THERAPEUTICALLY ACTIVE ESTRATRIENTHIAZOLE DERIVATIVES AS INHIBITORS OF 17 B-HYDROXYSTEROID DEHYDROGENASE, TYPE 1

FIELD OF THE INVENTION

The present relates to novel estrone C-15 thiazole derivatives, to their pharmaceutically acceptable salts, and their use in therapy. The invention further relates to pharmaceutical compositions comprising these compounds as active ingredients.

BACKGROUND OF THE INVENTION

17p-hydroxysteroid dehydrogenases (17p-HSDs), also known as 17-ketosteroid reductases (17-KSR) are NAD(H)- and/or NAPD(H)-dependent alcohol oxidoreductase enzymes which catalyse the last and key step in formation of all estrogens and androgens. More specifically 17p-HSDs catalyse the dehydrogenation (oxidation) of 17-hydroxysteroids into corresponding 17-ketosteroids or hydrogenation (reduction) of inactive 17-ketosteroids into corresponding active 17-hydroxysteroids.

As both estrogens and androgens have the highest affinity for their receptors in the 17p-hydroxy form, the 17p-HSD/KSRs regulate the biological activity of the sex hormones. At present, 15 human members of 17p-HSDs have been described (type 1 - 15). Different types of 17p-HSD/KSRs differ in their substrate and cofactor specificities. The 17KSR activities convert low-activity precursors to more potent forms while 17p-HSD activities decrease the potency of estrogens and androgens and consequently may protect tissues from excessive hormone action.

Each type of 17β-HSD has a selective substrate affinity and a distinctive, although in some cases overlapping, tissue distribution.

Type 1 17p-hydroxysteroid dehydrogenase (17p-HSD1) is most abundantly expressed in the ovarian granulosa cells of the developing follicles in ovaries and in human placenta, both being estrogen biosynthetic tissues. In addition 17p-HSD1 is expressed in estrogen target tissues, including breast, endometrium and bone. The human 17p-HSD1 is specific to estrogenic substrates and in vivo catalyzes the reduction of estrone to estradiol.

Type 2 17p-hydroxysteroid dehydrogenase (17p-HSD2) on the other hand converts estradiol, testosterone and 5a-dihydrotestosterone to their less active forms estrone, androstenedione and 5a-androstanedione, respectively. Due to its wide and abundant expression in number of various estrogen and androgen target tissues, such as uterus, placenta, liver and the gastroin-
testinal and urinary tracts, it has been suggested that type 2 enzyme protects tissues from excessive steroid actions.

Estradiol (E2) is about 10 times as potent as estrone (E1) and about 80 times as potent as estratriol (E3) in its estrogenic effect. In contrast to certain other estrogens, estradiol binds well to both estrogen receptors ERα and ERβ, and thus regulates the expression of a variety of genes.

Although both 17p-HSD1 and 17p-HSD2 are present in healthy pre-menopausal humans, increased ratio of 17p-HSD1 to 17-HSD2 in the tumors of postmenopausal patients with hormone-dependent breast cancer has been shown in several studies. 17HSD1 gene amplification and loss of heterozygosity of 17HSD2 allele are potential mechanisms involved to increased reductive estrogen synthesis pathway in breast tumors. Increased ratio of type 1 enzyme to type 2 enzyme results in an increased level of estradiol that then promotes the proliferation of the cancerous tissue via the estrogen receptors (ER). High levels of estrogen thus support certain cancers such as breast cancer and cancer of the uterine lining i.e. endometrial cancer and uterine cancer.

Similarly it has been suggested that 17p-HSD2 is down-regulated in endometriosis while both aromatase and 17p-HSD1 are expressed or up-regulated in comparison with normal endometrium. This again results in the presence of high concentration of estradiol (E2) which drives the proliferation of the tissue. Similar mechanism has been elucidated in uterine leiomyoma (uterine fibroids) and endometrial hyperplasia.

Reduction of the endogenous estradiol concentration in affected tissues will result in reduced or impaired proliferation of 17p-estradiol cells in said tissues and may thus be utilized in prevention and treatment of malignant and benign estradiol dependent pathologies. Due to the proposed involvement of 17p-estradiol in a number of malignant and benign pathologies, inhibitors of 17β-hydroxysteroid dehydrogenases, that can be used to impair endogenous production of estradiol from estrone, can have therapeutic value in the prevention or the treatment of such disorders or diseases are in great demand.

International application WO2008/034796 relates to estratrien triazoles suitable for use in treatment and prevention of steroid hormone dependent diseases or disorders requiring the inhibition of a 17p-hydroxysteroid dehydrogenases such as 17β-HSD type 1, type 2 or type 3 enzyme. Inhibitors of 17β-HSD type 3 enzyme have been disclosed in WO99/46279.

