CHEMICAL COMPOUNDS

FIELD OF THE INVENTION

The present invention relates to novel compounds with a variety of therapeutic uses, more particularly novel substituted naphthalene compounds that are particularly useful for selective estrogen receptor modulation.

BACKGROUND OF THE INVENTION

Estrogens are well-known endocrine regulators in the cellular processes involved in the development and maintenance of the reproductive system. Estrogens have also been shown to have important effects in many non-reproductive tissues such as bone, liver, the cardiovascular system, and the central nervous system. The most widely accepted hypothesis of how estrogens exert their effects is by binding to an intracellular steroid hormone receptor. After the receptor and bound ligand are transferred to the nucleus of the cell, the complex binds to recognition sites in DNA, which allows for the modulation of certain genes. Additionally, it is now becoming apparent that estrogens may mediate their effects via membrane-initiated signaling cascade, though much of this work is still experimental. Kousteni et al., Journal of Clinical Investigation, (2003), 111, 1651–1664, herein incorporated by reference with regard to such teaching.

Certain substances have demonstrated the ability to exhibit their biological activity in a “tissue-selective” manner. In other words, tissue selectivity allows functionality as estrogen agonists in certain tissues, while acting as estrogen antagonists in other tissues. The term “selective estrogen receptor modulators” (SERMs) has been given to these molecules. Examples of SERMs include tamoxifen, raloxifene, lasofoxifene, clomiphene, and raloxifene. The molecular basis for this tissue-selective activity is not completely understood. Without being limited to any particular theory, the ability of the ligand to place the estrogen receptor into different conformational states and allowing for differential capabilities in recruiting coactivator and corepressor proteins, as well as other important proteins involved in transcriptional regulation, is believed to play a role. See, McDonnell, D. P., The Molecular Pharmacology of SERMs, Trends Endocrinol. Metab. 1999, 301–311, herein incorporated by reference with regard to such description.

Historically estrogens were believed to manifest their biological activity through a single estrogen receptor, now termed estrogen receptor alpha (ERα). More recently, however, there was the discovery of second subtype of estrogen receptor, termed estrogen receptor beta (ERβ). See, Kuiper et al., WO 97/09348 and Kuiper et al., Cloning of a Novel
Estrogen Receptor Expressed in Rat Prostate and Ovary, Proc. Natl. Acad. Sci. U.S.A., 1996, pp. 5925–5930, herein incorporated by reference with regard to such subtype. ERβ is expressed in humans. See, Mosselman et al., ERβ: Identification and Characterization of a Novel Human Estrogen Receptor, FEBS Lett., 1996, pp. 49–53, herein incorporated by reference with regard to such expression. The discovery of this second subtype of estrogen receptor significantly increased the biological complexity of estrogen signaling and may be responsible for some of the tissue-selective actions of the currently available SERMs.

As noted above, estrogens have important effects in many non-reproductive tissues. Thus, estrogen modulation is believed useful in the treatment or prophylaxis of diseases and conditions associated with such tissues, including bone, liver, and the central nervous system. For example, osteoporosis is characterized by the net loss of bone mass per unit volume. Such bone loss results in a failure of the skeleton to provide adequate structural support for the body, thereby creating an increased risk of fracture. One of the most common types of osteoporosis is postmenopausal osteoporosis, which is associated with accelerated bone loss subsequent to cessation of menses and declining levels of endogenous estrogen in women. There is an inverse relationship between densitometric measures of bone mass and fracture risk, for peri- and postmenopausal women in the process of rapid bone loss due to declining levels of estrogen. See, Siemenda, et al., Predictors of Bone Mass in Perimenopausal Women, A Prospective Study of Clinical Data Using Photon Absorptiometry, Ann. Intern. Med., 1990, pp. 96–101 and Marshall, et al., Meta-Analysis of How Well Measures of Bone Mineral Density Predict Occurrence of Osteoporotic Fractures, Br Med. J., 1996, pp. 1254–1259, each of which is herein incorporated by reference with regard to such relationship. Elderly women currently have a lifetime risk of fractures of about 75%. In addition there is an approximate 40% risk of hip fracture for Caucasian women over age 50 in the United States. The economic burden from osteoporotic fractures is considerable because of the necessity of hospitalization. In addition, although osteoporosis is generally not thought of as life-threatening, the mortality within 4 months of hip fracture is currently approximately 20 to 30%. Current therapies for postmenopausal osteoporosis include hormone replacement therapy or treatment with other antiresorptive agents such as bisphosphonates or calcitonin. Similarly, SERMs have been shown to be effective in the treatment of postmenopausal osteoporosis (see, Lindsay, R.: Sex steroids in the pathogenesis and prevention of osteoporosis. In: Osteoporosis 1988. Etiology, Diagnosis and Management. Riggs BL (ed) I, Raven Press, New York, USA (1988):333–358; Barzel US: Estrogens in the prevention and treatment of postmenopausal osteoporosis: a review. Am J. Med (1988) 86:847–850; and Ettinger, B., Black, D.M., et al.,
Reduction of Vertebral Fracture Risk in Postmenopausal Women with Osteoporosis Treated with Raloxifene, JAMA, 1999, 282, 637–645, each of which is incorporated by reference with regard to such teaching).

As another example, the effects of estrogens on breast tissue, particularly breast cancer, have been well documented. For example, a previously identified SERM, tamoxifen, decreases the risk of recurrent breast cancer, contralateral breast cancer, and mortality as well as increases the disease-free survival rate of patients with breast cancer at multiple stages of the disease. See, Cosman, F., Lindsay, R. Selective Estrogen Receptor Modulators: Clinical Spectrum, Endocrine Rev., 1999, pp. 418–434, herein incorporated by reference with regard to such teaching. The profile of tamoxifen, however, is not ideal due to potential interactive properties on reproductive tissues, such as uterine tissues. There is room for an improved therapy for the treatment of such cancers, namely a SERM with no agonist properties on any reproductive tissues.

regard to such teaching). To what extent these findings may be extrapolated to SERMs is an issue that remains to be determined.

