Appl. No.: 11/379,423
Filed: Apr. 20, 2006

Abstract

The invention relates to pharmaceutical formulations of lipophilic therapeutic agents in which such agents are solubilized in largely aqueous vehicles, and processes for preparing and using the same.
FORMULATION FOR LIPOPHILIC AGENTS

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] This application is a continuation of U.S. patent application Ser. No. 10/247,765 filed Sep. 18, 2002, the entirety of the application incorporated herein by reference.

STATEMENT REGARDING FEDERALLY SPONSORED RESEARCH OR DEVELOPMENT

[0002] Not Applicable

BACKGROUND OF THE INVENTION

[0003] This invention relates to pharmaceutical formulations of lipophilic therapeutic agents in which such agents are solubilized in largely aqueous vehicles, and uses for such formulations. The formulations are stable in aqueous-based vehicles, and have therapeutically and commercially useful concentrations of active ingredient.

[0004] Many pharmacologically active substances are lipophilic, i.e., only sparingly or negligibly water-soluble. Lipophilic therapeutic agents span the entire range of biologically and/or pharmacologically active substances. For example, they include certain anesthetics and anti-inflammatory agents, anti-asthma agents, anti-bacterial agents, antiviral agents, anticoagulants, anti-depressants, anti-neoplastic agents and immunosuppressants, B-blockers, corticosteroids, opioid analgesics, lipid regulating agents, anxiolytics, sedatives, hypnotics and neuroleptics.

[0005] The poor water-solubility of these lipophilic agents often results in major difficulties in formulation, particularly when easily sterilizable and administrable homogeneous aqueous solutions are needed. Efficacious aqueous-based formulations are particularly problematic for systemic administration, in particular parenteral administration (e.g., injectable solutions) and for certain liquid preparations for, e.g., topical gynecologic, dermatologic ophthalmic, etc. use, and for use on the oral mucous membranes.

[0006] A number of approaches for obtaining aqueous compositions of sparingly water-soluble drugs are known. Such approaches seek to increase the solubility, and accordingly, increase the ease of formulation and the bioavailability of the sparingly soluble or lipophilic active agents. One such approach involves chemical modification of the lipophilic drug by introduction of a ionic or ionizable group or a group that lowers the melting point. The former generally depends upon the lipophilic drug having a hydroxyl or carboxylic group which can be used to form various kinds of esters. The latter is based on the concept that, to be solubilized, the molecules have to leave the crystal lattice. Any modification of the molecule that lowers the melting point, and thus reduces the energy of the crystal lattice, tends to increase the solubility thereof in any solvent.

[0007] Another method involves physico-chemical solubilization techniques such as micellar solubilization by means of surface-active agents, i.e., the use of surfactant micelles to solubilize and transport the therapeutic agent. Micelles are agglomerates of colloidal dimensions formed by amphiphilic compounds under certain conditions. Micelles, and pharmaceutical compositions containing micelles, have been extensively studied and are described in detail in the literature. In aqueous solution, micelles can incorporate lipophilic therapeutic agents in the hydrocarbon core of the micelle, or can entangle the agents at various positions within the micelle walls. Although micellar formulations can solubilize a variety of lipophilic therapeutic agents, the loading capacity of conventional micelle formulations is limited by the solubility of the therapeutic agent in the micelle surfactant. For many lipophilic therapeutic agents, such solubility is too low to offer formulations that can deliver therapeutically effective doses.

[0008] The formation of complexes, solid solutions and solid dispersions by means of the use of suitable polymers is another approach for increasing the water-solubility of pharmaceutically active substances. In such a case, the active ingredient is incorporated in a suitable hydrophilic carrier, which increases the solubility and the bioavailability thereof without any formal covalent bonds originating between the drug and the polymer matrix. The difference between a solid solution and a solid dispersion is typically in the form of the active ingredient. In a solid solution, the active is present in the amorphous molecular form, while in a dispersion the active is present in a crystalline form, as fine as possible.

[0009] Even more widespread and studied is the use of the interaction between a polymer and a drug to give rise to a true complex, wherein chemical bonds of a noncovalent nature are involved. Complexing polymers employed in the pharmaceutical field include, e.g., polyethylene glycols, polypropylene glycols, cyclodextrins, carboxymethylcellulose, polyvinylpyrrolidone (PVP)

[0010] Co-precipitation is yet another widespread method for the preparation of complexes with increased solubility. In this method, the substance and the polymer are dissolved in an organic solvent in which they are both soluble, and the solution is then evaporated at atmospheric pressure, under vacuum, by spray-drying or by lyophilization, to yield a dry product actually made of the complex of the treated drug. Such complexes can also be obtained by applying other methods, such as grinding and mixing the ingredients in a mill, or by extrusion of a paste containing the two products together with a minor amount of water, etc. In comparison with the starting drug, the complex typically shows an appreciably enhanced water-solubility.

[0011] In devising a working method for solubilizing drugs by complexation, it is necessary to take into account the molecular weight of the polymer, since the solubility of the active ingredient directly depends thereon. In general, low molecular weights are more suitable than medium to high molecular weights.

[0012] Still another method involves use of various cosolvent systems, i.e., compositions using a solvent mixture containing water and one or more organic solvents. One approach to solubilizing lipophilic drug agents in aqueous systems is to employ some combination of alcohols and glycols (PDA J. Pharm. Sci. Technol. 50(5) 1996; U.S. Pat. Nos. 6,136,799; 6,361,758 and 5,858,999) Organic contents as high as 50% or more are often required to ensure solubility during manufacturing, storage and administration. Although organic levels while high will still be below the LD₅₀ for a low volume parenteral dosage, the amounts are still typically undesirable. High levels of organic solvent can cause pain on injection and tissue necrosis.
Other methods involve the formation of complexes by the addition of chelating agents such as citric acid, tartaric acid, amino acids, thioglycolic acid and edetate disodium. Others use buffering agents such as acetate, citrate, glutamate and phosphate salts. However, buffers and chelating agents have been implicated in imparting aluminum levels in products to an excess of 3.5 parts per million leading to adverse side effects. (International Patent Application Publication WO 96/36340) Moreover, certain chelating agents such as EDTA have been implicated in adverse effects such as nephrotoxicity and renal tubular necrosis. (U.S. Pat. No. 6,361,758)

Each of these foregoing methods has its inherent limitations. For many of the pharmaceutical substances, the solubility levels that can be achieved with one or another of the methods discussed above are still insufficient to make their use in aqueous-based commercial products viable.