**BRIEF DESCRIPTION OF THE INVENTION**

An object of the present invention is to provide compounds useful in treating disorders and diseases associated with increased level of estradiol and/or treatable by inhibition of 17β-HSD1 enzyme. It is further an object of the present invention to provide compounds that show little or no inhibitory effect on 17p-HSD2 enzyme.

One of the problems associated with the known 17β-HSD1 inhibitors is the disposition, in particular the metabolic stability, of the compounds. It is therefore yet a further object of the present invention to provide compounds with improved metabolic stability.

GENERAL PREPARATION METHODS

Compounds of the present invention may be prepared by methods known in the art.

The following examples illustrate the preparation of compounds of formula (I).

General information

Commercial grade reagents and solvents were used without further purification. Thin-layer chromatography (TLC) was performed on Merck-plates; pre-coated aluminum sheets. Visualization of plates was done the following techniques: 1) ultraviolet illumination (254 nm), 2) dipping the plate into anisal-
dehye or vanillin solution followed by heating. 1H-NMR spectra were measured with a Bruker DPX (200 MHz) spectrometer with the solvent as indicated.

**Preparation of synthesis starting materials and precursors**

Compound VII may be synthesized as disclosed in Messinger et al. Mol Cell Endocrinol. 2009 (301) 216-224. The detailed synthesis of compound VII starting from estrone has been described in the Solvay Pharmaceuticals' PCT applications WO2005/047303 and WO2006/125800.

Benzyl-C15-C1 6-dehydroestrone II was prepared in five steps from estrone according to previously described methods. The compound II was treated with an allylic Grignard reagent in the presence of cuprous iodide and lithium chloride in temperature -78 °C. Hydroboration by borane tetrahydrofuran complex at room temperature (rt) to compound III and following hydrogen peroxide oxidation in alkaline conditions produced diol IV in over 90% yields. Jones oxidation in acetone-water afforded acid V, which was debenzylated by hydrogenation to compound VI by using Pd/C as a catalyst. The final step was the amide formation affording the β-thiazole VII.

The phenolic VII was acetylated by using acetyl chloride or acetic anhydride in the presence of pyridine to the compound I. The synthesis of the key precursor i.e. the phenolic thiazole VII is shown below.
Compound IX

3-((1S, 5R)-3-Methoxy-1, 7-oxo-7,8,9,11,12,13,14,15,16,17-decahydro-6H-cyclopenta[a]phenanthren-1-yl)-propionic acid

The compound VI (2.0 g, 100 mol-%) was dissolved in acetone (40 ml). Potassium carbonate (200 mol-%) and methyl iodide (500 mol-%) were added and stirred at rt overnight. Additional amounts of methyl iodide (200 mol-%) and potassium carbonate (100 mol-%) were added and refluxed for 10 hours. The solvent was evaporated. The precipitate was dissolved in methanol (50 ml) and 2M NaOH-solution was added until pH was >12. The reaction mixture was stirred at rt for 4 hours. The reaction mixture was acidified by HCl. The product was extracted with dichloromethane (DCM) (3 x 30 ml), washed several times with water and finally with brine. The amount of the product IX was 1.95 g; the yield was 94%.

H-NMR (CDCl3): 1.05 (s, 3H), 1.45-2.48 (m, 19H), 2.93 (m, 2H), 3.79 (s, 3H), 6.70 (m, 2H), 7.20 (d, 1H).

Inhibition of 173-hydroxysteroid dehydrogenase type 1 enzyme

17β-SD1 production and isolation: Recombinant baculovirus was generated by the "Bac to Bac Expression System" (Invitrogen). Recombinant bacmid was transfected to Sd9 insect cells using "Cellfectin Reagent" (Invitrogen). 60 h later cells were harvested; the microsomal fraction was isolated as described by Puranen, T.J., Poutanen, M.H., Peltoketo, H.E., Vihko, P.T. and Vihko, R.K. (1994) Site-directed mutagenesis of the putative active site of human 17 β-hydroxysteroid dehydrogenase type 1. Biochem. J. 304: 289-293. Aliquots were stored frozen until determination of enzymatic activity.

Assay - Inhibition of recombinant human 17β-SD1: Recombinant protein (1 µg/ml) was incubated in 20 mM KH₂PO₄ pH 7.4 with 30 nM estrone (including 800 000 cpm/ml of ³H-estrone) and 1 mM NADPH for 30 min at RT, in the presence of the potential inhibitor at concentrations 1 µM or 0.1 µM. Inhibitor stock solutions were prepared in DMSO. Final concentration of DMSO was adjusted to 1% in all samples. The enzyme reaction was stopped by addition of 10% trichloroacetic acid (final concentration). Samples were centrifuged in a microtiter plate at 4000 rpm for 10 min. Supernatants were applied to reverse phase HPLC on a Waters Symmetry C18 column, equipped with a Waters Sentry Guard column. Isocratic HPLC runs were per-
formed at RT at a flow rate of 1 ml/min in acetonitrile:water 48:52 as running solvent. Radioactivity was monitored in the eluate by a Packard Flow Scintillation Analyzer. Total radioactivity for estrone and estradiol were determined in each sample and percent conversion of estrone to estradiol was calculated according to the following formula:

\[
\text{% conversion} = 100 \times \frac{[(\text{cpm estradiol in sample with inhibitor})]}{[(\text{cpm estrone in sample with inhibitor}) + (\text{cpm estradiol in sample with inhibitor})]} \times \frac{[(\text{cpm estradiol in sample without inhibitor})]}{[(\text{cpm estrone in sample without inhibitor}) + (\text{cpm estradiol in sample without inhibitor})]}.
\]

