(54) **Title:** REAL TIME TOOL EROSION PREDICTION MONITORING

FIG. 2

(57) **Abstract:** A method, system and computer-readable medium for estimating a life expectancy of a tool used in a pumping operation is disclosed. A property of the tool is obtained and a pumping parameter of the downhole operation is selected. The pumping parameter is related to erosion of the tool. A value of the pumping parameter is measured during the pumping operation. The life expectancy of the tool is estimated during the pumping operation using the obtained property of the downhole tool and the measured value of the pumping parameter. The value of the pumping parameter may then be changed to a new value in order to affect the life expectancy.

WO 2015/171211 A1

REAL TIME TOOL EROSION PREDICTION MONITORING

CROSS REFERENCE TO RELATED APPLICATIONS

This application claims the benefit of U.S. Application No. 14/271692, filed on May 7, 2014, which is incorporated herein by reference in its entirety.

BACKGROUND OF THE DISCLOSURE

1. Field of the Disclosure

[0001] The present disclosure is related to a method of determining an erosion rate of a tool used in downhole applications and, in particular, to determining a life time of a tool using in-situ measurements of pumping parameters.

2. Description of the Related Art

[0002] Various downhole processes, such as stimulation or fracturing (“fracking”) processes for example, pump erosive fluids and other materials from a surface location to a subterranean formation in order to break up the subterranean formations, thereby causing the release of hydrocarbons. The tools that deliver these erosive materials are also in contact with the erosive fluid and therefore are susceptible to their erosive effects. Such downhole tools thus have an expected lifetime or wear rate that is determined, in part, by their level of exposure to and interaction with the erosive fluids. Therefore, when performing downhole processes, it is desirable to know how long one may be able to use the downhole tools before erosion renders the downhole tool sufficiently useless for its purposes in order that the tools may be replaced on a timely schedule.

SUMMARY OF THE DISCLOSURE

[0003] According to one aspect, the present disclosure provides a method of estimating a life expectancy of a tool used in a pumping operation, the method including: obtaining a property of the tool; selecting a pumping parameter of the downhole operation, wherein the pumping parameter is related to erosion of the tool; measuring a value of the pumping parameter during the pumping operation; and estimating, during the pumping operation, the life expectancy of the tool using the obtained property the downhole tool and the measured value of the pumping parameter.

[0004] According to another aspect, the present disclosure provides a system for estimating a life expectancy of a tool in a pumping operation, the system including: a sensor configured to measure, during the pumping operation, a value of a pumping parameter related

to erosion of the tool; and a processor configured to: obtain a property of the tool, and estimate, during the pumping operation, a life expectancy of the tool using the obtained property the tool and the measured value of the pumping parameter.

[0005] According to yet another aspect, the present disclosure provides a non-transitory computer-readable medium including a set of instructions stored thereon that when accessed by a processor enable the processor to perform a method of estimating a life expectancy of a tool used in a pumping operation, wherein the method includes: obtaining a property of the tool; selecting a pumping parameter of the pumping operation related to erosion of the tool; measuring a value of the pumping parameter during the pumping operation; and estimating, during the pumping operation, the life expectancy of the tool using the obtained property the tool and the measured value of the pumping parameter.

[0006] Examples of certain features of the apparatus and method disclosed herein are summarized rather broadly in order that the detailed description thereof that follows may be better understood. There are, of course, additional features of the apparatus and method disclosed hereinafter that will form the subject of the claims.

BRIEF DESCRIPTION OF THE DRAWINGS

[0007] For detailed understanding of the present disclosure, references should be made to the following detailed description, taken in conjunction with the accompanying drawings, in which like elements have been given like numerals and wherein:

FIG. 1 shows an exemplary completion system suitable for delivery of a fluid from a surface location to a reservoir downhole according to one embodiment of the present disclosure;

FIG. 2 shows a detailed view of surface equipment of the exemplary completion system of **FIG. 1**;

FIG. 3 schematically illustrates a process flow for estimating life expectancy of a tool of the completion system of **FIG. 1** during a pumping operation;

FIG. 4 shows a timeline illustrating multiple calculations of the life expectancy during a pumping process; and

FIG. 5 shows a flowchart illustrating an exemplary method for estimating a life expectancy of a tool used in a pumping operation in one embodiment.