Other therapeutic alternatives include estrogen replacement therapy and/or hormone replacement therapy, which may be useful in the treatment of vasomotor symptoms, genitourinary atrophy, depression, and diabetes. Over 75% of women experience vasomotor symptoms during the climacteric years. Clinical signs, such as vasomotor symptoms and genitourinary atrophy, abate upon treatment with estrogen replacement therapy. Sagraves, R., J. Clin. Pharmacol. (1995), 35(9 Suppl):2S–10S, herein incorporated by reference with regard to such teaching. Preliminary data suggest that estradiol may alleviate depression during perimenopause and that the combination of estrogens and selective serotonin reuptake inhibitors may alleviate depression during the postmenopausal period. Soares, C. N., Poitras, J. R., and Prouty, J., Drugs Aging, (2003), 20(2), 85–100, herein incorporated by reference with regard to such teaching. Furthermore, hormone replacement therapy may improve glycemic control among women with diabetes. Palin, S.L. et al., Diabetes Research and Clinical Practice, (2001), 54, 67–77; Ferrara, A. et al., Diabetes Care, (2001), 24(7), 1144–1150, each incorporated herein by reference with regard to such teaching. There is a need, however, for improved therapies that present better side effect profiles.

The present inventors discovered a novel group of cycloalkylidene compounds, which bind to and modulate estrogen receptor alpha and estrogen receptor beta. As SERMS, these compounds are believed to be useful for the treatment and/or prophylaxis of menopausal or postmenopausal disorders, vasomotor symptoms, urogenital or vulvar vaginal atrophy, atrophic vaginitis, endometriosis, female sexual dysfunction, breast cancer, depressive symptoms, diabetes, bone demineralization, and the treatment and/or prevention of osteoporosis.

The compounds of formulas (I) may crystallize in more than one form, a characteristic known as polymorphism, and such polymorphic forms ("polymorphs") are within the scope of formula (I). Polymorphism generally can occur as a response to changes in temperature, pressure, or both. Polymorphism can also result from variations in the crystallization process. Polymorphs can be distinguished by various physical characteristics known in the art such as x-ray diffraction patterns, solubility, and melting point.

Certain of the compounds described herein contain one or more chiral centers, or may otherwise be capable of existing as multiple stereoisomers. The scope of the present invention includes mixtures of stereoisomers as well as purified enantiomers or enantiomerically/diastereomerically enriched mixtures. Also included within the scope of the invention are the individual isomers of the compounds represented by formula (I), as well as any wholly or partially equilibrated mixtures thereof. The present invention also includes the individual isomers of the compounds represented by the formulas above as mixtures with isomers thereof in which one or more chiral centers are inverted.

Typically, the salts of the present invention are pharmaceutically acceptable salts. Salts encompassed within the term "pharmaceutically acceptable salts" refer to non-toxic salts of the compounds of this invention. Salts of the compounds of the present invention may comprise acid addition salts. Representative salts include acetate, benzenesulfonate, benzoate, bicarbonate, bisulfate, bitartrate, borate, bromide, calcium edetate, camyslate, carbonate, chloride, clavulanate, citrate, dihydrochloride, edetate, edisylate, estolate, esylate, fumarate, gluceptate, gluconate, glutamate, glycollylarsanilate, hexylresorcinale, hydrabamine, hydrobromide, hydrochloride, hydroxynaphthoate, iodide, isethionate, lactate, lactobionate, laurate, maleate, maleate, mandelate, mesylate, methylbromide, methylxinitrate, methylsulfate, monopotassium maleate, mucate, napsylate, nitrate, N-methylglucamine, oxalate, pamoate (embonate), palmitate, pantothenate, phosphate/diphosphate,

Other salts, which are not pharmaceutically acceptable, may be useful in the preparation of compounds of this invention and these should be considered to form a further aspect of the invention.

As used herein, the term “solvate” refers to a complex of variable stoichiometry formed by a solute (in this invention, a compound of Formula I, or a salt or physiologically functional derivative thereof) and a solvent. Such solvents, for the purpose of the invention, should not interfere with the biological activity of the solute. Non-limiting examples of suitable solvents include, but are not limited to water, methanol, ethanol, and acetic acid. Preferably the solvent used is a pharmaceutically acceptable solvent. Non-limiting examples of suitable pharmaceutically acceptable solvents include water, ethanol, and acetic acid. Most preferably the solvent used is water.

As used herein, the term “physiologically functional derivative” refers to any pharmaceutically acceptable derivative of a compound of the present invention that, upon administration to a mammal, is capable of providing (directly or indirectly) a compound of the present invention or an active metabolite thereof. Such derivatives, for example, esters and amides, will be clear to those skilled in the art, without undue experimentation. Reference may be made to the teaching of Burger's Medicinal Chemistry And Drug Discovery, 5th Edition, Vol 1: Principles and Practice, which is incorporated herein by reference to the extent that it teaches physiologically functional derivatives.

As used herein, the term "effective amount" means that amount of a drug or pharmaceutical agent that will elicit the biological or medical response of a tissue, system, animal or human that is being sought, for instance, by a researcher or clinician. The term "therapeutically effective amount" means any amount which, as compared to a corresponding subject who has not received such amount, results in improved treatment, healing, prevention, or amelioration of a disease, disorder, or side effect, or a decrease in the rate of advancement of a disease or disorder. The term also includes within its scope amounts effective to enhance normal physiological function.

For use in therapy, therapeutically effective amounts of a compound of formula (I), as well as salts, solvates, and physiological functional derivatives thereof, may be administered as the raw chemical. Additionally, the active ingredient may be presented as a pharmaceutical composition. Accordingly, the invention further provides pharmaceutical compositions that include effective amounts of compounds of the formula (I) and salts, solvates, and physiological functional derivatives thereof, and one or more pharmaceutically
acceptable carriers, diluents, or excipients. The compounds of formula (I) and salts, solvates, and physiologically functional derivatives thereof, are as described above. The carrier(s), diluent(s) or excipient(s) must be acceptable, in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient of the pharmaceutical composition. In accordance with another aspect of the invention there is also provided a process for the preparation of a pharmaceutical formulation including admixing a compound of the formula (I) or salts, solvates, and physiological functional derivatives thereof, with one or more pharmaceutically acceptable carriers, diluents or excipients.

