Title: TRANSMISSION OF PRIORITY INDICATOR BETWEEN ENSBs IN A LICENSED FREQUENCY BAND TO MANAGE COMMUNICATION RESOURCES IN AN UNLICENSED FREQUENCY BAND

Abstract: An eNodeB transmits a high priority indicator within a licensed frequency band. In response to receiving the high priority indicator, other eNodeBs refrain from transmitting signals within an unlicensed frequency band. After determining that no other eNodeBs are transmitting signals within the unlicensed frequency band, the eNodeB transmitting the high priority indicator transmits signals to a user equipment (UE) device.

TRANSMISSION OF PRIORITY INDICATOR BETWEEN ENBS IN A LICENSED FREQUENCY BAND TO MANAGE COMMUNICATION RESOURCES IN AN UNLICENSED FREQUENCY BAND

CLAIM OF PRIORITY

FIELD
[0002] This invention generally relates to wireless communications and more particularly to transmission of a priority indicator between eNBs in a licensed frequency band to manage communication resources in an unlicensed frequency band.

BACKGROUND
[0003] The frequency spectrum used by a particular communication system may be licensed or unlicensed. Licensed frequency spectrum (frequency band) is licensed to a system operator by a government agency such as the Federal Communications Commission (FCC). An example of such licensed spectrum includes frequency bands used for cellular communication. An unlicensed frequency band is any portion of frequency spectrum that does not require a license from the government agency to communicate with the unlicensed frequency band. Equipment operating within the unlicensed band, however, typically must adhere to regulations and/or communication standards. An example of unlicensed frequency spectrum includes frequency bands used for Institute of Electrical and Electronics Engineers (IEEE) 802.11 communication.

[0004] In some communication system implementations, a base station, such as eNodeB, provides a primary cell (PCell) and a secondary cell (SCell) where the two cells use different frequencies. In some situations, the PCell may use a licensed frequency band and the SCell operates in an unlicensed frequency band.
SUMMARY

[0005] An eNodeB transmits a high priority indicator within a licensed frequency band. In response to receiving the high priority indicator, other eNodeBs refrain from transmitting signals within an unlicensed frequency band. After determining that no other eNodeBs are transmitting signals within the unlicensed frequency band, the eNodeB transmitting the high priority indicator transmits signals to a user equipment (UE) device.

BRIEF DESCRIPTION OF THE DRAWINGS

[0006] FIG. 1 is a block diagram of a licensed communication system having eNodeBs (eNBs) that provide service using an unlicensed frequency band.

[0007] FIG. 2 is a block diagram of an example of a UE device suitable for use as one of the UE devices in FIG. 1.

[0008] FIG. 3 is a block diagram of an example of an eNB suitable for use as the eNBs in FIG. 1.

[0009] FIG. 4 is an illustration of transmissions between the eNBs for an example where a high priority indicator is sent after detection of transmission by an eNB in the unlicensed frequency band.

[0010] FIG. 5 is a block diagram of an example of a high priority indicator message suitable for transmitting the high priority indicator.

[0011] FIG. 6 is a flow chart of a method performed at an eNB for an example where the eNB has a pending high priority communication.

[0012] FIG. 7 is a flow chart of a method performed at an eNB for an example where a high priority indicator is received at the eNB.
FIG. 1 is a block diagram of a licensed communication system 100 having eNodeBs 102, 104 that provide service using an unlicensed frequency band. A first eNodeB (eNB) 102 provides wireless communication service to one or more user equipment (UE) devices 106 within a first secondary cell (SCell) 108 and a second eNB 104 provides wireless communication service to one or more UE devices 110 within a second SCell 112. The service areas of the SCells at least partially overlap. In some situations, one of the SCells may be completely within the other SCell service area. In addition, there may be several SCells within any other SCell. For the example of FIG. 1, each eNB provides a primary cell (PCell) using a licensed frequency band. The PCells may have the same geographic service area as the SCell of the particular eNB or may have a different geographic service area.

