BACKGROUND

Packaging the 3 billion nucleotides of the human genome into the nucleus of a cell requires tremendous compaction. To accomplish this feat, DNA in our chromosomes is wrapped around spools of proteins called histones to form dense repeating protein/DNA polymers known as chromatin. Far from serving as mere packaging modules, chromatin templates form the basis of a newly appreciated and fundamentally important set of gene control mechanisms termed epigenetic regulation. By conferring a wide range of specific chemical modifications to histones and DNA, epigenetic regulators modulate the structure, function, and accessibility of our genome, thereby exerting a tremendous impact on gene expression. Hundreds of epigenetic effectors have recently been identified, many of which are chromatin-binding or chromatin-modifying enzymes. Significantly, an increasing number of these enzymes have been associated with a variety of disorders such as cancer. Thus, therapeutic agents directed against this emerging class of gene regulatory enzymes promise new approaches to the treatment of human diseases.

There is currently a need for compounds that inhibit of KDM2 demethylases for treating hyperproliferative diseases.

The terms "measurable affinity" and "measurably inhibit," as used herein, refer to a measurable reduction in activity of a KDM2b enzyme between: (i) a sample comprising a compound as described herein and such KDM2b enzyme, and (ii) an equivalent sample comprising such KDM2b enzyme, in the absence of said compound.

"Pharmaceutically acceptable salts" include both acid and base addition salts.

"Pharmaceutically acceptable acid addition salt" refers to those salts which retain the biological effectiveness and properties of the free bases and which are not biologically or otherwise undesirable, formed with inorganic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, carbonic acid, phosphoric acid and the like, and organic acids may be selected from aliphatic, cycloaliphatic, aromatic, alariphatic, heterocyclic, carboxylic, and sulfonic classes of organic acids such as formic acid, acetic acid, propionic acid, glycolic acid, gluconic acid, lactic acid, pyruvic acid, oxalic acid, malic acid, maleic acid, malonic acid, succinic acid, fumaric acid, tartaric acid, citric acid, aspartic acid, ascorbic acid, glutamic acid, anthranilic acid, benzoic acid, cinnamic acid, mandelic acid, embonic acid, phenylacetic acid, methanesulfonic acid, ethanesulfonic acid, benzenesulfonic acid, p-toluenesulfonic acid, salicylic acid and the like.

"Pharmaceutically acceptable base addition salts" include those derived from inorganic bases such as sodium, potassium, lithium, ammonium, calcium, magnesium, iron, zinc, copper, manganese, aluminum salts and the like. Particularly base addition salts are the ammonium,
potassium, sodium, calcium and magnesium salts. Salts derived from pharmaceutically
acceptable organic nontoxic bases includes salts of primary, secondary, and tertiary amines,
substituted amines including naturally occurring substituted amines, cyclic amines and basic ion
exchange resins, such as isopropylamine, trimethylamine, diethylamine, triethylamine,
tripropylamine, ethanolamine, 2-diethylaminoethanol, tromethamine, dicyclohexylamine, lysine,
arginine, histidine, caffeine, procaine, hydrabamine, choline, betaine, ethylenediamine,
glucosamine, methylglucamine, theobromine, purines, piperazine, pipendine, N-ethylpiperidine,
polyamine resins and the like. Particularly organic non-toxic bases are isopropylamine,
diethylamine, ethanolamine, tromethamine, dicyclohexylamine, choline, and caffeine.

The term "tautomer" or "tautomeric form" refers to structural isomers of different
energies which are interconvertible via a low energy barrier. For example, proton tautomers
(also known as prototropic tautomers) include interconversions via migration of a proton, such
as keto-enol and imine-enamine isomerenations. Valence tautomers include interconversions by
reorganization of some of the bonding electrons.

A "solvate" refers to an association or complex of one or more solvent molecules and a
compound or pharmaceutically acceptable salt thereof as described herein. Examples of
solvents include water, isopropanol, ethanol, methanol, DMSO, ethyl acetate, acetic acid and
ethanolamine. The term "hydrate" refers to the complex where the solvent molecule is water.

