L’invention porte sur un procédé de préparation de cis-6,6-dimethyl-3-oxa-bicyclo[3.1.0]hexan-2-one consistant: soit (1) à faire réagir dans un solvant approprié un ester sulfonique de β,β-diméthyl-γ-(hydroxyméthyl)-γ-butyrolactone avec un compose de formule M(C_{1-6} alkoxide)$_y$, soit (2) à faire réagir dans un solvant approprié un ester alkyleique C$_{1-4}$ d’acide 4,5-époxys,3,3-diméthylpentanoïque avec un composé de formule M(C$_{1-6}$ alkoxide)$_y$. M étant un cation approprié, et y satisfaisant aux exigences de valence.

A process for the preparation of cis-6,6-dimethyl-3-oxa-bicyclo[3.1.0]hexan-2-one which comprises either: 1) reacting a sulphonic ester of β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone with a compound of formula M(C$_{1-6}$ alkoxide)$_y$, in a suitable solvent; or 2) reacting a C$_{1-4}$ alkyl ester of 4,5-epoxy-3,3-dimethylpentanoic acid with M(C$_{1-6}$ alkoxide)$_y$, in a suitable solvent, wherein M is a suitable cation and y fulfills valency requirements.

| (54) Title: | PREPARATION OF CIS-6,6-DIMETHYL-3-OXA-BICYCLO[3.1.0]HEXAN-2-ONE |

| (57) Abstract |

A process for the preparation of cis-6,6-dimethyl-3-oxa-bicyclo[3.1.0]hexan-2-one which comprises either: 1) reacting a sulphonic ester of β,β-dimethyl-γ-(hydroxymethyl)γ-butyrolactone with a compound of formula M(C$_3$-6 alkoxy)$_y$, in a suitable solvent; or 2) reacting a C$_1$-4 alkyl ester of 4,5-epoxy-3,3-dimethylpentanoic acid with M(C$_3$-6 alkoxy)$_y$, in a suitable solvent; wherein M is a suitable cation and $y$ fulfills valency requirements.
PREPARATION OF CIS-6,6-DIMETHYL-3-OXA-BICYCLO(3.1.0)HEXAN-2-ONE

The present invention relates a process for making cyclopropane esters useful in the synthesis of pyrethroids which are useful as pesticides, and to intermediates useful in said process.

Esters of cis-3-(2-chloro-3,3,3-trifluoroprop-1-en-1-yl)-2,2-dimethylcyclopropane carboxylic acid with for example 3-phenoxybenzyl alcohol, α-cyano-3-phenoxybenzyl alcohol and 2-methyl-3-phenylbenzyl alcohol are important insecticidal and acaricidal products, and esters of this acid are important intermediates in the manufacture of such products. These products are all chiral and it is preferred to manufacture such products as single enantiomers or in enantiomerically enriched form.

An asymmetric synthesis of single enantiomers of 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one involving a trans- to cis-isomerisation step from a hydroxyester precursor is described in Tet. Lett., 1983, 24, 103. The conversion of the resulting 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one to deltamethrin is also described.

The use of L-proline as a chiral auxiliary for the asymmetric synthesis of 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one (I) from methyl 4,5-epoxy-3,3-dimethylpentanoate to give a mixture of cis- and trans-cyclopropyl isomers is described in Heterocycles, 1985, 23, 2859. This methodology does not enable the geometry of the cyclopropyl ring to be controlled. This reference also describes rearrangement of epoxyester (IIIa) to lactone (I) and trans-hydroxyester (Vla) but, under the reaction conditions, (Vla) cannot be rearranged to form (I), viz:

\[
\text{IIIa) } \xrightarrow{\text{LiN(SiMe}_3)_2} \xrightarrow{\text{HCO}_2\text{Me}} \text{HO} H_\text{CO}_2\text{Me} + \text{H}_2\text{CO}_2\text{H}
\]

Thus, it is desirable to prepare cis-pyrethroid acids (see, for example, pyrethroid acids of formula (V) in Scheme 1) using a process under which any trans-isomer formed will be rearranged to the cis-form.