The licensed communication system 100 may be any communication system that uses a portion of frequency spectrum (frequency band) that is licensed to the system operator by a government agency such as the Federal Communications Commission (FCC). For the examples discussed herein, the licensed communication system 100 is a cellular system that operates in accordance with at least one revision of The Third-Generation Partnership Project Long-Term Evolution (3GPP LTE) communication specification. Examples of licensed frequency bands include Advanced Wireless Service (AWS) 4G frequencies in the range of 1,710-1,755 and 2,110-2,155 MHz. The unlicensed frequency band is any portion of frequency spectrum that does not require a license from the government agency to communicate with the unlicensed frequency band. Equipment operating within the unlicensed band, however, typically must adhere to regulations and/or communication standards. Examples of unlicensed bands include frequency bands used for IEEE 802.11 standards that comply with the FCC Rules and Regulations such as WiFi, Bluetooth, and Zigbee.

A cellular communication system is typically required to adhere to a communication standard or specification. The communication specification defines physical channel structure that at least includes a data channel and a control channel for uplink and downlink transmissions and specifies at least some timing and frequency
parameters for physical downlink control channels from a base station to a wireless communication device. The Third-Generation Partnership Project Long-Term Evolution (3GPP LTE) communication specification is a specification for systems where communication stations (eNodeBs) provide service to wireless communication devices (UE devices) using orthogonal frequency-division multiple access (OFDMA) on the downlink and single-carrier frequency-division multiple access (SC-FDMA) on the uplink. Although the techniques described herein may be applied in other types of communication systems, the exemplary systems discussed herein operate in accordance with an FDD 3GPP LTE communication specification.

[0016] The eNBs 102, 104 can be any type of communication station, transceiver station, or radio head and may be referred to as a base station, eNodeB, fixed station, access point, and other terms. The eNBs 102, 104 may be connected within a network of several other eNBs through a backhaul (not shown in FIG. 1). The UE devices 106, 110 are any type of user devices and are sometimes referred to by other terms such as, for example, handset, phone, smartphone, mobile device, portable device, and modem. Communication using the licensed band may include downlink transmissions from an eNB to UE devices, uplink communication from UE devices to an eNB, and device-to-device (D2D) communication between two or more UE devices.

[0017] The licensed communication system communicates in the licensed frequency band using a licensed physical channel structure. The physical channel structure for downlink communication may differ from the physical channel structure for uplink communication. The licensed physical channel structure partitions time and frequency to define a plurality of time-frequency resources (resource elements). Sets of resources are allocated for a particular type of communication. For example, different sets of time-frequency communication resources can be allocated for data, control, and reference signals. For the examples herein, the licensed physical channel structure adheres to at least one revision of the 3GPP LTE communication specification.

[0018] As discussed above, the eNBs can provide service to one or more UE devices using the unlicensed frequency band in the SCells. For the examples herein, the licensed communication system 100 uses an unlicensed physical channel structure
for communication in the unlicensed frequency band where the unlicensed physical channel structure at least has the same time and frequency divisions as the licensed physical channel structure. Although the frequencies are different, each frequency division in the unlicensed structure corresponds to a frequency division in the licensed structure such that the communication resource elements in the unlicensed structure correlate to the communication resource elements in the licensed structure. A reference set of communication resource elements for transmission of reference signals have the same symbol times as a reference set of resource elements allocated in the licensed physical channel structure for reference signals. Other arrangements may be used in some circumstances. An example of physical channel structure related to licensed and unlicensed communication is discussed in international patent application entitled "Physical Channel Structure For Communication In Unlicensed Frequency Band", Docket Number TUTL 00251 PC, international application number PCT/US2015/032279, international publication number WO 2015/179826, filed on May 22, 2015, and incorporated by reference herein.

[0019] For the examples herein, the licensed communication system uses the unlicensed frequency band for communication at times determined to avoid interference or at least to result in a tolerable level of interference. When it is determined that unlicensed equipment is operating nearby, the unlicensed frequency band is monitored prior to transmission to determine if the band is currently in use. If it is determined that the band is not in use, the licensed equipment transmits signals within the unlicensed frequency band. The monitoring procedure prior to transmission is the same, or at least similar to the sensing/back off procedures employed by conventional devices operating in the unlicensed frequency band. The techniques may be required by rules or standards governing operation in the unlicensed frequency band.

[0020] In the exemplary scenario depicted in FIG. 1, the second eNB is transmitting a signal 114 in the unlicensed frequency band to the UE device 110 in the SCell and the first eNB 102 detects the signal 114. The first eNB 102, however, has a high priority communication 118 pending transmission to the UE device 106 in the SCell 108. In accordance with the techniques herein, the first eNB 102 transmits a high priority
indicator 116 within a downlink channel in the licensed frequency band. In response to
detecting the high priority indicator 116, the second eNB stops transmission within the
SCell 112. After determining that the unlicensed frequency band is no longer in use, the
first eNB 102 transmits the high priority communication 118 to the UE device 106 in the
SCell 108 using the unlicensed frequency band.