DETAILED DESCRIPTION OF THE DISCLOSURE

[0008] FIG. 1 shows an exemplary completion system **100** suitable for delivery of a fluid from a surface location **104** to a reservoir **114** downhole according to one embodiment of the present disclosure. The exemplary system **100** includes a tool string **120** extending downward from the surface location **104** into a wellbore **110** formed in an earth formation **112**. In various embodiments, the tool string **120** may be a wired pipe and/or a drill pipe that is configured to convey various tool downhole for performing a completion operation. At the surface location **104**, the tool string **120** is coupled to surface equipment **102**. The surface equipment **102** may be suitable for performing various completion operations such as fracturing operations (“fracking”), gravel packing operations, acid stimulation operations, sand control operations, pumping a fluid into the formation, and pumping a proppant into a formation, among others. In an exemplary embodiment, the completion system **100** pumps a fracturing fluid (“frac fluid”), proppant, sand, acid, etc. from the surface location **104** to a downhole location. The surface equipment may further provide systems for control of the downhole equipment and for determining a life expectancy of downhole equipment, in various embodiments. While the exemplary completion system **100** is shown with respect to land-based completions, this is not meant as a limitation of the present disclosure. The methods and systems disclosed herein are equally suitable for ocean rig platforms, etc.

[0009] The exemplary wellbore **110** extends through the earth formation **112** and into a reservoir **114** having a production zone **113**. While only one production zone **113** is shown for illustrative purposes, any number of production zones may be formed as the wellbore **110** extends further into the reservoir **114**. The exemplary wellbore **110** includes a vertical section **110a** and a substantially deviated section **110b**. In various embodiments, the substantially deviated section **110b** may be a horizontal well. The wellbore **110** is lined with a casing **108**. A number of perforations **118** are created in the casing at the production zone **113** in order to create a passage for flow of hydrocarbons from the formation as well as to provide a passage for fluids to be pumped into the production zone **113**. The tool string **120** is shown to include a portion that extends along the deviated section **110b** of the wellbore **110**. An exemplary downhole tool, such as fracture tool assembly **134** (“frac assembly”) is conveyed along the tool string **120** to the production zone **113** to substantially coincide with the axial location of the perforations **118**. The exemplary frac assembly **134** may include a screen **140**. The frac assembly may further include a service tool **142** for controlling various operations of the frac assembly **134**. A sensor sub **144** for measuring downhole parameters associated with the completion operation may be arranged between a top end of the service

tool **142** and to a downhole end of the tool string **120**. The tool string **120** defines an internal axial flowbore **128** along its length. During pumping operations, various fluids and/or solids, such as fracturing fluid and/or proppant are sent downhole through the axial flowbore **128** and into the production zone **113** of the reservoir **114** via the frac assembly **134** and perforations **118**. A proppant may be naturally occurring sand grains or man-made proppants such as resin-coated sand or high-strength ceramic materials like sintered bauxite.

[0010] In an exemplary embodiment, the frac assembly **134** may be isolated within the wellbore **110** by a pair of packer devices **148** and **150**. Sump packer **150** isolates a lower portion of the tool string **120** at an end of the tool string **120**. Although only one frac assembly **134** is shown along the tool string **120**, multiple frac assemblies may be arranged along the tool string **120** when the wellbore includes multiple production zones. The one or more frac assemblies can be located in the vertical section **110a**, deviated section **110b** or both the vertical section **110a** and the deviated section **110b**.