The present invention provides a process for the preparation of cis-6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one which comprises either:

a) reacting a sulphonic ester of β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone with a compound of formula M(C_{1-4} alkoxide), in a suitable solvent;

or
b) reacting a C_{1-4} alkyl ester of 4,5-epoxy-3,3-dimethylpentanoic acid with M(C_{1-6} alkoxide),
   in a suitable solvent;

wherein M is a suitable cation and y fulfills valency requirements.

It is preferred that the C_{1-4} alkoxide is an alkoxide that can function both as a base and a
nucleophile, such as tert-butoxide.

It is preferred that M is an alkali metal salt (especially sodium or potassium), an alkaline earth
metal (especially calcium or magnesium) or an organic cation (especially a quaternary ammonium
such as NH_4 or N(CH_3)_4). It is especially preferred that M is sodium or potassium.

Alkyl esters of 4,5-epoxy-3,3-dimethylpentanoic acid are preferably the methyl or ethyl esters
of that acid.

Sulphonic esters of β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone include C_{1-4}
alkylsulphonyl and phenylsulphonyl (wherein phenyl is optionally substituted with C_{1-4} alkyl) esters,
such as the mesyl and tosyl esters.

In one aspect the present invention provides a process for the preparation of cis-6,6-dimethyl-
3-oxabicyclo[3.1.0]hexan-2-one which comprises either:

a) forming a sulphonic ester of β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone; and,

b) reacting the sulphonic ester with a compound of formula M(C_{1-6} alkoxide), in a suitable
   solvent;

or

reacting a C_{1-4} alkyl ester of 4,5-epoxy-3,3-dimethylpentanoic acid with M(C_{1-6} alkoxide), in
a suitable solvent;

wherein M is a suitable cation and y fulfills valency requirements.

Sulphonic esters of β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone can be formed, for
example, by adaptation of literature methods or by reacting an appropriate hydroxymethyl lactone
with a suitable sulphonyl chloride in the presence of a suitable base or mixture of bases (such as a
tri(C_{1-4} alkyl)amine or a di(C_{1-4} alkyl)aminopyrididine) in a suitable solvent.

In yet another aspect the present invention provides a sulphonic ester of β,β-dimethyl-γ-
(hydroxymethyl)-γ-butyrolactone.

One of the advantages of the present invention is that any enantiomeric excess present in β,β-
dimethyl-γ-(hydroxymethyl)-γ-butyrolactone is preserved and, thus, the process of the present
invention also allows the preparation of enantiomERICALLY enriched cis-6,6-dimethyl-3-
oxabicyclo[3.1.0]hexan-2-one which, in turn, can be used to prepare enantiomerically enriched pyrethroid acids.

Thus, in another aspect the present invention provides a process for the preparation of enantiomerically enriched cis-6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one which comprises:

a) forming enantiomerically enriched β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone;

b) forming a sulphonic ester of the enantiomerically enriched β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone; and,

c) reacting the sulphonic ester with a compound of formula M(C_{1-6} alkoxide)_{y}, in a suitable solvent;

wherein M is a suitable cation and y fulfills valency requirements.

In a further aspect the present invention provides a process for the preparation of enantiomerically enriched cis-6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one which comprises:

a) performing a Sharpless asymmetric dihydroxylation on a C_{1-4} alkyl ester of 3,3-dimethyl-4-pentenoate to form enantiomerically enriched β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone;

b) forming a sulphonic ester of the enantiomerically enriched β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone; and,

c) reacting the sulphonic ester with a compound of formula M(C_{1-6} alkoxide)_{y}, in a suitable solvent;

wherein M is a suitable cation and y fulfills valency requirements.

6,6-Dimethyl-3-oxabicyclo[3.1.0]hexan-2-one produced according to the present invention is preferably enantiomerically enriched and has an enantiomeric excess greater than 90%, preferably greater than 98%.

The term “enantiomeric excess” is defined as:

\[
\frac{\text{(% major enantiomer)} - \text{(% minor enantiomer)}}{\text{(% major enantiomer)} + \text{(% minor enantiomer)}}
\]

Enantiomerically enriched β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone can be prepared by Sharpless asymmetric dihydroxylation of a C_{1-4} alkyl ester of 3,3-dimethyl-4-pentenoate (see, for example, HC Kolb, MS Vannieuwenhze & KB Sharpless, Chemical Reviews, (1994) 94(8) 2483-2547, or H Becker & KB Sharpless, Angew. Chem. Int. Ed. Eng. (1996) 35 448-451); or by bioreolution (see, for example SM Robert, K Wiggins & G Casy (eds.) "Preparative
Biotransformations - Whole cells and isolated enzymes in organic synthesis* John Wiley & Sons, (1993)).