A therapeutically effective amount of a compound of the present invention will depend upon a number of factors. For example, the age and weight of the animal, the precise condition requiring treatment and its severity, the nature of the formulation, and the route of administration are all factors to be considered. The therapeutically effective amount ultimately should be at the discretion of the attendant physician or veterinarian. For example, an effective amount of a compound of formula (I) for the treatment of humans suffering from osteoporosis, generally, should be in the range of 0.1 to 100 mg/kg body weight of recipient (mammal) per day. More usually the effective amount should be in the range of 1 to 10 mg/kg body weight per day. Thus, for a 70 kg adult mammal the actual amount per day would usually be from 70 to 700 mg. This amount may be given in a single dose per day or in a number (such as two, three, four, five, or more) of sub-doses per day such that the total daily dose is the same. An effective amount of a salt, solvate, or physiologically functional derivative thereof, may be determined as a proportion of the effective amount of the compound of formula (I) per se. Similar dosages should be appropriate for treatment of the other conditions referred to herein that are mediated by estrogen.

Pharmaceutical formulations may be presented in unit dose forms containing a predetermined amount of active ingredient per unit dose. Such a unit may contain, as a non-limiting example, 0.5mg to 1g of a compound of the formula (I), depending on the condition being treated, the route of administration, and the age, weight, and condition of the patient. Preferred unit dosage formulations are those containing a daily dose or sub-dose, as herein above recited, or an appropriate fraction thereof, of an active ingredient. Such pharmaceutical formulations may be prepared by any of the methods well known in the pharmacy art.

Pharmaceutical formulations may be adapted for administration by any appropriate route, for example by an oral (including buccal or sublingual), rectal, nasal, topical (including
buccal, sublingual or transdermal), vaginal, or parenteral (including subcutaneous, intramuscular, intravenous or intradermal) route. Such formulations may be prepared by any method known in the art of pharmacy, for example by bringing into association the active ingredient with the carrier(s) or excipient(s).

5 Pharmaceutical formulations adapted for oral administration may be presented as discrete units such as capsules or tablets; powders or granules; solutions or suspensions, each with aqueous or non-aqueous liquids; edible foams or whips; or oil-in-water liquid emulsions or water-in-oil liquid emulsions. For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic pharmaceutically acceptable inert carrier such as ethanol, glycerol, water, and the like. Generally, powders are prepared by comminuting the compound to a suitable fine size and mixing with an appropriate pharmaceutical carrier such as an edible carbohydrate, as, for example, starch or mannitol. Flavorings, preservatives, dispersing agents, and coloring agents can also be present.

10 Capsules are made by preparing a powder, liquid, or suspension mixture and encapsulating with gelatin or some other appropriate shell material. Glideants and lubricants such as colloidal silica, talc, magnesium stearate, calcium stearate or solid polyethylene glycol can be added to the mixture before the encapsulation. A disintegrating or solubilizing agent such as agar-agar, calcium carbonate or sodium carbonate can also be added to improve the availability of the medicament when the capsule is ingested. Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents, and coloring agents can also be incorporated into the mixture. Examples of suitable binders include starch, gelatin, natural sugars such as glucose or beta-lactose, corn sweeteners, natural and synthetic gums such as acacia, tragacanth or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes, and the like. Lubricants useful in these dosage forms include, for example, sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride, and the like. Disintegrators include, without limitation, starch, methyl cellulose, agar, bentonite, xanthan gum, and the like. Tablets are formulated, for example, by preparing a powder mixture, granulating or sluggging, adding a lubricant and disintegrant, and pressing into tablets. A powder mixture may be prepared by mixing the compound, suitably comminuted, with a diluent or base as described above. Optional ingredients include binders, such as carboxymethylcellulose, alginates, gelatins, or polyvinyl pyrrolidone, solution retardants, such as paraffin, resorption accelerators such as a quaternary salt and/or adsorption agents such as bentonite, kaolin, or dicalcium phosphate.

15 The powder mixture can be wet-granulated with a binder such as syrup, starch paste, acadia...
mucilage or solutions of cellulosic or polymeric materials, and forcing through a screen. As an alternative to granulating, the powder mixture can be run through the tablet machine and the result is imperfectly formed slugs broken into granules. The granules can be lubricated to prevent sticking to the tablet forming dies by means of the addition of stearic acid, a stearate salt, talc or mineral oil. The lubricated mixture is then compressed into tablets. The compounds of the present invention can also be combined with a free flowing inert carrier and compressed into tablets directly without going through the granulating or slugging steps. A clear or opaque protective coating consisting of a sealing coat of shellac, a coating of sugar or polymeric material, and a polish coating of wax can be provided. Dyestuffs can be added to these coatings to distinguish different unit dosages.

Oral fluids such as solutions, syrups, and elixirs can be prepared in dosage unit form so that a given quantity contains a predetermined amount of the compound. Syrups can be prepared, for example, by dissolving the compound in a suitably flavored aqueous solution, while elixirs are prepared through the use of a non-toxic alcoholic vehicle. Suspensions can be formulated generally by dispersing the compound in a non-toxic vehicle. Solubilizers and emulsifiers such as ethoxylated isostearyl alcohols and polyoxyethylene sorbitol ethers, preservatives; flavor additives such as peppermint oil, or natural sweeteners, saccharin, or other artificial sweeteners; and the like can also be added.

Where appropriate, dosage unit formulations for oral administration can be microencapsulated. The formulation can also be prepared to prolong or sustain the release as for example by coating or embedding particulate material in polymers, wax or the like.

The compounds of formula (I) and salts, solvates, and physiological functional derivatives thereof, can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles, large unilamellar vesicles, and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine, or phosphatidylcholines.

The compounds of formula (I) and salts, solvates, and physiologically functional derivatives thereof may also be delivered by the use of monoclonal antibodies as individual carriers to which the compound molecules are coupled. The compounds may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone (PVP), pyran copolymer, polyhydroxypropylmethacrylamide–phenol, polyhydroxyethylaspartamidephenol, or polyethyleneoxidepolylysine substituted with palmitoyl residues. Furthermore, the compounds may be coupled to a class of biodegradable polymers useful in achieving controlled release of a drug; for example, polylactic acid, polyepson caprolactone, polyhydroxy butyric acid, polyorthoesters,
polyacetals, polydihydropyrans, polycyanocrylates, and cross-linked or amphipathic block copolymers of hydrogels.