[0021] Other techniques can be used to transmit the high priority indicator 116. For
element, the high priority indicator 116 can be transmitted over a licensed uplink
channel instead of the downlink channel. D2D communication resources may be used
for the uplink transmission in some circumstances. In addition, the high priority indicator
116 may be transmitted before the eNB determines that energy is present in the
unlicensed frequency band. In other words, the eNB reserves the unlicensed frequency
band from other eNB traffic.

[0022] FIG. 2 is a block diagram of an example of a UE device 200 suitable for use
as one of the UE devices 106, 110 in FIG. 1. The UE device 200 includes a licensed
band transceiver 202, a controller 204, as well as other components and circuitry (not
shown) such as memory, for example. For the examples herein, each UE device also
includes an unlicensed band transceiver 206 which includes an unlicensed band
receiver 208 and an unlicensed band transmitter 210. The unlicensed band transmitter
210 transmits signals over the unlicensed frequency band where, depending on the
situation, the signals may provide uplink control information to the eNB, uplink data
information to the eNB, D2D control information to another UE, and/or D2D data
information to another UE device. The unlicensed band transmitter 210 may be omitted
from the UE device 200. This may be the case where the UE device 200 is used to only
monitor the unlicensed band and/or only to receive signals within the unlicensed band.
The unlicensed band receiver 208 receives signals over the unlicensed frequency band
where, depending on the situation, the signals may provide downlink control information
from the eNB, downlink data information from the eNB, D2D control information from
another UE, and/or D2D data information from another UE device.

[0023] The licensed band transceiver 202 includes a transmitter that transmits uplink
wireless signals to eNBs and a receiver that receives downlink wireless signals from the
eNBs within the licensed frequency band. The transceiver can also be configured to transmit and receive D2D signals using allocated licensed uplink communication resources. The controller 204 controls components of the UE device 200 to manage the functions of the device 200 described herein as well as to facilitate the overall functionality of the device 200. The controller 204 is connected to the transceivers 202, 208 and other components such as memory.

[0024] FIG. 3 is a block diagram of an example of an eNB 300 suitable for use as the eNBs 102, 104 in FIG. 1. The eNB 300 includes a licensed band transceiver 302, a controller 304, as well as other components and circuitry (not shown) such as memory, for example. For the examples herein, the eNB 300 also includes an unlicensed band transceiver 306 which includes an unlicensed band receiver 308 and an unlicensed band transmitter 310. The unlicensed band transmitter 310 transmits signals over the unlicensed frequency band where, depending on the situation, the signals may provide downlink control information to the UE device and downlink data information to the UE device. The licensed band transceiver 302 exchanges wireless signals with the UE devices 106, 110 within the PCell service area. Transmissions within the licensed band from the eNB and from the UE devices are governed by a communication specification that defines signaling, protocols, and parameters of the transmission with the frequency band licensed to the operator of the licensed system 100. The communication specification may provide strict rules for communication and may also provide general requirements where specific implementations may vary while still adhering to the communication specification. Although the discussion herein is directed to the 3GPP Long Term Evolution (LTE) communication specification, other communication specifications may be used in some circumstances. The communication specification defines at least a data channel and a control channel for uplink and downlink transmissions and specifies at least some timing and frequency parameters for physical channels.

[0025] The licensed band transceiver 302, therefore, includes at least a downlink transmitter 312 for transmitting downlink signals and an uplink receiver 314 for receiving uplink signals. For the examples herein, the licensed band transceiver 302 also includes
a licensed downlink receiver 316 for receiving downlink signals transmitted from other eNBs where such downlink signals at least include high priority indicators 116. As discussed below, eNBs may wirelessly transmit unlicensed frequency band communication resource information in a downlink broadcast message for receipt by other nearby eNBs in addition to the high priority indicators 116. Accordingly, the downlink receiver 316 in the eNB 300 receives downlink signals from other eNBs. As explained above, the high priority indicator 116 may be transmitted over an uplink channel such as a D2D channel in some situations. In systems using an uplink channel for transmission of the high priority indicator 116, each eNB also includes an uplink transmitter 318.