An exemplary and important class of lipophilic drug agents are the vitamin D compounds. Properly metabolized vitamin D compounds are necessary for the maintenance of healthy bones and have been found to display other biological activities. The lipophilicity of the natural forms of vitamin D and of the many known synthetic analogs of vitamin D makes it difficult to manufacture an efficacious formulation, particularly, a parenteral formulation which is preferred for, e.g., renal dialysis patients.

Additionally, vitamin D compounds, among other lipophilic compounds, are known to be oxygen sensitive, being oxidized when exposed to air, and thus, losing integrity. One approach to circumventing this problem is to add an antioxidant directly to a formulation of the drug. However, certain antioxidants, such as ascorbic acid and sodium ascorbate, which are highly water soluble, will discolor in the course of performing their intended function. Buffers and/or chelating agents have also been added to decrease oxygen sensitivity thus maintaining active drug potency (U.S. Pat. Nos. 4,308,264; 4,948,788 and 5,182,274.) However, as noted above, buffers and chelating agents are known to introduce undesirable levels of aluminum into the product.

Thus, there is a need for pharmaceutical formulations of lipophilic therapeutic agents that overcome the limitations of the many known approaches.

BRIEF SUMMARY OF THE INVENTION

The present invention provides a pharmaceutical formulation that overcomes the problems associated with parenteral formulations of lipophilic drugs. The present invention provides a formulation that can be terminally sterilized, and contains little or no organic solvent such as alcohol. It has also been surprisingly discovered that the novel formulations of the present invention provide a synergistic solubilizing and antioxidative effect. Additionally, the present invention allows for the inclusion or occlusion of aseptic agents, depending on the intended use and/or handling.

The present invention provides a pharmaceutical formulation comprising a therapeutically effective amount of (1) a lipophilic therapeutic agent, (4) a non-ionolic solubilizer, (3) a lipophilic antioxidant, and (4) optionally, an agent that is an organic solvent, or a preservative (e.g., antimicrobial), or both, in an aqueous vehicle. Lipophilic therapeutic agents suitable for use in the formulations of the present invention are not particularly limited. Agents of particular interest include vitamin D compounds and analogs. By employing a lipophilic, i.e., fat-soluble, antioxidant, smaller amounts of antioxidant may be used compared to known formulations utilizing water soluble antioxidants.

The formulations of the present invention preclude the need for high organic solvent contents, which can cause irritations in some patients. In addition, formulations of the present invention omit buffers and chelating agents. The use of buffers and chelating agents in, e.g., some prior vitamin D formulations, has been linked to the introduction of undesirable aluminum levels into the product and eventually into the patient.

The invention also relates to methods for the treatment and/or prophylaxis of certain diseases and disorders comprising administering, e.g., parenterally, to a patient in need thereof a formulation in accordance with the present invention. For example, for formulations containing vitamin D compounds or analogs, these diseases include hyperparathyroidism, e.g., secondary hyperparathyroidism, neoplastic diseases, such as cancers of the pancreas, breast, colon or prostate as well as other diseases of abnormal cell differentiation and/or cell proliferation such as psoriasis, and disorders of calcium metabolism such as osteomalacia.

Other advantages and a fuller appreciation of the specific attributes of this invention will be gained upon an examination of the following detailed description of the invention, and appended claims.

BRIEF DESCRIPTION OF THE DRAWINGS

Not applicable.

DETAILED DESCRIPTION OF THE INVENTION

The present invention provides a stable, self-preserved pharmaceutical formulation of a lipophilic therapeutic agent in aqueous vehicle utilizing a non-ionic solubilizer and lipophilic antioxidant. The formulation is suitable for parenteral administration.

As used herein, “lipophilic” in reference to a therapeutic agent or drug is intended to mean a sparingly (or poorly, slightly, scarcely) soluble biologically active or pharmaceutically active substance or antigen-comprising material, which has a therapeutic or prophylactic effect, and has utility in the treatment or prevention of diseases or disorders affecting mammals, including humans, or in the regulation of an animal or human physiological condition. The water-solubility of lipophilic drugs, at room temperature, is typically too low to make commercially propelable, sufficiently active or advantageous any aqueous preparations containing the compound as an active ingredient. Lipophilic therapeutic agents include substances, typically compounds, with little or no water solubility. Intrinsic water solubilities (i.e., water solubility of the unionized form) for lipophilic therapeutic agents usable in the present invention include, for example, those with a solubility of less than about 1% by weight, and typically less than about 0.1% or 0.01% by weight, or, e.g., less than about 10 μg/mL.

Lipophilic therapeutic agents suitable for use in the formulations of the present invention are not particularly...
limited, as the method of the present invention is surprisingly capable of solubilizing and delivering a wide variety of lipophilic therapeutic agents. Therapeutic agents that can be utilized with the formulations of the present invention may be selected from a wide range of biologically and/or pharmacologically active substances which lack adequate solubility in aqueous systems without a solubilizing agent. Such therapeutic agents include any agents having therapeutic or other value when administered to an animal, particularly to a mammal, such as drugs, prodrugs (i.e., agents that transform into active substances), nutrients (nutraceuticals), and cosmetics (cosmeceuticals). Such therapeutic agents can be utilized in formulations in accordance with the present invention so as to yield an effective therapeutic dose, e.g., for parenteral administration. The precise biological and/or pharmacological activity of the substance is immaterial, so long as the substance can be solubilized in the present formulations.

[0027] Specific non-limiting examples of lipophilic therapeutic agents that can be used in the formulations of the present invention include the following representative compounds, as well as their pharmaceutically acceptable salts, isomers, esters and other derivatives. These include:

[0028] analgesics and anti-inflammatory agents, such as alopixin, auranofin, azapropazone, benorylate, capsaicin, celecoxib, diclofenac, diflunisal, etodolac, fenbufen, fenoprofen calcium, flurbiprofen, ibuprofen, indomethacin, keto- profen, ketorolac, lefunomide, meclofenamic acid, mefenamic acid, nabumetone, naproxen, oxaprozin, oxyphenbutazone, phenylbutazone, piroxicam, rofecoxib, sulindac, tetrahydrocannabinol, tramadol and tramethamine;

[0029] anthelmintics, such as albendazole, bophenium hydroxypropilato-phe, cambendazole, dichlorphen, ivermectin, mebendazole, oxamniquine, oxendazole, oxantel embonate, praziquantel, pyrantel embonate and thiabendazole;

[0030] anti-arrhythmic agents, such as amiodarone HCl, disopyramide, flecainide acetate and quinidine sulfate;

[0031] anti-asthma agents, such as zileuton, zafirlukast, terbutaline sulfate, montelukast, and albuterol;