[0011] FIG. 2 shows a detailed view of the surface equipment **102** of the exemplary completion system **100** of FIG. 1. A top end of tool string **120** is shown. A force application device **220** is coupled to the top end of the tool string **120** and may be used to apply a downward (or upward) force on the tool string **120**, for example, during a pumping process. The top end of the tool string **120** further includes an interface sub **204** and a head **202** known as a “frac head.” The frac head **202** is configured for delivery of fracturing fluid and various proppants downhole.

[0012] A fluid mixture source **230** provides a fluid mixture to the frac head **202**. The fluid mixture may include frac fluid and/or proppant in various ratios, compositions, etc. Pump **222** is coupled to the source **230** and pumps the fluid mixture via the conduit **224** into the frac head **202**. From the frac head **202**, the fluid mixture is delivered via tool string **120** to the production zone **113**. The frac fluid of the fluid mixture may contain various chemicals that are corrosive and/or erosive to the equipment, including the tool string **120**, the frac assembly **134** and any other downhole tools that come into contact with the frac fluid during the completion operation or pumping operation. The rate of erosion of the downhole tools may be related to various parameters such as the type of chemical, the flow rate of the fluid mixture, the viscosity of the fluid mixture, etc. Additionally, the proppant may cause erosion of the downhole equipment. The rate of the erosion may be related to various parameters of the proppant, such as the proppant type, the size of the proppant, the proppant density or proppant concentration in the fluid mixture, etc. Such parameters of the frac fluid and of the proppant that affect the erosion of the downhole tools are referred to herein as

“pumping parameters.” It is also noted that the erosion rate of a tool may further be related to a chemical composition of the material tool.

[0013] The signal interface sub **204** may include a sensor **206** that may provide various measurements of the fluid mixture in the tool string **120**, such as fluid flow rate and fluid viscosity. Additional sensors **232**, **234** and **236** also may provide measurements of various other parameters of the fluid, such as proppant type, proppant size, proppant density, etc. In alternate embodiments, additional sensors that may be used to provide additional pumping parameters. The measured values of the pumping parameters may be sent to a control unit **210**. The control unit **210** may use these pumping parameters to determine a life expectancy and/or wear rate of the tool string **120** and/or various downhole tools

[0014] The control unit **210** includes a processor **212** and a memory storage device **216**, which may be a non-transitory memory storage device, such as a solid-state memory, tape or hard disc. The memory storage device **216** stores therein one or more programs **214** that are accessible to the processor **212** for determining various values, such as wear rate, erosion rate, life expectancy of a tool, etc. as well as to operate the various surface equipment **102**. The control unit **210** may store these values to the memory storage device **216** or send these values to a display **218**.

[0015] **FIG. 3** schematically illustrates a process flow for estimating life expectancy of a tool of the completion system **100** during a pumping operation in one embodiment of the present disclosure. The pumping parameters **302** may be obtained from the various sensors (e.g., **206**, **232**, **234**, **236** of **FIG. 2**) or other sensors. Additional information may be provided from databases or by operator input. In one embodiment, the pumping parameters **302** are obtained while the pumping operation is in progress, so that in-situ measurements of fluid velocity, fluid viscosity, proppant concentration, volume, etc. may be obtained. The pumping parameters **302** are provided during the pumping operation to programs **304** which includes various algorithms that determine a rate of wear of a tool for selected values of the pumping data **302**. For example, a wear rate dM/dt may be a function of several variables:

$$\frac{dM}{dt} = f(v, \eta, C_{prop}, V_{prop}, \rho_{prop}) \quad \text{Eq. (1)}$$

where v is a fluid flow rate, η is a fluid viscosity, C_{prop} is a concentration of proppant, V_{prop} is a volume of the proppant and ρ_{prop} is a density of the proppant. Other pumping parameters may also be used to determine wear rate. In addition, any suitable equation or algorithm may be used to determine the wear rate. In a particular example, the wear rate may be determined by:

$$\frac{dM}{dt} = \sum_{p=1}^N \frac{\dot{m}_p C(dp) f(\alpha) v^{b(v)}}{A} \quad \text{Eq. (2)}$$