In a further aspect the present invention provides a process for the preparation of a compound of formula (VI):

(VI)

in enantiomerically enriched form, wherein X and Y are, independently, halogen, C<sub>1-3</sub> alkyl or C<sub>1-3</sub> haloalkyl, which comprises:

a) forming enantiomerically enriched β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone (such as by Sharpless asymmetric dihydroxylation or bioresolution);

b) forming a sulphonic ester of the enantiomerically enriched β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone;

c) reacting the sulphonic ester with a compound of formula M(C<sub>1-4</sub> alkoxide), in a suitable solvent to form enantiomerically enriched 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one;

d) reducing the enantiomerically enriched 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one under suitable conditions (such as using DIBAL in the presence of a solvent at low temperature) to provide a compound of formula (VII) in enantiomerically enriched form; and,

e) ring opening said compound of formula (VII) (such as by adaptation of methodologies described in S Takano, M Tanaka, K Seo, M Hirama & K Ogasawara, J. Org. Chem. (1985) 50 931-936 or J Tessier Chem Ind (1984) 199 which describe the conversion of a lactol to a dimethylvinyl cyclopropane derivative);

wherein M is a suitable cation and y fulfills valency requirements.

Halogen includes fluorine, chlorine or bromine.

C<sub>1-3</sub> Alkyl and C<sub>1-3</sub> haloalkyl groups include methyl and trifluoromethyl.

In a still further aspect the present invention provides a process for the preparation of a compound of formula (V):
in enantiomerically enriched form, wherein X and Y are, independently, halogen, C_{1-3} alkyl or C_{1-3} haloalkyl, which comprises:

a) forming enantiomerically enriched β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone (such as by Sharpless asymmetric dihydroxylation or bioresolution);

b) forming a sulphonic ester of the enantiomerically enriched β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone;

c) reacting the sulphonic ester with a compound of formula M(C_{1-6} alkoxide)$_n$ in a suitable solvent to form enantiomerically enriched 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one;

d) reducing the enantiomerically enriched 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one under suitable conditions to provide a compound of formula (VII) in enantiomerically enriched form;

e) ring opening said compound of formula (VII) to provide a compound of formula (VI) in enantiomerically enriched form; and,

wherein M is a suitable cation and y fulfills valency requirements.

It is preferred that the process of the invention is conducted without isolating the sulphonic ester of β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone.

The process of the present invention, together with synthesis of the relevant starting materials, is illustrated in Scheme 1 below, wherein R is C_{1-4} alkyl and R’ is the residue of a sulphonic acid (such as a C_{1-4} alkylsulphonic acid or a phenylsulphonic acid (wherein phenyl is optionally substituted with C_{1-4} alkyl), such as methanesulphonic acid or p-toluenesulphonic acid).
Although the compounds of formulae (I), (V), (VI) and (VII) are represented in Scheme 1 in enantiomeric forms, the invention is not limited to these forms, but covers all possible enantiomeric forms of these compounds.

Scheme 1

As shown in Scheme 1, lactone of formula (I) may be converted into pyrethroid acids (V) via a process involving reduction to the corresponding lactol (for example using diisobutylaluminium hydride (DIBAL)) followed by opening of the resulting lactol (for example using a Wittig reaction as described in *J. Org. Chem.*, 1985, 50(7), 931-936) and finally oxidising the product so formed to the corresponding pyrethroid acid (for example as described in *Indian J. Chem. Sect. B*, 1991, 30(6), 574-

Examples of compounds of formula (V) include compounds having purely cis-cyclopropyl ring geometry, in racemic mixture, enantiomerically enriched or single enantiomer form, of various pyrethroid acids such as the compounds wherein: X=Y=bromine (deltamethrin acid), X=Y=methyl
(chrysanthemic acid), X=chlorine and Y=methyl (permethrin acid) or X=chlorine and 
Y=trifluoromethyl (cyhalothrin acid).