[0032] anti-bacterial agents, such as alatrofloxacin, azithromycin, baclofen, benzathine penicillin, cinoxacin, ciprofloxacin HCl, clarithromycin, clofazimine, cloxacinil, demeclocycline, dirithromycin, doxycycline, erythromycin, ethionamide, furazolidone, gregosiloxin, imipenem, levofloxacin, lorofloxacin, moxifloxacin HCl, nalidixic acid, nitrofurantoin, norfloxacin, ofloxacin, rifampicin, rifabutine, rifapentine, sparfloxacin, spiramycin, sulphabenzamide, sulphadione, sulphamerazine, sulphacetamide, sulphadiazine, sulphafurazole, sulphamethoxazole, sulphapyridine, tetracycline, trimethoprim, trovafloxacin, and vancomycin;

[0033] anti-viral agents, such as abacavir, amprenavir, delavirdine, efavirenz, indinavir, lamivudine, nelfinavir, nevirapine, ritonavir, saquinavir, and stavudine;

[0034] anti-coagulants, such as cilostazol, clopidogrel, dicumarol, dipryidamole, nicoumalone, orefolvin, phenindione, ticlopidine, and tirofiban;

[0035] anti-depressants, such as amoxapine, bupropion, citalopram, clomipramine, fluoxetine HCl, maprotiline HCl, mianserin HCl, nortriptyline HCl, paroxetine HCl, sertraline HCl, trazodone HCl, trimipramine maleate, and venlafaxine HCl;

[0036] anti-diabetic agents, such as acetohexamide, chlorpropamide, glibenclamide, gliclazide, glipizide, glimepiride, miglitol, pioglitazone, repaglinide, rosiglitazone, tolazamide, tolbutamide and troglitazone;

[0037] anti-epileptic agents, such as clonazepam, ethosuximide, fexofenadine, mexitil, mexitilamidemide, methylphenobarbital, oxcarbazepine, parahyolazine, phenacetin, phenobarbital, phenol, phenolamine, primidone, sulfathiazole, tiagabine HCl, topiramate, valproic acid, and vigabatrin;

[0038] anti-fungal agents, such as amphotericin, benzafirine, butenaline, clotrimazole, econazole nitrate, fluconazole, fluconazole, griseofulvin, itraconazole, ketoconazole, micafungin, netilmicin, nystatin, sulconazole nitrate, oxconazole, terbinafine HCl, terconazole, tioconazole and undecenoic acid;

[0039] anti-gout agents, such as allopurinol, probenecid and sulfinpyrazone;

[0040] anti-hypertensive agents, such as amlosidine, bendipine, benzeitipir, candesartan, captopril, dardipine, dilizazem HCl, diurex, doxazosin HCl, enalapril, eposartan, losartan mesylate, felodipine, fensidipine, fenspirin, gau- nabanacetate, ibersartan, iradipine, lisinopril, minoxidil, nicardipine HCl, nifedipine, nimodipine, nisoldipine, nifedipine, phenoxybenzamine HCl, prazosin HCl, quinapril, reserpine, terazosin HCl, telsamartan, and valsartan;

[0041] anti-malarial agents, such as amodiaquine, chloroquine, chlorproguanil HCl, halofantrine HCl, methuquione HCl, pruquran HCl, pyrimethamine and quinidine sulfate;

[0042] anti-migraine agents, such as dihydroergotamine mesylate, ergotamine tartrate, furoxtripitan, methysergide maleate, naratriptan HCl, pizotifen maleate, rizatritan benzoate, sumatriptan succinate, and zolmitriptan;

[0043] anti-muscarinic agents, such as atropine, benzhexol HCl, biperiden, ethopropazine HCl, hyoscyamine, mepenzolate bromide, oxyphecomposition HCl and troprimamide;

[0044] anti-neoplastic agents and immunosuppressants, such as aminogluthimide, amsacrine, azathioprine, bicalutamide, biperazine, busulfan, camptothere, capesitabine, chlorambucil, cyclosporin, dacarbazine, eflupine, estramustine, etoposide, irinotecan, lomustine, melphalan, mercaptopurine, methotrexate, mitomycin, mitotane, mitoxantrone, mofetil mycopophenolate, nilutamide, paclitaxel, procarbazine HCl, sirolimus, tacrolimus, tamoxifen citrate, teniposide, testolactone, topecan HCl, and toremifene citrate;

[0045] anti-parasitic agents, such as atovaquone, beni- nazaole, cinoxacin, decoquinate, didehydroxyquinoline, diltiazem furoate, dinitolomide, furazolidone, metronida- zole, nimorazole, nitrofurazone, cimidazole and tindazole;

[0046] anti-thyroid agents, such as carbimazole and propylthiouracil;

[0047] anti-tussives, such as benzocaine;
anxiolytics, sedatives, hypnotics and neuroleptics, such as alprazolam, amitriptyline, barbitone, benzepame, bromazepam, bromoperidol, brotizolam, butorbarbtone, carbamaz, chlorazidoxizoxide, chlorhexahtiozo, chlorproma- zine, chlorprophoxime, clonazepam, clopabam, clozaepame, clozapine, diazepam, dimidperidol, ethinamate, flumitazine, flunitrazepam, fllupromazine, flupenthixol decanoate, fluphenizol, flurazane, gabapen, haloperi- dol, lorazepam, lorvazepam, medazepam, meprobamate, mesoridazine, methaqualone, methylphenidate, midazolam, molindone, nitrazepam, oxazapine, penta- barbione, perphenazene pimozone, prochlorperazine, pseudophradine, quetiapine, risperidine, sertraline, sulpiride, temazepam, thiadiazine, triazolam, zopiclone;

