Crossover Spinous Process Implant

BACKGROUND OF THE INVENTION

The leading cause of lower back pain arises from rupture or degeneration of lumbar
5 intervertebral discs. Pain in the lower extremities can be caused by the compression of spinal
nerve roots by a bulging disc, while lower back pain is caused by collapse of the disc and by
the adverse effects of articulation weight through a damaged, unstable vertebral joint.

In some cases, when a patient having a collapsed disc moves in extension (e.g., leans
backward), the posterior portion of the annulus fibrosis or the ligamentum flavum may
10 further compress and extend into the spinal canal. This condition, called "spinal stenosis",
narrows the spinal canal and causes impingement of tissue upon the spinal cord, thereby
producing pain.

There have been numerous attempts to provide relief for these afflictions by providing
a spacer that inserts between adjacent spinous processes present in the posterior portion of the
15 spinal column. This spacer essentially separates the upper spinous process from the lower
spinous process, thereby relieving stenosis. In general, these interspinous implants are
adapted to allow flexion movement in the patient, but resist or limit extension.

There are numerous publications disclosing interspinous process spacers having a
strut-like body disposed between the spinous processes. See, for example, US Patent No.
20 6451019; US Patent No. 6451020; US Patent No. 6652527; US Patent No. 7201751, US
Patent Publication No. 2005-0240182, US Patent Publication No. 2007--0203495, US Patent
Publication No. 2008-0033445, US Patent Publication No. 2008-0058941, US Patent
Publication No. 2008-006586, US Patent Publication No. 2008-0086212, US Patent
Publication No. 2008-0167656, and US Patent Publication No. 2008-0288075.

25 US Patent Publication No. 20080167655 (Wang) discloses devices, tools and methods
for minimally invasive implantation and distraction between spinous processes for treatment
of spinous disorders. Wang discloses an interspinous implant device for distracting at least
one pair of adjacent spinous processes includes a main body including a shaft having a
longitudinal axis; and first and second parallel arms extending transversely from the main

body, wherein at least one of the first and second parallel arms is slidably mounted with respect to the shaft. The parallel arms are configured and dimensioned to extend laterally from both sides of the spinous processes when implanted therebetween and to be inserted between the spinous processes laterally from a single side thereof. The parallel arms are
5 variably positionable between a closed configuration, in which the parallel arms are positioned close to or in contact with one another, to facilitate insertion of the parallel arms between the adjacent spinous processes, and an open configuration, in which the parallel arms are separated from one another.

US Patent Publication No. 2007-0162000 (Perkins) discloses an adjustable spacing
10 device configured to be placed between the spinous processes of at least two adjacent vertebrae and a method of using the device to treat spinal stenosis by restricting extension and allowing normal flexion of adjacent vertebrae relative to one another. Perkins discloses an implant having a horizontal member attached to two legs, one on each side of the spinous process.

US Patent Publication No. 2008-0177271 (Yeh) discloses an implant having a center
15 axle for rotation of the two pieces during insertion. Yeh discloses an interspinous process distraction device including a male distraction element and a female distraction element, which both have a clamping portion for fixedly pushing and rejecting the interspinous processes and also respectively have a first connecting portion and a second connecting
20 portion connected at the other end of the clamping portion. Here, the first connecting portion and the second connecting portion are paired for blocking with each other so as to form the interspinous process distraction device capable of having an opposite rotation. Besides, through clamping two interspinous processes which stress the nerve by the male distraction element and the female distraction element and rotating them to oppositely rotate, the two
25 interspinous processes can therefore be moved to be in alignment as the normal condition.

US Patent No. 5393036 (Sheridan) discloses an implant driven with a screw or threads to create distraction.

US Patent No. 5496318 (Howland) discloses an implant having an H-shape or belt to secure the implant. Howland discloses a spinal fixation device and method for the
30 stabilization of the spine after surgical procedures such as those related to degenerative disc

diseases. The device comprises a spacer, which is placed between adjacent vertebrae when installed and a locking mechanism attached to the spacer. The locking mechanism attaches the device to the spinous processes of adjacent vertebrae of the spine in a manner which is non-invasive with respect to the vertebrae to which it is attached.

5 US Patent No. 5092889 (Forte) discloses an implant held in place by wrapping around the ribs to provide stabilization in compression or distraction.

 US Patent Publication Nos. 20090248076 (Reynolds) and 20090248079 (Kwak) each discloses an interspinous spacer having a pair of hooks that, upon lateral insertion between opposed spinous process, bear upon the opposed spinous processes.