Typically compound (I) can be made by reacting a compound of formula (IIa) or (III) with a 
suitable alkoxide (such as potassium tert-butoxide) in a suitable solvent (preferably an ether (such as 
tetrahydrofuran) or a polar solvent (such as N,N-dimethylformamide)) at an elevated temperature 
(such as in the range 10-100°C).

A compound of formula (IIa) can be prepared by reacting a compound of formula (II) with a 
suitable sulphonic acid chloride (such as mesyl chloride or tosyl chloride) in the presence of a 
suitable base (such as triethylamine) in a suitable inert solvent (such as dichloromethane) preferably 
at ambient temperature.

A compound of formula (III) can be prepared by oxidising a compound of formula (IV) with a 
suitable oxidising agent (such as a peroxy acid (for example m-chloroperoxybenzoic acid)) at 
ambient temperature in an inert solvent (such as dichloromethane).

The invention is illustrated by, but not limited to, the following Examples.

**Example 1**

This Example illustrates the preparation of racemic 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-
one (I).

**Step A.** preparation of methyl 4,5-epoxy-3,3-dimethylpentanoate (III)

To a 500ml flask was added m-chloroperoxybenzoic acid (20g, taken as 66%) followed by 
dichloromethane (DCM, 235ml). The solution was stirred and methyl 3,3-dimethyl-4-pentenoate 
(10g) injected at room temperature. The reaction mixture was then left overnight. About 17hours 
later the reaction was quenched with saturated Na₂SO₄ solution (150ml) and the resulting mixture 
extracted with dichloromethane (3 x 50ml). The extracts were washed with saturated NaHCO₃ 
solution, brine and dried (MgSO₄). The solvent was evaporated to leave the sub-titled product 10.9g 
(98%). NMR showed this to be pure and therefore needed no further purification.

¹H NMR (CDCl₃): δ 3.674(3H,s), 2.906(H,dd, J=2.9, 4.0Hz), 2.707-2.621(2H,d), 
2.364(1H,d), 2.275(H,d), 1.015(3H,s), 0.995(3H,s)ppm.

**Step B.** preparation of 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one (I)

Potassium tert-butoxide (0.43g) was weighed into a 25ml flask and the flask fitted with a 
condenser and charged with argon and tetrahydrofuran (THF, 8.5ml). The solution was stirred and 
the epoxide from Step A (0.4g) injected. The flask was then immersed in an oil bath at 75°C. After
45 minutes the flask was removed from the oil bath and left to cool for 5 minutes before quenching the reaction mixture with hydrochloric acid (5M, 5ml). The resulting solution was extracted with diethyl ether, washed with NaHCO₃ solution, brine and dried (MgSO₄). The solvent was evaporated to leave the title compound (0.317g, 99%). Gas chromatography and NMR showed the title product to require no further purification.

¹H NMR (CDCl₃): δ 4.372 (H, dd, J=9.9, 5.5 Hz), 4.155 (H, dt, J=9.9, 1.1 Hz), 2.0515 (H, ddd, J=6.04, 5.5, 1.1 Hz), 1.953 (H, dd, J=6.04, 1.1 Hz), 1.185 (3H, s), 1.176 (3H, s) ppm.

Example 2

This Example illustrates the preparation of enantiomerically enriched β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone (II).

A jacketed vessel was cooled to 0°C with a circulating coolant. To the vessel was added tert-butanol (44.0ml) followed by water (44.0ml), K₂Fe(CN)₆ (69.2g), K₂CO₃ (29g), OsO₄ (4.5ml of a 4% solution in water) and (DHQD)₂PYR (0.62g; see J. Org. Chem. 58 3785 (1993)). The resulting mixture was stirred for 10 minutes, methyl-3,3-dimethyl-4-pentenoate (10g) added and the reaction mixture stirred for 3 days at 0°C. After quenching with saturated sodium thiosulphate solution (50ml) the aqueous was extracted with diethyl ether. The organic extracts were combined, washed with brine, dried (MgSO₄) and evaporated to leave a crude product. The crude product was recrystallised from diethyl ether and petroleum ether 30/40 to give the title compound (97% yield).