β-blockers, such as acebutolol, alpenolol, atenolol, labetalol, metoprolol, nadolol, oxprenolol, pindolol and propranolol;

cardiac inotropic agents, such as amrinone, digi- toxin, digoxin, enoximone, lanatoside C and medoximixin;

corticosteroids, such as beclomethasone, betamethasone, budesonide, cortisone acetate, desoxymethasone, dexamethasone, fludrocortisone acetate, flunisolide, floctolate, flucaine, flumethasone propionate, hydrocortisone, methylprednisolone, prednisolone, prednisone and triamcinolone;

diuretics, such as acetazolamide, amiloride, bendroflumethamide, bumetanide, chlorothiazide, chlorthali- done, ethacrynic acid, frusemide, metolazone, spironolac- tone and triamterene;

anti-parkinsonian agents, such as bromocriptine mesylate, lisuride maleate, pramipexole, ropinirol HCl, and tolcapone;

gastrointestinal agents, such as bisacodyl, cimetidine, cisapride, diphenoxylate HCl, domperidone, famotidine, lanosprazole, loperamide, mesalazine, nizatidine, ome- prazole, ondansetron HCl, rabeprazole sodium, ranitidine HCl and sulphasalazine;

histamine H₁ and H₂-receptor antagonists, such as acrivastine, astemizole, chlorpheniramine, cinnarizine, cetizine, clemastine fumarate, cyclerizone, cyproheptadine HCl, dexchlorpromazine, dimenhydrinate, fexofenadine, flunarizine HCl, loratadine, meclazine HCl, oxatizone, and terfenadine;

keratolytics, such as acetretin, calcipotriene, calcifediol, calcitriol, cholecalciferol, ergocalciferol, etretinate, retinoids, tretinoin, and tazarotene;

lipid regulating agents, such as atorvastatin, bezafibr- ate, cerivanstatin, cipofibrate, clofibrate, fenofibrate, flav- astatin, gemfibrozil, pravastatin, probucol, and simvastatin;

muscle relaxants, such as dantrolene sodium and tizanidine HCl;

nitrates and other anti-anginal agents, such as amyl nitrate, glyceryl trinitrate, isosorbide dinitrate, isosorbide mononitrate and pentaerythritol tetranitrate;

nutritional agents and fat-soluble vitamins, such as calcitriol, carotenoids, dihydroartchoysterol, essential fatty acids, non-essential fatty acids, phytanol, vitamin A, vitamin B₆, vitamin D, vitamin E and vitamin K;

opioid analgesics, such as codeine, dextropropoxyphene, diamorphine, dihydrocodeine, fentanyl, meptazinol, methadone, morphine, nalbuphine and pentazocine;

sex hormones, such as cloflikos, corti- sone acetate, danazol, dehydroepiandrosterone, ethyl estradiol, finasteride, fludrocortisone, flavoxymestrone, medroxyprogesterone acetate, megestrol acetate, mestranol, methyltestosterone, norethisterone, norgestrel, oestradiol, conjugated estrogens, progesterone, rimexolone, stanozol, stilbestrol, testosterone and tibolone;

stimulants, such as amphetamine, dexamphetamine, dextfenfluramine, fenfluramine and mazindol;

and others, e.g., erectile dysfunction improvement agents, anti-osteoporosis agents, anti-obesity agents, cognition enhancers, anti-urinary incontinence agents, anti-benign prostate hypertrophy agents, such as becaplermin, donepezil HCl, L-thyroxine, methioben, pergimerin, physostigmine, pyridostigmine, raltixifene HCl, sibutramine HCl, sildenafil citrate, tacrine, tamsulosin HCl, and tolterodine.

It should be appreciated that this listing of lipo- phile therapeutic agents and their therapeutic classes is merely illustrative. Indeed, a particular feature, and surprising advantage, of the formulations of the present invention is the ability of the present formulations to solubilize and deliver a broad range of lipophilic therapeutic agents, regardless of functional class. Of course, mixtures of lipoph- ilic therapeutic agents may also be used where desired.

Examples of lipophilic agents of particular interest include active vitamin D compounds. As used herein, the term “activated vitamin D” or “active vitamin D” is intended to include any biologically active vitamin D compound, including a pro-drug (or pro-hormone), a precursor, a metabolite or an analog, in any stage of its metabolism. It is known that vitamin D compounds display a variety of biological activities, e.g., in calcium and phosphate metabolism (see, e.g., U.S. Pat. No. 5,104,604), as an antineoplastic agent (see, e.g., U.S. Pat. No. 5,763,429), and as an anti-hyperparathyroid agent (see, e.g., U.S. Pat. No. 5,602,116), and it is contemplated that any of the biologically active forms of vitamin D can be used in the formulations in accordance with the present invention. Generally, an active vitamin D compound or analog is hydroxylated at least the C-1, C-24 or C-25 position of the molecule, and either the compound itself or its metabolite binds to the vitamin D receptor (VDR). Pro-drugs, for example, include vitamin D compounds that are hydroxylated in the C-1. Such compounds undergo further hydroxylation in vivo and their metabolites bind the VDR.

Precursors include previtamins, such as 1α,25-dihydroxyvitamin D₃, 1α,24-dihydroxyvitamin D₃, 1α,25-dihydroxyvitamin D₂, 24-dihydroxyvitamin D₂, 1α-25-dihydroxyvitamin D₃, and 1α,25-dihydroxyvitamin D₃, which are thermal isomeric forms of the vitamin forms. Metabolites generally include compounds or analogs that have undergone further metabolic processing, e.g., hydroxylation.

Examples of vitamin D compounds suitable for formulations of the present invention include, without lim-
tation, 1a,24-dihydroxyvitamin D₂, 1a,25-dihydroxyvitamin D₃, 1a,25-dihydroxyvitamin D₂, 1α,25-dihydroxyvitamin D₃ (calcitriol), 1α-hydroxyvitamin D₃ (α-calcidol) 1α,25-
dihydroxyvitamin D₂, 1α,25-dihydroxyvitamin D₃, and 1α,24,25-dihydroxyvitamin D₂, sexcalcit (EB-1089), cal-
ciprotol, 22-oxacalcitrol (maxacalcitrol), fluorinated com-
ounds such as falcacalcitrol, and 19-nor compounds such as
paricalcit. Among those compounds having a chiral center,
e.g., in the sidechain, such as at C-24, it is understood that
both epimers (e.g., R and S) and the epimeric mixture are
within the scope of the present invention.

[0069] It is also understood that any numerical value
recited herein includes all values from the lower value to
the upper value. For example, if a concentration range is stated
as 1% to 50%, it is intended that values such as 2% to 40%,
10% to 30%, or 1% to 3%, etc., are expressly enumerated in
this specification. These are only examples of what is
specifically intended, and all possible combinations of
numerical values between the lowest value and the highest
value enumerated are to be considered to be expressly stated
in this application.

[0070] The amount of selected therapeutic is not critical to
the present invention and may be varied to achieve the
desired therapeutic response for a particular patient. The
amount of active therapeutic agent in the formulations of
the invention will be dependent, in part, on the solubility of
the specific surfactant used and its intended use. Those skilled
in the arts can adjust the ratios without undue experimentation.
The selected dosage also will depend on the activity of the
specific therapeutic, the route of administration, the severity
of the condition being treated and the condition and history
of the specific patient. For example, a therapeutic dose for
vitamin D-type compounds may range between about 2 μg
and about 100 μg/dose.