10 **SUMMARY OF THE INVENTION**

 The device of the present invention is intended for the treatment of spinal stenosis. This device is an inter-spinous spacer that is introduced through a single posterior incision. It uses a single piece insertion technique with a unilateral approach. The surgeon does not need to access the opposite side of the spinous process. It allows the user infinite adjustability in
15 distraction height with a single locking mechanism.

 The implant of the present invention generally has four components:

- 20 a) Top body – for contacting the superior spinous process it includes 1) a hook shaped portion with angled contact surface, 2) a curved track with grooves to interface with the grooves on the bottom body, and 3) insertion feature or hole;
- 25 b) Bottom body - for contacting the inferior spinous process it includes 1) a hook shaped portion with angled contact surface, 2) a curved track with grooves to interface with the grooves on the top body, and 3) insertion feature or hole;
- 30 c) Housing – has a throughbore (or slot) that contains the curved tracks of the top and bottom bodies as well as the set screw. The housing further has a threaded recess that accepts a set screw. The housing further has a mating feature (such as a pin) to help constrain the tracks of the top and bottom bodies; and

- d) Set screw – threads into the housing threaded recess and compresses the curved track of the top and bottom bodies. The set screw also has a mating feature (such as a pin) to help constrain the tracks of the top and bottom bodies.

5 The device of the present invention has many advantages:

- a) The implant's geometry allows for placement between the spinous processes followed by distraction of the spinous processes. In contrast, other conventional spinous process implants distract the spinous processes while they are being inserted.
- 10 b) Each of the body components of the device has an integrated track with grooves to interface with the opposite body. The advantage of the grooves is that it allows for infinite adjustability. It also provides stability to the construct.
- c) The curve of the track allows more distraction with a smaller profile.

15 DESCRIPTION OF THE FIGURES

FIG. 1 discloses a top view of the present invention in the collapsed state.

FIG. 2 discloses an insertion profile view of the present invention in the collapsed state.

FIG. 3 discloses a top view of the present invention in the expanded state.

FIG. 4 discloses an insertion profile view of the present invention in the expanded state.

20 FIG. 5 discloses a pair of devices of the present invention implanted on a spine.

FIGS. 6a and 6b disclose an inserter of the present invention.

DETAILED DESCRIPTION

25 Referring now to FIGS. 1-4, there is provided an interspinous process device, comprising:

- a) a first body 1, the first body comprising i) a first hook-shaped portion 3 adapted for contacting a superior spinous process, and ii) a first curved track portion 5

having a first face 6 and a second face (not shown), the first face 6 having a groove 8 therein and a rail 7 thereon running parallel to the groove, the second face having a groove therein running parallel to the groove of the first face;

b) a second body 11, the second body comprising i) a second hook-shaped portion 13 adapted for contacting an inferior spinous process, ii) a second curved track portion 15 having a first face 16 and a second face (not shown), the first face 16 having a groove 17 therein, the second face having a groove therein and a rail thereon,

c) a housing 21 having i) a slot 23 therethrough slidably receiving the curved track portions, ii) a threaded throughhole 26 extending in a direction transverse to the slot, and a containing pin (not shown) extending into the slot

d) a set screw 25 adapted for compressing the curved track portions of the first and second bodies, the set screw having i) a peripheral thread threadably received in the throughhole of the housing, and ii) an end face (not shown) having a constraining feature (such as a pin) adapted to constrain the curved track portions,

wherein the rail and groove of the second face of the second body respectively slidably engage the groove and rail of the first face of the first body,

wherein the groove of the first face of the second body slidably engages the constraining feature of the set screw, and

wherein the groove of the second face of the first body slidably engages the containing pin of the housing.

In some embodiments, each hook has an acutely angled face to more closely match the angle of the posterior-most portion of the spinous process it contacts. In contrast, the hooks of some conventional spinous process implants have a face that is perpendicular to the distraction path. In the present invention, a first mating face 31 forms an acute angle α which is less than 90 degrees with respect to the tips, while the second mating face 33 forms an obtuse angle β which is more than 90 degrees with respect to the tips.

Therefore, in accordance with the present invention, there is provided an interspinous process device, comprising:

- a) a first hook-shaped portion adapted for contacting a first spinous process,
- b) a second hook-shaped portion adapted for contacting a second spinous process,
- c) a connector portion adapted to adjustably connect the first and second hook-shaped portions,

wherein the first hook-shaped portions has acutely angled contact surface, and wherein the second hook-shaped portion has an obtusely angled contact surface.

In some embodiments, each track has an arc shape, which allows for increasing the hook depth as distraction increases. Therefore, in accordance with the present invention, there is provided an interspinous process device, comprising:

- a) a first hook-shaped portion adapted for contacting a superior spinous process,
- b) a second hook-shaped portion adapted for contacting an inferior spinous process,
- c) an arced connector portion adapted to adjustably connect the first and second hook-shaped portions.