[0026] The unlicensed band receiver 308 may be used to sense/monitor the unlicensed frequency band before a transmission in the unlicensed frequency band when the eNB is operating in the sensing mode. For the examples, the controller and the unlicensed band receiver 308 measure one or parameters that indicate the energy level within the unlicensed frequency band. An example of a suitable technique includes determining the received signal strength indicator (RSSI) which is a measurement of the power present in the received radio signal. The RSSI is compared to a threshold. The threshold used by the eNB is typically the same as the threshold used by UE devices although in some circumstances the thresholds may be different. For the examples herein, the eNB detects energy in the unlicensed frequency band and does not make a determination on whether any detected energy is from another eNB or an unlicensed device. In some situations, however, the unlicensed band transceiver may determine whether a detected transmission is from another eNB. For the example, the eNB 300 also includes a communication interface 320 for facilitating communication over the backhaul with other eNBs and network entities. Where X2 signaling is available, the communication interface 320 communicates over the backhaul using X2. In some situations, where the X2 signaling is available between eNBs, the high priority indicator 116 may be transmitted to the other eNB(s) over the backhaul.

[0027] FIG. 4 is an illustration of transmissions between the eNBs for an example where a high priority indicator 116 is sent after detection of transmission by an eNB in
the unlicensed frequency band. For the example of FIG. 4, transmissions between two eNBs are discussed. In some situations, there may be transmissions between multiple eNBs. For example, the high priority indicator 116 may be broadcast to multiple eNBs in some scenarios.

[0028] As discussed above, each eNB 102, 104 provides a PCell in the licensed frequency band and an SCell in the unlicensed band. At transmission 402, the second eNB 104 is transmitting one or more signals within the unlicensed frequency band. During the transmission 402, the first eNB 102 determines that a high priority communication 118 should be transmitted in the unlicensed frequency band. During event 404, the first eNB 102 senses, or otherwise monitors, the unlicensed frequency band to detect the transmission 402 and determine that the second eNB 104 is transmitting within the unlicensed frequency band.

[0029] At transmission 406, the first eNB 102 sends a high priority indicator 116 in the licensed frequency band. For the examples of FIG. 4, the high priority indicator transmission 406 is transmitted in a downlink control channel such as a PDCCH in LTE. In some situations, the high priority indicator 116 may be broadcast in a broadcast control signal such as SIB in LTE.

[0030] In response to receiving the high priority indicator 116, the second eNB 104, ceases the transmission 402 and refrains from transmitting signals in the unlicensed frequency band. A portion of the intended transmission 408 by the second eNB 104 is illustrated by a dashed-line block to indicate that the transmission 402 has been stopped. As discussed below in further detail, the high priority indicator 116 may include information identifying a particular unlicensed frequency band and channels within the band. The second eNB 104 may use information to only refrain from transmitting signals within the identified band(s) and/or channel(s).

[0031] At event 410, the first eNB 102 monitors the unlicensed frequency band (or specific channels within the band) to determine that the second eNB is not transmitting within the unlicensed frequency band. At transmission 412, the first eNB 102 transmits the high priority communication 118 within the unlicensed frequency band.
In one example, the second eNB 104 resumes transmission in the unlicensed frequency band after receiving a message from the first eNB indicating that the ban on transmission has been lifted. In another example, the duration of the transmission ban is indicated in the message providing the high priority indicator 116.

FIG. 5 is a block diagram of an example of a high priority indicator message 500 suitable for transmitting the high priority indicator 116. The high priority indicator message 500 includes at least a high priority indicator portion 502 that conveys the high priority indicator 116. In some situations, the high priority indicator portion 502 may be a one-bit flag within a designated field within the message 500 that conveys to the receiving eNB that the eNB transmitting the message 500 has a high priority communication 118 pending and that transmission in the unlicensed frequency band should be suspended by the eNB receiving the message 500. In other situations, the high priority indicator portion 502 may provide additional information. For example, the high priority indicator portion 502 may indicate a particular priority level out of a several priority levels. Such a scheme may be useful in implementations where a distinction is made between very high priority communications (E911), and lower priority communications such as delay intolerant messages (e.g., voice).

For the example of FIG. 5, the high priority indicator message 500 includes a frequency band identifier 504 that identifies one or more unlicensed frequency bands. For example, the frequency band identifier 504 may identify a band from the several bands including 2.4 GHz, 5GHz and 60GHz unlicensed frequency bands.