[0071] Suitable solubilizing agents for the formulations of
the present invention include nonionic solubilizers. A non-
ic solubilizer is one where the hydrophilic part of the
solubilizer carries no charge but derives its water solubility
from highly polar groups such as hydroxy or polyoxyethyl-
ylene groups. Some surfactants known for use in the phar-
maceutical field also have a solubilizing function.

[0072] Solubilizers generally include, but are not limited
to, the polyoxyalkylenes dextrins, fatty acid esters of sac-
charose, fatty alcohol ethers of oligoglucoses (e.g., the
aklypolyolglycosides such as TRITON™), fatty acid esters of
glycerol (e.g., glycerol mono, dibasicate or glycerol mono-
laurate), and polyoxyethylene type compounds (e.g., POE,
PEG, PEO, SOLTOL™ CREOMPHOR™, MAC-
ROGOL, CARBOWAX, POLYXON). The latter also
include polyethoxylated fatty acid esters of sorbitan (e.g.,
soluborates, such as TWEEN™, SPAN™), fatty acid
esters of polyethylene oxide (e.g., polyoxyethylated lauryl ether), alklyphenol ethers of poly-
ethylene oxide (e.g., polyoxyethylated octyphenol), poly-
 oxyethylene-polyoxypropylene block copolymers (also
known as poloxamers, such as Pluronics™), and ethoxylated
fats and oils (e.g., ethoxylated castor oil, or polyoxyethyl-
ated castor oil, also known as polyethylene glycol-glycerol
tricinoleate). Mixtures of solubilizers are also within the
scope of the invention. Such mixtures are readily available
from standard commercial sources. Solubilizers of particular
interest include polysorbates, e.g., TWEEN™. Amounts of
such solubilizer present in the formulations of the present
invention include from about 0.05% to about 5% w/w.

[0073] Suitable lipophilic antioxidants include, but are not limited to, butylated hydroxytoluene (BHT), lipio acid,
lycopene, lutein, lycophyll, xanthophyll, carotene, zeaxan-
thin or vitamin E and/or esters thereof. The lipophilic
antioxidants are present in very small but effective amounts,
e.g., about 20 to about 2000 ppm.

[0074] If desired, formulations of the present invention
can optionally include additional agents to enhance the
solubility of the lipophilic therapeutic agent in the carrier
system. Examples of such optional agents include organics
solvents, preservatives or both. Such agents include alcohols
and polyols, such as ethanol, benzyl alcohol, chlorobutanol,
isopropanol, butanol, ethylene glycol, propylene glycol,
butanediols, glycerol, pentanethrol, sorbitol, mannitol,
transcutol, dimethyl isosorhide, polyethylene glycol,
polypropylene glycol, polyvinyl alcohol, hydroxypropyl
methylcellulose and other cellulose derivatives, cyclodex-
trin and cyclodextrin derivatives. Amounts of optional
agents include 0% to about 30% w/w, e.g., organic solvent.
A useful range is 0% to about 10% w/w, and a particularly
useful range is about 1% to about 3%.

[0075] Accordingly, a formula in accordance with the
present invention includes a lipophilic drug agent (e.g., a
drug agent with a solubility in water of 80 μg/mL), about
0.05% to about 5% w/w of a non-ionic solubilizer, about 20
and about 2000 ppm lipophilic antioxidant, and 0% to about
30% w/w optional agent. A particular formulation for treat-
ing secondary hyperparathyroidism includes 2-6 μg/mL
1α,25-dihydroxyvitamin D₃ (dorcalciferol), 2.5% w/w benzyl
alcohol, 0.5%-2.5% w/w TWEEN™, and 20 ppm BHT.
The amount of optional agent, e.g., benzyl alcohol or
ethanol, may range from 0 to 30% w/w; a highly useful
range comprises 1% to 3% w/w. With a vitamin D formu-
lization (e.g., a dorcalciferol formulation), a most useful
amount of optional agent comprises 2.5% w/w.

[0076] A pharmaceutical formulation in accordance with
the present invention comprises an aqueous vehicle. The
aqueous vehicle contains, of course, water, but it may
furthermore also contain pH adjusting agents, stabilizing
agents, solubilizing agent (see, hereinabove), isotonic
adjusting agents, and solvents (e.g., organic solvents; as
discussed above). A formulation in accordance with the
present invention precludes the need for high organic sol-
vent which can cause irritation in some patients. In some
cases, however, it may be appropriate to include an organic
solvent or co-solvents. The amount of water in a formulat-
ion in accordance with the present invention is normally at least
about from about 50% to about 95% w/w.

[0077] For the pharmaceutical formulations of the present
invention, the intended route of administration is suitably
parenteral, i.e., for use by injection into, e.g., an animal or
human body. Such route includes intravenous, intramuscular
and subcutaneous administration, the intravenous route
being especially suitable for the formulations of the present
invention for use in connection with, e.g., secondary hyper-
parathyroidism or neoplastic disorders.

[0078] However, whenever relevant, formulations in
accordance with the present invention may also be suitable
for use by other administration routes such as, e.g., the
oral route, the topical route or the nasal route. In such cases, a
person skilled in the art can make any necessary adjustments
with respect to the concentration of the active substance and with respect to the other ingredients included in the formulation.

[0079] A formulation in accordance with the present invention is normally presented as an aqueous solution. However, in certain cases such as, e.g., in connection with the administration of a formulation by the topical or oral route, a formulation in accordance with the present invention may include a liquid composition which may be presented in the form of a solution or a gel.

[0080] Pharmaceutical formulations may be readily prepared by using pharmaceutically grade reagents in which the reagents are made up in stock solutions from which the resulting solutions at the appropriate concentrations can be made. Once the appropriate amounts of stock solutions are combined, it is often desirable to stir the reagents for several minutes under nitrogen gas gently blown over the top of the mixture, i.e., a nitrogen gas overlay. Degassed Water for Injection is then added to bring the desired final volume, and stirring under nitrogen gas continued for another several minutes.

