentrated to a yellow oil that was further purified with silica gel flash chromatography (3:2 hexanes:EtOAc). EXAMPLE 200

25

This illustrates the synthesis of compound 200.

2-amino-6-chlorobenzothiazole (3.68 g, 20 mmol) and 1,2,3-trichloro-5-nitrobenzene (4.53 g, 20 mmol) were dissolved in anhydrous DMSO (10 mL). Solid K₂CO₃ (3.04 g, 22 mmol) was added and the reaction mixture heated to 150 °C for 4

hours. Let cool, then poured into 200 mL deionized water. A fine yellow solid precipitated which was collected by filtration after attempts to dissolve the product in ethyl acetate failed. The yellow solid was suspended in 100 mL of ethyl acetate and heated to reflux. After cooling to room temperature, filtration, rinsing with ethyl acetate followed by hexanes, and drying under vacuum provided the nitro compound 200 as a yellow powder. (1.06 g)

The mixture was heated at reflux overnight then quenched into water (100 mL). The product is extracted with methylene chloride and purified by flash chromatography to afford compound 201 (300 mg) as a yellow solid.

EXAMPLE 207

This illustrates the synthesis of compound 207.

2,7-dichlorobenzothiazole (Example 73.2) (0.85 g, 4.2 mmol) and 2,6-dichloro-4-nitroaniline (2.1 g, 10.4 mmol) were dissolved in anhydrous DMSO (10 mL). Solid Cs_2CO_3 (4.1 g, 12.5 mmol) was added and the reaction mixture heated to 80 °C for 16 hours. Let cool, then poured into 200 mL DI water. Excess cesium carbonate was neutralized with acetic acid. The aqueous layer was extracted 2 x 100 mL of ethyl acetate. The combined organic layers were washed with saturated brine, dried over MgSO_4 , filtered, and concentrated to a yellow-brown solid. The insolubility of this compound prevented purification, so the crude material was used directly in the next reaction.

During the addition process, a separate flask containing concentrated H_2SO_4 (50 mL) was cooled to 0 °C and fuming HNO_3 , obtained from Acros, (16.6 mL) was slowly added. This solution was then

After the addition was complete the resulting solution was allowed to warm to 10 °C over 3 hours. The crude solid material was filtered through a fritted filter funnel, washed with cold H_2O (200 mL), and dried under a stream of air followed by high vacuum to yield 21.7 g (44%) of product (246) which
25 contained 4% of the undesired regioisomer (2,3-Dichloro-6-nitrobenzoic acid 247) based on ^1H NMR analysis. The filtrate was slowly poured over ice and additional solid precipitated. This solid was observed to be a 3:1 mixture of 2,3-dichloro-6-nitrobenzoic acid (247) to 2,3-dichloro-5-nitrobenzoic acid (246) based on ^1H NMR analysis.

The ice bath was taken away and the resulting solution was heated to reflux for 17 hours (note: acid completely dissolves upon heating). After cooling to ambient temperature, the excess thionyl chloride was removed under vacuum and the resulting acid chloride was allowed to stand under high vacuum for 15 h and used in the next step without further purification.

To a 1M solution of NaH, 60% oil dispersion obtained from Aldrich, (11.39 g, 285 mmol) in DMF at 0 °C was slowly added diethylmalonate, obtained from Aldrich, (14.65 mL, 96.5 mmol) dropwise and the resulting solution was allowed to stir for 30 minutes. The acid chloride was dissolved in DMF (184 mL) and slowly added via cannula to the reaction mixture. The resulting solution was then allowed to stir for 16 h as ambient temperature was reached followed by recooling to 0 °C and slowly quenching with excess 2M aqueous HCl (200 mL). To the crude reaction was added H₂O (500 mL) and EtOAc (500 mL). The aqueous layer was extracted three times with EtOAc (500 mL), the organic layers were combined, washed four times with saturated aqueous brine (500 mL), dried over Na₂SO₄, and concentrated under vacuum to yield an oil which was used in the next step without further purification. The resulting product was dissolved in 111 mL of a 7.7/5/1 AcOH/H₂O/conc. H₂SO₄, solution and heated to reflux for 22 hours. The AcOH was removed under vacuum followed by EtOAc addition (200 mL).
