(54) Title: PACKAGING POUCH WITH FOOD FLOW PROPERTIES

(57) Abstract: In a packaging pouch made of a flexible mono or multilayer film for packaging viscous jelly and/or gravy matrix food, in which a thermo cycle such as retort, pasteurisation, hot filling or aseptic conditions are applicable, the surface of a layer of the film forming the pouch inner walls or a surface coating on the film being in contact with food comprises a substance having the effect that the surface tension of the layer or the surface coating on the layer is 24 mN/m or less and the pouch inner walls being in contact with food exhibit easy flow properties. The substance comprises a graft polymer having a polyolefin based acrylic copolymer backbone with the general structure \([\text{CH}_2\text{CRiCOO(CH}_3\text{)jCH}_3\text{]_n[CH}_2\text{CRiCOO(CH}_3\text{)j(CF}_2\text{)jCF}_3\text{]}\), with \(R = \text{H}, \text{CH}_3, R_i = \text{H}, \text{CH}_3, 0 < p < 35; 0 < q < 15; 40 > y/x > 0.03.\)

Packaging Pouch with Food Flow Properties

The invention relates to a packaging pouch made of a flexible mono or multilayer film for packaging viscous jelly and/or gravy matrix food, in which a thermo cycle such as retort, pasteurisation, hot filling or aseptic conditions are applicable, wherein the surface of a layer of the film forming the pouch inner walls or a surface coating on the film being in contact with food comprises a substance having the effect that the surface tension of the layer or the surface coating on the layer is 24 mN/m or less and the pouch inner walls being in contact with food exhibit easy flow properties.

Nowadays cooked and ready meals for human and pet consumption are really common. A conspicuous part of such food is sold in flexible flat/pillow or stand-up pouches. Pouches are produced and filled in line or as a two-step production. During the filling process several ingredients are inserted in solid and liquid states while the pouch is kept open. After filling, the pouch is sealed on the top and may pass through a thermal process for pasteurisation or sterilisation. However, part of the ingredients during filling can touch the inner walls of the pouch, and if this material does not flow down inside the pouch quickly, it will contaminate the sealing area and the pouch will not be sealed completely compromising food integrity.

A possible technological solution is to use ultrasonic sealing tool that is normally an expensive investment and not suitable for all material structures. With the same principle, when the consumer will empty the pouch, part of the meal will get in contact with pouch walls, and food which is not fast flowing out of the pouch will be quite inconvenient for the consumer that would need to use tools or shake/squeeze the pouch with the risk to spread food around. In case of pet food, consumers are even less keen in using a tool or touch the food by
trying to empty the pouch. This explains why having a pouch exhibiting easy and fast flowing of the food along the inner walls can strongly reduce rejections during filling, decrease food safety risk and be an important consumer convenience feature in the field of ready meals and wet pet food in pouches. As an example, ready meal pouches may contain meat, vegetables, rice in gravy or sauce added during filling and juice produced by the food during retort cooking. Pet food pouches may contain meat based food in jelly or gravy and juice produced during retort. Ready sauce pouches may be vegetable, meat or fat (eggs, butter) based and sterilised or pasteurised.

EP-A-1 808 291 discloses a packaging material made of thermoplastic polymers suitable for packaging foods. To prevent pasty and fatty foods from adhering to packaging material, a nonstick composition comprising a fatty ester of a polyhydric alcohol having at least one fatty acid radical per ester molecule with 19 or more carbon atoms is incorporated into at least one selected area of a polymer packaging material. A permanent nonstick effect is observed even if the fatty acid ester is included only in surface-close regions or layers of the packaging material. The outer layer in which the fatty acid ester additive is contained can be a sealing layer. The packaging preferably has the form of a pouch.