A channel identifier 506 in the message 500 identifies the channels or particular carriers within the unlicensed frequency band. The channel identifier 506 may identify channel numbers, for example.

In some situations, the eNB 102 that is transmitting the high priority indicator 116 may also provide a time when the eNB 104 can resume transmission in the unlicensed frequency band. Therefore, in some situations, the high priority indicator message 500 may include a transmission ban duration 508 that indicates to the eNB how long the eNB should refrain from transmitting in the unlicensed frequency band.
Further, a start time of the transmission ban may be specified with, for example, a subframe offset. Otherwise, the transmission ban is based on the receipt of the high priority indicator 116.

Some of the information in the message 500 shown in FIG. 5 may be omitted in some situations. For example, as an alternative to sending a transmission ban period 508, the eNB 102 may transmit a message indicating that the eNB 104 can resume transmission in the unlicensed frequency band. Also, the frequency band identifier 504 and/or the channel identifier 506 may be omitted in some circumstances. Accordingly, the high priority indicator message 500 may include any combination of the information identified in FIG. 5 in addition to other information. In some situations, the different information in the message 500 may be sent over more than one transmission.

The high priority indicator message 500 is transmitted in a downlink control channel for the examples herein. In some situations, the high priority indicator message 500 is transmitted within a PDCCH in accordance with LTE standards. For example, a dedicated Radio Network Temporary Identifier (RNTI) can be used such that all eNBs can monitor the dedicated RNTI for a high priority indicator 116. In other situations, the high priority indicator message 500 is transmitted in a broadcast channel allowing all eNBs within range to receive the high priority indicator 116. For example, the high priority indicator message 500 may be transmitted in a SIB message in accordance with LTE standards. As explained above, other channels and techniques can be used to transmit the high priority indicator 116. Examples of other techniques include using the uplink channels, D2D channels and communication through a backhaul such as transmissions using X2 signaling.

FIG. 6 is a flow chart of a method performed at an eNB for an example where the eNB has a pending high priority communication 118. Therefore, for the example, the method is performed by an eNB such as the first eNB 102 discussed above.

At step 602, the eNB 102 determines that a high priority communication 118 is pending. Such a communication may be an E911 call, for example.

At step 604, the eNB 102 determines whether the unlicensed frequency band is in use. The eNB 102 senses/monitors the unlicensed frequency band to determine
whether other devices are transmitting signals within the band. If the unlicensed frequency band is not in use, the method continues at step 606 where the eNB transmits the high priority communication 118 within the unlicensed frequency band. Otherwise, the method proceeds to step 608.

[0042] At step 608, the eNB 102 transmits the high priority indicator 116 to at least one other eNB. For the example, the eNB 102 transmits a high priority indicator message 500 in the licensed band downlink control channel. Other wireless and wired channels can be used in some circumstances as discussed above. In some circumstances, the eNB determines whether a high priority indicator 116 has been received from any other eNB and only transmits a high priority indicator 116 if no other high priority indicator has been received.

[0043] At step 610, the eNB determines if unlicensed frequency band is in use. The eNB monitors/senses the channel to determine if there is energy above a threshold. If the unlicensed frequency band is not in use, the method continues at step 606 where the high priority communication 118 is transmitted in the unlicensed frequency band. Otherwise, the method continues at step 612. In some circumstances, step 604 can be omitted and the eNB may transmit the high priority indicator 116 in response to determining that a high priority communication 118 is pending transmission. In such situations, therefore, the eNB determines that the message is pending, transmits the high priority indicator 116 and then monitors the unlicensed frequency band at step 610.

[0044] At step 612, the eNB senses the unlicensed frequency band and returns to step 610. The eNB, therefore, continues to monitor the unlicensed frequency band until the channel is not in use. When the channel is determined not to be in use the method continues at step 606.

[0045] For the example of FIG. 6, the eNB 102 transmits the high priority indicator 116 after detecting transmission by another eNB in the unlicensed frequency band. In other examples, the eNB 102 transmits the high priority indicator message 500 after determining that a high priority communication 118 is pending without monitoring the unlicensed frequency band. The eNB 102 may broadcast the high priority indicator
message 500 to all eNBs within range and then monitor the unlicensed channel until it is clear.