where \dot{m}_p is a mass flow rate of a p^{th} particle, $C(dp)$ is a physical factor or constant value, $f(\alpha)$ is an angle of impact of the fluid mixture at the downhole tool and v is a velocity of the fluid mixture ($b(v)$ is a velocity-dependent scalar quantity). Additionally, N is a number of particles in the fluid mixture and p is an index for counting the particles of the fluid mixture. The programs 304 provide the estimate of life expectancy and/or wear rate to a display 306. In various embodiments, the estimate may be shown at display 306 in a manner suitable for quick and comprehensive understanding by an operator.

[0016] Once a wear rate of the downhole tool is determined, a life expectancy of the tool may be determined. The life expectancy and/or the wear rate may be used, either by an operator or by the processor (212, FIG. 2) to determine course of action. In one embodiment, one or more of the pumping parameters may be altered so as to either increase or decrease an expected life expectancy of the tool. Alternatively, the processor (212, FIG. 2) may recommend a new value for a pumping parameter to an operator, wherein the new value has an effect on a life expectancy and/or wear rate of the downhole tool. The operator may then review the recommended new value and manually change the pumping parameter to its new value. For example, the fluid flow rate may be either increased or decreased during the pumping operation to achieve a selected life expectancy. Alternatively, the processor (212, FIG. 2) or operator may compare an accumulated time-of-use of the downhole tool to the estimated life expectancy or to a criterion based on the estimated life expectancy (e.g., a selected margin of safety with respect to the estimated life expectancy). When the accumulated time-of-use of the downhole tool matches or exceeds the estimate life expectancy or its related criterion, the processor (212, FIG. 2) or operator may stop or reduce use of the downhole tool. Additionally, maintenance schedules for the downhole tool may be set up with respect to the estimated life expectancy.

[0017] In various embodiments, the life expectancy and/or wear rate may be estimated several times during the pumping operation. The estimated wear rate or estimated life expectancy calculated at a first time during the pumping operation may be used in calculations of life expectancy and wear rate performed at a second time that comes after the first time. FIG. 4 shows a timeline illustrating multiple calculations of the life expectancy during a pumping process. The pumping operation starts at time $T=0$. At time ($T=1$) one or more pumping parameters $PP(T=1)$ are measured and used to determine the life expectancy (LE1) and/or wear rate of the tool. The pumping parameters may be altered at this time based

on the first estimate of life expectancy (LE1). At time ($T=2$), the one or more pumping parameters $PP(T=2)$ are measured. These measurements $PP(T=2)$ and the previously-determined life expectancy (LE1) may be used to calculate a second estimate of life expectancy (LE2). This iterative process may continue as illustrated in **FIG. 4** until a time ($T=T_F$) at which the pumping process ends.

[0018] **FIG. 5** shows a flowchart **500** illustrating an exemplary method for estimating a life expectancy of a tool used in a pumping operation in one embodiment. In **Box 502**, one or more properties of the downhole tool may be obtained (e.g., chemical composition of material of the tool, surface area, simulated flow fields, physical wear data, etc.). In **Box 504**, sensors (e.g., sensors **206, 232, 234, 236** of **FIG. 2**) measure a value of a pumping parameter of a fluid mixture. These values are measured during a pumping operation. In **Box 506**, an estimate is calculated for a life expectancy and/or wear rate of the downhole tool using the obtained property of the downhole tool and the measured value of the pumping parameter. In **Box 508**, a pumping parameter is altered based on the estimate for the life expectancy and/or wear rate. The alteration of the pumping parameter also occurs during the pumping operation. From **Box 508**, the method may return to **Box 504** in order to perform subsequent calculations of life expectancy and/or wear rate. Alternately, the method may proceed from **Box 508** to end at **Box 510**.