[0081] A pharmaceutical formulation in accordance with the present invention containing a vitamin D compound or a vitamin D analogue like those substances described above, is suitable for use in the treatment and/or prophylaxis of (i) diseases or conditions characterized by abnormal cell differentiation and/or cell hyperproliferation such as, e.g., psoriasis and other disturbances of keratinisation, neoplastic diseases and cancers, such as pancreas, breast, colon and prostate cancers as well as skin cancer; (ii) diseases of, or imbalance in, the immune system, such as host-versus-graft and graft-versus-host reaction and transplant rejection, and auto-immune diseases such as discoid and systemic lupus erythematosus, diabetes mellitus and chronic dermatoses of autoimmune type, e.g., scleroderma and pemphigus vulgaris; (iii) inflammatory diseases such as rheumatoid arthritis as well as in the treatment and/or prophylaxis of a number of (iv) other diseases or disease states, including hyperparathyroidism, particularly secondary hyperparathyroidism associated with renal failure, and in promoting (v) osteogenesis and treating/preventing bone loss as in osteoporosis and osteomalacia. (For use of vitamin D compounds for treatment and prophylaxis, see, e.g., U.S. Pat. Nos. 5,9722, 917; 5,798,345; 5,763,428; 5,602,116; 5,869,386; 5,104, 864; 5,403,831; 5,880,114; 5,561,123. The vitamin D formulations in accordance with the present invention are especially suited for treatment of cell hyperproliferative disorders, disorders of the calcium metabolism, such as osteomalacia; or neoplastic diseases, such as cancers of the pancreas, breast, colon or prostate. The method of treatment comprises treating the cells and/or administering to a patient in need thereof a formulation in accordance with the present invention in an amount that is effective to ameliorate or prevent the disease or disorder. For example, in the treatment of hyperproliferative or neoplastic diseases, an effective amount is, e.g., a growth-inhibiting amount. Daily dosages as well as episodic doses, e.g., once per week to three times per week, are contemplated.

[0082] Additionally, as described hereinabove, vitamin D compounds in accordance with the present invention include prodrugs, i.e., drugs that require further metabolic processing in vivo, e.g., additional hydrolysis. Such prodrugs of vitamin D compounds that have been found to be effective therapeutic agents are generally less reactive than, e.g., the dihydroxy natural hormone, 1α,25-dihydroxyvitamin D₃. These compounds may offer further advantage for use in formulations.

[0083] In addition, formulations of the current invention may be terminally sterilized by means of e.g., autoclaving.

[0084] The present invention is further explained by the following examples which should not be construed by way of limiting the scope of the present invention.

Preparation of Stock Solutions

EXAMPLE 1

Doxercalciferol (1α-hydroxyvitamin D₂) stock solution

[0085] 12.558 mg of doxercalciferol was weighed and transferred to a 10-mL volumetric flask. The solid was diluted to volume with ethanol and the flask was vigorously shaken to dissolve the solid.

EXAMPLE 2

Butylated Hydroxytoluene (BHT) Stock Solution

[0086] 2.22 g BHT was transferred to a 100-mL volumetric flask. The solid was diluted to volume with ethanol and the flask was vigorously shaken to dissolve the solid.

EXAMPLE 3

10% TWEEN™-20

[0087] 100 g TWEEN™-20 KR was transferred to a 1-L volumetric flask and diluted to volume with degassed Water for Injection. A magnetic stir bar was added and the mixture stirred to mix.

Formulations

EXAMPLE 4

Doxercalciferol Formulations

[0088] The general procedure for preparing doxercalciferol formulations was as follows. To a glass formulation vessel was added Doxercalciferol Stock Solution, 10% TWEEN™-20, BHT Stock Solution, and ethanol, in the order listed. Nitrogen gas was gently blown over the top of the mixture. A stir bar was added to the mixture and stirred for not less than 20 minutes while continuing the nitrogen gas overlay. Degassed Water for Injection was added to bring the final volume to one liter. The mixture was stirred for not less than 20 minutes while continuing the nitrogen gas overlay. The volumes of each component used in preparing the formulations are listed in the Table 1 below.

EXAMPLE 5

Double-blind Study in End Stage Renal Disease (ESRD) Patients Exhibiting Secondary Hyperparathyroidism

Up to 120 ESRD (End Stage Renal Disease) patients undergoing chronic hemodialysis are studied in a multicenter, double-blind, placebo-controlled study based in two major U.S. metropolitan areas. The selected patients reside in two major metropolitan areas within the continental U.S., have ages between 20 and 75 years and have a history of secondary hyperparathyroidism. They have been on hemodialysis for at least four months, have a normal (or near normal) serum albumin, and have controlled serum phosphorus (often by using oral calcium phosphate binders).

On admission to the study, each patient is assigned at random to one of two treatment groups. One of these groups receives two consecutive 12-week courses of therapy with 1α-OH-vitamin D₃ (doxercalciferol); the other receives a 12-week course of therapy with 1α-OH-vitamin D₃ followed, without interruption, by a 12-week course of placebo therapy. Each patient discontinues any 1α,25-(OH)₂-vitamin D₃ therapy for eight weeks prior to initiating 1α-OH-vitamin D₃ therapy (daily dose of 4 μg doxercalciferol formulated with 2.5% w/w benzyl alcohol, 0.5%-2.5% w/w TWEEN™ 20, and 20 ppm BHT). Throughout this eight-week washout (or control) period and the two subsequent 12-week treatment periods, patients are monitored weekly for serum calcium and phosphorus. Serum intact PTH is monitored weekly or biweekly, and bone-specific serum markers, serum vitamin D metabolites, serum albumin, blood chemistries, hemoglobin and hematocrit are monitored at selected intervals.

During the study, patients undergo routine hemodialysis (three times per week) using a 1.24 mM calcium dialysate and ingest calcium phosphate binders (such as calcium carbonate or calcium acetate) at an amount sufficient to keep serum phosphate controlled (6.9 mg/dL). Patients who develop persistent mild hypercalcemia or mild hyperphosphatemia during the treatment periods reduce their 1α-OH-vitamin D₃ to 4 μg three times per week (or lower). Patients who develop marked hypercalcemia or marked hyperphosphatemia immediately suspend treatment. Such patients are monitored at twice weekly intervals until the serum calcium or phosphorus is normalized, and resume 1α-OH-vitamin D₃ dosing at a rate which is 4 μg three times per week (or lower).

During the eight-week washout period, the mean serum level of PTH increases progressively and significantly. After initiation of 1α-OH-vitamin D₃ dosing, mean serum PTH decreases significantly to less than 50% of pretreatment levels. Due to this drop in serum PTH, some patients need to reduce their dosage of 1α-OH-vitamin D₃ to 4 μg three times per week (or to even lower levels) to prevent excessive suppression of serum PTH. In such patients, exhibiting excessive suppression of serum PTH, transient mild hypercalcemia is observed, which is corrected by appropriate reductions in 1α-OH-vitamin D₃ dosages.