Pharmaceutical formulations adapted for transdermal administration may be presented as discrete patches intended to remain in intimate contact with the epidermis of the recipient for a prolonged period of time. For example, the active ingredient may be delivered from the patch by iontophoresis as generally described in *Pharmaceutical Research*, 3(6), 318 (1986), incorporated herein by reference as related to such delivery systems.

Pharmaceutical formulations adapted for topical administration may be formulated as ointments, creams, suspensions, lotions, powders, solutions, pastes, gels, sprays, aerosols, or oils.

For treatments of the eye or other external tissues, for example mouth and skin, the formulations may be applied as a topical ointment or cream. When formulated in an ointment, the active ingredient may be employed with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredient may be formulated in a cream with an oil-in-water cream base or a water-in-oil base. Pharmaceutical formulations adapted for topical administrations to the eye include eye drops wherein the active ingredient is dissolved or suspended in a suitable carrier, especially an aqueous solvent. Pharmaceutical formulations adapted for topical administration in the mouth include lozenges, pastilles, and mouthwashes.

Pharmaceutical formulations adapted for nasal administration, where the carrier is a solid, include a coarse powder having a particle size for example in the range 20 to 500 microns. The powder is administered in the manner in which snuff is taken, i.e., by rapid inhalation through the nasal passage from a container of the powder held close up to the nose. Suitable formulations wherein the carrier is a liquid, for administration as a nasal spray or as nasal drops, include aqueous or oil solutions of the active ingredient.

Pharmaceutical formulations adapted for administration by inhalation include fine particle dusts or mists, which may be generated by means of various types of metered, dose pressurized aerosols, nebulizers, or insufflators.

Pharmaceutical formulations adapted for rectal administration may be presented as suppositories or as enemas.

Pharmaceutical formulations adapted for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams, or spray formulations.

Pharmaceutical formulations adapted for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers,
bacteriostats, and solutes that render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents. The formulations may be presented in unit-dose or multi-dose containers, for example sealed ampules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example water for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules, and tablets.

In addition to the ingredients particularly mentioned above, the formulations may include other agents conventional in the art having regard to the type of formulation in question. For example, formulations suitable for oral administration may include flavoring agents.

The compounds of the present invention and their salts, solvates, and physiologically functional derivatives thereof, may be employed alone or in combination with other therapeutic agents for the treatment of the conditions herein described. For example, in osteoporosis therapy, combination with other osteoporosis therapeutic agents is envisaged. Osteoporosis combination therapies according to the present invention thus comprise the administration of at least one compound of formula (I) or a salt, solvate, or physiologically functional derivative thereof, and the use of at least one other osteoporosis treatment method. Preferably, combination therapies according to the present invention comprise the administration of at least one compound of formula (I) or a salt, solvate, or physiologically functional derivative thereof, and at least one other osteoporosis treatment agent, for example, a bone building agent. The compound(s) of formula (I) and the other pharmaceutically active agent(s) may be administered together or separately and, when administered separately, administration may occur simultaneously or sequentially in any order. The amounts of the compound(s) of formula (I) and the other pharmaceutically active agent(s) and the relative timings of administration will be selected in order to achieve the desired combined therapeutic effect. The administration in combination of a compound of formula (I) salts, solvates, or physiologically functional derivatives thereof with other osteoporosis treatment agents may be in combination by administration concomitantly in: (1) a unitary pharmaceutical composition including each compound; or (2) separate pharmaceutical compositions each including one of the compounds. Alternatively, the combination may be administered separately in a sequential manner wherein one treatment agent is administered first and the other(s) subsequently or vice versa. Such sequential administration may be close in time or remote in time.
The compounds of the present invention and their salts, solvates, and physiologically functional derivatives thereof, may be employed alone or in combination with other therapeutic agents for the treatment of the conditions herein described. For example, regarding the use of the compounds of the present invention in the prevention of reduced bone mass, density, or growth, combination may be had with other anabolic or osteoporosis therapeutic agents. As one example, osteoporosis combination therapies according to the present invention would thus comprise the administration of at least one compound of the present invention or a salt, solvate, or physiologically functional derivative thereof, and the use of at least one other osteoporosis therapy. As a further example, combination therapies according to the present invention include the administration of at least one compound of the present invention or a salt, solvate, or physiologically functional derivative thereof, and at least one other osteoporosis treatment agent, for example, an anti-bone resorption agent. The compounds of the present invention and the other pharmaceutically active agent(s) may be administered together or separately and, when administered separately, administration may occur simultaneously or sequentially, in any order. The amounts of the compound(s) and the agent(s) and the relative timings of administration will be selected in order to achieve the desired combined therapeutic effect. The administration in combination of a compound of the present invention including salts, solvates, or physiologically functional derivatives thereof with other treatment agents may be in combination by administration concomitantly in: (1) a unitary pharmaceutical composition including both compounds; or (2) separate pharmaceutical compositions each including one of the compounds. Alternatively, the combination may be administered separately in a sequential manner wherein one treatment agent is administered first and the other second or vice versa. Such sequential administration may be close in time or remote in time.

As noted, one potential additional osteoporosis treatment agent is a bone building (anabolic) agent. Bone building agents can lead to increases in parameters such as bone mineral density that are greater than those than can be achieved with anti-resorptive agents. In some cases, such anabolic agents can increase trabecular connectivity leading to greater structural integrity of the bone.

Other potential therapeutic combinations include the compounds of the present invention combined with other compounds of the present invention, growth promoting agents, growth hormone secretagogues, growth hormone releasing factor and its analogs, growth hormone and its analogs, somatomedins, alpha-ardenergetic agonists, serotonin 5-HT₉ agonists, selective serotonin reuptake inhibitors, agents that inhibit somatostatin or its release, 5-α-reductase inhibitors, aromatase inhibitors, GnRH inhibitors, parathyroid
hormone, bisphosphonates, estrogen, testosterone, SERMs, progesterone receptor agonists, and/or with other modulators of nuclear hormone receptors.

The compounds of the present invention may be used in the treatment of a variety of disorders and conditions and, as such, the compounds of the present invention may be used in combination with a variety of other suitable therapeutic agents useful in the treatment or prophylaxis of those disorders or conditions. The bolded numerals reference the compounds as depicted in the following schemes.