"Therapeutically effective amount" refers to an amount of a a compound or
pharmaceutically acceptable salt thereof as described herein that (i) treats the particular disease,
condition or disorder, (ii) attenuates, ameliorates or eliminates one or more symptoms of the
particular disease, condition, or disorder, or (iii) prevents or delays the onset of one or more
symptoms of the particular disease, condition or disorder described herein. In the case of
cancer, the therapeutically effective amount of the drug may reduce the number of cancer cells;
reduce the tumor size; inhibit (i.e., slow to some extent and preferably stop) cancer cell
infiltration into peripheral organs; inhibit (i.e., slow to some extent and preferably stop) tumor
metastasis; inhibit, to some extent, tumor growth; and/or relieve to some extent one or more of
the symptoms associated with the cancer. For cancer therapy, efficacy can, for example, be
measured by assessing the time to disease progression (TTP) and/or determining the response
rate (RR). In the case of immunological disorders, the therapeutic effective amount is an
amount sufficient to decrease or alleviate an allergic disorder, the symptoms of an autoimmune
and/or inflammatory disease, or the symptoms of an acute inflammatory reaction (e.g. asthma).
In some embodiments, a therapeutically effective amount is an amount of a chemical entity
described herein sufficient to significantly decrease the activity or number of drug tolerant or drug tolerant persisting cancer cells.

"Treatment" (and variations such as "treat" or "treating") refers to clinical intervention in an attempt to alter the natural course of the individual or cell being treated, and can be performed either for prophylaxis or during the course of clinical pathology. Desirable effects of treatment include one or more of preventing occurrence or recurrence of disease, alleviation of symptoms, diminishment of any direct or indirect pathological consequences of the disease, stabilized (i.e., not worsening) state of disease, preventing metastasis, decreasing the rate of disease progression, amelioration or palliation of the disease state, prolonging survival as compared to expected survival if not receiving treatment and remission or improved prognosis.

In certain embodiments, a compound as described herein is used to delay development of a disease or disorder or to slow the progression of a disease or disorder. Those individuals in need of treatment include those already with the condition or disorder as well as those prone to have the condition or disorder, (for example, through a genetic mutation or aberrant expression of a gene or protein) or those in which the condition or disorder is to be prevented.

In certain embodiments, liquid oral compositions optionally further comprise one or more adjuvant, such as a wetting agent, a suspending agent, a sweetening agent, a flavoring agent and a perfuming agent.

Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution, suspension or emulsion in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, U.S.P. and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any
bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the preparation of injectables.

Injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium prior to use.

In order to prolong the effect of a compound as described herein, it may be desirable to slow the absorption of the compound from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the compound then depends upon its rate of dissolution that, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered compound form is accomplished by dissolving or suspending the compound in an oil vehicle. Injectable depot forms are made by forming microencapsule matrices of the compound in biodegradable polymers such as polylactide-polyglycolide. Depending upon the ratio of compound to polymer and the nature of the particular polymer employed, the rate of compound release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the compound in liposomes or microemulsions that are compatible with body tissues.

In certain embodiments, the composition for rectal or vaginal administration are formulated as suppositories which can be prepared by mixing a compound as described herein with suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a suppository wax, for example those which are solid at ambient temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the compound.

Example dosage forms for topical or transdermal administration of a compound as described herein include ointments, pastes, creams, lotions, gels, powders, solutions, sprays, inhalants or patches. The compound as described herein is admixed under sterile conditions with a pharmaceutically acceptable carrier, and optionally preservatives or buffers. Additional formulation examples include an ophthalmic formulation, ear drops, eye drops, transdermal patches. Transdermal dosage forms can be made by dissolving or dispensing the compound as described herein in medium, for example ethanol or dimethylsulfoxide. Absorption enhancers can also be used to increase the flux of the compound across the skin. The rate can be controlled by either providing a rate controlling membrane or by dispersing the compound in a polymer matrix or gel.
Nasal aerosol or inhalation formulations of a compound as described herein may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other conventional solubilizing or dispersing agents.