At the end of the first 12-week treatment period, mean serum PTH is in the desired range of 130 to 240 μg/mL and serum levels of calcium and phosphorus are normal or near normal for end stage renal disease patients. At the end of the second 12-week treatment period (during which time 1α-OH-vitamin D₃ treatment is suspended and replaced by placebo therapy), mean serum PTH values markedly increase, reaching pretreatment levels. This study demonstrates that: (1) 1α-OH-vitamin D₃ is effective in reducing serum PTH levels, and (2) 1α-OH-vitamin D₃ is safer than currently used therapies, despite its higher dosages and concurrent use of high levels of oral calcium phosphate binder.

EXAMPLE 6

Open Label Study of Elderly Subjects with Elevated Blood PTH from Secondary Hyperparathyroidism

Thirty elderly subjects with secondary hyperparathyroidism are enrolled in an open label study. The selected subjects have ages between 60 and 100 years and have elevated serum PTH levels (greater than the upper limit of young normal range). Subjects also have femoral neck osteopenia (femoral neck bone mineral density of 0.70 μg/cm²).

Subjects are requested to keep a diet providing approximately 500 mg calcium per day without the use of calcium supplements. For a twelve week treatment period, subjects self-administer orally 2.5 μg/day 1α-OH-vitamin D₃ (i.e., 2.5 μg doxercalciferol, 2.5% w/w benzyl alcohol, 0.5%-2.5% w/w TWEEN™ 20, and 20 ppm BHT). At regular intervals throughout the treatment period, subjects are monitored for serum PTH levels, serum calcium and phosphorus, and urine calcium and phosphorus levels. Efficacy is evaluated by pre- and post-treatment comparisons of serum PTH levels. Safety is evaluated by serum and urine calcium and phosphorus values.

The administration of 1α-OH-vitamin D₃ is shown to significantly reduce PTH levels with an insignificant incidence of hypercalcemia, hyperphosphatemia, hypercalciuria and hyperphosphaturia.

EXAMPLE 7

Clinical Studies of 1α,24-(OH)₂D₃ in Treatment of Prostate Cancer

Patients with advanced androgen-independent prostate cancer participate in an open-labeled study of 1α,24-(OH)₂D₃. Qualified patients are at least 40 years old, exhibit histologic evidence of adenocarcinoma of the prostate, and present with progressive disease which had previously responded to hormonal intervention(s). On admission to the study, patients begin a course of therapy with intravenous 1α,24-(OH)₂D₃ lasting 26 weeks, while discontinuing any previous use of calcium supplements, vitamin D supplements, and vitamin D hormone replacement therapies. During treatment, the patients are monitored at regular intervals for: (1) hypercalcemia, hyperphosphatemia, hypercalciuria, hyperphosphaturia and other toxicity; (2) evidence of changes in the progression of metastatic disease; and (3) compliance with the prescribed test drug dosage.

The study is conducted in two phases. During the first phase, the maximal tolerated dosage (MTD) of daily
1α,24-(OH)₂D₃ is determined by administering progressively higher dosages to successive groups of patients. All doses are administered in the morning before breakfast. The first group of patients is treated with 25.0 µg of 1α,24-(OH)₂D₃ (formulated with 2.5% w/w benzyl alcohol, 0.5%-2.5% w/w TWEEN™-20, and 20 ppm BHT). Subsequent groups of patients are treated with 50.0, 75.0 and 100.0 µg/day. Dosing is continued uninterrupted for the duration of the study unless serum calcium exceeds 11.6 mg/dL, or other toxicity of grade 3 or 4 is observed, in which case dosing is held in abeyance until resolution of the observed toxic effect(s) and then resumed at a level which has been decreased by 10.0 µg.

[0099] Results from the first phase of the study show that the MTD for 1α,24-(OH)₂D₃ is above 20.0 µg/day; a level which is 10- to 40-fold higher than can be achieved with 1α,25-(OH)₂D₃. Analysis of blood samples collected at regular intervals from the participating patients reveals that the levels of circulating 1α,24-(OH)₂D₃ increase proportionately with the dosage administered, rising to maximum levels well above 100 µg/mL at the highest doses, and that circulating levels of 1α,25-(OH)₂D₃ are suppressed, often to undetectable levels. Serum and urine calcium are elevated in a dose responsive manner. Patients treated with the MTD of 1α,24-(OH)₂D₃ for at least six months report that bone pain associated with metastatic disease is significantly diminished.

[0100] During the second phase, patients are treated with 1α,24-(OH)₂D₃ for 24 months at 0.5 and 1.0 times the MTD. After one and two years of treatment, CAT scans, X-rays and bone scans used for evaluating the progression of metastatic disease show stable disease or partial remission in many patients treated at the lower dosage, and stable disease and partial or complete remission in many patients treated at the higher dosage.

**EXAMPLE 8**

1α-(OH)D₂

[0101] The study of Example 7 is repeated for the active vitamin D compound, 1α-(OH)D₂ (formulated with 2.5% w/w benzyl alcohol, 0.5%-2.5% w/w TWEEN™-20, and 20 ppm BHT). The results of the phase one study indicate that patients treated with the MTD of 1α-(OH)D₂ for at least six months report that bone pain associated with metastatic disease is significantly diminished. The results of the phase two study indicate that after two years, CAT scans, X-rays and bone scans used for evaluating the progression of metastatic disease show stable disease or partial remission in many patients treated at the lower dosage, and stable disease and partial or complete remission in many patients treated at the higher dosage. In summary, the present invention provides an improved formulation for lipophilic drug agents that are only slightly soluble in an aqueous vehicle. The formulation in addition to the lipophilic drug agent includes a lipophilic antioxidant, a non-ionic solubilizer or surfactant, and optionally, an agent which is an organic solvent/preservative.

[0102] All patents, publications and references cited herein are hereby fully incorporated by reference. In the case of conflict between the present disclosure and the incorporated patents, publications and references, the present disclosure should control.

[0103] While the present invention has now been described and exemplified with some specificity, those skilled in the art will appreciate the various modifications, including variations, additions, and omissions that may be made in what has been described. Accordingly, it is intended that these modifications also be encompassed by the present invention and that the scope of the present invention be limited solely by the broadest interpretation that lawfully can be accorded the appended claims.

1. A formulation, comprising a vitamin D compound, a non-ionic solubilizer selected from the group consisting of polyoxyalkylenes, polysorbate 20, fatty acid esters of glycerol, cyclodextrins, dextrans, and fatty alcohol ethers of oligoglucosides; a lipophilic antioxidant selected from the group consisting of butylated hydroxytoluene (BHT), lipoid acid, lycopene, lutein, lycophyll, xanthophyll, carotene, zeaxanthin, vitamin E and esters thereof; and an aqueous vehicle.