WO 2004/050357 A1 discloses a laminate useful in the manufacture of packages for containers, in particular ovenable resistant food containers. The laminate includes a substrate, preferably of a paperboard, and a food contact release layer comprising a blend of polymethylpentene and polypropylene bonded to one side of the substrate. The food contact release layer has a lower surface tension than the food product to come into contact with the release layer and thus offers a good release from food products, particularly those containing high levels of starch and sugar.

WO 2005/092609 A1 discloses a coextruded biaxially oriented PET film with food release properties having a sealable skin layer comprising a hot melt
adhesive resin. The skin layer may further comprise fatty aides, waxes or silicon oils and particulate substances such as silica, clay and calcium carbonate.

WO 2008/009865 A1 discloses a fluoropolymer having antibacterial activity. Onto the fluoropolymer there is grafted at least one unsaturated monomer comprising a functional group functional group providing the antibacterial activity and an anion. The functional group providing antibacterial activity is a quaternary ammonium group, a phosphonium group, or a saturated or unsaturated heterocycle comprising a nitrogen atom, chosen from piperidine, piperazine, morpholine, thiomorpholine, thiazole, isothiazole, pyrazole, indole, indazole, imidazole, benzimidazole, quinoline, isoquinoline, benzotriazole, benzothiazole, benzoisothiazole, benzoazole, benzoazline, isoazole, pyrrole, pyrazine, pyrimidine, pyridazine, quinazoline and acridine.

EP 1 174 457 A1 discloses a biaxially oriented polyester film with release properties in aqueous environment. The film, which is used in metal cans as inner release coating, comprises a polyester in which ethylene terephthalate units and/or ethylene naphthalate units are the main structural components, and a wax compound and/or silicon compound.

US 6 528 134 B1 discloses a coextruded film with release and dead fold properties for packaging cheese. The film comprises three layers of polyethylene or polypropylene and glycerol monostearate as cheese release agent.

From the aforementioned prior art documents, packaging films having antistick or release properties are known.

EP 2 208 604 A1 discloses a packaging pouch made of a flexible mono or multilayer film for packaging viscous jelly and/or gravy matrix food, in which a thermo cycle such as retort, pasteurisation, hot filling or aseptic conditions are
applicable. The surface of a layer of the film forming the pouch inner walls or a surface coating on the film being in contact with food comprises a substance based on a molecule and or molecules system, defined as mixture of different molecular weight and/or molecular structure, functionalised by siloxane and/or fluorinated groups so that the surface tension of the layer or the surface coating on the layer is 24 mN/m or less and the pouch inner walls being in contact with food exhibit easy flow properties.

The object of the present invention is to provide a packaging pouch made of a flexible mono or multilayer film for packaging viscous jelly and/or gravy matrix food, in which a thermo cycle such as retort, pasteurisation, hot filling or aseptic conditions may be applicable, and which exhibits easy food flow properties of the pouch inner walls being in contact with food. The surface layer of pouch inner walls being in contact with food are typically polypropylene or polyethylene based sealing layers.

The aforementioned objective is achieved by way of the invention in that the substance comprises

a graft polymer having a polyolefin based acrylic copolymer backbone with the general structure

\[
[\text{CH}_2\text{CROO} \ (\text{CH}_2)_p\text{CH}_3]_x [\text{CH}_2\text{CR}_1\text{COO} \ (\text{CH}_2)_2(\text{CF}_2)_q\text{CF}_3]_y
\]

with \( R = \text{H}, \text{CH}_3; R_1 = \text{H}, \text{CH}_3; 0 < p < 35; 0 < q < 15; 40 > y/x > 0.03 \)

or

a graft polymer having a polysiloxane based acrylic copolymer backbone with the general structure

\[
[\text{CH}_2\text{CROO} \ (\text{CH}_2)_p(\text{SiO(CH}_3)_2)_m(\text{SiO(CH}_3)_3)]_x [\text{CH}_2\text{CR}_1\text{COO} \ (\text{CH}_2)_2(\text{CF}_2)_q\text{CF}_3]_y
\]