In certain embodiments, pharmaceutical compositions may be administered with or without food. In certain embodiments, pharmaceutically acceptable compositions are administered without food. In certain embodiments, pharmaceutically acceptable compositions of this invention are administered with food.

Specific dosage and treatment regimen for any particular patient will depend upon a variety of factors, including age, body weight, general health, sex, diet, time of administration, rate of excretion, drug combination, the judgment of the treating physician, and the severity of the particular disease being treated. The amount of a compound as described herein in the composition will also depend upon the particular compound in the composition.

In one embodiment, the therapeutically effective amount of the compound of the invention administered parenterally per dose will be in the range of about 0.01-100 mg/kg, alternatively about 0.1 to 20 mg/kg of patient body weight per day, with the typical initial range of compound used being 0.3 to 15 mg/kg/day. In another embodiment, oral unit dosage forms, such as tablets and capsules, contain from about 5 to about 100 mg of the compound of the invention.

An example tablet oral dosage form comprises about 2 mg, 5 mg, 25 mg, 50 mg, 100 mg, 250 mg or 500 mg of a compound as described herein, and further comprises about 95-30 mg anhydrous lactose, about 5-40 mg sodium croscarmellose, about 5-30 mg polyvinylpyrrolidone (PVP) K30 and about 1-10 mg magnesium stearate. The process of formulating the tablet comprises mixing the powdered ingredients together and further mixing with a solution of the PVP. The resulting composition can be dried, granulated, mixed with the magnesium stearate and compressed to tablet form using conventional equipment. An example of an aerosol formulation can be prepared by dissolving about 2-500 mg of a compound as described herein, in a suitable buffer solution, e.g. a phosphate buffer, and adding a tonifier, e.g. a salt such sodium chloride, if desired. EXEMPLIFICATION

As depicted in the Examples below, in certain exemplary embodiments, compounds are prepared according to the following general procedures. It will be appreciated that, although the general methods depict the synthesis of certain compounds, the following general methods, and other methods known to one of ordinary skill in the art, can typically be applied to all compounds and subclasses and species of each of these compounds, as described herein.

The general synthetic methods illustrated in Schemes 1-2 were used to prepare the compounds of the Examples as detailed below.
Treatment of β-ketoesters as exemplified by formula A in an organic solvent such as, but not limited to, DCM with trifluoromethanesulfonic anhydride in the presence of an organic base.
such as, but not limited to, diisopropylethyl amine at a temperature of -78° C can provide the
5 corresponding vinyl-triflate. Treatment of the vinyl-triflate with a nucleophile such as, but not
limited to, an alkyl stannane in the presence of a catalyst such as, but not limited to, palladium
triphenylphosphine tetrakis can then provide unsaturated esters as exemplified by
10 formula B. These entities can then be reduced using conditions such as, but not limited to,
hydrogenation in the presence of palladium to predominantly afford the cis-diastereomers of the
corresponding BOC-protected piperidine esters as exemplified by formula C. Both cis
diastereomers can then be transformed into the weinreb amide by treating with $\gamma$,O-
dimethylhydroxylamine hydrochloride in the presence of isopropylmagnesium chloride in an
organic solvent such as, but not limited to, THF at a temperature between -78° C and 0° C. The
weinreb amides can then be converted to the corresponding ketones as exemplified by formula
D under conditions such as, but not limited to, lithium halogen exchange conditions with both
commercially available and custom synthesized arylbromides. The BOC group can then be
cleaved to reveal the free amine of the piperidine sub-unit by exposure to strong acid such as,
but not limited to, trifluoroacetic acid in an organic solvent such as, but not limited to, DCM.
Next, the free amine can be treated with ketones and aldehydes in the presence of a reducing
agent such as, but not limited to, sodium triacetoxyborohydride or treated with alkylhalides in
the presence of an organic base such as, but not limited to, diisopropylethylamine to produce
N-alkylated piperidine ketones as exemplified by formula E. In addition, the cis-enantiomers can
25 be transformed into the corresponding frara-enantiomers exemplified by formula F by exposure
to a strong base such as, but not limited to, sodium ethoxide in an organic solvent such as, but
not limited to ethanol.