As illustrated below, compounds of formula (I) can be prepared using the routes described in Schemes 1–6. Several routes to the substituted naphthol VI are described in Schemes 1–5. Reaction of ary1 acetic acids (I) with a phenethylbromide (II) in the presence of nBuLi affords the carboxylic acid III. Friedel-Crafts cyclization of III via the intermediate acid chloride yields the tetralone IV. For Friedel-Crafts reaction conditions, see Friedel-Crafts and Related Reactions, G. A. Olah, ed., Vol 3, Pt 1, pp 1–382, J. Wiley and Sons, New York (1964); G. A. Olah, Friedel-Crafts Chemistry, Wiley Interscience, New York, (1973); and Larock, R. C., Comprehensive Organic Transformations, VCH Publishers, New York, 1989, each herein incorporated by reference with regard to such teaching. Conversion of IV to the intermediate naphthol VI was effected in 2 steps.

Further elaboration of the R3 substituent of VI can be carried out. For example, when R3 is an ester, saponification will yield the carboxylic acid VII and treatment with a reducing agent such as LAH yields the corresponding alcohol VIII. Acid VII can also be converted to a carboxamide IX. Treatment of acid (VII) with an amine in the presence of a coupling agent such as EDC and DMAP in dichloromethane followed by deprotection (if R* is
not hydrogen) provides amide IX. Alternatively, acid VII can be converted to the acid chloride using oxalyl chloride and DMF in toluene followed by treatment of the crude acid chloride with an amine and deprotection (if \( R^* \) is not hydrogen) to give amide IX. For conversion of carboxylic acids to amides, see Larock, R. C., *Comprehensive Organic Transformations*, VCH Publishers, New York, 1989.

Similarly, preparation of analogues of compounds VI – IX from a benzophenone related to compound III in which the methoxy group is meta to the carbonyl group can be accomplished using identical procedures (See Example 68).

Alternatively, naphthol VI can be prepared via intermediate XII, the synthesis of which is described in Scheme 2. Condensation of carbonyl compound A with an aryl Grignard reagent such as VII yields the acid VIII. A procedure for preparing acid VIII (R3 = Me, R4 = H) has been described by D.L. Vander Jagt et. al. *J. Med. Chem.*, 1998, 41, 3879-3887. Intramolecular Friedel-Crafts acylation affords the tetralone IX. Naphthols such as XI can be prepared using a modification of the procedure reported by G. R. Green et. al. *Tetrahedron*, 1998 54, 9875 – 9894. Treatment of IX with bromine in chloroform gave the dibromide X which can be dehydrohalogenated by exposure to a base such as DBU. The moderately unstable naphthol XI was protected as a MOM-ether. Conversion of XII to VI is described in Scheme 3.

**Scheme 2**

**MOM Bromide Route to Naphthalene-Based ER Ligands**
Another route to the preparation of naphthol VI was effected using the Peterson olefination protocol described in Scheme 3. Treatment of aryl ketone XIII with ethyl (trimethylsilyl)acetate affords acrylate ester XIV as a mixture of E and Z-isomers. For Peterson Olefination reaction conditions, see Ager, Organic Reactions 1990, 38, pp 1-223, herein incorporated by reference with regard to such teaching. Ester XIV was hydrogenated followed by Friedel-Crafts cyclization to tetralone IX using conditions previously described. Compound IX to the MOM-protected naphthol XII was carried using the conditions described for Scheme 2. Suzuki coupling of aryl boronic acids to the aryl bromide XII followed by removal of the MOM group yielded naphthol VI. For a review of the Suzuki boronic acid coupling reaction, see Miyaura, N. and Suzuki, A., Chem. Rev. 1995, 95, pp 2457 – 2483, herein incorporated by reference with regard to such teaching.

Scheme 3
Peterson Olefination Route to Naphthalene-Based ER Ligands
Naphthol VI can also be prepared using an acetylene cyclization approach based on the methodology reported by Makra, F. et al., *Tetrahedron Lett.*, 1995, 36, 6815 – 6818, herein incorporated by reference with regard to such teaching. Sonagashira coupling of terminal acetylenes to ortho-substituted aryl halide or triflate XVII in the presence of Cul and a palladium catalyst yields alkyne XVIII. The synthesis of compound XVIII used the procedure described by Zhang, Q, et. al, *J. Org Chem.*, 2000, 7977 – 7983, herein incorporated by reference with regard to such teaching. Preparation of the Weinreb amide followed by coupling to a benzylsubstituted grignard reagent provided ketone XIX, which can be cyclized to naphthol VI in the presence of a base such as potassium bis(trimethylsilyl)amide (KHMD).
Compounds of formula (I) can also be prepared starting from cyclobutenones (Scheme 5). The requisite cyclobutenones are made from the treatment of dialkylsquarates such as dimethylsquarate XX with organometallic reagents such as methyl lithium to afford β-alkoxy enol ethers. Acylation with trifluoroacetic anhydride (TFAA) activates carbinol intermediates for further derivatization. Methanol treatment of the trifluoroacetate intermediate affords dimethyl ketal protected cyclobutenediones XXI (Gayo, L. M.; Winters, M. P.; Moore, H. W. J. Org. Chem. 1992, 57, 6896). Addition of a second organometallic reagent such as (3-methoxy phenyl)lithium to the protected cyclobutenediones XXI gives cyclobutenediones XXII after TFAA promoted hydrolysis of the corresponding β-hydroxy enol ether. Addition of another organolithium reagent such as (3-methoxy phenyl)lithium to XXII is followed by trapping of the resulting lithium alkoxide with reagents such as methyl triflate. Hydrolysis of the ketal moiety or direct hydrolysis with aqueous acid provides highly substituted 4-alkoxy or 4-hydroxycyclobutenones XXIII. Hydroxycyclobutenones are treated with Lewis acids such as BF₃/Et₂O and silanes such as triethylsilane to provide 4-protiocyclobutenones XXIV. Finally, thermolysis of the 4-protio XXIV) or 4-alkoxy XXIII substituted cyclobutenones by heating in a higher boiling solvent such as toluene proceeds through a dienyl ketene to afford highly substituted napthols VI. This method of napthol synthesis provides a variety of substitution patterns that are not easily accessed through traditional methods (Tumbull, P.; Moore H. W. J. Org. Chem. 1995, 60, 644).

