

[Claim 8]

in the step of causing the wall surfaces to fix and hold the member, a position of the member in the space is determined by the wall surfaces. The manufacturing method according to claim 7, wherein in the step of causing the wall surfaces to fix and hold the member, the member is positioned in the space such that regions that are respectively formed in at least one of the substrates and in the member are linked.

[Claim 9]

The manufacturing method according to claim 8, wherein in the step of causing the wall surfaces to fix and hold the member, the thermocompression of the substrates is performed at a temperature which is higher than the heat distortion temperature of the thermoplastic resin that forms the substrates and which is lower than the heat distortion temperature of the material that forms the member.