Alternatively, the unsaturated esters exemplified by formula C can be converted to the
corresponding weinreb amides as exemplified by formula G through previously described
30 conditions. These intermediates can then be BOC deprotected and TV-alkylated using previously
described conditions to afford the N-alkylated weinreb amides as exemplified H. These entities
can then be converted into the corresponding aryl ketones as exemplified by formula E using
previously described conditions.

To a solution of tert-bu\textsubscript{X}y\textsubscript{3}-(6-methoxynaphthalene-2-carbonyl)piperidine-1-carboxylate (1.666 g, 4.51 mmol) in DCM (5 mL) was added TFA (5.142 g, 45.1 mmol). The mixture was stirred at
room temperature for 1 h. The mixture was concentrated to give (6-methoxynaphthalen-2-yl)(piperidin-3-yl)methanone as a colorless oil and used directly without purification.

A mixture of (6-methoxy-2-naphthyl)-(3-piperidyl)methanone (67.3 mg, 0.25 mmol), iodoethane (46.8 mg, 0.300 mmol) and K$_2$CO$_3$ (41.5 mg, 0.3 mmol) in EtOH (1 mL) was heated at 85 °C for 1 h. The mixture was cooled to room temperature, filtered, washed with EtOAc, and concentrated. The crude product was purified by preparative reverse phase HPLC to give the title compound (52.4 mg, 70.5% yield) as a light yellow oil. $^1$H NMR (400 MHz, DMSO-$d_6$) $\delta$ 8.60 (d, $J = 1.58$ Hz, 1H), 8.06 (d, $J = 9.02$ Hz, 1H), 7.96 - 7.86 (m, 2H), 7.40 (d, $J = 2.62$ Hz, 1H), 7.26 (dd, $J = 2.56$, 8.99 Hz, 1H), 3.92 (s, 3H), 3.72 (tt, $J = 3.53$, 10.88 Hz, 1H), 3.02 - 2.92 (m, 1H), 2.87 (d, $J = 11.01$ Hz, 1H), 2.35 (qd, $J = 2.99$, 7.15 Hz, 2H), 2.05 (t, $J = 10.76$ Hz, 1H), 1.87 (td, $J = 3.87$, 10.67 Hz, 2H), 1.76 - 1.63 (m, 2H), 1.45 - 1.30 (m, 1H), 0.98 (t, $J = 7.14$ Hz, 3H). Synthesis of Intermediates:

Intermediate 9: iV-methoxy-N-methyl-l-propylpiperidine-3-carboxamide

A solution of tert-butyl 3-(methoxy(methyl)carbamoyl)piperidine-l-carboxylate (1.0 g, 3.7 mmol) in 5 mL of DCM was charged with 5 mL of TFA and stirred at room temperature for one hour. The mixture was then concentrated in vacuo and azeotroped twice with toluene. The residue was then diluted with 5 mL of THF and 5 mL of methanol and charged with propionaldehyde (450 mg, 7.7 mmol) and Sodium Triacetoxyborohydride (1.6 g, 7.7 mmol). The mixture was then stirred at room temperature for one hour and concentrated in vacuo. The mixture was then diluted with ethyl acetate and water. The aqueous was discarded and the organic layer was washed once with water, dried over Na2SO4, filtered, and concentrated in
vacuo. The residue was then purified by silica-gel chromatography (1-10% MeOH in DCM) to afford the title compound (600 mg, 73% yield).