Percent inhibition was calculated flowingly: % inhibition = 100 - % conversion

The values % inhibition were determined for exemplified compounds and the results are summarized in Table 2.

**Inhibition of the 173-hydroxysteroid dehydrogenase type 2 enzyme**

**17β-HSD2 production and isolation:** Similarly to 17p-HSD1 the recombinant baculovirus was generated by the "Bac to Bac Expression System" (Invitrogen). Recombinant bacmid was transfected to Sd9 insect cells using "Cellfectin Reagent" (Invitrogen). 60 h later cells were harvested and supernatant were fractionated by the following protocol:

- cells were dissolved into 40 ml of A-buffer (40 mM TRIS, pH8.0, 20% glycerol, 20 µM NAD, 0.4 mM PMSF, 150 mM NaCl, 0.5% dodecyl-β-maltoside + protease inhibitor cocktail)
- cells were sonicated
- lysate was incubated on ice for 15 min
- lysate was centrifuged 5000 rpm 15 min, +4°C
- centrifugation of the supernatant 180 000 g 30 min, +4°C
- pellet was dissolved into 8 ml of A-buffer
- not resuspended material was removed by centrifugation 5000 rpm 15 min, +4°C
- the clear supernatant was divided into 100 µl aliquots and were stored frozen until determination of enzymatic activity.
The amount of 17p-HSD2 was analysed by immunoblotting and total protein concentration of each extract batch was determined.

**Assay - Inhibition of recombinant human 17p-HSD2:** Recombinant protein (4 μg/ml) was incubated in 20 mM KH2PO4 pH 8.5 with 50 nM estradiol (including 800 000 cpm/ml of 3H-estradiol) and 1 mM NADH for 30 min at RT, in the presence of the potential inhibitor at concentrations 1 μM or 0.1 μM. Inhibitor stock solutions were prepared in DMSO. Final concentration of DMSO was adjusted to 1% in all samples. The enzyme reaction was stopped by addition of 10% trichloroacetic acid (final concentration). Samples were centrifuged in a microtiter plate at 4000 rpm for 10 min. Supernatants were applied to reverse phase HPLC on a Waters Symmetry C18 column, equipped with a Waters Sentry Guard column. Isocratic HPLC runs were performed at RT at a flow rate of 1 ml/min in acetonitrile:water 48:52 as running solvent. Radioactivity was monitored in the eluate by a Packard Flow Scintillation Analyzer. Total radioactivity for estrone and estradiol were determined in each sample and percent conversion of estradiol to estrone was calculated according to the following formula:

\[

\]

Percent inhibition was calculated flowingly: % inhibition = 100 - % conversion

The values % inhibition were determined for exemplified compounds and the results are summarized in Table 2.

**Estrogen Receptor Binding Assay**

The binding affinity of the compounds of the invention to the estrogen receptor a (ERa) may be determined according to the in vitro ER binding assay described by Koffmann et al REF. Alternatively, an estrogen receptor binding assay may be performed according to international patent application WO2000/07996.
Estrogen Receptor Transactivation Assays

Compound of the invention showing binding affinity towards the estrogen receptor may be further tested with regard to their individual estrogenic or anti-estrogenic potential (Agonistic or antagonistic binding to the ERα or ERβ). The determination of the estrogen receptor antagonistic activity may be performed according to an in vitro assay system using the MMTV-ERE-LUC reporter system for example described in US patent application US2003/0170292.

Metabolic Stability Assay

The in vitro metabolic stability of the compounds of the invention was determined for exemplified compounds using human liver microsome and homogenate incubations. The incubation time points used with or without appropriate cofactors were 0 min and 60 min. Samples were collected at both time points and substrates were detected using LC/PDA/TOF-MS. In vitro metabolic stability (% remaining after 60 min in human liver homogenate or microsomes) of the compounds were calculated and the results are summarized in Table 3.

INTERNATIONAL SEARCH REPORT

Box No. II  Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. ☐ Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III  Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fees, this Authority did not invite payment of additional fees.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

   7, 8, 10-19(completely) ; 1-6, 9, 20-30(partially)

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant’s protest and, where applicable, the payment of a protest fee.

☐ The additional search fees were accompanied by the applicant’s protest but the applicable protest fee was not paid within the time limit specified in the invitation.

☒ No protest accompanied the payment of additional search fees.