with \( R = \text{H}, \text{CH}_3; R_1 = \text{H}, \text{CH}_3; 1 < p < 4; 0 < q < 15; 1 < m < 50; 40 > y/x > 0.03 \)

or
a graft polymer having a polysiloxane / polyolefin based copolymer backbone
with the general structure

$$[\text{CH}_2\text{CRCOO (CH}_2\text{)}_p\text{ (SiO(CH}_3\text{)}_2\text{m (SiO(CH}_3\text{)}_3\text{j)x[CH}_2\text{CRiCOO(CH}_2\text{)}_p\text{CH}_3\text{]}_y]$$

with $R = \text{H, CH}_3$; $\text{Ri} = \text{H, CH}_3$; $1 < p < 4$; $0 < q < 15$; $1 < m < 50$; $40 > y/x > 0.03$

or

a block structure with the extended formula

$$\text{CH}_3\text{(CH}_2\text{)}_{12}\text{CH}_2\text{COO(CF}_2\text{)}_{8}\text{CONHNHCOO(CF}_2\text{)}_{8}\text{COOCH}_2\text{(CH}_2\text{)}_{12}\text{CH}_3$$

of the general structure

![Diagram](image)

with

![Diagram](image)

or

a micro-dispersion of ultra high molecular weight siloxane polymers with a preferred average particle size of 5 $\mu\text{m}$.

Such micro-dispersions are known as Siloxane Masterbatches (Dow Corning®), suitable products are e.g. MB50-001 and MB50-321.

Preferably the surface tension of the layer or the surface coating is 21 mN/m or less.

The pouch can withstand thermo cycles up to 135°C for 90 min. This solution provides easy flow property also in case of aseptic filling application. A further application is related to products making problems during filling operation due
to their rheology. An example is the filling of ketchup sachets where process output makes the difference on the market. Increasing the speed of filling causes problems of product spilling out from the sachet and contaminating the sealing area of the sachet. With the easy flow properties of the packaging material according to the present invention it is possible to increase the process speed without the aforementioned problems.

To measure easy flow properties, there does not exist a scientific method such as for measuring the surface tension. However, it has been found that easy flow properties are correlated to surface tension. Therefore, a methodology and a tool to evaluate easy flowing has been developed by the inventors and will be explained later.

The layer of the film forming the pouch inner walls or the surface coating on the film preferably contains 0.01 to 10 wt.%, more preferably 0.5 to 3 wt.%, of the substance.

The layer of the film forming the pouch inner walls may be a coextruded layer or a monolayer. Since the substance migrates to the surface of layer of the film forming the pouch inner walls being in contact with food, an enrichment of the substance in a surface layer takes place, and consequently the concentration of the substance in this surface layer will increase with time and may therefore be higher than the overall concentration of the substance in the layer.

Preferably the surface of the layer of the film forming the pouch inner walls is polypropylene or polyethylene based.

The substance can be part of an organic or inorganic additive or filler material contained in the layer of the film forming the pouch inner walls or the surface coating on the film providing easy food flow properties. A preferred filler material is fumed silica, e.g. Aerosil® from Evonik.
The layer of the film forming the pouch inner walls can be additivated with additive or filler during production through blown or cast extrusion such as non-oriented, mono- or biaxial oriented film.

The surface coating on the film can be applied e.g. by rotogravure, flexography, spray coating, extrusion coating, curtain coating or atmospheric plasma treatment.

The packaging pouch according to the present invention can be of any shape or design, e.g. a flat pouch or a stand-up pouch, a pouch in the form of a doypack, a pillow, or a cheerpack.

With the packaging pouch according to the present invention easy flow properties are active during filling, i.e. food processing, as well as during food emptying by the consumer when the food is consumed.