**Synthesis of Final Compounds:**

**Example 90: [3-(diniethylamino)phenyl]-(1-propyl-3-piperidyl)methanone**

A solution of 3-bromo-\(N,N\)-dimethylaniline (140 mg, 0.7 mmol) in 1.2 ml of THF was cooled to -78°C and charged with 2.5 M n-butyl lithium (0.28 ml, 0.7 mmol). After stirring at -78°C for 5 minutes, \(N\)-methoxy-\(N\)-methyl-1-propylpiperidine-3-carboxamide (75 mg, 0.35 mmol) dissolved in 250 ul of THF was added dropwise. The mixture was then allowed to warm to room temperature and stirred at room temperature for 30 minutes. The mixture was diluted with ethyl acetate and saturated NaHCO₃. The aqueous was discarded and the organic layer was dried over magnesium sulfate and concentrated in vacuo. The residue was then purified by preparatory HPLC (Phenomenex Gemini-NX, 20-60% ACN in \(\text{NH}_4\text{OH}\) (aq)) to afford the title compound (31 mg, 31% yield). \(^1\)H NMR (400 MHz, DMSO-\(d_6\)) \(\delta\) 7.32 (t, \(J = 7.9\) Hz, 1H), 7.26 - 7.19 (m, 1H), 7.14 (t, \(J = 2.2\) Hz, 1H), 6.98 (dd, \(J = 8.3, 2.7\) Hz, 1H), 3.51 (tt, \(J = 10.6, 3.6\) Hz, 1H), 3.29 (s, 4H), 2.94 (s, 5H), 2.94 - 2.85 (m, 1H), 2.80 (dt, \(J = 11.4, 3.7\) Hz, 1H), 2.23 (t, \(J = 7.4\) Hz, 2H), 1.99 (t, \(J = 10.7\) Hz, 1H), 1.92 - 1.76 (m, 2H), 1.72 - 1.57 (m, 2H), 1.47 - 1.36 (m, 2H), 1.39 - 1.24 (m, 2H), 0.83 (t, \(J = 7.3\) Hz, 3H). Synthesis of Intermediates

Intermediate 10: /er/-butyl 3-(methoxy(methyl)carbamoyl)-4-methylpiperidine-1-carboxylate

5

Step 1:

4-methylpiperidine-3-carboxylic acid

To a solution of 4-methylnicotinic acid (10.0 g, 73.0 mmol) in AcOH (200 mL) was added PtO₂ (1.0 g). The mixture was stirred at 25 °C under H₂ atmosphere (50 psi) for 72 h and filtered through a short pad of Celite. The filtrate was concentrated to give the crude 4-methylpiperidine-3-carboxylic acid (10.0 g, 96% yield) as a colorless oil. This crude was used directly without further purification.

Step 2:

l-(tert-butoxycarbonyl)-4-methylpiperidine-3-carboxylic acid

To a stirred and cooled (0 °C) solution of 4-methylpiperidine-3-carboxylic acid (10.0 g, 70 mmol) in THF (200 mL) and water (200 mL) was added Na₂CO₃ (22.2 g, 210 mmol) and (Boc)₂O (15.1 g, 70 mmol). After addition, the mixture was allowed to warm to 25 °C, and stirred for 2 h. The solvent was removed under reduced pressure, and the residue was purified by column chromatography (petroleum ether: ethyl acetate = 2:1) to afford the title compound (10.0 g, 58.8 % yield) as a colorless oil.

Step 3:

tert-butyl 3-(methoxy(methyl)carbanioyl)-4-methylpiperidine-1-carboxylate

To a stirred and cooled (0 °C) solution of l-(tert-butoxycarbonyl)-4-methylpiperidine-3-carboxylic acid (10.0 g, 41.3 mmol) in THF (300 mL) was added CDI (8.0 g, 49.6 mmol). After addition, stirring was continued for 1 h, then N,N'-dimethylhydroxylamine hydrochloride (4.8 g, 49.6 mmol) and 1¾N (7.7 g, 49.6 mmol) was added. The resulting mixture was stirred at 25 °C for 17 h, at which time TLC showed the completion of the reaction. The solvent was removed under reduced pressure. The residue was dissolved in ethyl acetate (200 mL) and washed...
successively with 0.5 N aq. HCl (50 mL), sat aq. Na$_2$CO$_3$ (50 mL) and brine (50 mL). The organic layer was dried over Na$_2$SO$_4$ and evaporated under reduced pressure. The residue was purified by silica-gel chromatography (petroleum ether: ethyl acetate = 5:1) to give tert-butyl 3-(methoxy(methyl)carbamoyl)-4-methylpiperidine-1-carboxylate (8.5 g, 72.0% yield) as a pale yellow solid.