The 1-position of the substituted naphthol VI prepared by the methods described in Schemes 1–5 can be functionalized further to provide compounds that are active on the estrogen receptor (ER). As depicted in Scheme 6, O-arylation with appropriately substituted aryl fluorides (such as, 4-fluorobenzaldehyde) and a base such as cesium carbonate or sodium hydride, provides the substituted naphthalene XXV. The substituted benzaldehyde XXV, may be further functionalized by Wittig olefination with a reagent such as an ylide generated from triethylphosphonoacetate derivatives. Saponification of the resulting acrylate esters with aqueous lithium hydroxide or aqueous sodium hydroxide provides acrylic acids. Deprotection with BBBr_3 (R1 or R2 = OMe) or H_2/Pd (R1 or R2 = O-benzyl) affords naphthols (XXVI). Reduction of the acrylic acid olefin (XXVI) with H_2/Pd provides propanoic acids (XXVII). Additionally, the acrylic acids can be converted to the corresponding carboxamides (prior to treatment with BBBr_3), via the intermediate acid chlorides, with an amine in the presence of Et_3N (see Example 45 below).
Alternatively, aldehyde **XXV** can be subjected to Baeyer-Villiger oxidation to provide phenol **XXVIII**. For a review of the Baeyer-Villiger reaction see, *Oxidations in Organic Chemistry*, Hudlicky, T., pp. 186 – 195, American Chemical Society: Washington, 1990, herein incorporated by reference with regard to such teaching. Phenol **XXVIII** can be alkylation with an haloacetic acid ester followed by saponification to afford acid **XXIX** or with an appropriate alkyl halide to afford alcohol derivatives such as **XXX**. For examples of related phenol alkylation reactions see Rubin, V. et al., *Bioorganic & Med. Chem.* (2001), 9, 1579–1586, herein incorporated by reference with regard to such teaching. The aldehyde intermediate **XXV** in Scheme 6 can also be converted to the corresponding carboxylic acid or methyl ester **XXXI**. Phenol **XXVIII** may be used to prepare aryl (Ar) or heteroaryl (Het) substituted analogues **XXXII** via Suzuki reaction of an intermediate aryl triflate. For a review of the Suzuki boronic acid coupling reaction, see Miyaura, N. and Suzuki, A., *Chem. Rev.* 1995, 95, pp 2457 – 2483 and Ritter, K., *Synthesis* 1993, pp 735 – 762, herein incorporated by reference with regard to such teaching.

Nitroaryl intermediate XXXIII can be treated with a reducing agent such as PtO₂ to yield an aniline that can be subsequently acylated with a sulfonyl chloride to afford sulfonamide XXXIV (see Examples 6 and 8 below).

**EXAMPLES**

The following specific examples are included as illustrations and are not to be construed as limiting the scope of the present invention. For ease of reference the compounds are given reference numbers and referred to herein using this shorthand. The reference to any given compound should not be interpreted as the actual compound generated by any particular example, but rather as a general reference to a compound.

**Example 1 (11) Prepared using Scheme 1**

![Chemical structure of a compound]

**Step1:** 1-[3-(methyloxy)phenyl]-2-propanol (1)
To a cold solution (5 °C) of 1-[3-(methoxy)phenyl]-2-propanone (75 g, 0.457 mol) in MeOH (500 mL) was added NaBH₄ (19 g, 0.502 mol) portion-wise over a period of 0.5 h. The resultant mixture was stirred at that temperature for 1 h. Reaction mixture was quenched with 1 N aqueous HCl (250 mL) and concentrated under reduced pressure to remove most of the methanol. The reaction mixture was extracted with EtOAc (3 x 150 mL). The combined organic layer was washed with water (1 x 100 mL), brine (1 x 100 mL), dried (Na₂SO₄) and concentrated under reduced pressure to afford the crude product. The reaction mixture was just passed through a pad of silica gel and washed with 1:1 hexanes:EtOAc to afford 75 g (99%) of the title compound. ¹H NMR (400 MHz, CDCl₃):

δ 7.24 – 7.20 (m, 1H), 6.80 – 6.75 (m, 3H), 4.02 – 3.97 (m, 1H), 3.79 (s, 3H), 2.78 – 2.63 (m, 2H), 1.25 – 1.19 (m, 3H).

Step 2: 1-methyl-2-[3-(methoxy)phenyl]ethyl methanesulfonate (2)

To a cold solution (5 °C) of 1-[3-(methoxy)phenyl]-2-propanol (1) (75 g, 0.45 mol) in CH₂Cl₂ (500 mL) were added Et₃N (100 mL, 0.72 mol) and DMAP (2.75 g, 22.5 mmol).

Methanesulfonic acid (52 mL, 0.675 mol) was added slowly (drop-wise) to the above reaction mixture at that temperature over a period of 40 min. The resultant mixture was stirred between 5 °C and 10 °C for 8 h under N₂. The reaction mixture was washed with H₂O (3 x 150 mL), brine (1 x 100 mL), dried (Na₂SO₄) and concentrated under reduced pressure to afford the crude product which was passed through a pad of silica to afford 108 g (98%) of the title compound. ¹H NMR (400 MHz, CDCl₃): δ 7.24 and 7.20 (dd, J₁ = 15.2 Hz, J₂ = 3.8 Hz, 1H), 6.81 – 6.76 (m, 3H), 4.87 (sextet, J = 6.00 Hz, 1H), 3.77 (s, 3H), 2.96 and 2.92 (dd, J₁ = 14.0 Hz, J₂ = 8.0 Hz, 1H), 2.87 and 2.84 (dd, J₁ = 14.0 Hz, J₂ = 5.6 Hz, 1H), 2.54 (s, 3H), 1.44 (d, J = 6.4 Hz, 3H).