[0019] Therefore in one aspect, the present disclosure provides a method of estimating a life expectancy of a tool used in a pumping operation, the method including: obtaining a property of the tool; selecting a pumping parameter of the downhole operation, wherein the pumping parameter is related to erosion of the tool; measuring a value of the pumping parameter during the pumping operation; and estimating, during the pumping operation, the life expectancy of the tool using the obtained property of the downhole tool and the measured value of the pumping parameter. The tool may include, in various embodiments, a cross-over tool, a sand control tool, a gravel pack completion tool, a fracking tool, a pumping tool, etc. The pumping parameter may include a fluid flow rate, a fluid viscosity, a proppant type, a proppant size, a proppant density, etc. Use of the tool may be suspended when an accumulated time-of-use of the tool substantially matches a criterion related to the estimated life expectancy of the tool. The pumping parameter may be altered via a control unit. Alternatively, a new set of pumping parameter may be recommended to an operator. In one embodiment, the life expectancy of the tool may be calculated using or based on a previously-estimated life expectancy.

[0020] In another aspect, the present disclosure provides a system for estimating a life expectancy of a tool in a pumping operation, the system including: a sensor configured to measure, during the pumping operation, a value of a pumping parameter related to erosion of the tool; and a processor configured to: obtain a property of the tool, and estimate, during the pumping operation, a life expectancy of the tool using the obtained property the tool and the measured value of the pumping parameter. In various embodiments, the tool may include a cross-over tool, a sand control tool, a gravel pack completion tool, a fracking tool, a pumping tool, etc. The pumping parameter may include a fluid flow rate, a fluid viscosity, a proppant type, a proppant size, a proppant density, etc. The processor may be further configured to suspend use of the tool when an accumulated time-of-use of the tool substantially matches a criterion related to the estimated life-expectancy of the tool. Also, the processor may alter the pumping parameter during the pumping process in order to affect the life expectancy of the tool or recommend a new value of the pumping parameter to an operator. In one embodiment, the processor estimates the life expectancy of the tool using a previously-estimated life expectancy.

[0021] In yet another embodiment, the present disclosure provides a non-transitory computer-readable medium includes a set of instructions stored thereon that when accessed by a processor enable the processor to perform a method of estimating a life expectancy of a tool used in a pumping operation, the method including: obtaining a property of the tool; selecting a pumping parameter of the pumping operation related to erosion of the tool; measuring a value of the pumping parameter during the pumping operation; and estimating, during the pumping operation, the life expectancy of the tool using the obtained property the tool and the measured value of the pumping parameter. In various embodiments, the tool may include a cross-over tool, a sand control tool, a gravel pack completion tool, a fracking tool, a pumping tool, etc. The pumping parameter may include a fluid flow rate, a fluid viscosity, a proppant type, a proppant size, a proppant density, etc. The method may include suspending use of the tool when an accumulated time-of-use of the tool substantially matches a criterion related to the estimated life-expectancy of the tool. The method may further include at least one of: (i) altering the pumping parameter during the pumping process in order to affect the life expectancy of the tool; and (ii) recommending a new value of the pumping parameter to an operator. Additionally, the method may include estimating the life expectancy of the tool using a previously-estimated life expectancy.

[0022] While the disclosure has been described with reference to an exemplary embodiment or embodiments, it will be understood by those skilled in the art that various

changes may be made and equivalents may be substituted for elements thereof without departing from the scope of the disclosure. In addition, many modifications may be made to adapt a particular situation or material to the teachings of the disclosure without departing from the essential scope thereof. Therefore, it is intended that the disclosure not be limited to the particular embodiment disclosed as the best mode contemplated for carrying out this disclosure, but that the disclosure will include all embodiments falling within the scope of the claims.