¹H NMR (CDCl₃): δ 4.165 (H, dd, J=4.9, 4.4 Hz), 3.808 (2H, m), 2.491 (H, d, J=17.0 Hz), 2.318 (H, d), 1.207 (3H, s), 1.127 (3H, s) ppm.

Example 3

This Example illustrates the preparation of enantiomerically enriched 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one (I).

Step A, preparation of methanesulfonic acid 3,3-dimethyl-5-oxo-tetrahydrofuran-2-ylmethyl ester (IIa)

To a 250 ml flask was added DCM (170 ml), 4-(N,N-dimethylamino)pyridine (DMAP, 0.4g), and triethylamine (3.5ml), the flask was then flushed with argon and cooled in an ice bath to 0°C. The resulting solution was stirred and mesyl chloride (2.9ml) injected first followed by hydroxymethyl lactone (II) (prepared in Example 2; 5g). The resulting mixture was stirred for 1 hour before quenching with NH₄Cl solution (100ml). The aqueous was extracted with DCM (3 x 60ml), the extracts were combined, washed with NaHCO₃ solution, brine and dried (MgSO₄). The solvent
was evaporated to leave a residue (8.8g) which was purified by column chromatography on silica using DCM (40%), diethyl ether (40%) and petroleum ether 40/60 (20%) as eluant leaving the desired ester (7.09g, 92%).

\(^1\)H NMR (CDCl\(_3\)): \(\delta 4.474-4.320(3H, m), 3.092(3H, s), 2.438(2H, s), 1.278(3H, s), 1.157(3H, s)\)ppm.

**Step B. preparation of 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one (I)**

To a 25 ml flask was added potassium tert-butoxide (0.22g) and dry DMF (6.7ml). The flask was then filled with argon and a condenser fitted. The ester from Step A (0.22g) was added with vigorous stirring and the flask immersed in an oil bath at 80°C. (Gas chromatography showed the reaction to be complete after 20 minutes with the formation of only the cis-cyclopropane.) The reaction was quenched after 20 minutes with hydrochloric acid (5M, 3m) and the aqueous extracted with diethyl ether. The ether extracts were combined, washed with brine, dried (MgSO\(_4\)) and the solvent evaporated to leave a residue (0.61g) which was purified by chromatography on silica, using 40% diethyl ether in petroleum ether 40/60 as eluant to leave the title compound (0.116g, 93% yield, enantiomeric excess 99.0%).

\(^1\)H NMR (CDCl\(_3\)): \(\delta 4.372(1H, dd, J = 9.9, 5.5\)Hz), \(4.155(1H, dt, J = 9.9, 1.1\)Hz), \(2.0515(1H, ddd, J = 6.04, 5.5, 1.1\)Hz), \(1.953(1H, dd, J = 6.04, 1.1\)Hz), \(1.185(3H, s), 1.176(3H, s)\)ppm.

Enantiomeric excess was measured under the following conditions:

- **Column:** GPN (Gamma cyclodextrin propionyl) 10m x 0.25mm
- **Injector type/temperature:** Split/250°C
- **Detector type/temperature:** FID/250°C
- **Column head pressure:** 5psi
- **Oven temperature:** Isocratic at 130°C
- **Load:** 1µg
- **Split:** 100ml/min

**Example 4**

This Example illustrates the preparation of 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-ol (VII).

Dry THF (53ml) and DIBAL solution (9.5ml of a 1M in dichloromethane, 1.2eq) under argon were cooled to -78°C before injecting 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one (Example 3, 1g). The mixture was left overnight to warm to room temperature and quenched with hydrochloric acid...
(5M) over 5minutes. The aqueous was extracted with diethyl ether, the ether extracts were combined, washed with saturated NaHCO₃ solution and brine, and then dried (MgSO₄). The solvent was evaporated to leave a residue which was chromatographed on silica using an eluent of diethyl ether (40%) petroleum ether 40/60 (60%) to give the title product (88%).