2. A formulation as set forth in claim 1, wherein the lipophilic antioxidant is present in a concentration of 20 to 2000 ppm.

3. A formulation as set forth in claim 1, wherein the non-ionic solubilizer is present in a concentration of 0.05 to 5% w/w.

4. A formulation as set forth in claim 1, further comprising an optional agent which is an organic solvent, a preservative or both.

5. A formulation as set forth in claim 5, wherein the optional agent includes benzyl alcohol and ethanol.

6. A formulation as set forth in claim 6, wherein the optional agent includes ethanol.

7. A formulation as set forth in claim 6, wherein the optional agent includes benzyl alcohol.

8. A formulation as set forth in claim 6, wherein the optional agent is present in a concentration of 0% to 30% w/w.

9. A formulation as set forth in claim 9, wherein the optional agent is present in a concentration of 0% to about 10% w/w.

10. A formulation as set forth in claim 10, wherein the optional agent is present in a concentration of about 1% to about 3% w/w.

11. The formulation of claim 1, wherein the vitamin D compound is selected from the group consisting of 1α,24-dihydroxyvitamin D₂, 1α,24-dihydroxyvitamin D₃, 1α,25-dihydroxyvitamin D₂, 1α,25-dihydroxyvitamin D₃, 1α,25-dihydroxyvitamin D₄, 1α,25-dihydroxyvitamin D₅, and 1α,24,25-dihydroxyvitamin D₂, seocalcitol, calcipotriol, maxacalcitol, falcacalcitrol, paricalcitol.

12. The formulation of claim 1 where the vitamin D compound is 1α,24-dihydroxyvitamin D₂.

13. The formulation of claim 12 wherein the vitamin D is 1α,24-dihydroxyvitamin D₂.

14. The formulation of claim 12 wherein the vitamin D is 1α,24-dihydroxyvitamin D₃.

15. The formulation of claim 12 wherein the vitamin D is 1α,25-dihydroxyvitamin D₂.

16. The formulation of claim 12 wherein the vitamin D is 1α,25-dihydroxyvitamin D₃.

17. The formulation of claim 12 wherein the vitamin D is 1α,25-dihydroxyvitamin D₄.

18. The formulation of claim 12 wherein the vitamin D is 1α,25-dihydroxyvitamin D₅.

19. The formulation of claim 12 wherein the vitamin D is 1α,24,25-dihydroxyvitamin D₂.
20. The formulation of claim 12 wherein the vitamin D is seocalcitol.
21. The formulation of claim 12 wherein the vitamin D is calcipotriol.
22. The formulation of claim 12 wherein the vitamin D is maxacalcitol.
23. The formulation of claim 12 wherein the vitamin D is falecalcitriol.
24. The formulation of claim 12 wherein the vitamin D is paricalcitol.
25. The formulation of claim 1, wherein the vitamin D compound is a previtamin D compound selected from the group consisting of 1α-hydroxyvitamin D₂, 1α,25-dihydroxyvitamin D₂, 1α,25-dihydroxyvitamin D₃, 24-hydroxyvitamin D₂, 1α-hydroxyvitamin D₃, and 1α,25-dihydroxyvitamin D₃.
26. A parenteral formulation, comprising a vitamin D compound, 0.05 to 5% w/w of a non-ionic solubilizer non-ionic selected from the group consisting of polyoxyalkylenes, polysorbate 20, fatty acid esters of glycerol, cyclodextrins, dextrans, and fatty alcohol ethers of oligoglucoisides; and 20 to 2000 ppm of a lipophilic antioxidant selected from the group consisting of butylated hydroxytoluene (BHT), lipoic acid, lycopene, lutein, lycophyll, xanthophyll, carotene, zeaxanthin, vitamin E and esters thereof.
27. A formulation as set forth in claim 26, further comprising an optional agent.
28. A formulation as set forth in claim 27, wherein the non-ionic solubilizer includes 0.5%-2.5% w/w polysorbate 20, the lipophilic antioxidant includes 20 ppm BHT and the optional agent includes 2.5% w/w ethanol.
29. A formulation as set forth in claim 27, wherein the non-ionic solubilizer includes 0.5%-2.5% w/w polysorbate 20, the lipophilic antioxidant includes 20 ppm BHT and the optional agent includes 2.5% w/w benzyl alcohol.
30. The formulation of claim 26, wherein the vitamin D compound is selected from the group consisting of 1α,24-dihydroxyvitamin D₂, 1α,25-dihydroxyvitamin D₂, 1α,25-dihydroxyvitamin D₃, 1α-hydroxyvitamin D₃, 1α,25-dihydroxyvitamin D₃, 1α,25-dihydroxyvitamin D₄, and 1α,24, 25-dihydroxyvitamin D₂, seocalcitol, calcipotriol, maxacalcitol, falecalcitriol, paricalcitol.
31. The formulation of claim 30 wherein the vitamin D is 1α,24-dihydroxyvitamin D₂.
32. The formulation of claim 30 wherein the vitamin D is 1α,24-dihydroxyvitamin D₃.
33. The formulation of claim 30 wherein the vitamin D is 1α,25-dihydroxyvitamin D₂.
34. The formulation of claim 30 wherein the vitamin D is 1α,25-dihydroxyvitamin D₃.
35. The formulation of claim 30 wherein the vitamin D is 1α-hydroxyvitamin D₂.
36. The formulation of claim 30 wherein the vitamin D is 1α,25-dihydroxyvitamin D₂.
37. The formulation of claim 30 wherein the vitamin D is 1α,24,25-dihydroxyvitamin D₂.
38. The formulation of claim 30 wherein the vitamin D is seocalcitol.
39. The formulation of claim 30 wherein the vitamin D is calcipotriol.
40. The formulation of claim 30 wherein the vitamin D is maxacalcitol.
41. The formulation of claim 30 wherein the vitamin D is falecalcitriol.
42. The formulation of claim 30 wherein the vitamin D is paricalcitol.
43. The formulation of claim 26, wherein the vitamin D compound is a previtamin D compound selected from the group consisting of 1α-hydroxyvitamin D₂, 1α,24-dihydroxyvitamin D₂, 1α,25-dihydroxyvitamin D₂, 24-hydroxyvitamin D₂, 1α-hydroxyvitamin D₃, and 1α,25-dihydroxyvitamin D₃.
44. The formulation as set forth in claim 26, wherein the vitamin D compound is present at a concentration of 2-10 μg/mL.
45. The formulation as set forth in claim 26, wherein the vitamin D compound is present at a concentration of 10-100 μg/mL.