The combined organic layers were washed with water (3 *100 mL), brine (100 mL), dried (Na₂SO₄) and concentrated under reduced pressure. The residue was purified by silica-gel chromatography (petroleum ether: ethyl acetate = 10: 1) to give the title compound (5.0 g, 71% yield) as a white solid.

Synthesis of final compounds

In many of the Examples below, enantiomers and diastereomers are exemplified by alphabetical designations following the numerical designation. For example, 1a and 1b designations would refer to the two enantiomers of example 1. In addition, 2a, 2b, 2c, and 2d designations would refer to the four diastereomers of example 2. Moreover, when enantiomers or diastereomers are designated, super-fluid chromatography (SFC) using the conditions described per example were used for purification. When racemic mixtures are exemplified, purification by methods other than SFC were used and enantiomers or diastereomers were not separated.

Examples 109a and 109b: (1-(cyclopropylmethyl)piperidin-3-yl)(3-methoxyphenyl)methanone
Step 1:

**tert-butyl\ 3-(3-methoxybenzoyl)piperidine-l-carboxylate**

To a stirred and cooled (-78 °C) solution of 1-bromo-3-methoxybenzene (187 mg, 1.0 mmol) in THF (10 mL) was added n-BuLi (2.5 M in hexane, 0.4 mL, 1.0 mmol). After addition, stirring at -78 °C was continued for 1 h, and then a solution of **tert-butyl 3-(methoxy(methyl)carbamoyle)\piperidine-l-carboxylate** (Intermediate 10) (272 mg, 1.0 mmol) in THF (5 mL) was added dropwise. The resulting mixture was warmed up to room temperature and stirred for additional 2 h, at which time TLC indicated the reaction was completed. The mixture was quenched by addition of saturated aqueous NFLCl (10 mL) and extracted with ethyl acetate (3 x 30 mL). The combined organic layers were washed with brine, dried over Na₂S0₄ and concentrated under reduced pressure, to give crude **tert-butyl 3-(3-methoxybenzoyl)piperidine-l-carboxylate** (160 mg, 50% yield). This crude was used directly without further purification.

**Step 2:**

To a solution of **tert-butyl 3-(3-methoxybenzoyl)piperidine-l-carboxylate** (160 mg, 0.5 mmol) in ethyl acetate (5 mL) was added HCl/ethyl acetate (2 M, 5 mL, 10 mmol). The mixture was stirred for 1 h at room temperature. The solvent was removed under reduced pressure to give the crude **(3-methoxyphenyl)(piperidin-3-yl)\methanone hydrochloride** (128 mg, 99% yield). This crude was used directly in next step without further purification.

**Step 3:**

**(1-(cycIopropyImethyl)piperidin-3-yl)(3-methoxyphenyl)\methanone**

A solution of **(3-methoxyphenyl)(piperidin-3-yl)\methanone hydrochloride** (128 mg, 0.5 mmol), cyclopropanecarbaldehyde (70 mg, 1.0 mmol) and triethyl amine (2 mL) in dichloromethane (10 mL) was stirred at room temperature for 1 h before NaBH(OAc)₃ (212 mg, 1.0 mmol) was added to the mixture. The mixture was stirred for another 1 h and then quenched by addition of saturated aqueous NH₄Cl (5 mL). The solution was extracted with dichloromethane (2 x 20 mL). The combined organic layers were dried (Na₂S0₄) and concentrated under reduced pressure. The crude was first purified by reverse phase HPLC, then the enantiomers were separated by supercritical fluid chromatography (SFC) to provide 26.7 mg of 109a and 46.3 mg of 109b.