¹H NMR (CDCl₃): δ 5.213(1H,d, J =4.4Hz), 4.143(1H,m), 3.777(1H,d, J =8.24Hz), 1.5225(2H,m), 1.039(3H,s), 1.033(3H,s)ppm.
CLAIMS

1. A process for the preparation of cis-6,6-dimethyl-3-oxa-bicyclo[3.1.0]hexan-2-one which comprises either:
   a) reacting a sulphonic ester of β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone with a compound of formula M(C_{1-6} alkoxide), in a suitable solvent;
   or
   b) reacting a C_{1-4} alkyl ester of 4,5-epoxy-3,3-dimethylpentanoic acid with M(C_{1-6} alkoxide), in a suitable solvent;
   wherein M is a suitable cation and y fulfills valency requirements.

2. A process as claimed in claim 1 which comprises either:
   a) forming a sulphonic ester of β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone; and,
   b) reacting the sulphonic ester with a compound of formula M(C_{1-6} alkoxide), in a suitable solvent;
   or
   reacting a C_{1-4} alkyl ester of 4,5-epoxy-3,3-dimethylpentanoic acid with M(C_{1-6} alkoxide), in a suitable solvent;
   wherein M is a suitable cation and y fulfills valency requirements.

3. A process as claimed in claim 1 or 2 which comprises:
   a) forming enantiomerically enriched β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone;
   b) forming a sulphonic ester of the enantiomerically enriched β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone; and,
   c) reacting the sulphonic ester with a compound of formula M(C_{1-6} alkoxide), in a suitable solvent;
   wherein M is a suitable cation and y fulfills valency requirements.
4. A process for the preparation of a compound of formula (VI):

\[
\text{(VI)}
\]

in enantiomERICally enriched form, wherein \( X \) and \( Y \) are, independently, halogen, \( C_{1-3} \) alkyl or \( C_{1-3} \) haloalkyl, which comprises:

a) forming enantiomERICally enriched \( \beta,\beta\text{-dimethyl-}\gamma\text{-}(\text{hydroxymethyl})\text{-}\gamma\text{-butyrolactone;} \)

b) forming a sulphonic ester of the enantiomERICally enriched \( \beta,\beta\text{-dimethyl-}\gamma\text{-}(\text{hydroxymethyl})\text{-}\gamma\text{-butyrolactone;} \)

c) reacting the sulphonic ester with a compound of formula \( M(C_{1-8} \text{ alkoxide}), \) in a suitable solvent to form enantiomERICally enriched 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one;

d) reducing the enantiomERICally enriched 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one under suitable conditions to provide a compound of formula (VII):

\[
\text{(VII)}
\]

in enantiomERICally enriched form; and,

e) ring opening said compound of formula (VII);

wherein \( M \) is a suitable cation and \( y \) fulfills valency requirements.

5. A process for the preparation of a compound of formula (V):

\[
\text{(V)}
\]

in enantiomERICally enriched form, wherein \( X \) and \( Y \) are, independently, halogen, \( C_{1-3} \) alkyl or \( C_{1-3} \) haloalkyl, which comprises:

a) forming enantiomERICally enriched \( \beta,\beta\text{-dimethyl-}\gamma\text{-}(\text{hydroxymethyl})\text{-}\gamma\text{-butyrolactone (such as by Sharpless asymmetric dihydroxylation or bioresolution);} \)
b) forming a sulphonic ester of the enantiomerically enriched β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone;

c) reacting the sulphonic ester with a compound of formula M(C_{1-6} alkoxide)ₙ in a suitable solvent to form enantiomerically enriched 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one;

d) reducing the enantiomerically enriched 6,6-dimethyl-3-oxabicyclo[3.1.0]hexan-2-one under suitable conditions to provide a compound of formula (VII):

\[ \text{structure diagram of VII} \]

in enantiomerically enriched form;

e) ring opening said compound of formula (VII) to provide a compound of formula (VI):

\[ \text{structure diagram of VI} \]

in enantiomerically enriched form; and,

f) oxidising said compound of formula (VI) under suitable conditions; wherein M is a suitable cation and y fulfills valency requirements.

6. A process as claimed in any one of the preceding claims wherein the C_{1-6} alkoxide is tert-butoxide.

7. A process as claimed in any one of the preceding claims wherein M is sodium or potassium.

8. A sulphonic ester of β,β-dimethyl-γ-(hydroxymethyl)-γ-butyrolactone.