[0046] FIG. 7 is a flow chart of a method performed at the eNB for an example where a high priority indicator 116 is received by the eNB. Therefore, for the example, the method is performed by an eNB such as the second eNB 104 discussed above.

[0047] At step 702, it is determined whether a high priority indicator 116 has been received. The eNB 104 monitors the licensed downlink channel for the high priority indicator message 500. If the high priority indicator 116 is received, the method continues at step 704. Otherwise, the eNB continues to monitor the licensed downlink channel.

[0048] At step 704, the eNB 104 stops any current transmission in the unlicensed frequency band and refrains from transmitting in the unlicensed frequency band. In situations where the high priority indicator message 500 includes information regarding the particular frequency band and/or channels, the eNB 104 refrains from transmitting only in the resources identified in the message 500.

[0049] At step 706, the eNB determines whether transmission is authorized in the unlicensed frequency band. In some situations, the determination is based on whether a new message has been received from the eNB 102 indicating that the unlicensed frequency band can be used. In other situations, the duration of the transmission ban is indicated in the high priority indicator message 500 and the eNB determines if the duration has elapsed. When the eNB 104 determines that transmission is allowed, a normal transmission schedule resumes at step 708. Therefore, when the transmission ban is determined to be concluded, the eNB 104 operates in accordance with the rules required in the band without additional restrictions.

[0050] Clearly, other embodiments and modifications of this invention will occur readily to those of ordinary skill in the art in view of these teachings. The above description is illustrative and not restrictive. This invention is to be limited only by the following claims, which include all such embodiments and modifications when viewed in conjunction with the above specification and accompanying drawings. The scope of the invention should, therefore, be determined not with reference to the above description,
but instead should be determined with reference to the appended claims along with their full scope of equivalents.
CLAIMS

1. A method performed at an eNodeB (eNB), the method comprising:
   determining that a high priority communication is pending transmission to a user equipment (UE) device;
   transmitting a high priority indicator within a licensed frequency band to at least one other eNB, the high priority indicator indicating that the eNB has a high priority communication pending transmission; and
   transmitting the high priority communication over the unlicensed frequency band to the UE device when it is determined that the unlicensed frequency band is not in use.

2. The method of claim 1, wherein transmitting the high priority indicator comprises transmitting the high priority indicator within a downlink channel within the licensed frequency band.

3. The method of claim 1, wherein transmitting the high priority indicator comprises transmitting the high priority indicator within an uplink channel within the licensed frequency band.

4. The method of claim 1, further comprising:
   providing a primary cell (PCell) in accordance with at least one revision of The Third-Generation Partnership Project Long-Term Evolution (3GPP LTE) communication specification: and
   providing a secondary cell (SCell) in the unlicensed frequency band.
5. The method of claim 4, wherein providing the SCell comprises transmitting and receiving signals in the unlicensed frequency band in accordance with an Institute of Electrical and Electronics Engineers (IEEE) 802.11 communication standard.

6. The method of claim 1, further comprising transmitting a frequency band identifier identifying the unlicensed frequency band.

7. The method of claim 1, further comprising transmitting a channel identifier identifying a channel in the unlicensed frequency band and wherein the transmitting the high priority communication comprises transmitting the high priority communication over the channel in the unlicensed frequency band to the UE device when it is determined that the channel in the unlicensed frequency band is not in use.

8. The method of claim 1, wherein the transmitting the high priority indicator comprises:
   
   determining whether the unlicensed frequency band is in use;
   
   transmitting the high priority indicator only if the unlicensed frequency band is in use.

9. The method of claim 1, wherein the transmitting the high priority indicator comprises:
   
   determining whether the another high priority indicator has been received from another eNB;
   
   transmitting the high priority indicator only if no other high priority indicator has been received.
10. The method of claim 1, wherein the transmitting the high priority communication comprises:
   determining whether the another high priority indicator has been received from another eNB;
   transmitting the high priority communication only if no other high priority indicator has been received.

11. An eNodeB (eNB) comprising:
   an unlicensed frequency band receiver configured to detect energy in an unlicensed frequency band;
   a controller configured to:
      determining that a high priority communication is pending transmission to a user equipment (UE) device;
      determining that the unlicensed frequency band is in use when the unlicensed frequency band receiver detects energy above a threshold in the unlicensed frequency band;
   a licensed frequency band transmitter configured to transmit, in response to the controller, a high priority indicator within a licensed frequency band to at least one other eNB, the high priority indicator indicating that the eNB has a high priority communication pending transmission; and
   unlicensed frequency band transmitter configured to transmit, in response to the controller determining that the unlicensed frequency band is not in use, the high priority communication over the unlicensed frequency band to the UE device.