Step 3: 1-(2-bromopropyl)-3-(methoxy)benzene (3)

A round-bottomed flask was charged with 1-methyl-2-[3-(methoxy)phenyl]ethyl methanesulfonate (2) (90 g, 0.368 mol), LiBr (80 g, 0.92 mol), and acetone (650 mL). The reaction mixture was refluxed for 24 h under N₂ and then cooled to room temperature. The reaction mixture was filtered and concentrated under reduced pressure to afford the crude product. The product was passed through a pad of silica gel to remove inorganic impurities. The product was distilled under reduced pressure (2 – 3 mm Hg) at 130 – 135 °C to afford ~85 g (100%) of the title compound. ¹H NMR (400 MHz, CDCl₃): δ 7.25 (dd, J₁ = 8.00 Hz, J₂ = 8.00 Hz, 1H), 6.84 – 6.78 (m, 3H), 4.32 (sextet, J = 4.00 Hz, 1H), 3.82 (s, 3H), 3.25 and 3.21 (dd, J₁ = 16.00 Hz, J₂ = 8.00 Hz, 1H), 3.07 and 3.04 (dd, J₁ = 16.00 Hz, J₂ = 8.00 Hz, 1H), 1.71 (d, J = 8.00 Hz, 1H).

Step 4: 3-methyl-4-[3-(methoxy)phenyl]-2-phenylbutanoic acid (4)
To a cold (−78 °C) solution of phenylacetic acid (7.08 g, 52 mmol) in anhydrous THF (300 mL) was added slowly n-BuLi (2.5 M solution in n-hexanes) over a period of 0.5 h. The 1-(2-bromopropyl)-3-(methoxy)benzene (3) (18 g, 78.6 mmol) was added slowly and the reaction mixture stirred at −78 °C for 1 h and 23 h at room temperature. The reaction mixture was quenched with 1 N NaOH (200 mL) and the resulting mixture heated to 50 °C for 2 h. The reaction mixture was cooled to room temperature and washed with Et₂O (2 x 150 mL). The ethereal layer was washed with brine, dried (Na₂SO₄) and then concentrated to afford the excess 1-(2-bromopropyl)-3-(methoxy)benzene. The aqueous phase was acidified with 20% aqueous HCl and then extracted with EtOAc (4 x 200 mL). The combined organic layer was washed with brine, dried (Na₂SO₄) and concentrated under reduced pressure to afford 13 g (88%, crude yield) of compound 4 as an oil. This crude product was taken on to the next step without further purification or characterization.

**Step 5: 3-methyl-6-(methoxy)-2-phenyl-3,4-dihydro-1(2H)-naphthalenone (5)**

To a solution of 3-methyl-4-[3-(methoxy)pheny]l-2-phenylbutanoic acid (4) (13 g, 45.7 mmol) in CH₂Cl₂ (300 mL) was added oxalyl chloride (12 mL, 137.1 mmol) at room temperature. The reaction mixture was stirred for 10 h and concentrated under reduced pressure to afford the crude acid chloride. The acid chloride was redissolved in CH₂Cl₂ (300 mL) and cooled to 5 °C. Anhydrous aluminum chloride (9.2 g, 68.6 mmol) was added, portion-wise, over a period of 15 min. The resulting brown colored reaction mixture was stirred at 5 °C for 3 h under N₂. The reaction mixture was poured onto 2 N HCl (400 mL), stirred for 15 min and the layers were separated. The aqueous phase was further extracted with CH₂Cl₂ (3 x 200 mL). The combined organic solution was washed with sat. NaHCO₃ (1x 150 mL), brine (1 x 100 mL), dried (Na₂SO₄) and then concentrated under reduced pressure to afford the crude product. Step 1: 3-Methyl-6-(methyloxy)-3,4-dihydro-1(2H)-naphthalenone (12)