Example 149:

(l-cyclobutylpiperidin-3-yl)(2-(methylsulfonyl)-1,2,3,4-tetrahydroisoquinolin-6-yl)methanone

Example 149:
Step 1: tert-butyl 3-(2-(methylsulfonyl)-1,2,3,4-tetrahydroisoquinoline-6-carbonyl)piperidine-1-carboxylate

To a stirred and cooled (0 °C) solution of tert-butyl 3-(2-benzyl-1,2,3,4-tetrahydro isoquinoline-6-carbonyl)piperidine-1-carboxylate (430 mg, 1.0 mmol) and Et$_3$N (1.5 mL) in dichloromethane (30 mL) was added 1-chloroethyl carbonochloridate (0.5 mL). The mixture was stirred at room temperature for 3 h and the solvent was evaporated. The residue was dissolved in MeOH (30 mL), stirred for another 16 h and then evaporated under reduced pressure to give crude tert-butyl 3-(2-(methyl sulfonyl)-1,2,3,4-tetrahydroisoquinoline-6-carbonyl)piperidine-1-carboxylate (200 mg, 58% yield).

To a solution of the above crude and Et$_3$N (1.5 mL) in dichloromethane (10 mL) was added MsCl (0.5mL). The mixture was stirred for 12 h and then evaporated under reduced pressure to give crude tert-butyl 3-(2-(methylsulfonyl)-1,2,3,4-tetrahydro isoquinoline-6-carbonyl)piperidine-1-carboxylate (240 mg, 99% yield).

Step 2:
(2-(methylsulfonyl)-1,2,3,4-tetrahydroisoquinolin-6-yl)(piperidin-3-yl)methanone hydrochloride

To a solution of tert-butyl 3-(2-(methylsulfonyl)-1,2,3,4-tetrahydroisoquinoline-6-carbonyl)piperidine-1-carboxylate (211 mg, 0.5 mmol) in ethyl acetate (5 mL) was added HCl (2 N in ethyl acetate, 5 mL). The mixture was stirred at room temperature for 1 h and then evaporated under reduced pressure to give the title compound (177 mg, 99% yield).

Step 3:
(1-cyclobutylpiperidin-3-yl)(2-(methylsulfonyl)-1,2,3,4-tetrahydroisoquinolin-6-yl)methanone

A solution of (2-(methylsulfonyl)-1,2,3,4-tetrahydroisoquinolin-6-yl)(piperidin-3-yl) methanone hydrochloride (177 mg, 0.5 mmol), cyclobutanone (70 mg, 1.0 mmol) and Et$_3$N (2 mL) in dichloromethane (10 mL) was stirred at room temperature for 1 h. Then NaBH(OAc)$_3$ (212 mg, 1.0 mmol) was added and stirring was continued for another 1 h. The reaction was quenched by addition of saturated aqueous NH$_4$Cl (10 mL) and extracted with dichloromethane (3 x 20 mL). The combined organic layers were dried (Na$_2$SO$_4$) and concentrated under reduced pressure. The residue was purified by reverse phase HPLC (Phenomenx Gemini NX, 20-60% ACN in 0.1% NH$_4$OH (aq)) to provide 7.3 mg (11 % yield ) of the title compound as a white solid.