12. The eNB of claim 11, wherein the licensed frequency band transmitter is configured to transmit the high priority indicator within a downlink channel within the licensed frequency band.
13. The eNB of claim 11, wherein the licensed frequency band transmitter is configured to transmit the high priority indicator within an uplink channel within the licensed frequency band.

14. The eNB of claim 11, further comprising:

- a licensed frequency band receiver, the licensed frequency band transmitter and the licensed frequency band receiver configured to provide a primary cell (PCell) in accordance with at least one revision of The Third-Generation Partnership Project Long-Term Evolution (3GPP LTE) communication specification: and
- an unlicensed frequency band transmitter, the unlicensed frequency band transmitter and the unlicensed frequency band receiver configured to provide a secondary cell (SCell) in the unlicensed frequency band.

15. The eNB of claim 11, wherein the unlicensed frequency band transmitter and the unlicensed frequency band receiver are configured to provide the SCell by transmitting and receiving signals in the unlicensed frequency band in accordance with an Institute of Electrical and Electronics Engineers (IEEE) 802.11 communication standard.

16. A method performed at an eNodeB (eNB), the method comprising:

- receiving a high priority indicator within a licensed frequency band from another eNB, the high priority indicator indicating that the another eNB has a high priority communication pending transmission; and
- in response to receiving the high priority indicator, refraining from transmitting signals within an unlicensed frequency band.

17. The method of claim 16, further comprising:
beginning transmission to a user equipment (UE) device prior to receiving the high priority indicator; and
ending the transmission in response to receiving the high priority indicator.

18. The method of claim 16, wherein receiving the high priority indicator comprises receiving the high priority indicator within a downlink channel within the licensed frequency band.

19. The method of claim 16, wherein receiving the high priority indicator comprises receiving the high priority indicator within an uplink channel within the licensed frequency band.

20. The method of claim 16, further comprising:

providing a primary cell (PCell) in accordance with at least one revision of The Third-Generation Partnership Project Long-Term Evolution (3GPP LTE) communication specification: and

providing a secondary cell (SCell) in the unlicensed frequency band.

21. The method of claim 20, wherein providing the SCell comprises transmitting and receiving signals in the unlicensed frequency band in accordance with an Institute of Electrical and Electronics Engineers (IEEE) 802.11 communication standard.

22. The method of claim 16, wherein the high priority communication indicates a transmission ban end time indicating when the eNB is authorized to resume transmission in the unlicensed frequency band.
23. The method of claim 16, wherein the high priority communication indicates a transmission ban start time indicating when the eNB is not authorized to transmit signals in the unlicensed frequency band.
FIG. 4
FIG. 5

START

DETERMINE HIGH PRIORITY COMMUNICATION IS REQUIRED

NO

TRANSMIT HIGH PRIORITY COMMUNICATION IN UNLICENSED FREQUENCY BAND

YES

TRANSMIT HIGH PRIORITY INDICATOR

NO

UNLICENSED FREQUENCY BAND IN USE?

YES

APPLY CONVENTIONAL SENSING/BACKOFF PROCEDURE

FIG. 6
START

RECEIVE HIGH PRIORITY INDICATOR?

NORMAL TRANSMISSION

CEASE TRANSMISSION IN UNLICENSED BAND

TRANSMISSION ALLOWED IN UNLICENSED FREQUENCY BAND?

FIG. 7
INTERNATIONAL SEARCH REPORT

International application No. PCT/US2016/022689

A. CLASSIFICATION OF SUBJECT MATTER

H04W 72/10(2009.01)i, H04W 74/08(2009.01)i, H04W 88/10(2009.01)i

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

H04W 72/10; H04L 5/00; H04W 88/08; H04W 84/18; H04W 72/08; H04W 74/08; H04W 88/10

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Korean utility models and applications for utility models

Japanese utility models and applications for utility models

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

eKOMPASS(KIPO internal) & keywords: high priority communication, pending, indicator, licensed frequency band, transmit, unlicensed frequency band, not in use, detect, energy