The following laminates are examples of packaging materials suitable in the production of packaging pouches according to the present invention:

Polyester/adhesive/polyamide/adhesive/polypropylene
Polyester/adhesive/polyamide/adhesive/polyethylene
Polyester/adhesive/polyester/adhesive/polypropylene
Polyester/adhesive/polyester/adhesive/polyethylene
Polyester/adhesive/aluminium/adhesive/polypropylene
Polyester/adhesive/aluminium/adhesive/polyethylene
Polyester/adhesive/polyethylene
Polyester/adhesive/polypropylene
Polyester/adhesive/polyester/adhesive/polyamide/adhesive/polyethylene
Polyester/adhesive/polyester/adhesive/polyamide/adhesive/polypropylene
Polyester/adhesive/aluminium/adhesive/polypropylene

To provide barrier properties, polyester and/or polyamide of the above
structures without aluminium can be as well coated with a ceramic material, such as SiOx or AlOx, or coated with an organic barrier material. Polyethylene and polypropylene films can be as well coextruded with EVOH and mono- or bi-oriented. Polyester films, such as PET films, can be metallised.

The polyethylene or polypropylene layer is a sealing layer forming the pouch inner walls.

Further advantages, features and details of the invention are revealed in the following description of preferred exemplified embodiments and with the aid of the drawing which shows schematically in

Fig. 1 the apparatus used to evaluate easy flow properties;

Fig. 2 the top view of laminate according to the present invention and standard material at the end of the same easy flow test.

As shown in Fig. 1, a lower end of a leaning table 10 is fixed to a hinge-joint 12. A piston 16 of a cylinder 14 is linked to an upper end of the leaning table 10. The piston 16 can be extended at a constant speed of 0.01 to 1 m/min.

Test strips 18 are fixed on the leaning table 10 in a horizontal starting position, i.e., the tilting angle of the leaning table 10 at the start of each test is 0°. In this position, a portion of food 20 - in the present tests a portion of ketchup - is placed onto the surface of the test strip 18 at a starting line 22. Thereafter the leaning table is pivoted about the hinge-joint 12 from the starting position at 0° to and end position at a tilting angle of 50° within 3 minutes. Immediately when the tilting angle reaches 50°, photos of test strips are taken and visually analysed. The quantity of ketchup used in the tests are drops of 2 ml and 0.5 ml ketchup.

Wettability Tests
Figure 2 a-e show test strips each at the end of the test. The strips shown in Fig. 2 e is a standard polypropylene film without additive, Fig. 2 a-d are based on a polypropylene film with the following additives:

<table>
<thead>
<tr>
<th>Figure</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 a</td>
<td>5 wt% MB50-001</td>
</tr>
<tr>
<td>2 b</td>
<td>10 wt% MB50-001</td>
</tr>
<tr>
<td>2 c</td>
<td>5 wt% MB50-321</td>
</tr>
<tr>
<td>2 d</td>
<td>10 wt% MB50-321</td>
</tr>
</tbody>
</table>

Results:
- Ketchup drops start moving before and faster on the modified samples (Fig. 2 a-d) compared to the standard sample (Fig. 2 e)
- Also the lines drawn by using a black marker are showing a different wettability, the lowest on the left and the highest on the right on the standard product where the ink is perfectly adhering on the surface.
- Seal properties resulted to be in line with standard material.
- All the previous evaluations were made before and after retort.
- No major problems were faced during extrusion of these products.

The test results clearly demonstrate the superiority of an additive according to the present invention on the easy flow properties.

**Surface Tension Tests**

Surface tension measurements have been carried out on film material based on standard polypropylene (PP) with different concentration of graft polymer having a polyolefin based acrylic copolymer backbone with the general structure

\[ [CH_2CRCOO(CH_2)pCH_3]_x[CH_2CRiCOO(CH_2)_{2(CF_2)}_qCF_3]_y \]

with
\[ R = H; Ri = H; p = 29; q = 7; y/x = 15 \] (Copolymer E)
The results are presented in the following table.