Step 1:

tert-butyl 3-(5-(chloromethyl)-6-methoxy-2-naphthoyl) piperidine-1-carboxylate

To a stirred and cooled (-78 °C) solution of 6-bromo-l-(chloromethyl)-2-methoxy naphthalene (1.5 g, 5.3 mmol) in tetrahydrofuran (50 mL) was added n-BuLi (2.5 M in hexane, 2.6 mL, 6.4 mmol). After the addition, stirring at -78 °C was continued for 1 h, and then a solution of tert-butyl 3-(methoxy(methyl)carbamoyl)piperidine-1-carboxylate (Intermediate 19) (1.4 g, 5.3 mmol) in THF (5 mL) was added dropwise. The resulting mixture was warmed to room temperature and stirred for additional 2 h. The mixture was quenched by the addition of saturated aqueous NH4Cl (30 mL) and extracted with ethyl acetate (3 x 50 mL). The combined organic layers were washed with brine, dried over Na2SO4 and concentrated under reduced pressure. The residue was purified by silica-gel chromatography (petroleum ether: ethyl acetate = 5: 1) to give tert-butyl 3-(5-(chloromethyl)-6-methoxy-2-naphthoyl)piperidine-1-carboxylate (1.0 g, 45%) as a yellow solid.
Step 2:

EXAMPLE 200

KDM2B TR-FRET Assay for determining inhibitor IC₅₀

Full length KDM2B was cloned, expressed, and purified to homogeneity. Compound inhibition of KDM2B demethylase activity was assessed by monitoring the methylation status of a biotin-H3K36me2 peptide substrate (H2N-RKSAPATGGV(KMe2)KPHRYRPGTV-NTPEGBiot; New England Peptide) in the presence of α-ketoglutarate (2-OG) and iron (Fe²⁺) using the TR-FRET assay technology (Cisbio). Specifically, in a 384 well ProxiPlate KDM2B (5 mM final), ascorbate (500 µM final) and DTT (2 mM final) were combined with the biotin-H3K36me2 peptide substrate (200 nM final), 2-OG (0.3 µM or 6 µM final; Sigma K2010) and Fe²⁺ (100 µM final; Sigma F1543) in 50 mM HEPES (pH 6.5) and 0.01% Triton-X 100 either in the presence of DMSO (final 0.25% DMSO) or compound dilution series in DMSO and mixed.

After a two hour incubation at room temperature, a mixture of EU-anti-H3K36me1 antibody (2 nM final; Cisbio #64CUSKAZ), and Streptavidin-d2 (50 nM final; Cisbio #64CUS000) in 200 mM KF, 200 mM EDTA, 0.1% BSA and 50 mM HEPES (pH 6.5) was added. After 1 hour incubation, the plates were read on an Envision instrument, the readouts were transformed into % inhibition, and IC₅₀ values were generated using a four parameter logistic model (XLFIT5).

The KDM2B TR-FRET Assay described above represents an additional embodiment of the invention.
Data for representative compounds from the assay described in Example 200 is provided in the following Table.

51. The method of claim 50, wherein the cancer comprises cancer stem/progenitor cells.

52. The method of claim 50 or 51, wherein the KDM2 inhibitor is effective to induce differentiation of a cancer stem/progenitor cell(s), reduce activity of a cancer stem/progenitor cell(s), and/or deplete a cancer stem/progenitor cell population in the individual.

53. The method of any one of claims 50-52, wherein the KDM2 inhibitor is effective to reduce Notch signaling in a cancer stem/progenitor cell(s) in the individual.
54. A method of inducing differentiation of a cancer stem/progenitor cell(s) in an individual in need thereof, comprising administering an effective amount of a KDM2 inhibitor to the individual.

55. A method of reducing activity of a cancer stem/progenitor cell(s) in an individual in need thereof, comprising administering an effective amount of a KDM2 inhibitor to the individual.

56. A method of depleting a cancer stem/progenitor cell population in an individual in need thereof, comprising administering an effective amount of a KDM2 inhibitor to the individual.

57. A method of decreasing cancer initiation in an individual in need thereof, comprising administering an effective amount of a KDM2 inhibitor to the individual.

58. The method of any one of claims 50-57, wherein the cancer is lung, leukemia (e.g., AML, ALL, MLL), or lymphoma.

59. The method of any one of claims 50-58, wherein the inhibitor is a KDM2B inhibitor.

60. The method of any one of claims 50-59, wherein the KDM2 inhibitor specifically binds KDM2 and inhibits KDM2 demethylase activity.