In one arced embodiment, the arc forms a convex surface facing the hooked-shaped portions. In a second arced embodiment, the arc forms a concave surface facing the hooked-shaped portions. In preferred embodiments, the arc defines a radius of between about 2 cm and about 5 cm.

In preferred embodiments, the implant has a single locking mechanism. The requirement of only a single locking mechanism minimizes the amount of time the surgeon must spend stabilizing the device. Therefore, in accordance with the present invention, there is provided an interspinous process device, comprising:

- a) a first hook-shaped portion adapted for contacting a superior spinous process,
- b) a second hook-shaped portion adapted for contacting an inferior spinous process,
- 5 c) a adjustable connector portion adapted to adjustably connect the first and second hook-shaped portions,
- d) a single lock (such as a set screw) adapted to lock the adjustable connector portion.

10 In some embodiments, the set screw tightens upon an outer end portion of each track to produce an expanded hook state. In some embodiments, the inner end portion of each track is received in the housing to produce a collapsed hook state.

15 In some embodiments, each hook-shaped portion has an inflection point 35 in each outer end portion. The inflection point allows the concave side 37 of the hook tip 39 (i.e., the side of the tip associated with the concave face 41 of the hook) to contact the spinous process during insertion. The geometry of these hooks allows their insertion between the spinous processes without distracting the spinous processes. The hooks' subsequent distraction (upon actuation of the inserter) produces similar distraction in the spinous processes. In contrast, in other conventional interspinous process spacers (which do not contain an inflection point), the convex portion of the hook tip (i.e., the side of the tip associated with the convex portion
20 of the hook) distracts the spinous processes as the implant is being inserted. Therefore, the inflection point provides an advantage in that both hooks are passed between the spinous processes at the same time, thus insuring full capture of the spinous processes before distraction. Therefore, in accordance with the present invention, there is provided an interspinous process device, comprising:

- 25
- a) a first hook-shaped portion adapted for contacting a superior spinous process,
 - b) a second hook-shaped portion adapted for contacting an inferior spinous process,

- c) a connector portion adapted to adjustably connect the first and second hook-shaped portions,

wherein the first and second hook-shaped portions each have an inflection point.

- 5 In addition, the tips are bulleted to more easily puncture the ligament.

In some embodiments, at least one track has a longitudinal groove 7,17 therein, and the tracks are oriented in the housing so that the longitudinal grooves nest. Thus, each body component has an integrated track with grooves to interface with the opposite body. Therefore, in accordance with the present invention, there is provided an interspinous process device, comprising:

10

- a) a first hook-shaped portion adapted for contacting a superior spinous process,
- b) a second hook-shaped portion adapted for contacting an inferior spinous process,
- c) a connector portion adapted to adjustably connect the first and second hook-shaped portions,

15

wherein the connector portion comprises first and second track portions having mating grooves.

20

In some embodiments, the first and second bodies are oriented so that the hook-shaped portions open in opposite directions in the expanded state.

In some embodiments, the housing has a mating feature to constrain the tracks in the housing. In particular, this mating feature is a pin that prevents groove 17 from sliding all the way out of the housing, thereby preventing disassembly.

25

In some embodiments, the set screw has a mating feature to constrain the tracks in the housing. In particular, this mating feature is a pin that prevents groove 17 from sliding all the way out of the housing, thereby preventing disassembly.

In some embodiments, the threaded recess extends into the housing in a third direction, and the throughbore extends through the housing in a fourth direction substantially perpendicular to the third direction of the threaded recess.

5 In some embodiments, each body further comprises iii) an intermediate portion connecting the inner end portion of the first hook-shaped portion to the inner end portion of the first longitudinal track.

With correct material selection, the implant can be rigid for fusion, or have a spring-like action for non-fusion applications.

10 FIG. 5 discloses a pair of devices 51 of the present invention implanted on a spine. The angled faces of the devices put the devices in an orientation that allows multiple implants to be implanted without contacting each other.

FIGS. 6a and 6b disclose an inserter 61 of the present invention. In particular, the inserter comprises:

- 15 a) a longitudinal barrel 63 having a proximal end portion 65 and a distal end portion 67,
- b) a pistol grip 69 formed on the proximal end portion of the barrel, the pistol grip having a lever 71, and
- c) a shaft 73 disposed in the barrel and having a proximal end portion 75 and a distal end portion 78 having a pair of teeth 80 extending therefrom,
- 20 d) a knob 77 formed on the proximal end portion of the knob, and
- e) a pair of linkages 79 formed on the distal end portion 78 of the shaft, each linkage having a distal pin 81.