The Grignard, hydrolysis, and catalytic hydrogenation procedures described herein are analogous to those described for the preparation of similar compounds as reported by D. L. Vander Jagt et. al. (J. Med. Chem., 1998, 41, 3879-3887), with modification. To a stirred ice-water cooled solution of ethyl-3-methyl-4-oxocrotonate (50.1 g, 0.352 mol) in anhydrous THF (200 mL) was slowly added dropwise 3-methoxyphenyl magnesium bromide (1 M in THF) (352 mL, 0.352 mol, 1.0 eq) between 0 – 10 °C under a N₂. The ice-water bath was removed and the reaction mixture was stirred at RT for 1.5 h. The reaction mixture was poured slowly into a mixture of ice (650 g) and 6 N HCl (170 mL) and then extracted with Et₂O. The organic phase was separated, washed with H₂O followed by brine, dried over MgSO₄, filtered, and the filtrate was concentrated to give 98.4 g of crude ethyl (2E)-4-hydroxy-3-methyl-4-[3-(methyloxy)phenyl]-2-butenoate. The crude intermediate ester was dissolved in EtOH (900 mL) and KOH (44.2 g, 0.788 mol) was added followed by H₂O (200 mL). The reaction mixture was heated at reflux for 3 h and allowed to cool at RT. The EtOH was removed in vacuo and the basic aqueous mixture was diluted with H₂O (500 mL) and then washed with Et₂O. The basic aqueous mixture was cooled in an ice-water bath and the pH was adjusted to ~2 (litmus paper) via the slow dropwise addition of 6 N HCl. The acidic
aqueous mixture was extracted with EtOAc (2 x). The organic extracts were combined, washed with H₂O followed by brine, dried over MgSO₄, filtered, and the filtrate was concentrated to give 74.14 g of crude (2E)-4-hydroxy-3-methyl-4-[3-(methylxylo)phenyl]-2-butenoic acid as a dark orange oil. The crude butenoic acid was reduced by catalytic hydrogenation in three batches as described below. To a Parr hydrogenation bottle containing 10% palladium on carbon (1.0 g) was added a solution of the crude butenoic acid (24.13 g) in acetic acid (160 mL). The reaction mixture was hydrogenated at 25 – 30 psi over a 1 h period as the reaction mixture was warmed to 60 °C. Once the temperature reached 60 °C, the pressure of H₂ was increased to 55 psi for 7 h. The reaction mixture was allowed to stand overnight at RT between 40 – 45 psi. The reaction mixture was filtered through a pad of celite. The pad was washed with EtOH (2 x) and the filtrate was concentrated to give 18.61 g of crude 3-methyl-4-[3-(methylxylo)phenyl]butanoic acid as an oil. The remaining crude (2E)-4-hydroxy-3-methyl-4-[3-(methylxylo)phenyl]-2-butenoic acid was hydrogenated in a similar manner to give a total of 61.9 g of crude 3-methyl-4-[3-(methylxylo)phenyl]butanoic acid. To a solution of crude 3-methyl-4-[3-(methylxylo)phenyl]butanoic acid (18.6 g) in CH₂Cl₂ (400 mL) was slowly added oxalyl chloride (24 mL) with stirring at RT under N₂. The reaction mixture was allowed to stir at RT overnight. The reaction mixture was concentrated in vacuo to give crude 4-[3-(methylxylo)phenyl]butanoyl chloride as an oil. The crude acid chloride was dissolved in CH₂Cl₂ (400 mL) and the solution was cooled in an ice-water bath. To the cold acid chloride solution was added AlCl₃ (22.4 g, 0.168 mol) portionwise between 0 – 5 °C over a 1 h period. The reaction mixture was stirred for an additional 3 h and then slowly poured into 400 mL of cold 6 N HCl (cooled in an ice-water bath). The mixture was transferred to a separatory funnel and the organic phase was separated. The aqueous phase was extracted with CH₂Cl₂. The organic extracts were combined, carefully washed with saturated NaHCO₃ followed by brine, dried over MgSO₄, filtered, and the filtrate was concentrated to give 15.6 g of the crude title compound as a brown-orange oil. The remaining crude 3-methyl-4-[3-(methylxylo)phenyl]butanoic acid was treated in a similar manner to provide an additional 32.8 g of the crude title compound. The crude title compound (48.4 g) was purified by chromatography over SiO₂ with hexanes:EtOAc (9:1) to give 19.2 g (29% from 3-methoxyphenyl)magnesium bromide) of the title compound 12 as a pale yellow solid. ¹H NMR (400 MHz; CDCl₃): δ 1.13 (d, J = 6.2 Hz, 3 H), 2.22 – 2.38 (m, 2H), 2.65 (m, 2 H), 2.93 (m, 1H), 3.85 (s, 3H), 6.69 (d, J = 2.4 Hz, 1H), 6.82 (dd, J = 2.5 Hz, 8.7 Hz, 1H), 7.99 (d, J = 8.6 Hz, 1H). To a stirred solution of 3-methyl-6-(methoxyloxy)-3,4-dihydro-1(2H)-naphthalenone (12) (4.80 g, 25.2 mmol) in CHCl₃ (130 mL) was slowly added dropwise a solution of Br₂ (8.12 g, 50.81 mmol, 2.02 eq) in CHCl₃ (60 mL) over a period of 4 h at RT under N₂. To a round-bottomed flask containing 4-[[3-methyl-6-(methyl)oxy]-2-phenyl-1-naphthalenyl]oxy]benzaldehyde (8) (0.157 g, 0.426 mmol) was added 6 mL of an acetonewater (2:1) solution. The slightly turbid solution was cooled in an ice-water bath and sulfamic acid (0.097 g, 0.999 mmol, 2.3 eq) was added portionwise over five minutes. The
reaction mixture was stirred for 5 min and sodium chlorite (80% tech. Grade) (0.059 g, 0.52 mmol, 1.23 eq) was added portionwise. The reaction mixture was stirred for 40 min. The reaction mixture was partitioned between CH₂Cl₂ and water. The organic phase was separated, washed with brine, dried over MgSO₄, filtered, and the filtrate was concentrated to give 0.115 g of the crude title compound. The product was purified by SiO₂ column chromatography using hexanes:EtOAc (19:1 to 9:1) as an eluent to give 0.356 g (90%) of the title compound (288) as a colorless oil. LCMS (ESI) m/z 493.27 (M + Na)⁺.

ethyl 4-[[4-[[3-methyl-6-(methylxy)-2-phenyl-1-naphthalenyl]oxy]phenyl]oxy]butanoate (288) (0.300 g, 0.638 mmol) was dissolved in a 1:1 THF:EtOH (1:1, 30mL) mixture. To the above mixture was added 1 N NaOH (6.4 mL) at room temperature and heated to 70 °C. The reaction mixture was kept at that temperature for 2 h and cooled at RT. Reaction

**BIOLOGICAL DATA**

*Competition Binding Assay:*

Recombinant full length human ERα and ERβ protein was purchased from PanVera (PanVera-Invitrogen Discovery Screening, Discovery Center, 501 Charmany Drive, Madison, Wisconsin 53719, USA). Polylysine coated Yttrium Silicate SPA beads (Amersham #RPNQ 0010) are re-suspended in assay buffer [10 mM potassium phosphate buffer pH 7.0 containing 2 mM EDTA, 50 mM NaCl, 1 mM DTT, 2 mM CHAPS, 10% glycerol] to a concentration of 1g/60ml. 30 μl (0.5 mg) of the SPA beads are then added to each well of a Packard OptiPlate (Packard 6005190, Packard Instruments, Meriden, CT). The ERα or ERβ protein is diluted to the appropriate concentration (empirically determined for each protein prep by generating a protein curve using 0.5 to 10 μg total protein and 1 nM [3H] Estradiol and selecting a protein concentration that does not deplete the radioligand) and added as 30 μl aliquots to each well. [2, 4, 6, 7, 16, 17-3H(N)]-Estradiol is added as a 30 μl aliquot to give a final assay concentration of 1 nM. To give a final volume of 100μl, either 10 μl of a test compound solution (typically in 10% DMSO as solvent), solvent containing no test compound (to determine total binding, T), or solvent containing 17-b-estradiol at 100 μM (to determine non-specific binding, NS) are finally added to the plate. The plates are shaken vigorously for two hours then counted on a Packard TopCount using the protocol for counting tritium yttrium silicate SPA beads. Data analysis was done by standard methods. 

% Bound was Calcd for each concentration of each test compound using the equation %Bound =100*((Test – NS)/(T-NS)).
% Bound was plotted vs concentration and curve fitting was accomplished using non-linear regression.
At least two binding curves were generated for each compound.
The compounds of the present invention tested exhibited pIC$_{50}$ values ranging from 5 10 μM to 1 nM.
Test compounds were employed in free or salt form.
All research complied with the principles of laboratory animal care (NIH publication No. 85-23, revised 1985) and GlaxoSmithKline policy on animal use.
Although specific embodiments of the present invention are herein illustrated and described in detail, the invention is not limited thereto. The above detailed descriptions are provided as exemplary of the present invention and should not be construed as constituting any limitation of the invention.