Claims

1. Packaging pouch made of a flexible mono or multilayer film for packaging viscous jelly and/or gravy matrix food, in which a thermo cycle such as retort, pasteurisation, hot filling or aseptic conditions are applicable, wherein the surface of a layer of the film forming the pouch inner walls or a surface coating on the film being in contact with food comprises a substance having the effect that the surface tension of the layer or the surface coating on the layer is 24 mN/m or less and the pouch inner walls being in contact with food exhibit easy flow properties, characterised in that the substance comprises

a graft polymer having a polyolefin based acrylic copolymer backbone with the general structure

$$[	ext{CH}_2	ext{C}R	ext{COO}(	ext{CH}_2)p	ext{CH}_{3}]_x[	ext{CH}_2	ext{C}R_1	ext{COO}(	ext{CH}_2)2(	ext{CF}_2)q	ext{CF}_3]_y$$

with $R = H, \text{CH}_3; R_1 = H, \text{CH}_3; 0 < p < 35; 0 < q < 15; 40 > y/x > 0.03$

or

a graft polymer having a polysiloxane based acrylic copolymer backbone with the general structure

$$[	ext{CH}_2	ext{C}R	ext{COO}(	ext{CH}_2)p(	ext{SiO}(	ext{CH}_3)2)m(	ext{SiO}(	ext{CH}_3)3)]_x[	ext{CH}_2	ext{C}R_1	ext{COO}(	ext{CH}_2)2(	ext{CF}_2)q	ext{CF}_3]_y$$

with

$R = H, \text{CH}_3; R_1 = H, \text{CH}_3; 1 < p < 4; 0 < q < 15; 1 < m < 50; 40 > y/x > 0.03$

or

a graft polymer having a polysiloxane / polyolefin based copolymer backbone with the general structure

$$[	ext{CH}_2	ext{C}R	ext{COO}(	ext{CH}_2)p(	ext{SiO}(	ext{CH}_3)2)m(	ext{SiO}(	ext{CH}_3)3)]_x[\text{CH}_2	ext{C}R_1	ext{COO}(	ext{CH}_2)p\text{CH}_3]_y$$
with

\[ R = H, CH_3; R_i = H, CH_3; 1 < p < 4; 0 < q < 15; 1 < m < 50; 40 > y/x > 0.03 \]

or

a block structure with the extended formula

\[ CH_3(CH_2)_{12}CH_2COO(CF_2)_{6}CONHNCOO(CF_2)_{6}COONHNCOO(CF_2)_{6}COOCH_2(CH_2)_{2}CH_3 \]

with the general structure

![Diagram of a block structure with extended formula](image)

or

a micro-dispersion of ultra high molecular weight siloxane polymers with a preferred average particle size of 5 \( \mu m \).

2. Packaging pouch according to claim 1, wherein the surface tension of the layer or the surface coating is 21 mN/m or less.

3. Packaging pouch according to claim 1 or 2, wherein the layer of the film forming the pouch inner walls or the surface coating on the film contains 0.01 to 10 wt.%, preferably 0.5 to 3 wt.%, of the substance.

4. Packaging pouch according to any of claims 1 to 3, wherein the surface of the layer of the film forming the pouch inner walls is polypropylene or polyethylene based.
5. Packaging pouch according to any of claims 1 to 4, wherein the substance is part of an organic or inorganic additive or filler material, preferably fumed silica, contained in the layer of the film forming the pouch inner walls or the surface coating on the film providing easy food flow properties.

6. Packaging pouch according to any of claims 1 to 5, wherein the layer of the film forming the pouch inner walls is additivated with additive or filler during production through blown or cast extrusion such as non-oriented, mono- or biaxial oriented film.

7. Packaging pouch according to any of claims 1 to 6, wherein the surface coating on the film is applied by rotogravure, flexography, spray coating, extrusion coating, curtain coating or atmospheric plasma treatment.

8. Packaging pouch according to any of the preceding claims in the form of a doypack, a stand-up pouch, a pillow, a flat pouch or a cheerpack.