Actuation of the lever on the inserter serves to distract the implant.

25 Actuation of the knob on the inserter serves to actuate the teeth to hold the housing.

In use, the pin components of the inserter fits into the insertion features (holes) present on each of the bodies of the implant of the present invention. During insertion, the

inserter is actuated so that the linkages are in an essentially parallel state and the pins are relatively close together to reflect the collapsed state of the implant. During distraction, the inserter is actuated so that the linkages are in an essentially perpendicular state (as shown in FIGS. 6a and 6b) and the pins are relatively far apart to reflect the expanded state of the
5 implant.

The components of the device of the present invention could be metal, plastic, or ceramic.

If a metal is chosen as the material of construction for a component, then the metal is preferably selected from the group consisting of nitinol, titanium, titanium alloys (such as Ti-
10 6Al-4V), chrome alloys (such as CrCo or Cr-Co-Mo) and stainless steel.

If a polymer is chosen as a material of construction for a component, then the polymer is preferably selected from the group consisting of polycarbonates, polyesters, (particularly aromatic esters such as polyalkylene terephthalates, polyamides; polyalkenes; poly(vinyl fluoride); PTFE; polyarylethyl ketone PAEK; and mixtures thereof.

15 In some embodiments, the components could be made of a stainless steel alloy, preferably BioDur^R CCM Plus^R Alloy available from Carpenter Specialty Alloys, Carpenter Technology Corporation of Wyomissing, PA. In some embodiments, the component is made from a composite comprising carbon fiber. Composites comprising carbon fiber are advantageous in that they typically have a strength and stiffness that is superior to neat
20 polymer materials such as a polyarylethyl ketone PAEK. In some embodiments, the component is made from a polymer composite such as a PEKK-carbon fiber composite.

In some embodiments, the composite comprising carbon fiber further comprises a polymer. In some embodiments, the polymer is a polyarylethyl ketone (PAEK). In some embodiments, the PAEK is selected from the group consisting of polyetherether ketone
25 (PEEK), polyether ketone ketone (PEKK) and polyether ketone (PEK). In some embodiments, the PAEK is PEEK.

In some embodiments, the carbon fiber comprises between 1 vol% and 60 vol% (more preferably, between 10 vol% and 50 vol%) of the composite. In some embodiments, the polymer and carbon fibers are homogeneously mixed. In others, the material is a laminate. In
30 some embodiments, the carbon fiber is present in a chopped state. In some embodiments, the

chopped carbon fibers have a median length of between 1 mm and 12 mm, such as between 4.5 mm and 7.5 mm. In some embodiments, the carbon fiber is present as continuous strands.

In some embodiments, the composite comprises:

- 5 a) 40-99% (more preferably, 60-80 vol%) polyarylethyl ketone (PAEK), and
- b) 1-60% (more preferably, 20-40 vol%) carbon fiber,

wherein the polyarylethyl ketone (PAEK) is selected from the group consisting of polyetherether ketone (PEEK), polyether ketone ketone (PEKK) and polyether ketone (PEK).

In some embodiments, the composite consists essentially of PAEK and carbon fiber.

- 10 In some embodiments, the composite comprises 60-80 wt% PAEK and 20-40 wt% carbon fiber. For example, the composite may comprise 65-75 wt% PAEK and 25-35 wt% carbon fiber.

15

We Claim:

1. An interspinous process device, comprising:

- a) a first body, the first body comprising i) a first hook-shaped portion adapted for contacting a superior spinous process, and ii) a first track portion having a first groove therein,
- b) a second body, the second body comprising i) a second hook-shaped portion adapted for contacting an inferior spinous process, ii) a track portion having a groove therein,
- c) a housing having i) a slot therethrough slidably receiving the track portions, ii) a threaded throughhole extending in a direction transverse to the slot,
- d) a set screw adapted for compressing the track portions of the first and second bodies, the set screw having i) a peripheral thread threadably received in the throughhole of the housing,.

wherein the first and second bodies are slidingly received in the housing, and

wherein the first body slidingly engages the second body.

- 2. The device of claim 1 wherein the first hook shaped portion has a first angled contact surface.
- 3. The device of claim 1 wherein the first and second bodies each comprise an insertion feature for connection to an inserter instrument.
- 4. The device of claim 3 wherein the first insertion feature is a hole.
- 5. The device of claim 1 wherein the housing further comprises iii) a mating feature to help constrain the track portions. And the set screw further has ii) an end face having a constraining feature adapted to constrain the curved track portions
- 6. The device of claim 1 wherein each hook-shaped portion has an inflection point.
- 7. The device of claim 1 wherein the first hook-shaped portions has acutely angled contact surface, and wherein the second hook-shaped portion has an obtusely angled contact surface.