CLAIMS

What is claimed is:

1. A method of estimating a life expectancy of a tool used in a pumping operation, comprising:
 - obtaining a property of the tool;
 - selecting a pumping parameter of the downhole operation, wherein the pumping parameter is related to erosion of the tool;
 - measuring a value of the pumping parameter during the pumping operation; and
 - estimating, during the pumping operation, the life expectancy of the tool using the obtained property of the downhole tool and the measured value of the pumping parameter.
2. The method of claim 1, wherein the tool further comprises at least one selected from the group consisting of: (i) a cross-over tool; (ii) a sand control tool; (iii) a gravel pack completion tool; (iv) a fracking tool; and (v) a pumping tool.
3. The method of claim 1, wherein the pumping parameter includes at least one of: (i) a fluid flow rate; (ii) a fluid viscosity; (iii) proppant type; (iv) proppant size; (v) proppant density.
4. The method of claim 1, further comprising suspending use of the tool when an accumulated time-of-use of the tool substantially matches a criterion related to the estimated life-expectancy of the tool.
5. The method of claim 1, further comprising performing at least one of: (i) altering the pumping parameter during the pumping operation to affect the life expectancy of the tool; and (ii) recommending a new value of the pumping parameter to an operator.
6. The method of claim 1, further comprising estimating the life expectancy of the tool using a previously-estimated life expectancy.
7. A system for estimating a life expectancy of a tool in a pumping operation, comprising:
 - a sensor configured to measure, during the pumping operation, a value of a pumping parameter related to erosion of the tool; and
 - a processor configured to:
 - obtain a property of the tool, and
 - estimate, during the pumping operation, a life expectancy of the tool using the obtained property the tool and the measured value of the pumping parameter.

8. The system of claim 7, wherein the tool further comprises at least one selected from the group consisting of: (i) a cross-over tool; (ii) a sand control tool; (iii) a gravel pack completion tool; (iv) a fracking tool; and (v) a pumping tool.

9. The system of claim 7, wherein the pumping parameter includes at least one of: (i) a fluid flow rate; (ii) a fluid viscosity; (iii) proppant type; (iv) proppant size; (v) proppant density.

10. The system of claim 7, wherein the processor is further configured to suspend use of the tool when an accumulated time-of-use of the tool substantially matches a criterion related to the estimated life-expectancy of the tool.

11. The system of claim 7, wherein the processor is further configured to perform at least one of: (i) altering the pumping parameter during the pumping process in order to affect the life expectancy of the tool; and (ii) recommending a new value of the pumping parameter to an operator.

12. The system of claim 7, wherein the processor is further configured to estimate the life expectancy of the tool using a previously-estimated life expectancy.

13. A non-transitory computer-readable medium includes a set of instructions stored thereon that when accessed by a processor enable the processor to perform a method of estimating a life expectancy of a tool used in a pumping operation, the method comprising:
obtaining a property of the tool;
selecting a pumping parameter of the pumping operation related to erosion of the tool;
measuring a value of the pumping parameter during the pumping operation; and
estimating, during the pumping operation, the life expectancy of the tool using the obtained property the tool and the measured value of the pumping parameter.

14. The non-transitory computer-readable medium of claim 13, wherein the tool further comprises at least one selected from the group consisting of: (i) a cross-over tool; (ii) a sand control tool; (iii) a gravel pack completion tool; (iv) a fracking tool; and (v) a pumping tool.

15. The non-transitory computer-readable medium of claim 13, wherein the pumping parameter further includes at least one of: (i) a fluid flow rate; (ii) a fluid viscosity; (iii) proppant type; (iv) proppant size; (v) proppant density.

16. The non-transitory computer-readable medium of claim 13, wherein the method further comprises suspending use of the tool when an accumulated time-of-use of the tool substantially matches a criterion related to the estimated life-expectancy of the tool.

17. The non-transitory computer-readable medium of claim 13, wherein the method further comprises at least one of: (i) altering the pumping parameter during the pumping process in order to affect the life expectancy of the tool; and (ii) recommending a new value of the pumping parameter to an operator.

18. The non-transitory computer-readable medium of claim 13, wherein the method further comprises estimating the life expectancy of the tool using a previously-estimated life expectancy.