8. A method of using the interspinous spacer of claim 1, the method comprising the steps of:

- a) inserting the hooked-shaped portions of the spacer into an interspinous space,
- b) expanding the spacer.

5 9. The method of claim 8 wherein the set screw tightens upon an outer end portion of each track to lock the spacer in an expanded hook state.

10. The method of claim 8 wherein the first and second bodies each have a geometry that allows their insertion between the spinous processes without distracting the spinous processes.

10 11. An interspinous process spacer, comprising:

- a) a first body comprising i) a first hook-shaped portion having an outer end portion and an inner end portion, ii) a first longitudinal track having an outer end portion and an inner end portion, wherein the inner end portion of the first hook-shaped portion is connected to the inner end portion of the first longitudinal track,

15 b) a second body comprising i) a second hook-shaped portion having an outer end portion and an inner end portion, ii) a second longitudinal track having an outer end portion and an inner end portion, wherein the inner end portion of the second hook-shaped portion is connected to the inner end portion of the second longitudinal track,

20 c) a fixation housing having i) a threaded recess extending into the housing, and ii) a throughbore extending through the housing to meet the threaded recess,

- d) a set screw received in the threaded recess,

wherein the first and second longitudinal tracks are slidably received in the throughbore in opposite directions.

25 12. The spacer of claim 11 wherein the set screw tightens upon an outer end portion of each track to produce an expanded hook state.

13. The spacer of claim 12 wherein the inner end portion of each track is received in the housing to produce a collapsed hook state.
14. The spacer of claim 11 wherein at least one track has a longitudinal groove therein, and the tracks are oriented in the housing so that the longitudinal grooves nest.
- 5 15. The spacer of claim 11 wherein the first and second bodies are oriented so that the hook-shaped portions open in opposite directions in the expanded state.
16. The spacer of claim 11 wherein each track has a curved shape.
17. The spacer of claim 11 wherein the housing has a mating feature to constrain the tracks in the housing.
- 10 18. The spacer of claim 11 wherein the set screw has a mating feature to constrain the tracks in the housing.
19. The spacer of claim 11 wherein each hook-shaped portion has an inflection point.
20. The spacer of claim 11 wherein the threaded recess extends into the housing in a third direction, and the throughbore extends through the housing in a fourth direction
15 substantially perpendicular to the third direction of the threaded recess.
21. The spacer of claim 11 wherein each body further comprises iii) an intermediate portion connecting the inner end portion of the first hook-shaped portion to the inner end portion of the first longitudinal track.
22. An interspinous process device, comprising:
- 20 a) a first hook-shaped portion adapted for contacting a first spinous process,
- b) a second hook-shaped portion adapted for contacting an second spinous process,
- c) a connector portion adapted to adjustably connect the first and second hook-shaped portions,
- 25 wherein the first hook-shaped portion has acutely angled contact surface, and wherein the second hook-shaped portion has an obtusely angled contact surface.

23. An interspinous process device, comprising:

- a) a first hook-shaped portion adapted for contacting a superior spinous process,
- b) a second hook-shaped portion adapted for contacting an inferior spinous process,
- 5 c) an arced connector portion adapted to adjustably connect the first and second hook-shaped portions.

24. An interspinous process device, comprising:

- a) a first hook-shaped portion adapted for contacting a superior spinous process,
- b) a second hook-shaped portion adapted for contacting an inferior spinous
10 process,
- c) a connector portion adapted to adjustably connect the first and second hook-shaped portions,

wherein the first and second hook-shaped portions each have an inflection point.

15 25. An interspinous process device, comprising:

- a) a first hook-shaped portion adapted for contacting a superior spinous process,
- b) a second hook-shaped portion adapted for contacting an inferior spinous process,
- 20 c) a connector portion adapted to adjustably connect the first and second hook-shaped portions,

wherein the connector portion comprises first and second track portions having mating grooves.

25

26. An interspinous process device, comprising:

- a) a first hook-shaped portion adapted for contacting a superior spinous process,
- b) a second hook-shaped portion adapted for contacting an inferior spinous process,
- c) an adjustable connector portion adapted to adjustably connect the first and second hook-shaped portions, and
- d) a single lock adapted to lock the adjustable connector portion.

☐ Further documents are listed in the continuation of Box C.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier application or patent but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family

Date of the actual completion of the international search

10 April 2011 (10.04.2011)

Date of mailing of the international search report

19 APR 2011

Name and mailing address of the ISA/US
